Antidepressant

Synonyms. Desmethylinipramine; DMI.

3-(10,11-Dihydro-5H-dibenz[*b,f*]azepin-5-yl)-N-methylpropyl-amine

$C_{18}H_{22}N_2 = 266.4$

CAS—50-47-5

Desipramine Hydrochloride

Proprietary Names. Norpramin; Pertofran(e).

$C_{18}H_{22}N_2 \cdot \text{HCl} = 302.8$

CAS—58-28-6

A white crystalline powder. M.p. about 214°.

Soluble 1 in 20 of water, 1 in 20 of ethanol, and 1 in about 4 of chloroform; practically insoluble in ether; freely soluble in methanol.

Dissociation Constant. pK_a 10.2 (24°).

Partition Coefficient. Log *P* (octanol/pH 7.4), 1.4.

Colour Tests. Forrest Reagent—blue; Mandelin's Test—yellow → blue.

Thin-layer Chromatography. *System TA*—Rf 26; *system TB*—Rf 20; *system TC*—Rf 11. (Dragendorff spray, positive; FPN reagent, blue; acidified iodoplatinate solution, positive; Marquis reagent, blue.)

Gas Chromatography. *System GA*—RI 2242.

High Pressure Liquid Chromatography. *System HA*—desipramine k' 2.1, didesmethylipramine k' 1.3, 2-hydroxydesipramine k' 1.2; *system HF*—desipramine k' 3.60.

Ultraviolet Spectrum. Aqueous acid—250 nm ($A_1^1 = 308$ a). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 746, 741, 763, 1230, 1590, 1104 (desipramine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 235, 195, 208, 44, 234, 193, 194, 71; 2-hydroxydesipramine 44, 209, 211, 250, 210, 224, 42, 251.

Quantification. See also under Imipramine.

GAS CHROMATOGRAPHY. In plasma or serum: detection limit 1 ng/ml, AFID—E. Antal *et al.*, *J. Chromat.*, 1980, 183; *Biomed. Appl.*, 9, 149–157.

Disposition in the Body. Well absorbed after oral administration. Metabolised by aromatic hydroxylation and possibly hydroxylamine formation; *N*-demethylation to form didesmethylimipramine may occur to a minor extent. 2-Hydroxydesipramine, the major metabolite, is active. Less than 5% of a dose is excreted in urine in 24 hours as unchanged drug; the urinary excretion of unchanged drug is pH-dependent and is increased in acidic urine; the hydroxylated metabolites are excreted mainly as glucuronide conjugates. The extent of 2-hydroxylation is genetically determined.

Desipramine is the major active metabolite of imipramine and lofepramine.

THERAPEUTIC CONCENTRATION. Plasma concentrations vary considerably between individual subjects.

After administration of a single oral dose of 50 mg to 4 subjects, peak plasma-desipramine concentrations of 0.008 to 0.015 µg/ml (mean 0.012) were attained in 3 to 6 hours; peak plasma concentrations of 2-hydroxydesipramine of 0.011 to 0.013 µg/ml were attained in about 2 to 4 hours (C. L. De Vane *et al.*, *Eur. J. clin. Pharmac.*, 1981, 19, 61–64).

Following daily oral doses of about 2.5 mg/kg to 47 subjects, minimum steady-state plasma concentrations of 0.02 to 0.88 µg/ml (mean 0.17) of desipramine and 0.007 to 0.13 µg/ml (mean 0.04) of 2-hydroxydesipramine were reported (J. L. Bock *et al.*, *Clin. Pharmac. Ther.*, 1983, 33, 322–328).

TOXICITY. Plasma concentrations greater than 0.4 µg/ml may produce toxic effects. Fatalities are comparatively rare, but may occur with plasma concentrations greater than 10 µg/ml.

Recovery has occurred in 2 subjects after the ingestion of up to 2 g; peak plasma concentrations of 1.56 µg/ml and 1.58 µg/ml were reported (J. T. Biggs, *J. Am. med. Ass.*, 1977, 238, 135–138).

In 1 fatal case, a blood concentration of 3 µg/ml and a liver concentration of 140 µg/g were reported (R. C. Baselt and R. H. Cravey, *J. analyt. Toxicol.*, 1977, 1, 81–103).

The following postmortem concentrations were found after the death of a 2-year-old child: blood 8 µg/ml, liver blood 22 µg/ml, bile 67 µg/ml, urine 2 µg/ml (A. E. Robinson *et al.*, *J. analyt. Toxicol.*, 1979, 3, 3–13).

HALF-LIFE. Plasma half-life, 10 to 35 hours.

PROTEIN BINDING. In plasma, about 70 to 90%.

NOTE. For a review of the pharmacokinetics of tricyclic antidepressants see G. Molnar and R. N. Gupta, *Biopharm. Drug Disp.*, 1980, 1, 283–305.

Dose. 25 to 200 mg of desipramine hydrochloride daily; up to 300 mg daily has been given.

Deslanoside

Cardiac Glycoside

Synonyms. Deacetyl-lanatoside C; Desacetyl-lanatoside C.

Proprietary Names. Cedilanid-D; Cedilanid(e); Desace.

Note. The name Cedilanid(e) is also applied to preparations of lanatoside C.

3β-[(*O*-β-D-Glucopyranosyl-(1 → 4)-*O*-2,6-dideoxy-β-D-ribo-hexopyranosyl-(1 → 4)-*O*-2,6-dideoxy-β-D-ribo-hexopyranosyl-(1 → 4)-2,6-dideoxy-β-D-ribo-hexopyranosyl)oxy]-12β,14-dihydroxy-5β,14β-card-20(22)-enolide

$C_{47}H_{74}O_{19}$ = 943.1

CAS—17598-65-1

White hygroscopic crystals or crystalline powder. M.p. about 220°.

Practically **insoluble** in water; soluble 1 in 300 of ethanol and 1 in 200 of methanol; practically insoluble in chloroform and ether.

Colour Test. Dissolve 2 to 3 mg in 5 ml of a solution containing 0.5 ml of a 9% ferric chloride solution and 100 ml of acetic acid; underlay with 5 ml of sulphuric acid—intense blue in the acetic acid layer and a brown ring free from red at the junction of the two liquids (see also Lanatoside C).

Thin-layer Chromatography. System TK—Rf 27. (Perchloric acid solution, followed by examination under ultraviolet light, blue fluorescence; *p*-anisaldehyde reagent, blue.)

Disposition in the Body. Incompletely absorbed after oral administration and metabolised to digoxin. After intravenous administration, about 80% of a single dose is excreted in the urine in 72 hours, mostly as unchanged drug, and about 10% of a dose is eliminated in the faeces. During maintenance treatment, about 30% of a daily dose is excreted in the 24-hour urine. After oral administration digoxin accounts for about 50% of the total urinary excretion material.

Deslanoside is a metabolite of lanatoside C.

THERAPEUTIC CONCENTRATION.

After an intravenous dose of 400 µg given to 5 subjects, a mean plasma concentration of 0.03 µg/ml was reported at 15 minutes, declining to 0.001 µg/ml at 48 hours; after an oral dose of 800 µg given to 5 subjects, a mean peak plasma concentration of 0.003 µg/ml was attained in 2 hours (A. Marzo *et al.*, *Farmaco, Edn prat.*, 1982, 37, 28–37).

HALF-LIFE. Plasma half-life, about 33 hours.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 1.4.

PROTEIN BINDING. In plasma, weakly bound.

Dose. For rapid digitalisation, 0.8 to 1.6 mg intravenously.

Desmetryne

Herbicide

Proprietary Name. Semeron 25 WP

2-Isopropylamino-4-methylamino-6-methylthio-1,3,5-triazine

$C_8H_{15}N_5S$ = 213.3

CAS—1014-69-3

A white crystalline solid. M.p. 84° to 86°.

Very slightly **soluble** in water; readily soluble in organic solvents.

Thin-layer Chromatography. System TA—Rf 73. (Dragendorff spray, positive.)

Gas Chromatography. System GA—RI 1795; system GK—retention time 0.95 relative to caffeine.

Ultraviolet Spectrum. Aqueous acid—258 nm ($A_1^1 = 450$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1531, 1587, 1258, 806, 1292, 1163 (KBr disk).

Mass Spectrum. Principal peaks at m/z 213, 57, 58, 198, 82, 171, 43, 99.

Desonide

Corticosteroid

Synonyms. Desfluorotriamcinolone Acetonide; 16-Hydroxy-prednisolone 16,17-Acetonide.

Proprietary Names. Apolar; Locapred; Tridesilon; Tridésonit.

11 β ,21 - Dihydroxy - 16 α ,17 α - isopropylidenedioxypregna - 1,4 - diene-3,20-dione

$C_{24}H_{32}O_6 = 416.5$

CAS—638-94-8

White powder or crystals.

Ultraviolet Spectrum. Methanol—243 nm ($A_1^1 = 450$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1639, 1052, 1612, 1086, 1265, 1694.

Use. Topically as a 0.05% cream or ointment.

Dexamethasone

Corticosteroid

Synonyms. Desamethasone; 9 α -Fluoro-16 α -methylprednisolone.

Proprietary Names. Aeroseb-Dex; Decaderm; Decadron (elixir and tablets); Decalix; Decaspray; Dexacortisyl; Dexalocal; Dexasone (tablets); Dexone; Dezone (tablets); Fortecortin (tablets); Hexadrol (tablets); Maxidex; Millicorten; Miral; Oradexon (tablets). It is an ingredient of Maxitrol.

9 α -Fluoro-11 β ,17 α ,21-trihydroxy-16 α -methylpregna-1,4-diene-3,20-dione

$C_{22}H_{29}FO_5 = 392.5$

CAS—50-02-2

Dexamethasone is a synthetic glucocorticoid and is an isomer of betamethasone.

A white crystalline powder. M.p. about 250° to 253°, with decomposition. A solution in dioxan is dextrorotatory.

Practically **insoluble** in water; soluble 1 in 42 of ethanol and 1 in 165 of chloroform; sparingly soluble in acetone and methanol; very slightly soluble in ether.

Dexamethasone Acetate

Synonym. Dexamethasone 21-Acetate

Proprietary Names. Decadron-LA; Dexacen-La-8; Dexasone L.A.; Fortecortin (suspension for injection).

$C_{24}H_{31}FO_6 = 434.5$

CAS—1177-87-3 (anhydrous); 55812-90-3 (monohydrate)

A white powder. M.p. about 225°, with decomposition.

Practically **insoluble** in water; soluble 1 in 40 of ethanol, 1 in 25 of dehydrated alcohol, 1 in 33 of chloroform, and 1 in 1000 of ether; freely soluble in acetone and methanol.

Dexamethasone Isonicotinate

Synonym. Dexamethasone 21-Isonicotinate

Proprietary Names. Auxison(e). It is an ingredient of Dexa-Rhinaspray.

$C_{28}H_{32}FNO_6 = 497.6$

CAS—2265-64-7

Dexamethasone Sodium Phosphate

Synonym. Sodium 9 α -Fluoro-16 α -methylprednisolone 21-Phosphate

Proprietary Names. Dalaron; Decadron (injection); Decasone; Dexacene-4; Dexasone (injection); Dezone (injection); Fortecortin (injection); Hexadrol (injection); Novadex; Oradexon (injection); Savacort-D; Turbinaire Decadron.

$C_{22}H_{28}FNa_2O_8P = 516.4$

CAS—2392-39-4

A white or slightly yellow, very hygroscopic, crystalline powder.

Soluble 1 in 2 of water; sparingly soluble in dehydrated alcohol; practically insoluble in chloroform and ether.

Dexamethasone Tebutate

Synonyms. Dexamethasone Butylacetate; Dexamethasone TBA; Dexamethasone Tertiary Butyl Acetate.

Proprietary Name. Decadron-TBA

$C_{28}H_{38}FO_6 = 490.6$

CAS—24668-75-5

Practically **insoluble** in water; soluble in ethanol and acetone.

Colour Tests. Antimony Pentachloride—green; Naphthol-Sulphuric Acid—yellow-green/yellow; Sulphuric Acid—orange-pink.

Thin-layer Chromatography. *System TP*—Rf 32; *system TQ*—Rf 08; *system TR*—Rf 00; *system TS*—Rf 00. (DPST solution.)

Gas Chromatography. *System GA*—RI 2970.

High Pressure Liquid Chromatography. *System HT*—k' 4.8.

Ultraviolet Spectrum. Methanol—240 nm ($A_1^1 = 385$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1663, 896, 1622, 1695, 1052, 1603.

Mass Spectrum. Principal peaks at m/z 121, 122, 315, 43, 147, 223, 135, 41.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or tissues: sensitivity 10 ng in plasma, UV detection—B. Cham *et al.*, *Ther. Drug Monit.*, 1980, 2, 373–377.

RADIOIMMUNOASSAY. In plasma or urine: sensitivity 1 ng/ml—J. English *et al.*, *Eur. J. clin. Pharmac.*, 1975, 9, 239–244.

Disposition in the Body. Rapidly absorbed after oral administration. Up to 65% of a dose is excreted in the urine in 24 hours, mainly as metabolites.

HALF-LIFE. Plasma half-life, about 2 to 5 hours.

VOLUME OF DISTRIBUTION. About 1 litre/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 1.2.

PROTEIN BINDING. In plasma, about 67%.

REFERENCE. S. E. Tsuei *et al.*, *J. Pharmacokin. Biopharm.*, 1979, 7, 249–264.

Dose. 0.5 to 9 mg daily.

Dexamphetamine

Central Stimulant

Synonym. Dextroamphetamine

Proprietary Names. It is an ingredient of Biphetamine and Durophet.

(S)- α -Methylphenethylamine

$C_9H_{13}N = 135.2$

CAS—51-64-9

**Dexamphetamine Phosphate**

Synonyms. Dextroamphetamine Phosphate; Monobasic Dextroamphetamine Phosphate.

$C_9H_{13}N, H_3PO_4 = 233.2$

CAS—7528-00-9

A white crystalline powder.

Soluble 1 in 20 of water; slightly soluble in ethanol; practically insoluble in chloroform and ether.

Dexamphetamine Sulphate

Synonym. Dextro Amphetamine Sulphate

Proprietary Names. Dexamper; Dexedrine; Diphylets; Ferndex. It is an ingredient of Dexamyl and Eskatrol.

$(C_9H_{13}N)_2, H_2SO_4 = 368.5$

CAS—51-63-8

A white or almost white crystalline powder. M.p. 295° to 300°.

Soluble 1 in 9 to 1 in 10 of water and 1 in 800 of ethanol; practically insoluble in ether.

For analytical data and Quantification see under Amphetamine.

Disposition in the Body. Well absorbed after oral administration. It is approximately twice as potent as amphetamine. For information on metabolism, excretion, and pharmacokinetics, see under Amphetamine.

Dose. 5 to 60 mg of dexamphetamine sulphate daily.

Dexbrompheniramine

Antihistamine

(+)-3-(4-Bromophenyl)-*NN*-dimethyl-3-(2-pyridyl)propylamine

$C_{16}H_{19}BrN_2 = 319.2$

CAS—132-21-8

An oily liquid.

Dexbrompheniramine Maleate

Proprietary Names. It is an ingredient of Disophrol, Drixoral, and Halin.

$C_{16}H_{19}BrN_2, C_4H_4O_4 = 435.3$

CAS—2391-03-9

A white crystalline powder. M.p. 103° to 113°.

Soluble 1 in 1.2 of water, 1 in 2.5 of ethanol, and 1 in 2 of chloroform; very slightly soluble in ether.

For analytical data see under Brompheniramine.

Disposition in the Body. See under Brompheniramine. Dexbrompheniramine is approximately twice as potent as brompheniramine.

TOXICITY.

The following postmortem concentrations of dexbrompheniramine were reported in a fatality involving the ingestion of dexbrompheniramine and 3 other drugs: blood 0.2 μ g/ml, liver 4.5 μ g/g (R. C. Baselt and E. M. Gross, *J. analyt. Toxicol.*, 1977, 1, 168–170).

Dose. Usually 8 mg of dexbrompheniramine maleate daily; up to 18 mg daily has been given in sustained-release preparations.

Dexchlorpheniramine

Antihistamine

(+)-3-(4-Chlorophenyl)-*NN*-dimethyl-3-(2-pyridyl)propylamine

$C_{16}H_{19}ClN_2 = 274.8$

CAS—25523-97-1

An oily liquid.

Soluble in chloroform.

Dexchlorpheniramine Maleate

Proprietary Names. Destral; Polaramin(e).

$C_{16}H_{19}ClN_2 \cdot C_4H_4O_4 = 390.9$

CAS—2438-32-6

A white crystalline powder. M.p. 110° to 115°.

Soluble 1 in 1.1 of water, 1 in 2 of ethanol, and 1 in 1.7 of chloroform; very slightly soluble in ether.

For analytical data see under Chlorpheniramine.

Disposition in the Body. See under Chlorpheniramine. Dexchlorpheniramine is more potent than chlorpheniramine.

Dose. 6 to 8 mg of dexchlorpheniramine maleate daily; up to 18 mg daily has been given in sustained-release preparations.

Dexpanthenol

Vitamin B Activity

Synonyms. Dextro-Pantothenyl Alcohol; Pantothenol.

Proprietary Names. Bepanthen(e); Ilopan; Motilyn; Panthoderm.

(*R*)-2,4-Dihydroxy-*N*-(3-hydroxypropyl)-3,3-dimethylbutyramide

$C_9H_{19}NO_4 = 205.3$

CAS—81-13-0

A clear, colourless or slightly yellow, hygroscopic, viscous liquid.

Miscible with water and ethanol; soluble 1 in 70 of chloroform and 1 in 200 of ether.

Thin-layer Chromatography. *System TA*—Rf 70. (*Acidified potassium permanganate solution*, positive, developing slowly.)

Gas Chromatography. *System GA*—RI 1807.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1629, 1035, 1064, 1520, 1282, 1250 (thin film).

Dose. Dexpanthenol has been given in doses of 250 to 500 mg intramuscularly.

Dextromethorphan

Cough Suppressant

(+)-3-Methoxy-9a-methylmorphinan

$C_{18}H_{25}NO = 271.4$

CAS—125-71-3

An almost white or slightly yellow crystalline powder. M.p. 109° to 113°.

Practically **insoluble** in water; freely soluble in chloroform.

Dextromethorphan Hydrobromide

Proprietary Names. Balminil D.M.; Broncho-Grippol-DM; Cosylan; DM Syrup; Dormethan; Robidex; Romilar; Sedatuss; Tussorphan. It is an ingredient of Actifed Compound Linctus, Benafed, Benylin (fortified linctus), CoTylenol (liquid), Dexylets, Lotussin, Paranorm, Rondec-DM, Syrtussar, Tancolin, Tusana, Tussils, and Unitussin.

$C_{18}H_{25}NO \cdot HBr \cdot H_2O = 370.3$

CAS—125-69-9 (anhydrous); 6700-34-1 (monohydrate)

A white crystalline powder. M.p. about 125°, with decomposition.

Soluble 1 in 60 to 1 in 65 of water and 1 in 10 of ethanol; freely soluble in chloroform with the separation of water; practically insoluble in ether.

Dissociation Constant. pK_a 8.3.

Colour Tests. Aromaticity (Method 2)—yellow/orange-red; Liebermann's Test—black.

Thin-layer Chromatography. *System TA*—Rf 34; *system TB*—Rf 44; *system TC*—Rf 17. (*Acidified iodoplatinate solution*, positive.)

Gas Chromatography. *System GA*—dextromethorphan RI 2140, dextrophan RI 2230.

High Pressure Liquid Chromatography. *System HA*—dextromethorphan k' 5.6 (tailing peak), dextrophan k' 4.7 (tailing peak).

Ultraviolet Spectrum. Aqueous acid—278 nm ($A_1^1 = 70$ a). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1496, 1242, 1040, 1300, 1280, 1070 (dextromethorphan hydrobromide, KBr disk).

Mass Spectrum. Principal peaks at m/z 59, 271, 150, 270, 31, 214, 42, 171; dextrorphan 59, 257, 150, 256, 31, 76, 42, 157.

Quantification. SPECTROFLUORIMETRY. In plasma: dextrorphan—G. Ramachander *et al.*, *J. pharm. Sci.*, 1977, 66, 1047–1048.

GAS CHROMATOGRAPHY. In serum: dextromethorphan, sensitivity 1 ng/ml, ECD—J. W. Barnhart and E. N. Massad, *J. Chromat.*, 1979, 163; *Biomed. Appl.*, 5, 390–395.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: dextrorphan, sensitivity 20 ng/ml, fluorescence detection—R. Gillilan *et al.*, *Analyt. Lett. (Part B)*, 1980, 13, 381–387. In urine: dextromethorphan and metabolites, sensitivity 17 to 90 ng/ml in non-hydrolysed urine and 110 to 210 ng/ml in hydrolysed urine, UV detection—Y. H. Park *et al.*, *J. pharm. Sci.*, 1984, 73, 24–29.

Disposition in the Body. Well absorbed after oral administration. Metabolised by *N*- and *O*-demethylation followed by sulphate or glucuronic acid conjugation. The major metabolite is dextrorphan, (+)-3-hydroxy-*N*-methylnorphinan; (+)-3-hydroxymorphinan has also been identified. About 50% of a dose is excreted in the urine in 24 hours, mostly as the glucuronide and sulphate conjugates of the metabolites; about 8% of a dose is excreted as unchanged drug in 6 hours.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 30 mg to 6 subjects, a mean peak plasma concentration of 0.38 $\mu\text{g/ml}$ of conjugated dextrorphan was attained in 2 hours (G. Ramachander *et al.*, *J. pharm. Sci.*, 1977, 66, 1047–1048).

After an oral dose of 20 mg of dextromethorphan hydrobromide given to 12 subjects, peak serum concentrations of less than 0.001 $\mu\text{g/ml}$ to 0.008 $\mu\text{g/ml}$ (mean 0.0018) of dextromethorphan were attained in about 2.5 hours (J. W. Barnhart and E. N. Massad, *J. Chromat.*, 1979, 163; *Biomed. Appl.*, 5, 390–395).

TOXICITY. The estimated minimum lethal dose is 0.5 g.

Dose. 15 to 120 mg of dextromethorphan hydrobromide daily.

Dextromoramide

Narcotic Analgesic

Synonyms. Dextrodiphenopyrine; *d*-Moramid; Pyrrolamidol.

(+)-1-(3-Methyl-4-morpholino-2,2-diphenylbutyl)-pyrrolidine

$\text{C}_{25}\text{H}_{32}\text{N}_2\text{O}_2 = 392.5$

CAS—357-56-2

A white amorphous or microcrystalline powder. M.p. 184°.

Practically **insoluble** in water; soluble 1 in 50 of ethanol, 1 in 3 of chloroform, 1 in 30 of isopropyl alcohol, and 1 in 45 of methanol; slightly soluble in ether.

Dextromoramide Tartrate

Synonym. Dextromoramide Acid Tartrate

Proprietary Names. Jetrium; Palfium.

$\text{C}_{25}\text{H}_{32}\text{N}_2\text{O}_2 \cdot \text{C}_4\text{H}_6\text{O}_6 = 542.6$

CAS—2922-44-3

A white amorphous or crystalline powder. M.p. about 190°, with slight decomposition.

Soluble 1 in 25 of water, 1 in 85 of ethanol, and 1 in 40 of methanol; slightly soluble in chloroform and isopropyl alcohol; very slightly soluble in ether.

Colour Test. Liebermann's Test (100°)—green.

Thin-layer Chromatography. System TA—Rf 76; system TB—Rf 40; system TC—Rf 71. (Dragendorff spray, positive; acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2940; system GC—RI 3625.

High Pressure Liquid Chromatography. System HA— k' 0.7; system HC— k' 0.09.

Ultraviolet Spectrum. Aqueous acid—254 nm, 259 nm ($A_1^1 = 10.6$ a), 264 nm. No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1623, 703, 1107, 717, 858, 1002 (Nujol mull).

Mass Spectrum. Principal peaks at m/z 100, 265, 128, 266, 44, 98, 56, 101.

Disposition in the Body. Absorbed after oral administration. Metabolic reactions may include *N*-oxidation, hydroxylation, and amide hydrolysis; it is possible that 2-hydroxydextromoramide is a major metabolite. Excreted in the urine, partly as unchanged drug.

TOXICITY. The estimated minimum lethal dose is 500 mg. Fatalities have occurred at blood concentrations greater than 0.04 μg/ml.

The following postmortem disposition was found in a fatal case after the injection of dextromoramide and diazepam: blood, dextromoramide 0.5 μg/ml, diazepam 0.13 μg/ml; liver, dextromoramide 0.9 μg/g, diazepam 0.37 μg/g; urine, dextromoramide not detected, diazepam 0.33 μg/ml (P. Ashton *et al.*, *Bull. int. Ass. forens. Toxicol.*, 1978, 14(2), 22–24).

Dose. The equivalent of 5 to 20 mg of dextromoramide, repeated as necessary.

Dextropropoxyphene

Narcotic Analgesic

Synonym. Propoxyphene

(+)-(1*S*,2*R*)-1-Benzyl-3-dimethylamino-2-methyl-1-phenylpropyl propionate

$C_{22}H_{29}NO_2 = 339.5$

CAS—469-62-5

Crystals. M.p. 75° to 76°.

Very slightly **soluble** in water.

Dextropropoxyphene Hydrochloride

Synonym. Propoxyphene Hydrochloride

Proprietary Names. Algaphan; Algodex; Antalvic; Daraphen; Darvon; Depronal; Depronal SA; Develin; Dolene; Dolocap; Erantin; Mardon; Novopropoxyn; Pro-65; Proxagesic; SK-65; 642 Tablets. It is an ingredient of Cosalgic, Dextrogesic, and Distalgic.

$C_{22}H_{29}NO_2 \cdot HCl = 375.9$

CAS—1639-60-7

A white or slightly yellow powder. M.p. 163° to 169°.

Soluble 1 in 0.3 of water, 1 in 1.5 of ethanol, and 1 in 0.6 of chloroform; practically insoluble in ether.

Dextropropoxyphene Napsylate

Synonym. Propoxyphene Napsylate

Proprietary Names. Darvon-N; Doloxene. It is an ingredient of Darvocet-N, Distalgic Soluble, Dolasan, and Napsalgic.

$C_{22}H_{29}NO_2 \cdot C_{10}H_8O_3S \cdot H_2O = 565.7$

CAS—17140-78-2 (anhydrous); 26570-10-5 (monohydrate)

A white powder. M.p. 158° to 165°.

Practically **insoluble** in water; soluble 1 in 13 to 1 in 15 of ethanol, and 1 in 3 of chloroform; soluble in acetone and methanol.

Dissociation Constant. pK_a 6.3.

Colour Tests. Liebermann's Test—brown; Mandelin's Test—grey-brown; Marquis Test—black-violet → green.

Thin-layer Chromatography. *System TA*—Rf 68; *system TB*—Rf 59; *system TC*—Rf 55. (*Dragendorff spray*, positive; *acidified iodoplatinate solution*, positive; *Marquis reagent*, violet.)

Gas Chromatography. *System GA*—dextropropoxyphene RI 2188, norpropoxyphene RI 2395; *system GB*—dextropropoxyphene RI 1938; *system GC*—dextropropoxyphene RI 2173; *system GF*—dextropropoxyphene RI 2370, norpropoxyphene RI 3025.

High Pressure Liquid Chromatography. *System HA*—dextropropoxyphene k' 1.9, norpropoxyphene k' 1.3; *system HC*— k' 0.19.

Ultraviolet Spectrum. Aqueous acid—252 nm, 257 nm ($A_1^1 = 12$ a), 263 nm. No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1730, 1175, 725, 704, 776, 1026 (Nujol mull).

Mass Spectrum. Principal peaks at m/z 58, 117, 208, 115, 193, 91, 179, 130 (no peaks above 210); norpropoxyphene 44, 208, 117, 58, 193, 130, 57, 29.

Quantification. SPECTROFLUORIMETRY. In blood, urine or tissues: limit of detection 10 ng—J. C. Valentour *et al.*, *Clin. Chem.*, 1974, 20, 275–277.

GAS CHROMATOGRAPHY. In plasma: dextropropoxyphene and norpropoxyphene, FID—M. Cleeman, *J. Chromat.*, 1977, 132,

287–294. In plasma: review of thermal decomposition of dextropropoxyphene during gas chromatography—B. J. Millard *et al.*, *J. pharm. Sci.*, 1980, 69, 1177–1179. In plasma or urine: sensitivity 50 ng/ml for dextropropoxyphene and 100 ng/ml for norpropoxyphene, AFID—P. A. Margot *et al.*, *J. chromatogr. Sci.*, 1983, 21, 201–204.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or breast milk: dextropropoxyphene and norpropoxyphene, sensitivity 20 ng/ml, UV detection—R. L. Kunka *et al.*, *J. pharm. Sci.*, 1985, 74, 103–104.

Disposition in the Body. Readily and completely absorbed but undergoes considerable first-pass metabolism; bioavailability about 40%. Rapidly distributed and concentrated in the brain, lungs, liver, and kidneys. The main metabolic reaction is *N*-demethylation which produces norpropoxyphene, the major metabolite, and also dinorpropoxyphene which is dehydrated to cyclic dinorpropoxyphene. Norpropoxyphene has less than half the activity of dextropropoxyphene. In 24 hours, about 35% of a dose is excreted in urine with about 13% of the dose as norpropoxyphene and up to 5% as unchanged drug. A total of 60 to 70% of a dose is excreted in urine in about 5 days; about 18% of the dose may be eliminated in the faeces over the same period.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.05 to 0.75 µg/ml.

Peak plasma concentrations of dextropropoxyphene of 0.17 to 0.37 µg/ml (mean 0.23) were attained 2 hours after administration of a single oral dose of 130 mg to 6 subjects; peak norpropoxyphene concentrations of 0.19 to 0.42 µg/ml (mean 0.27) were attained in 4 hours (K. Verebely and C. E. Inturrisi, *Clin. Pharmac. Ther.*, 1974, 15, 302–309).

Following daily oral dosing of 195 mg to 3 subjects, steady-state plasma concentrations were: dextropropoxyphene 0.24 to 0.75 µg/ml (mean 0.4); norpropoxyphene 0.6 to 3.0 µg/ml (mean 1.5) (K. Verebely and C. E. Inturrisi, *J. Chromat.*, 1973, 75, 195–205).

TOXICITY. The estimated minimum lethal dose is 0.5 g. Blood concentrations in the region of 1 µg/ml are likely to cause toxic reactions; concentrations of 2 µg/ml or more may be lethal. In fatalities in which dextropropoxyphene is involved, it is common to find much greater concentrations in the liver and lungs than in the blood. Addicts can ingest 10 times the normal dosage before showing toxicity whereas children show toxic symptoms after only one-twentieth of the normal dose.

In a review of a number of fatalities, blood concentrations in 23 cases ranged from 1 to 60 µg/ml (mean 13) and liver concentrations in 73 cases ranged from 5 to 550 µg/g (mean 97) (R. H. Cravey *et al.*, *J. forens. Sci.*, 1974, 19, 72–80).

In 6 fatalities attributed to dextropropoxyphene overdose, the following postmortem tissue concentrations, µg/ml or µg/g (mean, *n*), were reported:

	Dextropropoxyphene	Norpropoxyphene
Blood	1.1–4.9 (3.5, 6)	1.4–5.9 (3.5, 6)
Brain	2.8–25.2 (14, 4)	4–9.1 (6, 4)
Liver	5.7–229 (117, 6)	24.2–73.2 (50, 6)
Urine	1.5–60.2 (17, 5)	1.6–287 (68, 5)

(A. J. McBay, *Clin. Chem.*, 1976, 22, 1319–1321).

HALF-LIFE. Plasma half-life, dextropropoxyphene 8 to 24 hours (mean 15), norpropoxyphene 20 to 50 hours (mean 29).

VOLUME OF DISTRIBUTION. About 16 litres/kg.

CLEARANCE. Plasma clearance, about 15 ml/min/kg.

PROTEIN BINDING. In plasma, about 70 to 80%.

NOTE. For a review of dextropropoxyphene pharmacokinetics and overdose, see R. J. Young, *Drugs*, 1983, 26, 70–79.

Dose. Usually 195 to 260 mg of dextropropoxyphene hydrochloride, or 300 to 400 mg of the napsylate, daily.

Dextrorphan

Cough Suppressant

(+)-9a-Methylmorphinan-3-ol

C₁₇H₂₃NO = 257.4

CAS—125-73-5

Crystals. M.p. 198° to 199°.

Thin-layer Chromatography. System TA—Rf 35; system TB—Rf 13; system TC—Rf 07. (Dragendorff spray, positive; acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2230.

High Pressure Liquid Chromatography. System HA—k' 4.7 (tailing peak).

Ultraviolet Spectrum. Aqueous acid—279 nm (A₁¹ = 79 a); aqueous alkali—240 nm (A₁¹ = 339 a), 299 nm (A₁¹ = 119 a).

Infra-red Spectrum. Principal peaks at wavenumbers 1240, 1495, 1280, 1580, 756, 1610 (KBr disk).

Mass Spectrum. Principal peaks at m/z 59, 257, 150, 256, 31, 76, 42, 157.

Quantification. See under Dextromethorphan.

Disposition in the Body. Dextrophan is the major metabolite of dextromethorphan but has less antitussive activity.

Diamorphine

Narcotic Analgesic

Synonyms. Acetomorphine; Diacetylmorphine; Heroin.

3,6-*O*-Diacetylmorphine

$C_{21}H_{23}NO_5 = 369.4$

CAS—561-27-3

White crystals. M.p. about 170°. It is rapidly hydrolysed by alkalis.

Soluble 1 in 1700 of water, 1 in 31 of ethanol, 1 in 1.5 of chloroform, and 1 in 100 of ether.

Diamorphine Hydrochloride

$C_{21}H_{23}NO_5 \cdot HCl \cdot H_2O = 423.9$

CAS—1502-95-0 (anhydrous)

An almost white crystalline powder. M.p. 229° to 233°.

Soluble 1 in 1.6 of water, 1 in 12 of ethanol, and 1 in 1.6 of chloroform; practically insoluble in ether.

Diamorphine hydrolyses in aqueous solution to 3-*O*- and 6-*O*-monoacetylmorphine and morphine to a significant extent at room temperature.

Dissociation Constant. pK_a 7.6 (23°).

Partition Coefficient. Log P (ether/pH 7.0), 0.2.

Colour Tests. Liebermann's Test—black; Mandelin's Test—blue-grey; Marquis Test—violet.

Thin-layer Chromatography. System *TA*—Rf 47; system *TB*—Rf 15; system *TC*—Rf 38. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, violet.)

Gas Chromatography. System *GA*—diamorphine RI 2614, 6-monoacetylmorphine RI 2537, morphine RI 2454.

High Pressure Liquid Chromatography. System *HA*—diamorphine k' 3.0 (tailing peak), 6-monoacetylmorphine k' 3.6 (tailing peak), morphine k' 3.8 (tailing peak); system *HC*—diamorphine k' 0.66, 6-monoacetylmorphine k' 0.80, morphine k' 1.30; system *HS*—diamorphine k' 0.35, 6-monoacetylmorphine k' 1.00, morphine k' 5.16.

Ultraviolet Spectrum. Aqueous acid—279 nm ($A_1^1 = 46$ a); aqueous alkali—299 nm ($A_1^1 = 69$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1245, 1764, 1178, 1215, 911, 1736 (diamorphine hydrochloride, Nujol mull). Two polymorphic forms may occur.

Mass Spectrum. Principal peaks at m/z 327, 43, 369, 268, 310, 42, 215, 204; 6-monoacetylmorphine 327, 268, 42, 43, 215, 44, 328, 269; morphine 285, 162, 42, 215, 286, 124, 44, 284.

Quantification. GAS CHROMATOGRAPHY. In blood: diamorphine and 6-monoacetylmorphine, sensitivity 100 ng/ml, AFID—D. A. Smith and W. J. Cole, *J. Chromat.*, 1975, 105, 377–381. In

illicit heroin samples—G. Machata and W. Vycudlik, *J. analyt. Toxicol.*, 1980, 4, 318–321.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In illicit samples, using reversed phase ion-pair chromatography—I. S. Lurie *et al.*, *J. forens. Sci.*, 1982, 27, 519–526. In blood: diamorphine, 6-monoacetylmorphine, and morphine, sensitivity 12.5 ng/ml, UV detection—J. G. Umans *et al.*, *J. Chromat.*, 1982, 233; *Biomed. Appl.*, 22, 213–225.

Disposition in the Body. Readily absorbed after oral administration or by injection. Rapidly hydrolysed to 6-monoacetylmorphine in blood and then more slowly metabolised to morphine which is the major active metabolite; normorphine is also formed to a minor extent; small quantities of codeine are occasionally seen in the urine of addicts, but this is thought to arise from the presence of acetylcodeine as an impurity in illicit heroin samples. All metabolites may be conjugated with glucuronic acid. Up to 80% of a dose is excreted in the urine in 24 hours, mainly as morphine-3-glucuronide with about 5 to 7% of the dose as free morphine, 1% as 6-monoacetylmorphine, 0.1% as unchanged drug, and trace amounts of other metabolites; after inhalation, 14 to 20% of the dose appears in the urine; morphine metabolites are excreted in the bile.

THERAPEUTIC CONCENTRATION. Because of its rapid hydrolysis, diamorphine is difficult to detect in plasma. Morphine plasma concentrations are usually in the range 0.01 to 0.07 µg/ml.

Diamorphine was detected in blood 2 minutes after an intravenous dose of 4 to 5 mg given to 4 subjects, but declined to a blood concentration of less than 0.01 µg/ml within 10 to 15 minutes (C. E. Inturrisi *et al.*, *New Engl. J. Med.*, 1984, 310, 1213–1217).

TOXICITY. Diamorphine is 2 to 3 times more potent than morphine. The estimated minimum lethal dose is 200 mg, but addicts may be able to tolerate up to 10 times as much; fatalities have occurred after doses of 10 mg.

The following postmortem disposition (total morphine and conjugates) was reported in 2 cases of suicide: blood 0.38 and 0.41 µg/ml, brain 0.25 and 0.35 µg/g, kidney 0.70 and 1.51 µg/g, liver 0.35 and 0.66 µg/g, urine 0.49 and 0.10 µg/ml (D. Reed *et al.*, *Forens. Sci.*, 1977, 9, 49–52).

In a review of 40 cases of death due to injection of diamorphine by addicts, the following postmortem disposition (total morphine and conjugates) was reported: blood 0.01 to 1.4 µg/ml (mean 0.19, 34 cases), bile 0.02 to 300 µg/ml (mean 22.5, 38 cases), brain 0.02 to 0.60 µg/g (mean 0.20, 21 cases), lung 0.02 to 4.2 µg/g (mean 0.46, 36 cases), urine 0.1 to 120 µg/ml (mean 13.2, 23 cases) (R. G. Richards *et al.*, *J. forens. Sci.*, 1976, 21, 467–482).

HALF-LIFE. Plasma half-life, diamorphine about 3 minutes, morphine about 2 to 3 hours.

VOLUME OF DISTRIBUTION. Morphine about 3 to 5 litres/kg.

CLEARANCE. Plasma clearance, morphine about 15 to 20 ml/min/kg.

PROTEIN BINDING. In plasma, morphine about 20 to 35%.

NOTE. For a review of the metabolism and excretion of diamorphine see U. Boerner *et al.*, *Drug Met. Rev.*, 1975, 4, 39–73.

Dose. 5 to 10 mg of diamorphine hydrochloride every 4 hours.

Diamphenethide

Anthelmintic (Veterinary)

Synonym. Diamfenetide

Proprietary Name. Coriban

$\beta\beta'$ -Oxybis(aceto-*p*-phenetide)

$C_{20}H_{24}N_2O_5 = 372.4$

CAS—36141-82-9

A white to pale buff-coloured powder.

Practically **insoluble** in water; soluble 1 in 160 of ethanol, 1 in 500 of chloroform, and 1 in 150 of methanol; practically insoluble in ether.

Colour Test. Mandelin's Test—grey-green.

Thin-layer Chromatography. System TA—Rf 81. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—244 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1653, 1508, 1529, 1238, 1136, 1597 (KBr disk).

Diamthazole

Antifungal

Synonyms. Amycazol; Dimazole.

6-(2-Diethylaminoethoxy)-2-dimethylaminobenzothiazole

$C_{15}H_{23}N_3OS = 293.4$

CAS—95-27-2

Diamthazole Hydrochloride

Proprietary Name. Asterol

$C_{15}H_{23}N_3OS \cdot 2HCl = 366.3$

CAS—136-96-9

A white, hygroscopic, crystalline powder.

Soluble in water, ethanol, and methanol; very slightly soluble in chloroform and ether.

Colour Test. Liebermann's Test—green.

Thin-layer Chromatography. System *TA*—Rf 52; system *TB*—Rf 30; system *TC*—Rf 30. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—270 nm ($A_1^1 = 370$ b), 293 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1015, 1041, 667, 1548, 1602, 1190 (KBr disk).

Mass Spectrum. Principal peaks at m/z 86, 100, 44, 30, 29, 42, 58, 56.

Use. Diamthazole hydrochloride has been used in a concentration of 5%.

Diaveridine

Coccidiostat (Veterinary)

Proprietary Name. It is an ingredient of Saquadil.

5-Veratrylpyrimidine-2,4-diylidiamine

$C_{13}H_{16}N_4O_2 = 260.3$

CAS—5355-16-8

A white or creamy-white crystalline powder. M.p. about 233°. Very slightly **soluble** in water and ethanol; soluble 1 in 600 of chloroform.

Colour Tests. Mandelin's Test—green; Marquis Test—grey → violet-brown.

Thin-layer Chromatography. System *TA*—Rf 58. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—276 nm ($A_1^1 = 300$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1630, 1645, 1598, 1250, 1510, 1570 (KBr disk).

Diazepam

Tranquilliser

Proprietary Names. Alupram; Apozepam; Atensine; Dialar; Diazemuls; D-Tran; Ducene; E-Pam; Evacalm; Lorinon; Meval; Neo-Calme; Novodipam; Paxel; Pro-Pam; Serenack; Solis; Stesolid; Stress-Pam; Tensium; Valium; Valrelease; Vivol.

7-Chloro-1,3-dihydro-1-methyl-5-phenyl-2*H*-1,4-benzodiazepin-2-one

$C_{16}H_{13}ClN_2O = 284.7$

CAS—439-14-5

A white or yellow crystalline powder. M.p. 131° to 135°.

Very slightly **soluble** in water; soluble 1 in 25 of ethanol, 1 in 2 of chloroform, and 1 in 39 of ether.

Dissociation Constant. pK_a 3.3 (20°).

Partition Coefficient. Log *P* (octanol/pH 7.4), 2.7.

Colour Test. Formaldehyde-Sulphuric Acid—orange.

Thin-layer Chromatography. System *TA*—Rf 75; system *TB*—Rf 23; system *TC*—Rf 73; system *TD*—Rf 58; system *TE*—Rf 77; system *TF*—Rf 48. (Dragendorff spray, positive; *FPN* reagent, yellow; acidified iodoplatinate solution, positive; *Marquis* reagent, yellow.)

Gas Chromatography. System *GA*—diazepam RI 2425, desmethyldiazepam RI 2496, oxazepam RI 2336, temazepam RI 2633; system *GF*—diazepam RI 3045; system *GG*—diazepam RI 2940, desmethyldiazepam RI 3041, oxazepam RI 2803, temazepam RI 3125.

High Pressure Liquid Chromatography. System *HA*—diazepam k' 0.1, desmethyldiazepam k' 0.2; system *HI*—diazepam k' 9.47, desmethyldiazepam k' 8.00, oxazepam k' 4.62, temazepam k' 5.68; system *HJ*—diazepam k' 2.29; system *HK*—diazepam k' 2.49, desmethyldiazepam k' 1.99, oxazepam k' 0.73, temazepam k' 0.60.

Ultraviolet Spectrum. Aqueous acid—242 nm ($A_1^1 = 1020$ a), 284 nm, 366 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1681, 1313, 705, 840, 1125, 740 (KBr disk).

Mass Spectrum. Principal peaks at m/z 256, 283, 284, 285, 257, 255, 258, 286; desmethyldiazepam 242, 269, 270, 241, 243, 271, 244, 272; oxazepam 257, 77, 268, 239, 205, 267, 233, 259; temazepam 271, 273, 300, 272, 256, 77, 255, 257.

Quantification. GAS CHROMATOGRAPHY. In plasma, saliva, or urine: diazepam and metabolites, sensitivity about 7.5 ng/ml, ECD—J. L. Valentine *et al.*, *Analyt. Lett. (Part B)*, 1982, 15, 1665–1683. In whole blood: diazepam and desmethyldiazepam, limit of detection 10 ng/ml, AFID—H. H. McCurdy *et al.*, *J. analyt. Toxicol.*, 1979, 3, 195–198.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In blood, plasma or urine: diazepam and metabolites, sensitivity 50 ng/ml in blood or plasma, 200 ng/ml in urine, UV detection—S. Cotler *et al.*, *J. Chromat.*, 1981, 222; *Biomed. Appl.*, 11, 95–106. In plasma: diazepam and desmethyldiazepam, comparison with a gas

chromatographic method, UV detection—V. A. Raisys *et al.*, *J. Chromat.*, 1980, 183; *Biomed. Appl.*, 9, 441–448.

RADIOIMMUNOASSAY. In blood, plasma or saliva: sensitivity 30 ng/ml in blood or plasma, 300 pg/ml in saliva—R. Dixon and T. Crews, *J. analyt. Toxicol.*, 1978, 2, 210–213.

Disposition in the Body. Rapidly and completely absorbed after oral administration. The main metabolic reactions are *N*-demethylation, 3-hydroxylation, and glucuronic acid conjugation. The major active metabolite is desmethyldiazepam (nordazepam) which accumulates during chronic dosing; other metabolites include oxazepam and temazepam, both of which are active. Only small traces of unchanged diazepam are excreted in the urine and the relative amounts of metabolites are variable and appear to be dose-dependent. About 70% of a dose is excreted in the urine, mainly as oxazepam glucuronide and conjugated desmethyldiazepam, together with smaller amounts of conjugated temazepam. About 10% of the dose may be eliminated in the faeces.

Diazepam is a metabolite of ketazolam and medazepam.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.1 to 2.5 µg/ml. After discontinuation of chronic therapy, concentrations of desmethyldiazepam may be substantially higher than diazepam and both unchanged drug and metabolite are still detectable 7 days after cessation of dosing.

Following a single oral dose of 10 mg to 4 subjects, peak blood concentrations of 0.14 to 0.19 µg/ml (mean 0.15) were attained in 1 to 1.5 hours; average peak concentrations of 0.03 µg/ml of desmethyldiazepam were attained after 24 hours (S. A. Kaplan *et al.*, *J. pharm. Sci.*, 1973, 62, 1789–1796).

After chronic daily oral dosing of 5 mg twice daily to 15 subjects, steady-state plasma concentrations were: diazepam 0.09 to 0.37 µg/ml (mean 0.23), desmethyldiazepam 0.13 to 0.46 µg/ml (mean 0.29), oxazepam 0.01 to 0.03 µg/ml (mean 0.02), temazepam 0.01 to 0.05 µg/ml (mean 0.03) (I. A. Zingales, *J. Chromat.*, 1973, 75, 55–78).

TOXICITY. Toxic effects may be produced by blood concentrations greater than 1.5 µg/ml; fatalities caused by diazepam alone are rare, but may occur at blood concentrations greater than 5 µg/ml.

In a review of 914 drug-related deaths in which diazepam was involved it was found to be the sole cause of death in only 2 cases; postmortem concentrations of diazepam in the 2 cases were: blood 5 and 19 µg/ml, liver 13 µg/g in the first case (B. S. Finkle *et al.*, *J. Am. med. Ass.*, 1979, 242, 429–434).

In a fatality due to diazepam and alcohol ingestion, postmortem tissue-diazepam concentrations were: blood 1.3 µg/ml, bile 4.5 µg/ml, brain 2.4 µg/g, kidney 11.7 µg/g, liver 11.4 µg/g, urine 6.6 µg/ml (R. K. Simon, *Bull. int. Ass. forens. Toxicol.*, 1976, 12(1), 19–20).

HALF-LIFE. Plasma half-life, diazepam 20 to 100 hours (mean 48), desmethyldiazepam about 40 to 100 hours but there is considerable intersubject variation—see under Nordazepam. The plasma half-life appears to be increased in elderly subjects and neonates, and in subjects with liver disease; sex differences have also been suggested.

VOLUME OF DISTRIBUTION. Diazepam and desmethyldiazepam, 0.5 to 2.5 litres/kg, increased in elderly subjects.

CLEARANCE. Plasma clearance, diazepam about 0.3 to 0.5 ml/min/kg, desmethyldiazepam about 0.1 to 0.3 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, diazepam 1.8, desmethyldiazepam 1.7.

PROTEIN BINDING. In plasma, diazepam 98 to 99%, desmethyldiazepam about 97%.

NOTE. For a review of the clinical pharmacokinetics of diazepam see M. Mandelli *et al.*, *Clin. Pharmacokinet.*, 1978, 3, 72–91.

Dose. Usually 5 to 30 mg daily.

Diazinon

Pesticide

Synonym. Dimpylate*Proprietary Names.* Basudin; Diazitol.*OO*-Diethyl *O*-(2-isopropyl-6-methylpyrimidin-4-yl) phosphorothioate $C_{12}H_{21}N_2O_3PS = 304.3$

CAS—333-41-5

The pure compound is a colourless liquid; the technical grade is a pale to dark brown liquid. It is stable in alkaline solutions but is slowly hydrolysed in water and dilute acids.

Slightly **soluble** in water; miscible with ethanol, ether, and petroleum oils.

Colour Tests. Palladium Chloride—orange-brown; Phosphorus Test—yellow.

Thin-layer Chromatography. *System TW*—Rf 82.

Gas Chromatography. *System GA*—RI 1758; *system GK*—retention time 0.79 relative to caffeine.

Ultraviolet Spectrum. Hexane—248 nm ($A_1^1 = 170$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1020, 1587, 971, 1562, 823, 1159.

Mass Spectrum. Principal peaks at m/z 137, 179, 152, 93, 153, 199, 97, 43.

Quantification. GAS CHROMATOGRAPHY—In postmortem tissues: FID or ECD—A. Poklis *et al.*, *Forens. Sci. Int.*, 1980, 15, 135–140.

Disposition in the Body. Rapidly absorbed from the lungs and through the skin.

TOXICITY. The estimated minimum lethal dose is 25 g.

In 2 fatalities due to diazinon ingestion, postmortem tissue concentrations were: blood 0.7, 33 µg/ml, brain 12, 62 µg/g, kidney 3, – µg/g, liver 30, 345 µg/g, adipose tissue 37, – µg/g (W. H. Wall, *Bull. int. Ass. forens. Toxicol.*, 1981, 16(2), 27–28).

In a fatality attributed to diazinon, the following postmortem tissue concentrations were reported: blood 277 µg/ml, bile 200 µg/ml, brain 2 µg/g, kidney 0.1 µg/g, liver 4 µg/g (A. Poklis *et al.*, *Forens. Sci. Int.*, 1980, 15, 135–140).

Diazoxide

Antihypertensive/Hyperglycaemic

Proprietary Names. Eudemine; Hyperstat; Hypertonalum; Proglycem; Proglycem.

7-Chloro-3-methyl-2*H*-1,2,4-benzothiadiazine 1,1-dioxide $C_8H_7ClN_2O_2S = 230.7$

CAS—364-98-7

A white or creamy-white crystalline powder. M.p. 330° to 331°. Practically **insoluble** in water, chloroform, and ether; soluble 1 in 250 of ethanol; very soluble in solutions of alkali hydroxides; freely soluble in dimethylformamide.

Dissociation Constant. pK_a 8.5.

Thin-layer Chromatography. *System TA*—Rf 82; *system TB*—Rf 01; *system TC*—Rf 28.

Gas Chromatography. *System GA*—not eluted.

High Pressure Liquid Chromatography. *System HA*— k' 0.1.

Ultraviolet Spectrum. Aqueous alkali—280 nm ($A_1^1 = 585$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1139, 1294, 1166, 1495, 1112, 812 (KBr disk).

Mass Spectrum. Principal peaks at m/z 125, 189, 230, 127, 191, 63, 232, 90.

Quantification. GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In plasma or urine: sensitivity 10 ng/ml—W. Sadee *et al.*, *J. Pharmacokinet. Biopharm.*, 1973, 1, 295–305.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: detection limit 100 ng/ml, UV detection—T. B. Vree *et al.*, *J. Chromat.*, 1979, 164; *Biomed. Appl.*, 6, 228–234.

THIN-LAYER CHROMATOGRAPHY—ULTRAVIOLET SPECTROPHOTOMETRY. In plasma, urine or faeces: diazoxide and metabolites—A. W. Pruitt *et al.*, *J. Pharmac. exp. Ther.*, 1974, 188, 248–256.

Disposition in the Body. Readily absorbed after oral administration. Metabolised by oxidation to the 3-hydroxymethyl derivative which is conjugated with sulphate or further metabolised to the 3-carboxy derivative. About 90% of a dose is excreted in the urine in 5 to 6 days, of which 6 to 50% is unchanged drug; the 3-hydroxymethyl and 3-carboxy metabolites each account for about 20 to 30% of the excreted material; the amount of unchanged drug excreted in the urine appears to be reduced in hypertensive patients; about 2% of a dose is eliminated in the faeces.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 15 to 50 µg/ml.

Following a single oral dose of 300 mg to 2 subjects, peak plasma concentrations of about 15 to 20 µg/ml were attained in 3 to 6 hours (A. W. Pruitt *et al.*, *Clin. Pharmac. Ther.*, 1973, 14, 73–82).

TOXICITY. Toxic effects may be associated with plasma concentrations greater than 100 µg/ml.

HALF-LIFE. Plasma half-life, adults, about 20 to 70 hours; appears to be lower in children.

VOLUME OF DISTRIBUTION. About 0.2 to 0.3 litre/kg.

CLEARANCE. Plasma clearance, about 0.1 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 1.7.

PROTEIN BINDING. In plasma, about 90%; decreased in subjects with renal impairment.

NOTE. For a review of the pharmacokinetics of diazoxide see R. M. Pearson, *Clin. Pharmacokinet.*, 1977, 2, 198-204.

Dose. In the treatment of intractable hypoglycaemia: initially 5 mg/kg daily, by mouth. In hypertensive crises: 300 mg intravenously.

Dibenzepin

Antidepressant

10 - (2 - Dimethylaminoethyl) - 5,10 - dihydro - 5 - methyl - 11H - dibenzo[*b,e*] [1,4]diazepin-11-one

$C_{18}H_{21}N_3O = 295.4$

CAS—4498-32-2

M.p. 116° to 117°.

Dibenzepin Hydrochloride

Proprietary Names. Deprex; Écatril; Noveril.

Note. Deprex is also used as a proprietary name for amitriptyline hydrochloride.

$C_{18}H_{21}N_3O \cdot HCl = 331.8$

CAS—315-80-0

A colourless, fine crystalline powder. M.p. about 237°.

Soluble 1 in 16 of water; soluble in ethanol and chloroform.

Partition Coefficient. Log *P* (octanol/pH 7.4), 1.7.

Colour Test. Mandelin's Test—green.

Thin-layer Chromatography. System *TA*—Rf 54; system *TB*—Rf 20; system *TC*—Rf 35. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System *GA*—RI 2443; system *GF*—RI 2885.

High Pressure Liquid Chromatography. System *HA*—*k'* 2.8; system *HF*—*k'* 0.50.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1639, 775, 761, 1603, 1250, 1316 (dibenzepin hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at *m/z* 58, 224, 209, 71, 225, 72, 210, 180.

Quantification. ULTRAVIOLET SPECTROPHOTOMETRY. In blood, urine or tissues: detection limit 500 ng/g for dibenzepin plus desmethyl metabolites—H. Christensen and S. Felby, *Acta pharmac. tox.*, 1975, 37, 393-401.

GAS CHROMATOGRAPHY. In blood, urine or tissues: dibenzepin and desmethyl metabolites, detection limit 300 ng/g, AFID—H.-J. Schlicht and H.-P. Gelbke, *J. Chromat.*, 1978, 166, 599-603.

Disposition in the Body. Readily absorbed after oral administration; rapidly and extensively metabolised, mainly by *N*-demethylation. About 20 to 30% of a dose is excreted in the urine as free and conjugated desmethyl metabolites in 24 hours, together with about 1% of the dose as unchanged drug.

THERAPEUTIC CONCENTRATION.

During daily oral treatment with doses of 8 mg/kg of dibenzepin hydrochloride given to 12 patients for 22 days, mean plasma concentrations of 0.18 µg/ml of dibenzepin and 0.28 µg/ml of *N*-monodesmethyldibenzepin (demethylated in the side-chain) were reported, determined 4 hours after a dose. Plasma concentrations declined slightly during therapy (R. Gauch and J. Modestin, *Arzneimittel-Forsch.*, 1973, 23, 687-690).

TOXICITY. The estimated minimum lethal dose is about 3 g; doses greater than 1.5 g may result in serious poisoning. Patients liable to arrhythmias are particularly susceptible to toxic effects. The following tissue disposition of total dibenzepin and metabolites was reported in 6 suicides due to the ingestion of dibenzepin: blood 23 to 147 µg/g (mean 73), liver 255 to 566 µg/g (mean 386), urine 63 to 695 µg/g (mean 230, 4 cases) (H. Christensen and S. Felby, *Acta pharmac. tox.*, 1975, 37, 393-401).

In a fatality due to the ingestion of 3.6 g of dibenzepin, the following postmortem tissue concentrations were reported for dibenzepin and total desmethyl metabolites, respectively: blood 23, – µg/ml; bile 113, 137 µg/ml; brain 42, 12 µg/g; kidney 63, 38 µg/g; liver 130, 134 µg/g; urine 350, 258 µg/ml (H.-J. Schlicht and H.-P. Gelbke, *J. Chromat.*, 1978, 166, 599-603).

HALF-LIFE. Plasma half-life, about 4 hours (dibenzepin plus desmethyl metabolites).

Dose. 240 to 560 mg of dibenzepin hydrochloride daily.

Dibromopropamide

Antibacterial/Antifungal

4,4'-Trimethylenedioxybis(3-bromobenzamide)

$C_{17}H_{18}Br_2N_4O_2 = 470.2$

CAS—496-00-4

Dibromopropamide Isethionate

Proprietary Names. Brolene (eye ointment); Brulidine.

$C_{17}H_{18}Br_2N_4O_2 \cdot 2C_2H_6O_4S = 722.4$

CAS—614-87-9

A white crystalline powder. M.p. 226°.

Soluble 1 in 2 of water and 1 in 60 of ethanol; practically insoluble in chloroform and ether.

Colour Tests. Aromaticity (Method 2)—yellow/brown; Liebermann's Test—black.

Thin-layer Chromatography. System TA—Rf 01. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—261 nm ($A_1^1 = 512$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1190, 1654, 1266, 1047, 1600, 1306 (dibromopropamide isethionate, KBr disk).

Use. Dibromopropamide isethionate is used in a concentration of 0.15%.

Dibutyl Phthalate

Insect Repellent

Synonyms. Butyl Phthalate; DBP.

Dibutyl benzene-1,2-dicarboxylate

$C_{16}H_{22}O_4 = 278.3$

CAS—84-74-2

A clear, colourless or faintly yellow, somewhat viscous liquid. Wt per ml about 1.045 g. B.p. about 330°. Refractive index 1.492 to 1.495.

Soluble 1 in 2500 of water; miscible with ethanol, ether, and most other organic solvents.

Gas Chromatography. System GA—RI 1913.

Ultraviolet Spectrum. Methanol—274 nm ($A_1^1 = 45$ b).

Mass Spectrum. Principal peaks at m/z 149, 41, 29, 57, 56, 104, 32, 65.

Dichloralphenazone

Hypnotic/Sedative

Synonym. Dichloralantipyrine

Proprietary Names. Bonadorm; Chloralol; Welldorm. It is an ingredient of Midrid and Paedo-Sed.

A complex of chloral hydrate and phenazone.

$C_{15}H_{18}Cl_6N_2O_5 = 519.0$

CAS—480-30-8

A white microcrystalline powder. M.p. 64° to 67°.

Soluble 1 in 10 of water, 1 in 1 of ethanol, and 1 in 2 of chloroform; soluble in dilute acids.

Note. It is decomposed by dilute alkalis with the liberation of chloroform. In aqueous and ethanolic solutions it dissociates into chloral hydrate and phenazone.

Gas Chromatography. System GA—phenazone RI 1848.

Ultraviolet Spectrum. Phenazone: aqueous acid—230 nm ($A_1^1 = 590$ b); aqueous alkali—242 nm ($A_1^1 = 494$ a), 256 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1656, 767, 1587, 1562, 1315, 1298 (KBr disk).

Mass Spectrum. Principal peaks at m/z 188, 47, 82, 96, 29, 77, 84, 56.

Quantification. See under Chloral Hydrate and Phenazone.

Disposition in the Body. After administration, dichloralphenazone acts as a mixture of chloral hydrate and phenazone and reference should be made to the entries under these substances.

TOXICITY.

Blood concentrations of 20 µg/ml of trichloroethanol and 40 µg/ml of phenazone were reported in a comatose subject following an overdose of dichloralphenazone; the subject eventually recovered (R. J. Armstrong and H. M. Stone, *Bull. int. Ass. forens. Toxicol.*, 1972, 8(4), 8–9).

Dose. 0.65 to 1.95 g daily.

Dichlorodifluoromethane

Aerosol Propellant/Refrigerant

Synonyms. Difluorodichloromethane; Propellant 12; Refrigerant 12.

Proprietary Names. Arcton 12. It is an ingredient of PR Spray and Skefron.

$\text{CCl}_2\text{F}_2 = 120.9$

CAS—75-71-8

A colourless non-inflammable gas which, when liquefied by compression, forms a clear colourless liquid. F.p. -155° . B.p. about -29.8° .

Gas Chromatography. *System GA*—RI 305; *system GI*—retention time 0.9 min.

Mass Spectrum. Principal peaks at m/z 85, 87, 101, 50, 103, 31, 66, 35.

Dichlorophen

Anthelmintic

Synonym. Di-phenthane-70

Proprietary Names. Anthiphen; Dicastal (vet.); Ovis; Plath-Lyse; Wespuril.

2,2'-Methylenebis(4-chlorophenol)

$\text{C}_{13}\text{H}_{10}\text{Cl}_2\text{O}_2 = 269.1$

CAS—97-23-4

A white or slightly cream-coloured powder. M.p. about 175° . Practically **insoluble** in water; soluble 1 in 1 of ethanol and 1 in less than 1 of ether.

Colour Tests. Aromaticity (Method 2)—yellow/brown; Folin-Ciocalteu Reagent—blue; Liebermann's Test—violet-brown; Millon's Reagent—red.

Thin-layer Chromatography. *System TD*—Rf 58; *system TE*—Rf 34; *system TF*—Rf 67.

Gas Chromatography. *System GA*—RI 2140.

Ultraviolet Spectrum. Aqueous acid—282 nm; aqueous alkali—245 nm ($A_1^1 = 650$ a), 304 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1226, 817, 1111, 1162, 1245, 1170 (KBr disk).

Mass Spectrum. Principal peaks at m/z 128, 141, 268, 130, 270, 77, 143, 233.

Dose. Usually 6 g daily for 2 or 3 days; a single dose of 9 g has also been given.

Dichlorophenoxyacetic Acid

Herbicide

Synonym. 2,4-D

Proprietary Names. Cornox D; Destox; Dicotox; Dioweed; Dormone; Fernimine; For-ester; Iso-planatox; Palormone D; Silvapron D; Syford; Vigon-DC. It is an ingredient of Econal, Nettle Ban, Spontox, and Stancide BWK 75.

2,4-Dichlorophenoxyacetic acid

$\text{C}_8\text{H}_6\text{Cl}_2\text{O}_3 = 221.0$

CAS—94-75-7

A white powder which is corrosive. M.p. about 140° . Very slightly **soluble** in water; soluble in aqueous solutions of alkalis and in alcohols.

Thin-layer Chromatography. *System TD*—Rf 04; *system TE*—Rf 04; *system TF*—Rf 06.

Gas Chromatography. Dichlorophenoxyacetic acid methyl ester: *system GA*—RI 1605; *system GK*—retention time 0.65 relative to caffeine. Dichlorophenoxyacetic acid iso-octyl ester: *system GK*—retention times 1.12, 1.18 relative to caffeine.

Ultraviolet Spectrum. Ethanol—284 nm ($A_1^1 = 95$ b), 292 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1090, 1230, 795, 1264, 1247, 1724 (Nujol mull). (See below)

Mass Spectrum. Principal peaks at m/z 199, 45, 175, 145, 111, 109, 234, 133 (dichlorophenoxyacetic acid methyl ester).

**Dichlorophenamide**

Carbonic Anhydrase Inhibitor

Synonyms. DCPA; Dichlorophenamide; Diclofenamide.**Proprietary Names.** Daranide; Oralcon; Oratrol.

4,5-Dichlorobenzene-1,3-disulphonamide

 $C_6H_4Cl_2N_2O_4S_2 = 305.2$

CAS—120-97-8

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: FID—J. D. Kohli *et al.*, *Xenobiotica*, 1974, 4, 97–100. In urine: sensitivity 100 ng/ml, ECD—A. E. Smith and B. J. Hayden, *J. Chromat.*, 1979, 171, 482–485.

Disposition in the Body. Readily absorbed after ingestion but poorly absorbed through the skin. After ingestion, about 80% is excreted in the urine unchanged in 4 days, and about 13% is excreted as conjugates.

BLOOD CONCENTRATION.

After ingestion of 5 mg/kg by 6 subjects, average peak plasma concentrations of about 35 µg/ml were attained in 7 to 24 hours (J. D. Kohli *et al.*, *Xenobiotica*, 1974, 4, 97–100).

TOXICITY. The estimated minimum lethal dose is 7 g. The maximum permissible atmospheric concentration is 10 mg/m³ and the maximum acceptable daily intake is 300 µg/kg. Dichlorophenoxyacetic acid is very irritating to the eyes, nose, and throat.

The following postmortem tissue concentrations have been reported in 4 fatalities involving ingestion of dichlorophenoxyacetic acid: blood 126 to 826 µg/ml (mean 447, 4 cases), bile 573 µg/ml (1 case), brain 13 and 66 µg/g (2 cases), kidney 62 to 82 µg/g (mean 69, 3 cases), liver 21 to 183 µg/g (mean 134, 4 cases), urine 111 and 264 µg/ml (2 cases) (K. Nielsen *et al.*, *Acta pharmac. tox.*, 1965, 22, 224–234; A. Coutselenis *et al.*, *Forens. Sci.*, 1977, 10, 203–204; J. E. Ryall, *Bull. int. Ass. forens. Toxicol.*, 1978, 14(2), 17–18; M. Watson, *ibid.*, 18).

HALF-LIFE. Plasma half-life, about 12 to 33 hours.

VOLUME OF DISTRIBUTION. About 0.1 litre/kg.

Dichlorotetrafluoroethane Aerosol Propellant/Refrigerant

Synonyms. Cryofluorane; Propellant 114; Refrigerant 114; Tetrafluorodichloroethane.

Proprietary Names. Arcton 33; Arcton 114.

1,2-Dichloro-1,1,2,2-tetrafluoroethane

 $CClF_2 \cdot CClF_2 = 170.9$

CAS—76-14-2

A colourless non-inflammable gas which, when liquefied by compression, forms a clear colourless liquid. B.p. about 3.5°.

In the liquid state it is practically **immiscible** with water, but miscible with dehydrated alcohol.

Gas Chromatography. System GA—RI 361; system GI—retention time 2.0 min.

Mass Spectrum. Principal peaks at m/z 85, 135, 87, 137, 31, 101, 100, 50.

A white crystalline powder. M.p. about 240°.

Practically **insoluble** in water and chloroform; soluble 1 in 30 of ethanol; slightly soluble in ether; freely soluble in pyridine; soluble in solutions of alkali hydroxides and carbonates.

Dissociation Constant. pK_a 7.4, 8.6.

Partition Coefficient. Log P (ether/pH 7.4), 1.0.

Colour Test. Koppanyi-Zwicker Test—violet.

Thin-layer Chromatography. System TA—Rf 82; system TD—Rf 14; system TE—Rf 33; system TF—Rf 64. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—286 nm ($A_1^1 = 60$ a), 296 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1162, 1176, 882, 702, 907, 1123 (KBr disk).

Mass Spectrum. Principal peaks at m/z 304, 306, 64, 74, 109, 177, 176, 48.

Quantification. GAS CHROMATOGRAPHY. In rabbit serum: sensitivity 20 ng/ml, ECD—C. Schmitt *et al.*, *J. pharm. Sci.*, 1979, 68, 381–383.

Dose. 100 to 200 mg daily in the treatment of glaucoma.

Diclofenac

Synonym. Diclophenac

[2-(2,6-Dichloroanilino)phenyl]acetic acid

$C_{14}H_{11}Cl_2NO_2 = 296.2$

CAS—15307-86-5

Crystals. M.p. 156° to 158°.

Diclofenac Sodium

Proprietary Names. Voltaren(e); Voltarol.

$C_{14}H_{10}Cl_2NNaO_2 = 318.1$

CAS—15307-79-6

Crystals. M.p. 283° to 285°.

Colour Tests. Liebermann's Test—red-brown; Mandelin's Test—red-brown; Marquis Test—brown (slow).

Thin-layer Chromatography. *System TD*—Rf 25; *system TE*—Rf 13; *system TF*—Rf 40; *system TG*—Rf 29. (Chromic acid solution, red.)

Gas Chromatography. *System GA*—RI 2271; *system GD*—retention time of methyl derivative 1.42 relative to *n*-C₁₆H₃₄.

High Pressure Liquid Chromatography. *System HD*—*k'* 11.5; *system HV*—retention time 0.85 relative to meclofenamic acid.

Ultraviolet Spectrum. Aqueous acid—273 nm (*A*₁¹ = 309 b); aqueous alkali—275 nm (*A*₁¹ = 351 b).

Infra-red Spectrum. Principal peaks at wavenumbers 1572, 756, 1504, 775, 1286, 1308 (diclofenac sodium, KBr disk).

Mass Spectrum. Principal peaks at *m/z* 214, 216, 242, 295, 215, 297, 179, 178.

Analgesic

Quantification. GAS CHROMATOGRAPHY. In plasma: detection limit 100 ng/ml, ECD—M. Ikeda *et al.*, *J. Chromat.*, 1980, 183; *Biomed. Appl.*, 9, 41–47.

GAS CHROMATOGRAPHY (CAPILLARY COLUMN). In urine: diclofenac and hydroxy metabolites, ECD—W. Schneider and P. H. Degen, *J. Chromat.*, 1981, 217, 263–271.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 5 ng/ml, UV detection—K. K. H. Chan *et al.*, *Analyt. Lett. (Part B)*, 1982, 15, 1649–1663.

Disposition in the Body. Well absorbed after oral administration but undergoes significant first-pass metabolism; bioavailability about 50 to 60%. Up to about 70% of a dose is excreted in the urine in 3 days, including 20 to 40% as conjugates of the major

metabolite 4'-hydroxydiclofenac (active) and up to about 15% as conjugates of unchanged diclofenac. Other metabolites identified in the urine include 5-hydroxydiclofenac (about 12% of the dose), 3'-hydroxydiclofenac, and 4',5-dihydroxydiclofenac. About 10 to 20% of a dose is excreted in the bile as 4'-hydroxydiclofenac and less than 5% as unchanged drug.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 50 mg as an enteric-coated tablet, administered to 12 subjects under fasting conditions, peak plasma concentrations of 0.75 to 2.0 µg/ml (mean 1.3) were attained in about 2 hours. A similar dose administered under non-fasting conditions produced peak plasma concentrations of 0.05 to 1.8 µg/ml (mean 0.8) in about 5 hours (J. V. Willis *et al.*, *Eur. J. clin. Pharmac.*, 1981, 19, 33-37).

Following oral administration of 50 mg of diclofenac sodium three times a day to 4 subjects, peak plasma concentrations of 0.1 to 2.2 µg/ml (mean 0.8) of diclofenac and 0.3 to 2.0 µg/ml (mean 1.2) of 4'-hydroxydiclofenac were reported 3 hours after a dose; peak concentrations in synovial fluid of 0.1 to 0.6 µg/ml (mean 0.3) of diclofenac and 0.2 to 1.0 µg/ml (mean 0.6) of 4'-hydroxydiclofenac were attained in 3 hours; concentrations in synovial fluid exceeded those in plasma after 4 hours (P. D. Fowler *et al.*, *Eur. J. clin. Pharmac.*, 1983, 25, 389-394).

TOXICITY.

A 19-year-old man was admitted to hospital following the ingestion of 1.5 g of diclofenac sodium and 4 g of chlormezanone. Plasma-diclofenac concentrations of 60.1 µg/ml and 0.19 µg/ml were reported at 7 and 15 hours, respectively; chlormezanone could not be determined. The subject recovered after about 2 days (P. Netter *et al.*, *Eur. J. clin. Pharmac.*, 1984, 26, 535-536).

HALF-LIFE. Plasma half-life, about 1 to 2 hours.

CLEARANCE. Plasma clearance, about 4 ml/min/kg.

PROTEIN BINDING. In plasma, more than 99%.

NOTE. For a review of diclofenac see R. W. Brogden *et al.*, *Drugs*, 1980, 20, 24-48.

Dose. 75 to 150 mg of diclofenac sodium daily.

Dicophane

Pesticide

Synonyms. Chlorophenothane; Chlorphenothanum; Clofenotanium; DDT; Dichlorodiphenyltrichloroethane; Dichophanum; Parachlorocidum; Penticidum.

Dicophane contains about 70% of 1,1,1-trichloro-2,2-bis(4-chlorophenyl)ethane (*pp'*-DDT) together with varying quantities of an isomer, 1,1,1-trichloro-2-(2-chlorophenyl)-2-(4-chlorophenyl)ethane (*op'*-DDT) and other related compounds.

$C_{14}H_9Cl_5 = 354.5$

CAS—50-29-3

White or nearly white crystals, small granules, flakes, or powder. M.p. about 109°. The technical product is a waxy solid of indefinite melting point.

Practically **insoluble** in water; soluble 1 in 50 of ethanol, 1 in 6 of boiling ethanol, 1 in 2.5 of acetone, 1 in 3.5 of chloroform, and 1 in 4 of ether.

Colour Tests. Liebermann's Test—brown; Nitric-Sulphuric Acid—red → orange → green.

Heat a small quantity with a 0.5% solution of hydroquinone in sulphuric acid—red.

NOTE. Dicophane does not react to the Fujiwara Test.

Thin-layer Chromatography. System TD—Rf 82; system TE—Rf 87; system TF—Rf 74.

Gas Chromatography. System GA—*pp'*-DDT RI 2299, *op'*-DDT RI 2218, *pp'*-DDE RI 2130, *op'*-DDE RI 2070; system GK—*pp'*-DDT retention time 1.32, *op'*-DDT retention time 1.24, both relative to caffeine.

Ultraviolet Spectrum. Methanol—236 nm ($A_1^1 = 510$ b), 267 nm ($A_1^1 = 19$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 775, 790, 1500, 1100, 1022, 850 (KBr disk).

Mass Spectrum. Principal peaks at m/z 235, 237, 165, 236, 75, 239, 82, 199 (*pp'*-DDT).

Quantification. GAS CHROMATOGRAPHY. In serum: dicophane and metabolites, ECD—W. E. Dale *et al.*, *J. Ass. off. analyt. Chem.*, 1970, 53, 1287-1292. In blood or tissues: dicophane and metabolites, sensitivity, blood <1 ng/ml, tissues <5 ng/g, ECD—J. L. Radomski and A. Rey, *J. chromatogr. Sci.*, 1970, 8, 108-114. In urine: dichlorodiphenylacetic acid (DDA), detection limit 50 pg, ECD—H. Della Fiorenza *et al.*, *J. Chromat.*, 1978, 157, 421-426.

Disposition in the Body. Dicophane dry powder is poorly absorbed from the gastro-intestinal tract and is not absorbed through the skin. Solutions of dicophane in oils are rapidly absorbed through intact skin and are also readily absorbed from the gastro-intestinal tract. Dicophane is metabolised to a small extent by dehydrochlorination to dichlorodiphenyldichloroethylene (DDE) which is less toxic; DDE does not appear to be metabolised further and is stored indefinitely in adipose tissues. Most of the DDE present in human fat is thought to be due to preformed DDE taken in the diet rather than being due to ingestion of dicophane. The major metabolic route for dicophane is dechlorination to dichlorodiphenyldichloroethane (DDD) followed by degradation to dichlorodiphenylacetic acid (DDA) which is the major urinary excretion product. Urinary concentrations of DDA are indicative of storage of DDT in adipose tissue.

The following tissue concentrations of total DDT plus metabolites were reported in 35 industrially-exposed subjects: blood 0.11 to 2.2 µg/ml (mean 0.6), fat 38 to 647 µg/g (mean 204), urine 0.05 to 3.4 µg/ml (mean 1.3); DDE accounted for about 40% of the material stored in fat and 6% of the urinary material compared to about 80% and 60%, respectively, reported for members of the general population (E. R. Laws *et al.*, *Archs. envir. Hlth*, 1967, 15, 766–775).

Fat residues ranging from 0.04 to 17 µg/g (mean 2.6) of total DDT were reported in 236 subjects, without occupational exposure, in the United Kingdom in 1976–77 (D. C. Abbott *et al.*, *Br. med. J.*, 1981, 283, 1425–1428).

TOXICITY. The estimated minimum lethal dose is 30 g but a single oral dose of 10 mg/kg may produce toxic symptoms; the maximum permissible atmospheric concentration is 1 mg/m³ and the maximum acceptable daily intake is 5 µg/kg. The toxicity of some of the organic solvents, such as kerosene, used in the application of dicophane has probably contributed to dicophane fatalities.

Dicoumarol

Anticoagulant

Synonyms. Bishydroxycoumarin; Dicoumarin; Dicumarol; Melitoxin.

Proprietary Name. Dufalone

3,3'-Methylenebis(4-hydroxycoumarin)

C₁₉H₁₂O₆ = 336.3

CAS—66-76-2

A white or creamy-white crystalline powder. M.p. about 290°. Practically **insoluble** in water, ethanol, and ether; slightly soluble in chloroform; freely soluble in solutions of alkali hydroxides.

Dissociation Constant. pK_a 4.4, 8.0.

Thin-layer Chromatography. *System TD*—Rf 18; *system TE*—Rf 32; *system TF*—Rf 32. (Acidified potassium permanganate solution, positive.)

Ultraviolet Spectrum. Aqueous alkali—314 nm (A₁¹ = 756 a).

Mass Spectrum. Principal peaks at *m/z* 336, 121, 120, 215, 162, 92, 337, 187.

Quantification. ULTRAVIOLET SPECTROPHOTOMETRY. In plasma: sensitivity 2 µg/ml—R. Nagashima *et al.*, *J. pharm. Sci.*, 1968, 57, 58–67.

Disposition in the Body. Slowly and irregularly absorbed after oral administration. It is extensively metabolised with less than 1% of a dose being excreted in the urine as unchanged drug.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 150 mg to 8 subjects, a mean peak plasma concentration of 16.7 µg/ml was attained in 12 hours (H. M. Solomon and J. J. Schrogie, *Clin. Pharmac. Ther.*, 1967, 8, 65–69).

Following daily oral administration of 2 mg/kg to 3 subjects, plasma concentrations of 44 to 59 µg/ml (mean 53) were reported on the 6th day (E. S. Vesell and J. G. Page, *J. clin. Invest.*, 1968, 47, 2657–2663).

TOXICITY. Fatalities, usually due to severe haemorrhage, have been reported following daily oral doses of 100 mg or more.

HALF-LIFE. Plasma half-life, dose-dependent and may range from 7 to 100 hours.

PROTEIN BINDING. In plasma, more than 99%.

Dose. Maintenance, 25 to 150 mg daily.

Dicyclomine

Anticholinergic

Synonym. Dicycloverine

2-Diethylaminoethyl bicyclohexyl-1-carboxylate

C₁₉H₃₅NO₂ = 309.5

CAS—77-19-0

Dicyclomine Hydrochloride

Proprietary Names. Atumin; Benacol; Bentyt; Bentytol; Cyclobec; Formulex; Menospasm; Merbentyl; Or-Tyl; Pasmin; Procyclomin; Spasmoban; Viscerol. It is an ingredient of Diarrest, Kolanticon, Kolantyl, and Ovol.

C₁₉H₃₅NO₂·HCl = 346.0

CAS—67-92-5

A white crystalline powder. M.p. 169° to 174°.

Soluble 1 in 20 of water, 1 in 5 of ethanol, and 1 in 2 of chloroform; practically insoluble in ether.

Thin-layer Chromatography. *System TA*—Rf 68; *system TB*—Rf 67; *system TC*—Rf 64. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 2097; *system GF*—RI 2265.

High Pressure Liquid Chromatography. *System HA*—k' 1.1.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1714, 1214, 1136, 1197, 1184, 1155 (dicyclomine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 86, 71, 99, 58, 55, 56, 100, 87.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 1 ng/ml, AFID—P. J. Meffin *et al.*, *Analyt. Chem.*, 1973, 45, 1964–1966.

Disposition in the Body. Rapidly absorbed after oral administration. About 80% of a dose is excreted in the urine and 10% is eliminated in the faeces.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 20 mg to 1 subject, a peak plasma concentration of about 0.02 µg/ml was attained in about 1.5 hours; following administration of 40 mg to the same subject as a sustained-release preparation, a maximum plasma concentration of about 0.08 µg/ml was reported after about 2.5 hours (P. J. Meffin *et al.*, *ibid.*).

TOXICITY. Fatalities have been reported in children after the ingestion of about 0.2 g of a sustained-release preparation.

HALF-LIFE. Plasma half-life, about 5 hours.

Dose. 30 to 80 mg of dicyclomine hydrochloride daily.

Dieldrin

Insecticide

Proprietary Name. Dilstan EC-15

Dieldrin contains about 85% of HEOD, 1,2,3,4,10,10-hexachloro-6,7-epoxy-1,4,4a,5,6,7,8,8a-octahydro-1,4:5,8-dimethanonaphthalene, the remaining 15% being mainly chlorinated organic compounds related to HEOD.

$C_{12}H_8Cl_6O = 380.9$

CAS—60-57-1 (HEOD)

A light-tan, flaky, crystalline solid.

Practically **insoluble** in water; soluble 1 in 4 of ethanol, 1 in 40 of carbon tetrachloride, and 1 in 1 of methanol; moderately soluble in chloroform.

Colour Tests. Nitric–Sulphuric Acid—pink; Sulphuric Acid–Fuming Sulphuric Acid—red.

Gas Chromatography. System GA—RI 2110; system GK—retention time 1.13, relative to caffeine.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 848, 811, 1038, 700, 1005, 912 (KCl disk).

Mass Spectrum. Principal peaks at m/z 79, 82, 81, 263, 77, 108, 265, 80.

Quantification. GAS CHROMATOGRAPHY. In blood or tissues: ECD—A. Steentoft, *Medicine, Sci. Law*, 1979, 19, 268–269.

Disposition in the Body. Both dieldrin powder and solutions are readily absorbed after oral administration, through the lungs, and through intact skin. Dieldrin is selectively stored in body fat and persists for several weeks after cessation of exposure. It is eliminated in the faeces mainly as unknown hydrophilic metabolites; a small amount is excreted in the urine as metabolites but very little as unchanged dieldrin. Dieldrin is a metabolite of aldrin.

BLOOD CONCENTRATION. Blood concentrations averaging 0.001 µg/ml have been reported in subjects with no occupational exposure to dieldrin.

Serum concentrations ranging from 0.001 to 0.137 µg/ml (mean 0.02) were reported in 71 industrially-exposed workers and fat concentrations of 0.6 to 32 µg/g (mean 6) were reported in 28 of these subjects (W. T. Hayes and A. Curley, *Archs envir. Hlth*, 1968, 16, 155–162).

Steady-state blood concentrations of about 0.007 and 0.02 µg/ml were reported in 2 groups of 3 subjects who received doses of 0.05 mg and 0.21 mg daily for 2 years; maximum fat concentrations of 1.3 to 1.6 µg/g and 2.2 to 4.9 µg/g were reported in the same subjects (C. G. Hunter *et al.*, *Archs. envir. Hlth*, 1969, 18, 12–21).

Fat residues in 236 non-exposed subjects were reported to be in the range <0.01 to 0.5 µg/g (mean 0.1) (D. C. Abbott *et al.*, *Br. med. J.*, 1981, 283, 1425–1428).

TOXICITY. The estimated minimum lethal dose is 5 g; ingestion of 10 mg/kg may produce toxic effects. The maximum permissible atmospheric concentration is 0.25 mg/m³ and the maximum acceptable daily intake is 0.1 µg/kg. Blood concentrations greater

than 0.15 µg/ml are usually toxic. Several fatalities due to accidental or deliberate ingestion of dieldrin have been reported. A serum concentration of 0.27 µg/ml and a fat concentration of 47 µg/g were reported 3 days after ingestion of dieldrin by a 4-year-old boy who survived (L. K. Garrettson and A. Curley, *Archs. envir. Hlth*, 1969, 19, 814–822).

In a fatality due to the ingestion of dieldrin, postmortem blood and liver concentrations of 0.5 µg/ml and 29 µg/g, respectively, were reported (A. Steentoft, *Medicine, Sci. Law*, 1979, 19, 268–269).

HALF-LIFE. Blood half-life, 50 to 170 days (mean 97).

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 1.5.

PROTEIN BINDING. In plasma, more than 99%.

Dienoestrol

Oestrogen

Synonyms. Dehydrostilbestrol; Dienestrol; Oestrodienolum.

Proprietary Names. Cycladiene; DV; Estraguard; Hormofemin.

(*E,E*)-4,4'-[Di(ethylidene)ethylene]diphenol

$C_{18}H_{18}O_2 = 266.3$

CAS—84-17-3; 13029-44-2 (*E,E*)

White crystals or crystalline powder. M.p. 227° to 234°.

Practically **insoluble** in water; soluble 1 in 8 of ethanol, 1 in 5 of acetone, and 1 in 15 of ether; slightly soluble in chloroform.

Caution. Dienoestrol is a powerful oestrogen. Contact with the skin or inhalation should be avoided.

Colour Tests. Antimony Pentachloride—red; Naphthol-Sulphuric Acid—orange-brown/yellow; Sulphuric Acid—orange-red.

Dissolve about 0.5 mg in 0.2 ml of *acetic acid*, add 1 ml of *phosphoric acid*, and heat on a water-bath for 3 minutes—violet, becoming slightly more blue on dilution with 3 ml of *acetic acid*. (This test distinguishes dienioestrol from stilboestrol, which produces a yellow colour.)

Thin-layer Chromatography. System TP—Rf 72; system TQ—Rf 25; system TR—Rf 34; system TS—Rf 05, streaking may occur.

Infra-red Spectrum. Principal peaks at wavenumbers 1206, 827, 1173, 1510, 1248, 775 (KBr disk).

Disposition in the Body. Readily absorbed after oral administration. It is excreted in the urine mainly as a glucuronide conjugate.

Dose. Dienoestrol has been given by mouth in doses of 0.5 to 30 mg daily. It is used as a 0.01 to 0.025% vaginal cream.

Diethazine

Anticholinergic

Synonym. Eazamine

10-(2-Diethylaminoethyl)phenothiazine

$C_{18}H_{22}N_2S = 298.4$

CAS—60-91-3

An oily liquid.

Diethazine Hydrochloride

$C_{18}H_{22}N_2S \cdot HCl = 334.9$

CAS—341-70-8

A white or slightly cream-coloured crystalline powder. M.p. 185° to 188°.

Soluble 1 in 2.5 of water, 1 in 5 of ethanol, and 1 in 2 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 9.1 (20°).

Colour Tests. Formaldehyde-Sulphuric Acid—red-violet; Forrester Reagent—red; FPN Reagent—orange; Mandelin's Test—green → violet (excess reagent); Marquis Test—violet-brown.

Thin-layer Chromatography. System TA—Rf 58; system TB—Rf 57; system TC—Rf 51. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2377.

High Pressure Liquid Chromatography. System HA— k' 3.4.

Ultraviolet Spectrum. Aqueous acid—250 nm ($A_1^1 = 1200$ b), 298 nm; aqueous alkali—265 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 748, 1245, 1587, 1282, 1562, 1219 (KBr disk).

Mass Spectrum. Principal peaks at m/z 86, 298, 87, 30, 58, 299, 212, 180.

Dose. Diethazine hydrochloride has been given in doses of 0.15 to 1.5 g daily.

Diethyl Phthalate

Plasticiser/Solvent

Synonym. Ethyl Phthalate

Diethyl benzene-1,2-dicarboxylate

$C_{12}H_{14}O_4 = 222.2$

CAS—84-66-2

A clear, colourless, somewhat viscous liquid. Wt per ml about 1.117 g. B.p. about 295°. Refractive index 1.500 to 1.505. Practically **insoluble** in water; miscible with ethanol and ether.

Gas Chromatography. *System GA*—RI 1564.

Infra-red Spectrum. Principal peaks at wavenumbers 1733, 1287, 1086, 1132, 744, 1044 (thin film).

Mass Spectrum. Principal peaks at m/z 149, 177, 150, 65, 76, 105, 176, 104.

Diethylcarbamazine

Antifilarial

NN-Diethyl-4-methylpiperazine-1-carboxamide

$C_{10}H_{21}N_3O = 199.3$

CAS—90-89-1

A crystalline powder. M.p. 49°.

Soluble in water, ethanol, chloroform, and ether.

Diethylcarbamazine Citrate

Synonyms. Diethylcarbamazine Acid Citrate; Ditraxini Citras.

Proprietary Names. Banocide; Hetrazan; Notézine.

$C_{10}H_{21}N_3O_7 = 391.4$

CAS—1642-54-2

A white, crystalline, slightly hygroscopic powder. M.p. 136° to 141°. Very **soluble** in water; soluble 1 in 35 of ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 7.7 (20°).

Thin-layer Chromatography. *System TA*—Rf 52; *system TB*—Rf 17; *system TC*—Rf 26. (*Dragendorff spray*, positive.)

Gas Chromatography. *System GA*—RI 1497.

High Pressure Liquid Chromatography. *System HA*— k' 1.4.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1618, 1258, 1217, 1712, 1105, 1149 (KBr disk).

Mass Spectrum. Principal peaks at m/z 71, 72, 58, 100, 83, 56, 70, 44.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: detection limit 10 ng/ml, AFID—G. D. Allen *et al.*, *J. Chromat.*, 1979, 164; *Biomed. Appl.*, 6, 521–526.

Disposition in the Body. Readily absorbed after oral administration. About 50% of a dose is excreted in the urine as unchanged drug and 10% as the *N*-oxide metabolite in 48 hours; the excretion of unchanged drug is pH-dependent being increased in acidic urine (pH 5) but decreasing to less than 10% in alkaline urine (pH 8).

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 50 mg to 5 subjects, peak plasma concentrations of 0.08 to 0.20 µg/ml were attained in about 1 to 2 hours; a secondary rise in plasma concentrations was observed at 3 to 9 hours (G. Edwards *et al.*, *Clin. Pharmac. Ther.*, 1981, 30, 551–557).

HALF-LIFE. Plasma half-life, about 10 hours under alkaline urinary pH conditions or 3 hours if an acidic urinary pH is maintained.

PROTEIN BINDING. In plasma, not significantly bound.

Dose. 1 to 6 mg/kg of diethylcarbamazine citrate daily, by mouth.

Diethylpropion

Anorectic

Synonym. Amfepramone

2-Diethylaminopropiophenone

$C_{13}H_{19}NO = 205.3$

CAS—90-84-6

Diethylpropion Hydrochloride

Proprietary Names. Dietec; D.I.P.; Moderatan Diffucap; Nobensine-75; Prefamone; Regenon; Regibon; Tenuate Dospan; Tepanil. It is an ingredient of Apisate.

Note. The name Tepanil is also applied to phenylpropanolamine hydrochloride.

$C_{13}H_{19}NO \cdot HCl = 241.8$

CAS—134-80-5

A white to off-white, fine, crystalline powder. M.p. about 175°, with decomposition.

Soluble 1 in 0.5 of water, 1 in 3 of ethanol, and 1 in 3 of chloroform; practically insoluble in ether.

Colour Test. Liebermann's Test—yellow.

Thin-layer Chromatography. *System TA*—Rf 76; *system TB*—Rf 62; *system TC*—Rf 63. (*Dragendorff spray*, positive; *FPN reagent*, pink; *acidified iodoplatinate solution*, positive; *Marquis reagent*, violet-brown.)

Gas Chromatography. *System GA*—diethylpropion RI 1486, norephedrine RI 1313; *system GB*—diethylpropion RI 1507, norephedrine RI 1353; *system GC*—diethylpropion RI 1715, norephedrine RI 1383; *system GF*—diethylpropion RI 1655.

High Pressure Liquid Chromatography. *System HA*—diethylpropion k' 1.7, norephedrine k' 0.9; *system HC*—diethylpropion k' 0.16, norephedrine k' 0.70.

Ultraviolet Spectrum. Aqueous acid—253 nm ($A_1^1 = 673$ a); aqueous alkali—246 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 701, 1230, 1682, 1287, 973, 1594 (diethylpropion hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 100, 44, 72, 101, 77, 56, 42, 105 (no peaks above 110); norephedrine 44, 77, 79, 51, 45, 42, 107, 105.

Quantification. GAS CHROMATOGRAPHY. In urine: diethylpropion and metabolites, sensitivity 300 ng/ml, FID—B. Testa and A. H. Beckett, *J. Chromat.*, 1972, 71, 39–54.

GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In plasma: sensitivity 600 pg/ml—G. J. Wright *et al.*, *Drug Met. Rev.*, 1975, 4, 267–276.

Disposition in the Body. Readily absorbed after oral administration. Metabolised by *N*-dealkylation, reduction, deamination, and *N*-hydroxylation primarily to active metabolites; keto-reduction is stereoselective resulting in the formation of *threo*-hydroxylated metabolites; glucuronide formation also occurs along with the formation of hippuric and mandelic acids. About 80 to 90% of a dose is excreted in the urine; the amount excreted in the urine is reduced when the urine is alkaline; of the urinary excreted material, *N*-ethylaminopropiophenone, norephedrine (phenylpropanolamine), and hippuric acid are the main metabolites together with small amounts of unchanged drug, aminopropiophenone, *N*-diethylnorephedrine, and *N*-ethylnorephedrine.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 75 mg to 5 subjects, a mean peak plasma concentration of 0.007 µg/ml was attained in 0.5 hour; total concentrations

of the monodesethyl and didesethyl metabolites reached an average peak of 0.19 µg/ml at 2 hours (G. J. Wright *et al.*, *ibid.*).

TOXICITY. The estimated minimum lethal doses are 200 mg for a child and 2 g for an adult.

The following disposition was reported in a case of fatal overdose resulting from the injection of illicit diethylpropion tablets: blood 5.4 µg/ml, bile 14.4 µg/ml, kidney 0.9 µg/g, liver 0.9 µg/g, injection site 43.2 µg/g (R. R. Fysh and J. F. Taylor, *Bull. int. Ass. forens. Toxicol.*, 1978, 14(2), 16–17).

HALF-LIFE. Derived from urinary excretion data, 1.5 to 3 hours in subjects whose urines are acidic.

Dose. Usually 75 mg of diethylpropion hydrochloride daily.

Diethylthiambutene *Narcotic Analgesic (Veterinary)*

NN-Diethyl-1-methyl-3,3-di-(2-thienyl)prop-2-enylamine

$C_{16}H_{21}NS_2 = 291.5$

CAS—86-14-6

Diethylthiambutene Hydrochloride

$C_{16}H_{21}NS_2 \cdot HCl = 327.9$

CAS—132-19-4

A white crystalline powder. M.p. 151° to 154°.

Soluble 1 in 2 of water and 1 in 1 of ethanol; practically insoluble in ether.

Colour Tests. Liebermann's Test (100°)—orange; Mandelin's Test—green→green-blue; Marquis Test—violet; Sulphuric Acid—orange.

Cold *nitric acid* gives a pink-brown colour changing to green.

Thin-layer Chromatography. *System TA*—Rf 70; *system TB*—Rf 61; *system TC*—Rf 43. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, red-violet.)

Gas Chromatography. *System GA*—RI 2008.

High Pressure Liquid Chromatography. *System HA*—k' 2.0.

Ultraviolet Spectrum. Aqueous acid—268 nm, 288 nm ($A_1^1 = 362$ a); aqueous alkali—295 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 716, 743, 851, 833, 1244, 1618 (diethylthiambutene hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 276, 111, 219, 42, 277, 97, 29, 100.

Diethyltoluamide

Insect Repellent

Synonym. Deet

Proprietary Name. Autan

NN-Diethyl-*m*-toluamide

$C_{12}H_{17}NO = 191.3$

CAS—134-62-3

A colourless or faintly yellow liquid. Wt per ml 0.997 to 1.000 g. Practically **immiscible** with water; miscible with ethanol, chloroform, and ether.

Thin-layer Chromatography. *System TA*—Rf 73. (*Acidified iodoplatinate solution*, positive.)

Gas Chromatography. *System GA*—RI 1583.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1629, 1284, 794, 1305, 1581, 1095 (KBr disk).

Quantification. GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In urine: diethyltoluamide and metabolites—A. Wu *et al.*, *J. High Resolut. Chromat. Chromat. Commun.*, 1979, 2, 558–562.

Use. As a 50 to 75% solution.

Diethyltryptamine

Hallucinogen

Synonyms. D.E.T.; *NN*-Diethyltryptamine.

3-(2-Diethylaminoethyl)indole

$C_{14}H_{20}N_2 = 216.3$

CAS—61-51-8

An orange oily liquid.

Soluble in ethanol and chloroform.

Diethyltryptamine Hydrochloride

A white crystalline powder. M.p. 87° to 89°.

Soluble in water.

Colour Tests. Mandelin's Test—grey-green → yellow; Marquis Test—yellow → brown.

Thin-layer Chromatography. *System TA*—Rf 46; *system TB*—Rf 15; *system TC*—Rf 10. (*Dragendorff spray*, positive; *acidified iodoplatinate solution*, positive; *Marquis reagent*, brown.)

Gas Chromatography. *System GA*—RI 1910.

Ultraviolet Spectrum. Aqueous acid—278 nm ($A_1^1 = 270$ a), 287 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 740, 1111, 1063, 1086, 1234, 724.

Mass Spectrum. Principal peaks at m/z 86, 30, 58, 29, 130, 87, 77, 42.

Diflunisal

Analgesic

Proprietary Names. Dolobid; Donobid.

5-(2,4-Difluorophenyl)salicylic acid

$C_{13}H_8F_2O_3 = 250.2$

CAS—22494-42-4

White crystals or crystalline powder. M.p. about 212°.

Practically **insoluble** in water; soluble in ethanol, ether, and in dilute alkalis.

Colour Tests. Ferric Chloride—violet; Folin-Ciocalteu Reagent—blue; McNally's Test—violet.

Thin-layer Chromatography. *System TD*—Rf 08; *system TE*—Rf 16; *system TF*—Rf 10; *system TG*—Rf 37. (*Chromic acid solution*, blue-grey.)

Gas Chromatography. *System GD*—retention time of methyl derivative 1.20 relative to n -C₁₆H₃₄.

High Pressure Liquid Chromatography. *System HD*— k' 4.1; *system HV*—retention time 0.77 relative to meclofenamic acid.

Ultraviolet Spectrum. Acid methanol—251 nm ($A_1^1 = 560$ a), 315 nm ($A_1^1 = 130$ a); aqueous alkali—277 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1683, 1492, 1248, 1220, 1150, 978, (KBr disk). Two polymorphic forms may occur.

Mass Spectrum. Principal peaks at m/z 232, 250, 175, 204, 176, 233, 102, 78.

Quantification. SPECTROFLUORIMETRY. In plasma: sensitivity 500 ng—D. J. Tocco *et al.*, *Drug Met. Disp.*, 1975, 3, 453–466.

GAS CHROMATOGRAPHY. In plasma or urine: sensitivity 1 µg/ml, FID—D. J. Tocco *et al.*, *idem*.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: sensitivity 50 ng/ml, fluorescence detection—J. E. Ray and R. O. Day, *J. pharm. Sci.*, 1983, 72, 1403–1405.

Disposition in the Body. Well absorbed after oral administration. Up to about 80% of a dose is excreted in the urine in 24 hours, mostly as the ester and ether glucuronides. Less than 3% of a dose is eliminated in the faeces.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 500 mg given to 5 subjects, peak plasma concentrations of 58 to 92 µg/ml (mean 77) were attained in 2 hours (R. Verbeeck *et al.*, *Br. J. clin. Pharmac.*, 1979, 7, 273–282).

Following oral administration of 500 mg twice daily to 6 subjects, steady-state plasma concentrations of 66 to 183 µg/ml were reported (E. Wählin-Boll *et al.*, *Eur. J. clin. Pharmac.*, 1981, 20, 375–378).

TOXICITY. Diflunisal appears to be relatively non-toxic.

A 47-year-old woman went into a coma after ingesting 29 g of diflunisal but subsequently recovered uneventfully (H. P. Upadhyay and S. K. Gupta, *Br. med. J.*, 1978, 2, 640).

HALF-LIFE. Plasma half-life, about 5 to 12 hours (dose-dependent).

VOLUME OF DISTRIBUTION. About 0.1 litre/kg.

CLEARANCE. Plasma clearance, about 0.1 ml/min/kg.

PROTEIN BINDING. In plasma, about 99%.

NOTE. For a review of the pharmacokinetics of diflunisal see R. N. Brogden *et al.*, *Drugs*, 1980, 19, 84–106.

Dose. 0.5 to 1 g daily.

Digitoxin

Cardiac Glycoside

Synonyms. Digitaline Cristallisée; Digitoxoside.

Proprietary Names. Asthenthilo; Crystodigin; Digimerck; Digitaline Nativelle; Digitox; Digitrin; Ditaven; Purodigin.

3β-[(O-2,6-Dideoxy-β-D-ribo-hexopyranosyl-(1→4)-O-2,6-dideoxy-β-D-ribo-hexopyranosyl)-(1→4)-2,6-dideoxy-β-D-ribo-hexopyranosyl]oxy]-14-hydroxy-5β,14β-card-20(22)-enolide

$C_{41}H_{64}O_{13}$ = 764.9

CAS—71-63-6

A glycoside obtained from suitable species of *Digitalis* (Scrophulariaceae).

A white or pale buff-coloured, microcrystalline powder. M.p. about 256°.

Practically **insoluble** in water; soluble 1 in 150 of ethanol and 1 in 40 of chloroform; slightly soluble in ether and methanol; freely soluble in a mixture of equal volumes of chloroform and methanol.

Colour Test. Antimony Pentachloride—yellow→brown→black-violet.

Thin-layer Chromatography. System TK—Rf 72. (Perchloric acid solution, followed by examination under ultraviolet light, red fluorescence; p-anisaldehyde reagent, blue.)

Gas Chromatography. System GA—RI 1902.

High Pressure Liquid Chromatography. System HM—k' 5.4. For further information on allied compounds and metabolites, see p. 217.

Infra-red Spectrum. Principal peaks at wavenumbers 1072, 1058, 1010, 1740, 1168, 990 (KBr disk).

Mass Spectrum. Principal peaks at m/z 43, 29, 39, 41, 45, 57, 68, 58.

Quantification. THIN-LAYER CHROMATOGRAPHY. In serum: sensitivity 1 to 2 ng—D. B. Faber *et al.*, *J. Chromat.*, 1977, 143; *Biomed. Appl.*, 1, 95–103.

RADIOIMMUNOASSAY. In serum, urine or cerebrospinal fluid: sensitivity 5 ng/ml—A. K. Nore *et al.*, *Clin. Chem.*, 1980, 26, 321–323.

FLUOROIMMUNOASSAY. In serum: sensitivity 1 ng/ml—M. H. H. Al-Hakiem *et al.*, *Clin. Chem.*, 1982, 28, 1364–1366.

Disposition in the Body. Readily absorbed after oral administration; bioavailability greater than 90%. High concentrations are found in the kidney, ventricular myocardium, liver, and skeletal muscle. Extensively metabolised by hydrolysis to digitoxigenin bisdigitoxoside, digitoxigenin monodigitoxoside and digitoxigenin, and by hydroxylation to digoxin and the corresponding digoxigenin derivatives, all of which are active. Epimerisation to the inactive metabolites, epidigitoxigenin and epidigoxigenin, followed by glucuronide conjugation also occurs; dihydrodigitoxin has also been detected in plasma. About 60 to 80% of a single dose is excreted in the urine over a period of 3 weeks, mainly as metabolites, and up to 20% is eliminated in the faeces. The excretion of digitoxin and its active and inactive metabolites is very variable and is independent of dose and route of administration. About 20 to 50% of a dose appears to be excreted as unchanged drug in urine and faeces in variable proportions, and the amount of unchanged drug in the urine has been reported to be greater during maintenance treatment than in single dose studies.

Digitoxin is a metabolite of acetyldigitoxin.

THERAPEUTIC CONCENTRATION. In serum, usually in the range 0.01 to 0.03 µg/ml.

After a single oral dose of 20 µg/kg, given to 6 children, peak serum concentrations of 0.02 to 0.05 µg/ml were attained in 1.5 to 2.5 hours (A. Larsen and L. Storstein, *Clin. Pharmac. Ther.*, 1983, 33, 717–726).

Following daily oral doses of 0.1 mg to 7 subjects, steady-state serum concentrations of 0.009 to 0.026 µg/ml (mean 0.017) were reported (K. Hausteim, *Eur. J. clin. Pharmac.*, 1981, 19, 45–51).

TOXICITY. The estimated minimum lethal dose is 3 mg. Toxic effects are usually associated with serum concentrations of about 0.03 µg/ml or more.

In a fatality due to the ingestion of 15 mg of digitoxin, a plasma concentration of 0.32 µg/ml was attained 4 hours after ingestion; death occurred after 14 hours (M. Mercier, *Bull. int. Ass. forens. Toxicol.*, 1971, 7(4), 10–11).

A subject who ingested 10 mg of digitoxin recovered following treatment with activated charcoal; a plasma concentration of 0.26 µg/ml was reported 4 hours after the dose, decreasing to 0.027 µg/ml at 80 hours (S. Pond, *et al.*, *Lancet*, 1981, 2, 1177–1178).

HALF-LIFE. Plasma half-life, 3 to 16 days (mean 7).

VOLUME OF DISTRIBUTION. 0.4 to 0.8 litre/kg (mean 0.6); increased in children.

CLEARANCE. Plasma clearance, about 0.04 ml/min/kg; increased in children.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 1.7.

PROTEIN BINDING. In plasma, about 95%.

NOTE. For a review of the clinical pharmacokinetics of digitoxin see D. Perrier *et al.*, *Clin. Pharmacokinet.*, 1977, 2, 292–311.

Dose. Maximum initial total dose of 1.6 mg over 1 to 2 days; maintenance, 50 to 200 µg daily.

Digoxin

Cardiac Glycoside

Synonym. Digoxosidum

Proprietary Names. Allocor (injection); Cardiox; Coragoxine; Digacin; Digoxin(e) Nativelle; Eudigox; Lanoxin(e); Lenoxin; Natigoxin; Novodigal; Prodigox.

3β-[(O-2,6-Dideoxy-β-D-ribo-hexopyranosyl-(1→4)-O-2,6-dideoxy-β-D-ribo-hexopyranosyl-(1→4)-2,6-dideoxy-β-D-ribo-hexopyranosyl)oxy]-12β,14-dihydroxy-5β,14β-card-20(22)-enolide

$C_{41}H_{64}O_{14}$ = 780.9

CAS—20830-75-5

A glycoside obtained from the leaves of *Digitalis lanata* (Scrophulariaceae).

Colourless crystals or a white powder. M.p. about 240°, with decomposition.

Practically **insoluble** in water, dehydrated alcohol, and ether; soluble 1 in 122 of ethanol (80%) and 1 in 4 of pyridine; slightly soluble in chloroform; freely soluble in a mixture of equal volumes of chloroform and methanol.

Colour Test. Antimony Pentachloride—yellow → brown → black-violet.

Thin-layer Chromatography. System TD—Rf 01; system TE—Rf 33; system TF—Rf 05; system TK—Rf 62. (Perchloric acid solution, followed by examination under ultraviolet light, blue fluorescence; p-anisaldehyde reagent, blue.)

High Pressure Liquid Chromatography. System HM—k' 11.3. For further information on allied compounds and metabolites, see p. 217.

Infra-red Spectrum. Principal peaks at wavenumbers 1075, 1709, 1055, 1020, 1160, 1110 (KBr disk).

Mass Spectrum. Principal peaks at m/z 73, 58, 57, 43, 41, 39, 29, 45 (no peaks above 360).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In urine: tritiated digoxin and metabolites, sensitivity 8 pg/ml for digoxin—M. H. Gault *et al.*, *J. Chromat.*, 1980, 182; *Biomed. Appl.*, 8, 465–472.

HIGH PRESSURE LIQUID CHROMATOGRAPHY—RADIOIMMUNOASSAY. In plasma: digoxin and metabolites—H. A. Nelson *et al.*, *J. Chromat.*, 1979, 163; *Biomed. Appl.*, 5, 169–177.

RADIOIMMUNOASSAY. In haemolysed blood—S. M. Fletcher *et al.*, *J. forens. Sci. Soc.*, 1979, 19, 183–188. In serum or urine: dihydrodigoxin, sensitivity 250 pg/ml—V. P. Butler jun. *et al.*, *J. Pharmac. exp. Ther.*, 1982, 221, 123–131.

REVIEW. See W. J. F. van der Vijgh—*Pharm. Weekbl.*, 1978, 113, 585–594.

Disposition in the Body. The absorption of digoxin after oral administration is variable and subject to bioavailability differences; absorption occurs mainly in the small intestine and is

delayed in the presence of food. The mean bioavailability is about 67% from tablets, 80% from elixirs, and up to 100% from encapsulated elixirs. Digoxin is rapidly distributed throughout the body and less than 20% of the total digoxin in the body is located in the blood. High concentrations are found in the heart and kidneys, but the skeletal muscles form the largest digoxin store. Digoxin is metabolised by stepwise removal of the sugar moieties to form digoxigenin, which is further metabolised to inactive metabolites which may be excreted in the free or conjugated form. Reduction to dihydrodigoxin, which is relatively inactive, also occurs. Up to 80% of a dose is excreted in the urine in 7 days with 27% of the dose in the first 24 hours; the remainder is eliminated in the faeces via the bile. In most patients, 80 to 90% of the material excreted in the urine is unchanged, up to 10% is in the dihydro form, and a small amount includes digoxigenin and the mono- and bisdigitoxosides. In about 10% of patients, however, between 20 and 55% is excreted as metabolites, mainly dihydrodigoxin. Of the material excreted in the bile, about 50% is unchanged, about 25% is digoxin bisdigitoxoside, about 25% is digoxin monodigitoxoside, and about 1% is digoxigenin.

Digoxin is a metabolite of deslanoside, digitoxin, lanatoside C, and medigoxin.

THERAPEUTIC CONCENTRATION. In serum, usually in the range 0.001 to 0.0025 µg/ml. Blood concentrations are significantly lower in hyperthyroidism, but increased in hypothyroidism and in patients with renal failure; children tolerate higher serum concentrations than adults.

Following a single oral dose of 0.25 mg to 6 subjects, a mean peak serum concentration of 0.001 µg/ml was attained in 1 hour (J. C. Panisset *et al.*, *Can. med. Ass. J.*, 1973, 109, 700–702).

Steady-state plasma concentrations of 0.0004 to 0.0021 µg/ml (mean 0.0011) were reported in 14 patients on an oral daily dosage of 0.125 to 0.25 mg (J. Gayes and D. Greenblatt, *J. clin. Pharmac.*, 1978, 5, 92–93).

TOXICITY. Toxic effects are usually associated with serum concentrations of 0.0014 to 0.0028 to 0.007 µg/ml and fatalities with concentrations of 0.0015 to 0.010 to 0.03 µg/ml.

In 7 fatalities involving ingestion of digoxin, postmortem 'serum' concentrations of 0.007 to 0.024 µg/ml (mean 0.013) were reported; in a fatality involving intramuscular injection of 1 mg of digoxin in an infant, a postmortem 'serum' concentration of 0.071 µg/ml was reported (A. C. Moffat, *Acta pharmac. tox.*, 1974, 35, 386–394).

Postmortem blood concentrations vary according to the origin of the sample; serum from the right heart of 10 patients, in whom digoxin was not implicated as the cause of death, was found to contain 0.001 to 0.004 µg/ml of digoxin (mean 0.002), whereas serum from the femoral vein contained 0.0007 to 0.003 µg/ml (mean 0.001) (D. W. Holt and J. G. Benstead, *J. clin. Path.*, 1975, 28, 483–486).

Serum-digoxin concentrations usually increase after death; average postmortem: antemortem ratios varying from 1.42 for blood from the femoral vein to 1.96 for heart blood have been reported; in contrast, postmortem vitreous humour concentrations were usually lower than antemortem values (T. E. Vorpahl and J. I. Coe, *J. forens. Sci.*, 1978, 23, 329–334).

The following distribution was observed in a 3-day-old child who received a total of 4 mg of digoxin and died several hours later: blood 0.03 µg/ml, brain 0.0009 µg/g, kidney 0.13 µg/g, liver 0.034 µg/g (M. Selesky *et al.*, *J. forens. Sci.*, 1977, 22, 409–417).

In a suicide due to digoxin overdose, the following postmortem tissue concentrations were reported: blood 0.022 µg/ml, brain 0.0097 µg/g, heart 0.043 µg/g, kidney 1.4 µg/g, liver 0.081 µg/g, lung 0.053 µg/g (R. Aderjan *et al.*, *Arch. Tox.*, 1979, 42, 107–114).

HALF-LIFE. Plasma half-life, about 20 to 50 hours, prolonged in subjects with renal impairment.

VOLUME OF DISTRIBUTION. About 5 to 10 litres/kg.

CLEARANCE. Plasma clearance, about 1 to 4 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 0.93.

PROTEIN BINDING. In plasma, 20 to 40%.

NOTE. For reviews of the pharmacokinetics of digoxin see E. Iisalo, *Clin. Pharmacokinet.*, 1977, 2, 1–16 and J. K. Aronson, *ibid.*, 1980, 5, 137–149.

Dose. 125 to 750 µg daily. For rapid digitalisation, an initial dose of 0.75 to 1.5 mg may be given.

Dihydralazine

Antihypertensive

Synonym. Dihydrallazine
1,4-Dihydrazinophthalazine
 $C_8H_{10}N_6 = 190.2$
CAS—484-23-1

Orange crystalline needles which decompose at about 180°.

Dihydralazine Sulphate

Proprietary Name. Nepresol

$C_8H_{10}N_6 \cdot H_2SO_4 = 288.3$

CAS—7327-87-9

A white to slightly yellow crystalline powder. M.p. 245°.

Slightly **soluble** in water; practically insoluble in ethanol, chloroform, and methanol.

Colour Tests. Mandelin's Test—yellow; Nessler's Reagent—black.

Thin-layer Chromatography. System TA—Rf 55; system TB—Rf 36; system TC—Rf 02.

Ultraviolet Spectrum. Aqueous acid—240 nm, 274 nm, 306 nm ($A_1^1 = 323$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1608, 1575, 1537, 1136, 769, 1100 (KBr disk).

Quantification. GAS CHROMATOGRAPHY. In plasma: dihydralazine plus acid-labile hydrazones, sensitivity 5 ng/ml, ECD—P. H. Degen *et al.*, *J. Chromat.*, 1982, 233; *Biomed. Appl.*, 22, 375–380.

Dose. Dihydralazine sulphate has been given in doses of 12.5 to 150 mg daily.

Dihydrocodeine

Narcotic Analgesic

Synonyms. Drocode; Hydrocodeine.

Proprietary Name. Remedacen

7,8-Dihydro-3-O-methylmorphine •

$C_{18}H_{23}NO_3 = 301.4$

CAS—125-28-0

Crystals. M.p. 112° to 113°.

Dihydrocodeine Phosphate

$C_{18}H_{23}NO_3 \cdot H_3PO_4 = 399.4$

CAS—24204-13-5

A white to yellowish-white crystalline powder.

Soluble 1 in 3 of water; slightly soluble in ethanol.

Dihydrocodeine Tartrate

Synonyms. Dihydrocodeine Acid Tartrate; Dihydrocodeine Bitartrate.

Proprietary Names. DF 118; Fortuss; Paracodin; Rikodeine; Tuscodin.

It is an ingredient of Onadox-118 and Paramol.

$C_{18}H_{23}NO_3 \cdot C_4H_6O_6 = 451.5$

CAS—5965-13-9

Colourless crystals or white crystalline powder. M.p. 190° to 194°.

Soluble 1 in 5 of water; sparingly soluble in ethanol; practically insoluble in ether.

Dissociation Constant. pK_a 8.8 (25°).

Partition Coefficient. Log P (ether/pH 7.0), –1.5.

Colour Tests. Mandelin's Test—grey-green; Marquis Test—violet.

Thin-layer Chromatography. System TA—Rf 26; system TB—Rf 08; system TC—Rf 13. (*Dragendorff spray*, positive; *acidified iodoplatinate solution*, positive; *Marquis reagent*, blue-violet.)

Gas Chromatography. System GA—RI 2363; system GC—RI 2702; system GF—RI 2840.

High Pressure Liquid Chromatography. System HA— k' 7.2 (tailing peak); system HC— k' 2.50.

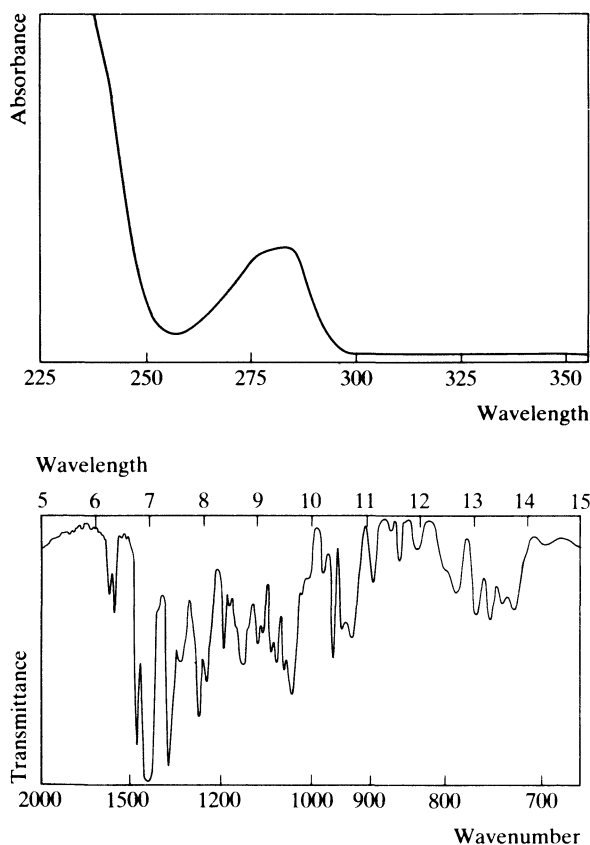

Ultraviolet Spectrum. Aqueous acid—283 nm ($A_1^1 = 47$ a). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1495, 1271, 1040, 1250, 1055, 1149 (Nujol mull).

Mass Spectrum. Principal peaks at m/z 301, 44, 42, 59, 164, 70, 302, 242.

Quantification. GAS CHROMATOGRAPHY. In blood, bile, liver blood or urine: FID—M. A. Peat and A. Sengupta, *Forens. Sci.*, 1977, 9, 21–32.

Disposition in the Body. Well absorbed after oral administration but appears to undergo extensive first-pass metabolism; bio-availability about 20%. Little is known about the metabolic fate

of dihydrocodeine, but it is likely that *N*-demethylation to form nordihydrocodeine, *O*-demethylation producing dihydromorphine and conjugation occur, similarly to codeine. After an oral dose of 52 mg, 20 to 30% is excreted in the urine in 24 hours; this is increased to about 35% when the urine is acid. After an intramuscular dose of about 43 mg under conditions of controlled acidic urinary pH, 40 to 60% is excreted in the urine in 24 hours. About 30 to 45% of the urinary excreted material is conjugated.

THERAPEUTIC CONCENTRATION.

Following single oral doses of 30 mg and 60 mg to 7 subjects, mean peak plasma concentrations of 0.072 and 0.146 µg/ml were attained in 1.7 hours; the corresponding peak plasma concentrations of acidic metabolites were 0.56 and 1.48 µg/ml (F. J. Rowell *et al.*, *Eur. J. clin. Pharmac.*, 1983, 25, 419-424).

TOXICITY. The estimated minimum lethal dose is 0.5 g, but addicts may be able to tolerate up to ten times as much, whereas 25 mg may be fatal in children.

In a fatality attributed to an oral overdose of dihydrocodeine, the following postmortem tissue concentrations were reported: blood 12 µg/ml, bile 5340 µg/ml, liver 620 µg/g, urine 570 µg/ml; chlordiazepoxide was also detected. In a second case in which the death of an addict occurred rapidly after an intravenous overdose of dihydrocodeine, the postmortem concentrations were: blood 720 µg/ml, bile 3 µg/ml, liver blood 364 µg/ml, urine 7 µg/ml; pentobarbitone and paracetamol were also detected (M. A. Peat and A. Sengupta, *Forens. Sci.*, 1977, 9, 21-32).

In four fatalities due to ingestion of dihydrocodeine, postmortem blood concentrations of 7.2 to 12.0 µg/ml (mean 9.0) were reported (S. C. Patterson, *Forens. Sci. Int.*, 1985, 27, 129-133).

HALF-LIFE. Plasma half-life, about 4 hours.

VOLUME OF DISTRIBUTION. About 1 litre/kg.

CLEARANCE. Plasma clearance, about 4 ml/min/kg.

Dose. 30 to 60 mg of dihydrocodeine tartrate every 4 to 6 hours.

Dihydroergotamine

Treatment of Migraine

9,10-Dihydro-12'-hydroxy-2'-methyl-5'α-benzylergotaman-3',6',18-trione

$C_{33}H_{37}N_5O_5 = 583.7$

CAS—5111-12-6

White crystals. M.p. 239°.

Practically **insoluble** in water; slightly soluble in ethanol and chloroform.

Dihydroergotamine Mesylate

Synonym. Dihydroergotamine Methanesulphonate

Proprietary Names. DET MS; D.H.E. 45; Dihyergot; Ikaran; Séglor; Tonopres.

$C_{33}H_{37}N_5O_5 \cdot CH_3SO_3H = 679.8$

CAS—6190-39-2

A white to slightly yellowish, or an off-white to slightly red, microcrystalline powder.

Soluble 1 in 125 of water, 1 in 90 of ethanol, 1 in 175 of chloroform, and 1 in 2600 of ether; soluble in acetone.

Dihydroergotamine Tartrate

$(C_{33}H_{37}N_5O_5)_2 \cdot C_4H_6O_6 = 1318$

CAS—5989-77-5

Colourless crystals or a white crystalline powder. M.p. about 203°, with decomposition.

Very slightly **soluble** in water; sparingly soluble in ethanol; soluble in pyridine.

Dissociation Constant. pK_a 6.9 (24°).

Colour Tests. *p*-Dimethylaminobenzaldehyde—violet; Mandelin's Test—violet-brown; Marquis Test—grey-brown.

Thin-layer Chromatography. *System TA*—Rf 60; *system TB*—Rf 01; *system TC*—Rf 28; *system TL*—Rf 14; *system TM*—Rf 40. (*Van Urk reagent*, blue.)

Gas Chromatography. *System GA*—RI 2315.

High Pressure Liquid Chromatography. *System HA*— k' 0.6; *system HP*— k' 11.4.

Ultraviolet Spectrum. Aqueous acid—280 nm ($A_1^1 = 108$ a). No alkaline shift. (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 1660, 1210, 1712, 1053, 1140, 768 (KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 70, 125, 91, 153, 43, 41, 44, 244 (no peaks above 340).

Quantification. **RADIOIMMUNOASSAY.** In plasma—J. Rosenthaler and H. Munzer, *Experientia*, 1979, 32, 234-240.

Disposition in the Body. Poorly absorbed after oral administration and undergoes extensive first-pass metabolism with considerable intersubject variation; bioavailability less than 5%. After oral administration less than 5% of a dose is excreted in the urine unchanged in 24 hours, compared to about 11% after intravenous administration. The major metabolite is the 8'-hydroxy derivative, which is active.

THERAPEUTIC CONCENTRATION.

Following single oral doses of 10, 20, and 30 mg to 6 subjects, mean plasma concentrations of about 0.0002, 0.0006, and 0.001 µg/ml, respectively, were attained in about 0.5 to 1 hour (P. J. Little *et al.*, *Br. J. clin. Pharmacol.*, 1982, 13, 785-790).

HALF-LIFE. Plasma half-life, about 2 to 4 hours; a longer terminal elimination half-life of about 20 to 30 hours has also been reported.

VOLUME OF DISTRIBUTION. 6 to 23 litres/kg (mean 14).

CLEARANCE. Plasma clearance, 7 to 22 ml/min/kg (mean 15).

Dose. 1 to 3 mg of dihydroergotamine mesylate, repeated if necessary to a maximum of 10 mg daily.

Dihydromorphine

Narcotic Analgesic

7,8-Dihydromorphine

$C_{17}H_{21}NO_3 = 287.4$

CAS—509-60-4

White crystals. M.p. of the hydrated compound, 157°, with decomposition.

Practically **insoluble** in water; soluble in ethanol and chloroform.

Dihydromorphine Hydrochloride

$C_{17}H_{21}NO_3 \cdot HCl = 323.8$

CAS—1421-28-9

Crystals.

Very **soluble** in water; slightly soluble in ethanol.

Dissociation Constant. pK_a 8.6.

Partition Coefficient. Log P (octanol/pH 7.4), -1.0.

Colour Tests. Mandelin's Test—grey; Marquis Test—red-violet.

Thin-layer Chromatography. System TA —Rf 25; system TB —Rf 01; system TC —Rf 03. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, violet.)

Gas Chromatography. System GA —RI 2451; system GC —RI 2504.

High Pressure Liquid Chromatography. System HA — k' 5.7 (tailing peak); system HC — k' 2.75.

Ultraviolet Spectrum. Aqueous acid—283 nm ($A_1^1 = 45$ a); aqueous alkali—297 nm ($A_1^1 = 82$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1245, 760, 940, 747, 1085, 1145 (KBr disk).

Mass Spectrum. Principal peaks at m/z 287, 70, 44, 164, 42, 288, 59, 230.

Dihydrostreptomycin*Antibiotic*

4-*O*-[2-*O*-(2-Deoxy-2-methylamino- α -L-glucopyranosyl)-5-deoxy-3-*C*-hydroxymethyl- α -L-lyxofuranosyl]-*NN'*-diamidino-D-streptamine

$C_{21}H_{41}N_7O_{12} = 583.6$

CAS—128-46-1

**Dihydrostreptomycin Sulphate**

Proprietary Names. Abiocine; Enterastrept; Solvo-strept. It is an ingredient of Guanimycin.

$(C_{21}H_{41}N_7O_{12})_2 \cdot 3H_2SO_4 = 1461$

CAS—5490-27-7

A white hygroscopic solid.

Very **soluble** in water; practically insoluble in ethanol, chloroform, and ether.

Dissociation Constant. pK_a 7.8.

Colour Tests. Nessler's Reagent—yellow → brown; Palladium Chloride—brown (slow).

Thin-layer Chromatography. System TA—Rf 01. (Acidified potassium permanganate solution, positive.)

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1111, 1666, 1052, 1724, 1250, 1515.

Dose. The equivalent of 0.5 to 1 g of dihydrostreptomycin has been given daily, intramuscularly.

Dihydrotachysterol*Vitamin D Activity*

Synonym. Dichysterol

Proprietary Names. AT 10; Calcamine; Dihydral; Dygratyl; Hytakerol; Tachyrol.

(5*E*,7*E*,22*E*)-10 α -9,10-Secoergosta-5,7,22-trien-3 β -ol

$C_{28}H_{46}O = 398.7$

CAS—67-96-9

Colourless crystals or white crystalline powder. M.p. 123° to 129°. May also occur in a form melting at about 113°.

Practically **insoluble** in water; soluble 1 in 20 of ethanol, 1 in 0.7 of chloroform, and 1 in 3 of ether.

Ultraviolet Spectrum. Methanol—242 nm, 251 nm ($A_1^1 = 990$ a), 261 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1056, 967, 1018, 1009, 870, 980 (KBr disk).

Dose. Initially 0.25 to 2.5 mg daily.

Di-iodohydroxyquinoline*Anti-amoebic*

Synonyms. Diiodohydroxyquin; Diodoxyquinoléine; Iodoquinol.

Proprietary Names. Diodoquin; Direxiode; Embequin; Floraquin; Moebiquin; Yodoxin.

5,7-Di-iodoquinolin-8-ol

$C_9H_5I_2NO = 397.0$

CAS—83-73-8

A light yellowish to tan-coloured microcrystalline powder, not readily wetted in water. M.p. 200° to 215°, with decomposition. Practically **insoluble** in water; sparingly soluble in ethanol, acetone, and ether.

Colour Test. Heat a few crystals with 1 ml of *sulphuric acid*—violet iodine vapour.

Thin-layer Chromatography. *System TD*—Rf 17; *system TE*—Rf 28; *system TF*—Rf 19.

Ultraviolet Spectrum. Dilute 5 ml of a 0.01% w/v solution in dioxan to 100 ml with dehydrated alcohol—258 nm ($A_1^1 = 1060$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1204, 781, 806, 920, 1265, 869 (KBr disk).

Mass Spectrum. Principal peaks at m/z 397, 115, 242, 398, 88, 143, 271, 62.

Quantification. COLORIMETRY. In urine: sensitivity 10 µg/ml—L. Berggren and O. Hansson, *Clin. Pharmac. Ther.*, 1968, 9, 67–70.

Disposition in the Body. Incompletely and irregularly absorbed from the small intestine. About 5% of a dose is excreted in the urine as the glucuronide conjugate in 10 hours.

Dose. Usually 1.8 g daily.

Diloxanide

Anti-amoebic

Synonym. Diloxan

2,2-Dichloro-4'-hydroxy-*N*-methylacetanilide

$C_9H_9Cl_2NO_2 = 234.1$

CAS—579-38-4

A white crystalline powder. M.p. 175°.

Slightly **soluble** in water; soluble 1 in 8 of ethanol, 1 in 35 of chloroform, and 1 in 66 of ether.

Diloxanide Furoate

Proprietary Names. Furamide. It is an ingredient of Entamizole.

$C_{14}H_{11}Cl_2NO_4 = 328.2$

CAS—3736-81-0

A white crystalline powder. M.p. 114° to 116°.

Very slightly **soluble** in water; soluble 1 in 100 of ethanol, 1 in 2.5 of chloroform, and 1 in 130 of ether.

Colour Tests. Folin-Ciocalteu Reagent—blue; Liebermann's Test—yellow.

Thin-layer Chromatography. *System TA*—Rf 66; *system TB*—Rf 16; *system TC*—Rf 74. (*Acidified iodoplatinate solution*, positive.)

Gas Chromatography. *System GA*—RI 2420.

Ultraviolet Spectrum. Diloxanide furoate: aqueous acid—262 nm ($A_1^1 = 224$ b); ethanol—258 nm ($A_1^1 = 705$ a). Diloxanide: ethanol—278 nm ($A_1^1 = 104$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1678, 1197, 1093, 1290, 1727, 1167 (KBr disk).

Mass Spectrum. Principal peaks at m/z 95, 327, 39, 329, 96, 122, 244, 67 (diloxanide furoate).

Disposition in the Body. After oral administration diloxanide furoate is hydrolysed to diloxanide and then readily absorbed; it is excreted in the urine and faeces.

Dose. 1.5 g of diloxanide furoate daily.

Dimeflin*Respiratory Stimulant*

8-Dimethylaminomethyl-7-methoxy-3-methyl-2-phenyl-4H-chromen-4-one

 $C_{20}H_{21}NO_3 = 323.4$

CAS—1165-48-6

**Dimeflin Hydrochloride***Proprietary Name.* Remeflin(e) $C_{20}H_{21}NO_3 \cdot HCl = 359.9$

CAS—2740-04-7

A white crystalline powder. It decomposes at about 213°.

Soluble in water and ethanol; practically insoluble in chloroform and ether.**Colour Test.** Liebermann's Test—orange.**Thin-layer Chromatography.** *System TA*—Rf 59; *system TB*—Rf 15; *system TC*—Rf 48. (Acidified iodoplatinate solution, positive.)**Gas Chromatography.** *System GA*—RI 2555.**Ultraviolet Spectrum.** Aqueous acid—309 nm ($A_1^1 = 950$ b).**Infra-red Spectrum.** Principal peaks at wavenumbers 1637, 1278, 1602, 1081, 699, 1136 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 279, 163, 323, 58, 277, 308, 280, 322.**Dose.** Dimeflin hydrochloride has been given in doses of 16 to 48 mg daily.**Dimenhydrinate***Antihistamine**Synonyms.* Anautin; Chloranautine; Diphenhydramine Theoclate.*Proprietary Names.* Amosyt; Andrumin; Dimate; Dramamine; Dramocen; Epha-retard; Gravol; Nauseatol; Novodiminate; Novomina; Travamine; Vomex A.

The diphenhydramine salt of 8-chlorotheophylline.

 $C_{17}H_{21}NO \cdot C_7H_7ClN_4O_2 = 470.0$

CAS—523-87-5

A white crystalline powder. M.p. 102° to 107°.

Soluble 1 in 95 of water, 1 in 2 of ethanol, and 1 in 2 of chloroform; sparingly soluble in ether.**Gas Chromatography.** *System GA*—RI 1844; *system GB*—RI 1875.**Ultraviolet Spectrum.** Aqueous acid—276 nm ($A_1^1 = 268$ a); aqueous alkali—278 nm.**Infra-red Spectrum.** Principal peaks at wavenumbers 1640, 1685, 1118, 755, 712, 1255 (KBr disk).

Mass Spectrum. Principal peaks at m/z 58, 73, 45, 43, 57, 167, 44, 165.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: detection limit 50 ng/ml, UV detection—G. Skofitsch and F. Lembeck, *Arzneimittel-Forsch.*, 1983, 33, 1674–1676.

Dose. 100 to 300 mg daily.

Dimercaprol

Chelating Agent

Synonyms. BAL; British Anti-Lewisite; Dimercaptopropanol.

Proprietary Name. Sulfactin

2,3-Dimercaptopropan-1-ol

$C_3H_8OS_2 = 124.2$

CAS—59-52-9

A clear, colourless or slightly yellow liquid. Relative density 1.239 to 1.259. Refractive index 1.568 to 1.574.

Soluble 1 in 20 of water; miscible with ethanol, ether, and methanol.

Colour Test. Palladium Chloride—yellow.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1022, 1050, 990, 1270, 1235, 1170 (thin film).

Dose. 2.5 to 4 mg/kg, intramuscularly, up to 6 times daily.

Dimethadione

Anticonvulsant

5,5-Dimethyloxazolidine-2,4-dione

$C_5H_7NO_3 = 129.1$

CAS—695-53-4

Crystals. M.p. 76° to 77°.

Dissociation Constant. pK_a 6.1 (37°).

Colour Tests. Koppanyi–Zwicker Test—violet; Mercurous Nitrate—black.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1740, 1760, 1815, 1188, 1280, 1007.

Quantification. See under Troxidone.

Disposition in the Body. Dimethadione is the active metabolite of troxidone. It is very slowly excreted in the urine over a period of several days, the rate of excretion being increased in alkaline urine.

TOXICITY. Toxic effects may be associated with plasma concentrations greater than 1000 µg/ml.

HALF-LIFE. Derived from urinary excretion data, 6 to 13 days.

Dimethindene

Antihistamine

Synonyms. Dimethylpyrindene; Dimethylpyrindene.

NN-Dimethyl-2-{3-[1-(2-pyridyl)ethyl]-1*H*-inden-2-yl}-ethylamine

$C_{20}H_{24}N_2 = 292.4$

CAS—5636-83-9

Dimethindene Maleate

Proprietary Names. Fenistil; Fenostil; Forhistal; Triten. It is an ingredient of Vibrocil.

$C_{20}H_{24}N_2 \cdot C_4H_4O_4 = 408.5$

CAS—3614-69-5

A white to off-white crystalline powder. M.p. about 161°, with decomposition.

Soluble 1 in 63 of water, 1 in 185 of ethanol, and 1 in 10 of chloroform; practically insoluble in ether.

Colour Tests. Cyanogen Bromide—orange-pink; Mandelin's Test—green; Marquis Test—violet → blue.

Thin-layer Chromatography. *System TA*—Rf 42; *system TB*—Rf 36; *system TC*—Rf 13. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 2258; *system GC*—RI 2669.

High Pressure Liquid Chromatography. *System HA*—k' 5.1.

Ultraviolet Spectrum. Aqueous acid—260 nm ($A_1^1 = 613$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 763, 1590, 724, 747, 1570, 1050.

Mass Spectrum. Principal peaks at m/z 58, 59, 72, 45, 292, 218, 42, —.

Quantification. GAS CHROMATOGRAPHY. In serum or urine: sensitivity 10 ng/ml, FID—M. M. Wermeille and G. A. Huber, *J. Chromat.*, 1982, 228; *Biomed. Appl.*, 17, 187–194.

Dose. Up to 6 mg of dimethindene maleate daily.

Thin-layer Chromatography. *System TA*—Rf 61; *system TB*—Rf 55; *system TC*—Rf 46; *system TL*—Rf 28. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 2030.

High Pressure Liquid Chromatography. *System HA*— k' 2.2; *system HR*— k' 11.24.

Ultraviolet Spectrum. Aqueous acid—261 nm, 269 nm ($A_1^1 = 159$ a), 331 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1576, 1631, 1499, 1155, 1115, 751 (KBr disk).

Mass Spectrum. Principal peaks at m/z 71, 58, 72, 43, 159, 56, 42, 201.

Use. Dimethisoquin hydrochloride is used in a concentration of 0.5%.

Dimethisterone

Progestational Steroid

Synonym. 6 α ,21-Dimethylethisterone

17 β -Hydroxy-6 α ,21-dimethyl-17 α -pregn-4-en-20-yn-3-one monohydrate

$C_{23}H_{32}O_2 \cdot H_2O = 358.5$

CAS—79-64-1 (anhydrous); 41354-30-7 (monohydrate)

A white crystalline powder. M.p. about 100°, with decomposition.

Practically **insoluble** in water; soluble 1 in 3 of ethanol, 1 in 0.7 of chloroform, and 1 in 1 of pyridine.

Colour Tests. Antimony Pentachloride—brown; Naphthol-Sulphuric Acid—red-brown/brown-green; Sulphuric Acid—orange-red.

Thin-layer Chromatography. *System TP*—Rf 80; *system TQ*—Rf 42; *system TR*—Rf 91; *system TS*—Rf 95.

Dimethisoquin

Local Anaesthetic

Synonyms. Chinisocaine; Quinisocaine.

2-(3-Butyl-1-isoquinolyloxy)-*NN*-dimethylethylamine

$C_{17}H_{24}N_2O = 272.4$

CAS—86-80-6

A liquid. B.p. about 156°.

Dimethisoquin Hydrochloride

Proprietary Names. Haenal; Isochinol; Pruralgan; Pruralgin; Quotane.

$C_{17}H_{24}N_2O \cdot HCl = 308.9$

CAS—2773-92-4

A white crystalline powder. M.p. 144° to 148°.

Soluble 1 in 8 of water, 1 in 3 of ethanol, and 1 in 2 of chloroform; very slightly soluble in ether.

Ultraviolet Spectrum. Dimethisterone anhydrous: dehydrated alcohol—240 nm ($A_1^1 = 467$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1658, 1605, 1275, 876, 1281, 1241 (KBr disk).

Mass Spectrum. Principal peaks at m/z 67, 137, 91, 138, 55, 79, 41, 95.

Dose. Dimethisterone has been given in doses of 15 mg daily.

Dimethoate

Pesticide

Synonym. Fosfamid

Proprietary Names. Rogor E; Roxion.

OO-Dimethyl *S*-methylcarbamoylmethyl phosphorodithioate

$C_5H_{12}NO_3PS_2 = 229.2$

CAS—60-51-5

A white solid. M.p. 51° to 52°.

Soluble 1 in 40 of water; soluble in most organic solvents except saturated hydrocarbons.

Colour Tests. Palladium Chloride—yellow; Phosphorus Test—yellow.

Thin-layer Chromatography. *System TW*—Rf 19.

Gas Chromatography. *System GA*—RI 1725; *system GK*—retention time 0.86 relative to caffeine.

Infra-red Spectrum. Principal peaks at wavenumbers 1010, 1666, 819, 666, 1538, 1176.

Mass Spectrum. Principal peaks at m/z 87, 93, 125, 58, 47, 63, 79, 42.

Dimethothiazine

Antihistamine

Synonyms. Dimetiotazine; Fonazine.

10-(2-Dimethylaminopropyl)-*NN*-dimethylphenothiazine-2-sulphonamide

$C_{19}H_{25}N_3O_2S_2 = 391.5$

CAS—7456-24-8

Dimethothiazine Mesylate

Proprietary Names. Banistyl; Migristene; Promaquid.

$C_{19}H_{25}N_3O_2S_2 \cdot CH_3SO_3H = 487.6$

CAS—7455-39-2; 13115-40-7

A white crystalline powder. M.p. about 175°.

Very **soluble** in water; practically insoluble in ether.

Colour Tests. Formaldehyde-Sulphuric Acid—yellow; Forrest Reagent—red; FPN Reagent—red; Mandelin's Test—red-violet; Marquis Test—red.

Thin-layer Chromatography. *System TA*—Rf 56; *system TB*—Rf 13; *system TC*—Rf 48. (*Acidified iodoplatinate solution*, positive.)

Gas Chromatography. *System GA*—RI 3078.

High Pressure Liquid Chromatography. *System HA*— k' 2.1.

Ultraviolet Spectrum. Aqueous acid—235 nm, 262 nm ($A_1^1 = 675$ a); aqueous alkali—268 nm ($A_1^1 = 808$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1205, 1190, 1057, 1160, 1220, 717 (dimethothiazine mesylate, KBr disk).

Mass Spectrum. Principal peaks at m/z 72, 73, 320, 71, 70, 56, 210, 198.

Dose. Usually the equivalent of 60 to 120 mg of dimethothiazine daily.

Dimethoxanate

Cough Suppressant

2-(2-Dimethylaminoethoxy)ethyl phenothiazine-10-carboxylate

$C_{19}H_{22}N_2O_3S = 358.5$

CAS—477-93-0

Dimethoxanate Hydrochloride

Proprietary Name. Cotrane

$C_{19}H_{22}N_2O_3S \cdot HCl = 394.9$

CAS—518-63-8

Crystals. M.p. 161° to 163°, with decomposition.

Colour Tests. Mandelin's Test—green → brown; Marquis Test—violet.

Thin-layer Chromatography. *System TA*—Rf 39; *system TB*—Rf 18; *system TC*—Rf 24. (*Dragendorff spray*, positive; *FPN reagent*, violet; *acidified iodoplatinate solution*, positive; *Marquis reagent*, brown; *ninhydrin spray*, positive.)

Gas Chromatography. *System GA*—RI 2029.

High Pressure Liquid Chromatography. *System HA*— k' 5.8 (tailing peak).

Ultraviolet Spectrum. Aqueous acid—254 nm ($A_1^1 = 24$ b). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1718, 1317, 1217, 1250, 763, 1298 (KBr disk).

Mass Spectrum. Principal peaks at m/z 58, 116, 198, 199, 72, 59, 42, 44.

Dose. Dimethoxanate hydrochloride has been given in doses of 75 to 200 mg daily.

Dimethyl Phthalate

Insect Repellent

Synonyms. DMP; Methyl Phthalate.

Proprietary Name. Affel

Dimethyl benzene-1,2-dicarboxylate

$C_{10}H_{10}O_4 = 194.2$

CAS—131-11-3

A colourless liquid. Wt per ml 1.186 to 1.192 g. B.p. about 280°, with decomposition. Refractive index 1.515 to 1.517.

Soluble 1 in 250 of water; miscible with ethanol, ether, and most organic solvents.

Gas Chromatography. *System GA*—RI 1406.

Ultraviolet Spectrum. Ethanol—275 nm ($A_1^1 = 75$ b).

Mass Spectrum. Principal peaks at m/z 163, 77, 164, 135, 194, 76, 92, 50.

Use. Topically in concentrations of at least 40%.

Dimethyl Sulphoxide

Solvent

Synonyms. Dimethyl Sulfoxide; Dimexide; DMSO; Methyl Sulphoxide.

Proprietary Names. Deltan; Kemsol; Rimso-50. It is an ingredient of Herpid and Iduridin.

$CH_3 \cdot SO \cdot CH_3 = 78.13$

CAS—67-68-5

A colourless, hygroscopic, viscous liquid. Wt per ml 1.099 to 1.101 g. F.p. not lower than 18.3°. B.p. 189° to 192°. Refractive index 1.478 to 1.479.

Miscible with water with the evolution of heat, with ethanol, acetone, chloroform, ether, and most organic solvents.

Colour Tests. It decolorises a 1% potassium permanganate solution.

Cautiously add 1.5 ml dropwise to 2.5 ml of *hydriodic acid* cooled in ice and filter rapidly—unstable violet residue which is soluble in chloroform giving a red solution.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Mass Spectrum. Principal peaks at m/z 63, 78, 45, 61, 46, 62, 48, 47.

Quantification. GAS CHROMATOGRAPHY. In serum or urine: dimethyl sulphoxide and sulphone metabolite, FID—H. B. Hucker *et al.*, *J. Pharmac. exp. Ther.*, 1967, 155, 309–317. In plasma, serum, urine or cerebrospinal fluid: sensitivity 10 µg/ml, FID—S. E. Garretson and J. P. Aitchison, *J. analyt. Toxicol.*, 1982, 6, 76–81.

Disposition in the Body. Readily absorbed after injection or after oral or percutaneous administration. Widely distributed throughout the body. It is oxidised to dimethyl sulphone. After an oral dose, about 30 to 70% is excreted in the urine unchanged and about 20% as the sulphone; after percutaneous administration, about 13% is excreted unchanged and about 18% as the sulphone; about 3% of a dose is eliminated through the lungs as dimethyl sulphide.

BLOOD CONCENTRATION.

After an oral dose of 1 g/kg to 6 subjects, peak serum concentrations of dimethyl sulphoxide of 1029 to 3380 µg/ml (mean 2200) were attained in 1 to 4 hours, and peak concentrations of the sulphone metabolite of 260 to 600 µg/ml were reported after about 72 hours. After percutaneous administration of 1 g/kg to 2 subjects, peak serum concentrations of about 500 µg/ml of dimethyl sulphoxide and 350 µg/ml of the sulphone metabolite were reported after 4 to 8 hours and 36 to 72 hours respectively (H. B. Hucker *et al.*, *J. Pharmac. exp. Ther.*, 1967, 155, 309–317).

TOXICITY. Dimethyl sulphoxide has low systemic toxicity, but gives local toxic effects.

HALF-LIFE. Plasma half-life, dimethyl sulphoxide about 10 to 20 hours, sulphone metabolite about 70 hours.

REFERENCE. H. B. Hucker *et al.*, *ibid.*

Dimethylamphetamine

Central Stimulant

N,N, α -Trimethylphenethylamine

$C_{11}H_{17}N = 163.3$

CAS—4075-96-1

Dissociation Constant. pK_a 9.8.

Gas Chromatography. *System GA*—RI 1236; *system GB*—RI 1261; *system GC*—RI 1429.

High Pressure Liquid Chromatography. *System HB*— k' 11.08; *system HC*— k' 1.89.

Mass Spectrum. Principal peaks at m/z 72, 91, 73, 44, 42, 56, 70, 65.

Dimethyltryptamine

Hallucinogen

Synonyms. *NN*-Dimethyltryptamine; DMT.

3-(2-Dimethylaminoethyl)indole

 $C_{12}H_{16}N_2 = 188.3$

CAS—61-50-7

An active principle obtained from the seeds and leaves of *Piptadenia peregrina* (Mimosaceae).

Crystals. M.p. 44° to 47°.

Freely **soluble** in dilute acetic acid and dilute mineral acids.**Dimethyltryptamine Hydrochloride**

A white crystalline powder. M.p. 165° to 168°.

Soluble in water.**Colour Test.** Marquis Test—orange.

Thin-layer Chromatography. *System TA*—Rf 40; *system TB*—Rf 09; *system TC*—Rf 09. (*Dragendorff* spray, positive; *acidified iodoplatinate solution*, positive; *Marquis reagent*, grey-brown; *Van Urk reagent*, blue.)

Gas Chromatography. *System GA*—RI 1810.

Ultraviolet Spectrum. Aqueous acid—279 nm ($A_1^1 = 327$ a), 288 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 743, 1113, 1235, 1050, 812, 1010 (KBr disk).

Mass Spectrum. Principal peaks at m/z 58, 188, 130, 59, 42, 143, 129, 115.

Quantification. GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In blood: sensitivity 10 pg/ml—R. W. Walker *et al.*, *J. Chromat.*, 1979, 162; *Biomed. Appl.*, 4, 539–546. In urine: sensitivity 100 pg/ml—M. Räisänen and J. Kärkkäinen, *ibid.*, 579–584.

Disposition in the Body. It is inactive when taken orally. After intramuscular injection it is rapidly and extensively metabolised, primarily to indol-3-ylacetic acid. About 33% of a dose is excreted in the urine in 6 hours as free and conjugated

(glucuronide) indol-3-ylacetic acid; less than 0.1% of a dose is excreted unchanged in the urine in 24 hours.

BLOOD CONCENTRATION. Plasma concentrations of endogenous dimethyltryptamine are generally less than 0.001 µg/ml.

After intramuscular injection of 0.7 mg/kg to 11 subjects, peak blood concentrations averaged 0.1 µg/ml at 0.17 hour, coinciding with the maximum psychoactive effects (J. Kaplan *et al.*, *Psychopharmacologia*, 1974, 28, 239–245).

TOXICITY. Dimethyltryptamine produces hallucinations and perceptual distortion similar to the effects of lysergide.

Dimetridazole

Antiprotozoal (Veterinary)

Proprietary Name. Emtryl

1,2-Dimethyl-5-nitroimidazole

 $C_5H_7N_3O_2 = 141.1$

CAS—551-92-8

An almost white to brownish-yellow powder, which darkens on exposure to light. M.p. 138° to 141°.

Slightly **soluble** in water; soluble 1 in 30 of ethanol, 1 in 5 of chloroform, and 1 in 170 of ether.

Dimetridazole Hydrochloride $C_5H_7N_3O_2 \cdot HCl = 177.6$

CAS—25332-20-1

Crystals. M.p. 195°.

Freely **soluble** in water and ethanol.

Colour Test. Methanolic Potassium Hydroxide—violet (when boiled).

Thin-layer Chromatography. *System TA*—Rf 63. (*Acidified potassium permanganate solution*, strong reaction.)

Gas Chromatography. *System GA*—RI 1353.

Ultraviolet Spectrum. Aqueous acid—277 nm ($A_1^1 = 405$ b); aqueous alkali—322 nm ($A_1^1 = 500$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1181, 1258, 1515, 825, 746, 1119 (KBr disk).

Diminazene

Antiprotozoal/Antibacterial

1,3-Bis(4-amidinophenyl)triazene

$C_{14}H_{15}N_7 = 281.3$

CAS—536-71-0

Diminazene Acetate

Proprietary Name. Berenil

$C_{22}H_{29}N_9O_6 \cdot 4H_2O = 587.6$

CAS—908-54-3 (anhydrous)

A yellow powder. M.p. 217°, with decomposition.

Soluble 1 in 14 of water; slightly soluble in ethanol; very slightly soluble in chloroform and ether.

Thin-layer Chromatography. *System TA*—Rf 00; *system TB*—Rf 00; *system TC*—Rf 00. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Diminazene acetate: aqueous acid—257 nm ($A_1^1 = 305$ a); aqueous alkali—247 nm (broad) ($A_1^1 = 239$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1610, 1635, 1588, 1171, 1267, 1198 (KBr disk).

Mass Spectrum. Principal peaks at m/z 30, 43, 72, 102, 73, 42, 118, 99.

Dimoxyline

Antispasmodic

Synonym. Dioxylene

1-(4-Ethoxy-3-methoxybenzyl)-6,7-dimethoxy-3-methylisoquinoline

$C_{22}H_{25}NO_4 = 367.4$

CAS—147-27-3

Crystals. M.p. 124° to 125°.

Dimoxyline Phosphate

Proprietary Names. Paveril Phosphate; Paverona.

$C_{22}H_{25}NO_4 \cdot H_3PO_4 = 465.4$

CAS—5667-46-9

A white crystalline powder. M.p. about 198°, with decomposition.

Soluble 1 in 25 of water and 1 in 320 of ethanol.

Colour Tests. Mandelin's Test—green; Marquis Test—brown.

Thin-layer Chromatography. *System TA*—Rf 68; *system TB*—Rf 16; *system TC*—Rf 75. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 2895.

Ultraviolet Spectrum. Aqueous acid—285 nm, 309 nm ($A_1^1 = 179$ b), 335 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1504, 1247, 1208, 1145, 1225, 865 (KCl disk).

Mass Spectrum. Principal peaks at m/z 352, 367, 338, 366, 29, 368, 353, 339.

Disposition in the Body. Absorbed from the gastro-intestinal tract. Metabolised in the liver and excreted in the urine.

Dose. 0.3 to 1.6 g of dimoxyline phosphate daily.

Dinitolmide

Coccidiostat (Veterinary)

Synonyms. Dinitrotoluamide; Methyl dinitrobenzamide.

Proprietary Name. Salcostat

3,5-Dinitro-*o*-toluamide

$C_8H_7N_3O_5 = 225.2$

CAS—148-01-6

A cream-coloured to light tan-coloured powder. M.p. 177° to 181°.

Practically **insoluble** in water; soluble 1 in 100 of ethanol, 1 in 15 of acetone, 1 in 650 of chloroform, and 1 in 850 of ether.

Colour Tests. Methanolic Potassium Hydroxide—green; Nessler's Reagent—brown-orange.

Thin-layer Chromatography. *System TA*—Rf 75. (Acidified iodoplatinate solution, positive, developing slowly.)

Infra-red Spectrum. Principal peaks at wavenumbers 1527, 1672, 1612, 738, 1595, 1289 (KBr disk).

Dinitro-orthocresol

Insecticide/Herbicide

Synonyms. Dinitrocresol; Dinitrol; Ditrosol; DN; DNC; DNOC; KIII; KIV.

Proprietary Names. Cresofin; Sandolin A.

2-Methyl-4,6-dinitrophenol
 $C_7H_6N_2O_5 = 198.1$
 CAS—534-52-1

Yellowish crystals. M.p. 86° .

Soluble 1 in 7500 of water; soluble in most organic solvents.

Caution. It is explosive and is usually moistened with up to 10% of water to reduce the hazard.

Colour Test. Methanolic Potassium Hydroxide—orange (100°).

Gas Chromatography. *System GA*—RI 1617. Dinitro-orthocresol methyl ether: *system GK*—retention time 0.74 relative to caffeine.

Ultraviolet Spectrum. Aqueous acid—271 nm ($A_1^1 = 631$ b); aqueous alkali—265 nm ($A_1^1 = 251$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1605, 1232, 1090, 1218, 1546, 1156 (Nujol mull).

Mass Spectrum. Principal peaks at m/z 182, 165, 89, 90, 212, 51, 65, 91 (dinitro-orthocresol methyl ether).

Quantification. COLORIMETRY. In blood or tissues—M. L. Fenwick and V. H. Parker, *Analyst, Lond.*, 1955, 80, 774–776.

Disposition in the Body. Absorbed through the skin, by inhalation, or by accidental ingestion. It acts as a cumulative poison causing an increase in the metabolic rate, and it is eliminated slowly over a period of weeks. After ingestion, less than 5% is excreted unchanged in the urine.

TOXICITY. The acute toxic dose is about 200 mg and the maximum permissible atmospheric concentration is 0.2 mg/m^3 . Blood concentrations greater than about $50 \text{ } \mu\text{g/ml}$ are associated with severe toxicity.

NOTE. For a review of poisoning by dinitro-orthocresol see P. L. Bidstrup *et al.*, *Lancet*, 1952, 1, 794–795.

Diperodon

Local Anaesthetic

Synonym. Diprocaine

Proprietary Name. Diothane

3-Piperidinopropylene bis(phenylcarbamate) monohydrate

$C_{22}H_{27}N_3O_4 \cdot H_2O = 415.5$

CAS—101-08-6 (anhydrous); 51552-99-9 (monohydrate)

A white to cream-coloured powder.

Practically **insoluble** in water; soluble 1 in 3 of ethanol, 1 in 10 of chloroform, 1 in 4 of ether, and 1 in 1 of methanol.

Diperodon Hydrochloride

$C_{22}H_{27}N_3O_4 \cdot HCl = 433.9$

CAS—537-12-2

A white crystalline powder. M.p. about 198° .

Soluble 1 in 100 of water; soluble in ethanol; slightly soluble in acetone; practically insoluble in ether.

Colour Tests. Liebermann's Test—brown; Mandelin's Test—red → green.

Thin-layer Chromatography. *System TA*—Rf 70; *system TB*—Rf 15; *system TC*—Rf 58; *system TL*—Rf 66. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 2370.

High Pressure Liquid Chromatography. *System HR*—k' 2.48.

Ultraviolet Spectrum. Aqueous acid—232 nm ($A_1^1 = 1320$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1210, 1705, 1530, 1600, 1305, 1050 (KBr disk).

Mass Spectrum. Principal peaks at m/z 98, 119, 91, 99, 124, 64, 41, 55.

Use. Diperodon has been applied topically in a concentration of 1%.

Diphepanil Methylsulphate

Anticholinergic

Synonyms. Diphepanil Methylsulfate; Diphenmethanil Methylsulphate; Vagophemanil Methylsulphate.

Proprietary Name. Prantal

4-Benzhydrylidene-1,1-dimethylpiperidinium methylsulphate

$C_{20}H_{24}N \cdot CH_3SO_4 = 389.5$

CAS—62-97-5

A white, hygroscopic, crystalline powder. M.p. 189° to 196° .

Soluble 1 in 33 of water, 1 in 33 of ethanol, and 1 in 33 of chloroform; very slightly soluble in ether.

Colour Tests. Liebermann's Test—brown; Mandelin's Test—brown; Marquis Test—orange-red; Sulphuric Acid—orange.

Thin-layer Chromatography. System *TA*—Rf 02. (Acidified iodoplatinate solution, positive.)

Infra-red Spectrum. Principal peaks at wavenumbers 708, 1250, 1230, 1010, 765, 699 (KBr disk).

Dose. 400 to 800 mg daily.

Diphenadione

Anticoagulant/Rodenticide

Synonym. Diphacinone

Proprietary Name. Diphacin (rodenticide)

2-(Diphenylacetyl)indan-1,3-dione

$C_{23}H_{16}O_3 = 340.4$

CAS—82-66-6

Yellow crystals or crystalline powder. M.p. 144° to 150°. Practically **insoluble** in water; soluble 1 in less than 100 of ethanol and chloroform; soluble in ether and glacial acetic acid.

Colour Tests. Liebermann's Test—orange-brown; Methanolic Potassium Hydroxide—yellow; Sulphuric Acid—yellow.

Thin-layer Chromatography. System *TD*—Rf 11; system *TE*—Rf 46; system *TF*—Rf 33. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. System *GA*—RI 2934.

Ultraviolet Spectrum. Aqueous acid—336 nm ($A_1^1 = 675$ b). No alkaline shift.

Mass Spectrum. Principal peaks at m/z 173, 340, 168, 167, 165, 341, 174, 322.

Dose. Maintenance, 2.5 to 5 mg daily.

Diphenhydramine

Antihistamine

Synonym. Benzhydramine

2-Benzhydryloxy-*NN*-dimethylethylamine

$C_{17}H_{21}NO = 255.4$

CAS—58-73-1

Note. Diphenhydramine is an isomer of phenyltoloxamine.

Diphenhydramine Di(acefyllinate)

Synonym. Bietanautine

Proprietary Name. Nautamine

$C_{17}H_{21}NO \cdot 2C_9H_{10}N_4O_4 = 731.8$

CAS—6888-11-5

Diphenhydramine Hydrochloride

Synonym. Dimedrolum

Proprietary Names. Alergicap; Benadryl; Bidramine; Dolestan; Halbmönd; Histegan; Insomnal; Lensen; Pheramin; Somnium; Valdrene; Wehydriyl. It is an ingredient of Benafed, Benylin, Caladryl, Globolotion, Guanor, Histalix, Lotussin, Noradran, Pharmidone, Propain, Ticipect, and Uniflu.

$C_{17}H_{21}NO \cdot HCl = 291.8$

CAS—147-24-0

A white crystalline powder which slowly darkens on exposure to light.

M.p. 167° to 172°.

Soluble 1 in 1 of water, 1 in 2 of ethanol, and 1 in 2 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 9.0 (25°).

Partition Coefficient. Log *P* (octanol), 3.3.

Colour Tests. Liebermann's Test—brown-orange; Mandelin's Test—yellow; Marquis Test—yellow; Sulphuric Acid—orange.

Thin-layer Chromatography. System *TA*—Rf 55; system *TB*—Rf 45; system *TC*—Rf 33. (Dragendorff spray, positive; *FPN* reagent, pink; acidified iodoplatinate solution, positive; Marquis reagent, yellow; ninhydrin spray, positive.)

Gas Chromatography. System *GA*—RI 1873; system *GB*—RI 1872; system *GC*—RI 2378; system *GF*—RI 2105.

High Pressure Liquid Chromatography. System *HA*— k' 3.3.

Ultraviolet Spectrum. Aqueous acid—252 nm, 257 nm ($A_1^1 = 17$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 713, 754, 1103, 1017, 1180, 991 (diphenhydramine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 58, 73, 45, 167, 165, 166, 44, 152 (no peaks above 200); didesmethyl-diphenhydramine 30, 167, 45, 168, 165, 183, 166, 152; monodesmethyl-diphenhydramine 44, 167, 168, 165, 183, 105, 152, 77.

Quantification. GAS CHROMATOGRAPHY. In blood, urine or tissues: FID—R. C. Backer *et al.*, *J. analyt. Toxicol.*, 1977, 1, 227–228.

GAS CHROMATOGRAPHY (CAPILLARY COLUMN). In serum: sensitivity 2.5 ng/ml, AFID—D. Lutz *et al.*, *J. clin. Chem. clin. Biochem.*, 1983, 21, 595–597.

Disposition in the Body. Readily absorbed after oral administration, but undergoes extensive first-pass metabolism by *N*-dealkylation and oxidative deamination to form monodesmethyl and didesmethyl metabolites, and diphenylmethoxyacetic acid which may be conjugated with glutamine or glycine; bioavailability about 50%. Up to 65% of a dose is excreted in the urine in 96 hours. The major urinary metabolite appears to be diphenylmethoxyacetic acid in free or conjugated form; very little is excreted as unchanged drug.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.1 to 1.0 µg/ml.

Following a single oral dose of 100 mg of diphenhydramine hydrochloride to 4 subjects, peak plasma concentrations of 0.08 to 0.16 µg/ml (mean 0.11) were obtained 2 to 4 hours after administration; total amine concentrations were approximately 50% higher due to the presence of *N*-dealkylated metabolites. After single oral doses of 100 mg to a further 4 subjects, the concentration of acidic metabolites increased over a period of 24 hours to about 2 µg/ml. After multiple oral doses of 50 mg of diphenhydramine hydrochloride four times daily to 4 subjects, maximum steady-state plasma-diphenhydramine concentrations of 0.10 to 0.27 µg/ml were reported; the maximum steady-state amine concentrations were between 0.17 and 0.37 µg/ml (A. J. Glazko *et al.*, *Clin. Pharmac. Ther.*, 1974, 16, 1066–1076).

TOXICITY. The estimated minimum lethal dose is 3 g. Toxic effects may be produced by plasma concentrations greater than 1 µg/ml.

In 4 fatalities due to overdosage of diphenhydramine, the following postmortem concentrations were obtained: blood 8 to 31 µg/ml (mean 20), brain 8 and 32 µg/g (2 cases), kidney 13 µg/g (1 case), liver 23 to 47 µg/g (mean 34), urine 40 and 6.4 µg/ml (2 cases) (R. C. Backer *et al.*, *J. analyt. Toxicol.*, 1977, 1, 227–228; R. C. Baselt and R. H. Cravey, *ibid.*, 81–103; C. Peclet *et al.*, *Bull. int. Ass. forens. Toxicol.*, 1981, 16(1), 26–27). In 2 fatalities attributed to diphenhydramine, the following postmortem tissue concentrations were reported (µg/ml or µg/g):

	Diphenhydramine	Diphenylmethoxyacetic acid
Blood	19.7, 6.9	3.0, 15.3
Heart blood	50, 14.7	3.6, 19
Kidney	114, —	—, —
Liver	260, —	—, —
Lung	460, —	—, —
Urine	34.9, 376	0.3, 20.4

In the first case death occurred within 3 hours whereas the second subject survived for 12 hours after ingestion (R. Aderjan *et al.*, *Z. Rechtsmed.*, 1982, 88, 263–270).

HALF-LIFE. Plasma half-life, about 9 hours.

VOLUME OF DISTRIBUTION. About 8 litres/kg.

CLEARANCE. Plasma clearance, about 10 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 1.3.

SALIVA. Plasma: saliva ratio, about 3.

PROTEIN BINDING. In plasma, 80 to 98%.

Dose. 75 to 200 mg of diphenhydramine hydrochloride daily.

Diphenidol

Anti-emetic

Synonym. Difenidol

1,1-Diphenyl-4-piperidinobutan-1-ol

$C_{21}H_{27}NO = 309.5$

CAS—972-02-1

M.p. 103° to 104°.

Diphenidol Hydrochloride

Proprietary Names. Vontrol; Vontrol.

$C_{21}H_{27}NO \cdot HCl = 345.9$

CAS—3254-89-5

A white crystalline powder. M.p. 214° to 221°, with decomposition. Sparingly soluble in water and chloroform; soluble in ethanol; practically insoluble in ether.

Colour Tests. Liebermann's Test—brown; Mandelin's Test—yellow; Marquis Test—yellow; Sulphuric Acid—orange.

Thin-layer Chromatography. System TA—Rf 61; system TB—Rf 56; system TC—Rf 45. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2384.

Ultraviolet Spectrum. Aqueous acid—252 nm, 258 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 697, 701, 749, 773, 1123, 1219 (KBr disk).

Mass Spectrum. Principal peaks at m/z 98, 99, 105, 77, 55, 41, 127, 111.

Disposition in the Body. Absorbed from the gastro-intestinal tract; peak blood concentrations are attained in 1.5 to 3 hours. It is excreted in the urine and faeces.

Dose. The equivalent of 25 to 50 mg of diphenidol every 4 hours; maximum of 300 mg daily.

Diphenoxylate

Narcotic Antidiarrhoeal

Ethyl 1-(3-cyano-3,3-diphenylpropyl)-4-phenylpiperidine-4-carboxylate

$C_{30}H_{32}N_2O_2 = 452.6$

CAS—915-30-0

Diphenoxylate Hydrochloride

Proprietary Names. It is an ingredient of Diarsed, Lomotil, Reasec, and Retardin.

Preparations of diphenoxylate hydrochloride usually contain subclinical amounts of atropine sulphate in an attempt to prevent abuse by deliberate overdosage.

$C_{30}H_{32}N_2O_2 \cdot HCl = 489.1$

CAS—3810-80-8

A white crystalline powder. M.p. 220° to 226°. Sparingly **soluble** in water; soluble 1 in 50 of ethanol and 1 in 2.5 of chloroform; soluble in methanol; practically insoluble in ether.

Dissociation Constant. pK_a 7.1.

Colour Test. Sodium Picrate—orange.

Thin-layer Chromatography. System *TA*—Rf 74; system *TB*—Rf 42; system *TC*—Rf 81. (*Dragendorff* spray, positive; *acidified iodoplatinate* solution, positive; *Marquis* reagent, orange.)

Gas Chromatography. System *GA*—RI 2443.

High Pressure Liquid Chromatography. System *HA*—diphenoxylate k' 0.2, diphenoxycic acid k' 0.6 (tailing peak).

Ultraviolet Spectrum. Methanol—252 nm, 258 nm ($A_1^1 = 14$ a), 264 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1728, 697, 1183, 1120, 1215, 1495 (KBr disk).

Mass Spectrum. Principal peaks at m/z 246, 42, 247, 91, 103, 165, 115, 56; diphenoxycic acid 218, 42, 219, 91, 165, 155, 193, 115.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: TCD—S. Abu al Ragheb *et al.*, *Medicine, Sci. Law*, 1982, 22, 210–214.

GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In plasma: diphenoxycic acid, sensitivity 20 ng/ml—G. C. Ford *et al.*, *Biomed. Mass Spectrom.*, 1976, 3, 45–47.

Disposition in the Body. Rapidly absorbed after oral administration but it is usually administered together with a small quantity of atropine and this may delay absorption, especially with high doses. It is extensively metabolised by hydrolysis, hydroxylation, and conjugation with glucuronic acid. The major metabolites are diphenoxycic acid (difenoxin), which is active, and hydroxydiphenoxycic acid in both free and conjugated forms. About 14% and 50% of a dose, respectively, is excreted in the urine and faeces in 96 hours; less than 0.1% of a dose is excreted in the urine as unchanged drug in 24 hours.

THERAPEUTIC CONCENTRATION.

After an oral dose of 5 mg, peak plasma concentrations of diphenoxylate of about 0.01 µg/ml were attained in 2 hours and peak concentrations of diphenoxycic acid of about 0.04 µg/ml were attained in the same period (A. Karim *et al.*, *Clin. Pharmac. Ther.*, 1972, 13, 407–419).

TOXICITY. Diphenoxylate has addiction-producing properties. The estimated minimum lethal dose is 0.2 g although recovery has occurred after the ingestion of 0.75 g.

A postmortem blood concentration of 0.34 µg/ml was reported in a 3½-year-old child who died after ingesting diphenoxylate (S. Abu al Ragheb *et al.*, *Medicine, Sci. Law*, 1982, 22, 210–214).

HALF-LIFE. Plasma half-life, diphenoxylate about 2.5 hours, diphenoxycic acid about 4 hours.

VOLUME OF DISTRIBUTION. About 4 litres/kg.

Dose. Initially 10 mg of diphenoxylate hydrochloride, followed by 5 mg every 6 hours.

Diphenyl

Fungistatic

Synonym. Phenylbenzene

Biphenyl

$C_{12}H_{10}$ = 154.2

CAS—92-52-4

A white crystalline powder. M.p. about 69°. B.p. 254° to 255°. Practically **insoluble** in water; soluble in ethanol and ether.

Gas Chromatography. System *GA*—RI 1389.

Infra-red Spectrum. Principal peaks at wavenumbers 740, 710, 1573, 1175, 1018, 918 (KBr disk).

Diphenylpyraline

Antihistamine

Synonym. Diphenylpyrilene

4-Benzhydryloxy-1-methylpiperidine

$C_{19}H_{23}NO$ = 281.4

CAS—147-20-6

**Diphenylpyraline Hydrochloride**

Proprietary Names. Allertzine; Anti-Hist; Diafen; Hispril; Histalert; Histyl; Kolton (gel); Lergoban; Lyssipoll. It is an ingredient of Eskornade and Expansyl.

$C_{19}H_{23}NO \cdot HCl = 317.9$

CAS—132-18-3

A white crystalline powder. M.p. 204° to 209°.

Soluble 1 in 1 of water, 1 in 3 of ethanol, and 1 in 2 of chloroform; practically insoluble in ether.

Colour Tests. Liebermann's Test—red-orange; Mandelin's Test—yellow; Marquis Test—yellow.

Thin-layer Chromatography. System TA—Rf 46; system TB—Rf 37; system TC—Rf 28. (Dragendorff spray, positive; FPN reagent, pink; acidified iodoplatinate solution, positive; Marquis reagent, brown; ninhydrin spray, positive.)

Gas Chromatography. System GA—RI 2099; system GB—RI 2136; system GC—RI 2447; system GF—RI 2405.

High Pressure Liquid Chromatography. System HA— k' 3.3 (tailing peak).

Ultraviolet Spectrum. Aqueous acid—253 nm, 258 nm ($A_1^1 = 17$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1070, 709, 1050, 696, 765, 1101 (diphenylpyraline hydrochloride, KCl disk).

Mass Spectrum. Principal peaks at m/z 99, 114, 98, 167, 70, 165, 57, 43.

Quantification. GAS CHROMATOGRAPHY. In urine: FID—G. Graham and A. G. Bolt, *J. Pharmacokinet. Biopharm.*, 1974, 2, 191–195.

Disposition in the Body. Absorbed after oral administration. Less than 10% of a dose is excreted in the urine as unchanged drug. Possible metabolites include the *N*-oxide and *N*-desmethyldiphenylpyraline.

HALF-LIFE. Derived from urinary excretion data, 24 to 40 hours.

Dose. 10 to 20 mg of diphenylpyraline hydrochloride daily.

Dipipanone

Narcotic Analgesic

Synonyms. Phenylpiperone; Piperidyl Methadone; Piperidylamidone.

(±)-4,4-Diphenyl-6-piperidinoheptan-3-one

$C_{24}H_{31}NO = 349.5$

CAS—467-83-4

**Dipipanone Hydrochloride**

Proprietary Names. It is an ingredient of Diconal and Wellconal.

$C_{24}H_{31}NO \cdot HCl \cdot H_2O = 404.0$

A white crystalline powder. M.p. 124° to 127°.

Soluble 1 in 40 of water, 1 in 1.5 of ethanol, and 1 in 6 of acetone; practically insoluble in ether.

Dissociation Constant. pK_a 8.5 (25°).

Colour Test. Mandelin's Test—green → blue.

Thin-layer Chromatography. System TA—Rf 66; system TB—Rf 66; system TC—Rf 33. (Dragendorff spray, positive; acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2474; system GC—RI 2894; system GF—RI 2710.

High Pressure Liquid Chromatography. System HA— k' 2.2; system HC— k' 1.61.

Ultraviolet Spectrum. Aqueous acid—259 nm, 265 nm, 293 nm ($A_1^1 = 15.6$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1708, 698, 1491, 1110, 1092, 1030 (KBr disk).

Mass Spectrum. Principal peaks at m/z 112, 264, 113, 91, 179, 110, 178, 115.

Disposition in the Body. Absorbed after oral administration with rapid onset of action. It is excreted in the urine and faeces. Prolonged use of dipipanone may produce dependence of the morphine type.

Toxicity. The estimated minimum lethal dose is 0.1 g.

In two fatalities following intravenous injection of Diconal® (dipipanone with cyclizine), the following postmortem tissue concentrations (µg/ml or µg/g) were reported:

	Cyclizine	Dipipanone
Blood	2.0, 0.5	6.2, 0.5
Bile	20, —	—, —
Liver	3.0, —	5.2, —
Urine	0.5, 9.5	—, 18.5

In 34 addicts, urinary concentrations of free dipipanone ranged from 0 to 5.2 µg/ml (mean 1.6) (T. M. T. Sheehan *et al.*, The Abuse of Preparations Containing Dipipanone and Cyclizine, in *Forensic Toxicology—Proceedings of the European Meeting of the International Association of Forensic Toxicologists*, J. S. Oliver (Ed.), London, Croom Helm, 1979).

Dose. 10 to 30 mg of dipipanone hydrochloride every 6 hours.

Diprenorphine

Narcotic Antagonist (Veterinary)

(6*R*,7*R*,14*S*)-17-Cyclopropylmethyl-7,8-dihydro-7-(1-hydroxy-1-methylethyl)-6-*O*-methyl-6,14-ethano-17-normorphine

$C_{26}H_{35}NO_4 = 425.6$

CAS—14357-78-9

A white microcrystalline powder. M.p. 190° to 192°.

Diprenorphine Hydrochloride

Proprietary Name. Revivon

$C_{26}H_{35}NO_4 \cdot HCl = 462.0$

CAS—16808-86-9

A white crystalline powder.

Soluble 1 in 30 of water, 1 in 160 of ethanol, and 1 in 2500 of chloroform; practically insoluble in ether.

Colour Tests. Liebermann's Test—black; Mandelin's Test—grey; Marquis Test—grey-violet.

Thin-layer Chromatography. System TA—Rf 70. (Acidified iodoplatinate solution, positive.)

High Pressure Liquid Chromatography. System HA— k' 0.6.

Ultraviolet Spectrum. Aqueous acid—230 nm ($A_1^1 = 158$ b), 286 nm ($A_1^1 = 36$ a); aqueous alkali—246 nm ($A_1^1 = 184$ b), 299 nm ($A_1^1 = 58$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1160, 947, 1311, 1092, 1078, 934 (KBr disk).

Diprophylline

Xanthine Bronchodilator

Synonyms. Dihydroxypropyltheophyllinum; Dyphylline; Glyphyllinum; Hyphylline.

Proprietary Names. Aerophylline; Airtet; Asthmolysin; Dilin; Dilor; Droxine; Dyflex; Emfabid; Lufyllin; Neothylline; Neutraphylline; Protophylline; Silbephylline; Zäpfchen. It is an ingredient of Noradran and Tedral Expect.

7-(2,3-Dihydroxypropyl)theophylline

$C_{10}H_{14}N_4O_4 = 254.2$

CAS—479-18-5

A white crystalline powder. M.p. 160° to 165°.

Soluble 1 in 3 of water and 1 in 50 of ethanol; slightly soluble in chloroform; practically insoluble in ether.

Colour Test. Amalic Acid Test—yellow/violet.

Thin-layer Chromatography. System TA—Rf 48; system TB—Rf 00; system TC—Rf 12. (Acidified potassium permanganate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—273 nm ($A_1^1 = 380$ a). No alkaline shift. (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 1660, 1700, 1039, 747, 1562, 1234 (KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 180, 223, 194, 254, 109, 95, 193, 166.

Quantification. GAS CHROMATOGRAPHY. In serum or saliva: FID—Z. K. Shihabi and R. P. Dave, *Clin. Chem.*, 1977, 23, 942–943.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma, saliva or urine: limit of detection 25 ng/ml for plasma and 50 ng/ml for saliva—L. Gisclon *et al.*, *Res. Commun. chem. Path. Pharmac.*, 1979, 23, 523–531. In serum: sensitivity 1 µg/ml, UV detection—N. Paterson, *J. Chromat.*, 1982, 232; *Biomed. Appl.*, 21, 450–455.

Disposition in the Body. Rapidly and almost completely absorbed after oral administration; bioavailability about 90%. About 83% of a dose is excreted in the urine as unchanged drug in 24 hours; less than 1% of a dose is eliminated in the faeces.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 10 to 20 µg/ml.

After a single oral dose of 1.2 g to 6 subjects, peak plasma concentrations of 18 to 29 µg/ml (mean 22) were attained in about 0.5 hour and peak saliva concentrations of 7 to 17 µg/ml (mean 12) were reported at 0.7 hour (L. G. Gisclon *et al.*, *Am. J. hosp. Pharm.*, 1979, 36, 1179–1184).

TOXICITY. Plasma concentrations greater than 20 µg/ml may produce toxic effects.

HALF-LIFE. Plasma half-life, about 2 hours.

VOLUME OF DISTRIBUTION. About 0.8 litre/kg.

CLEARANCE. Plasma clearance, about 5 ml/min/kg.

Dose. 0.6 to 1.6 g daily.

Dipyridamole *Antithrombotic/Anti-anginal Vasodilator*

Proprietary Names. Coronarine; Dipyrida; Functiocardon; Natyl; Pérídamol; Persantin(e); Prandiol.

2,2',2'',2''' - [(4,8 - Dipiperidinopyrimido[5,4-*d*]pyrimidine - 2,6 - diyl)dinitrilo]tetraethanol

$C_{24}H_{40}N_8O_4 = 504.6$

CAS—58-32-2

An intensely yellow crystalline powder. Solutions have a yellowish-blue fluorescence. M.p. 164° to 167°.

Practically **insoluble** in water; very soluble in ethanol; soluble in chloroform, methanol, and dilute acids; practically insoluble in ether.

Dissociation Constant. pK_a 6.4.

Colour Tests. Mandelin's Test—violet; Marquis Test—orange.

Thin-layer Chromatography. System TA—Rf 68; system TB—Rf 00; system TC—Rf 37. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 1640.

High Pressure Liquid Chromatography. System HA— k' 0.2.

Ultraviolet Spectrum. Acid methanol—230 nm, 285 nm ($A_1' = 650$ a); aqueous alkali—295 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1526, 1214, 1010, 1076, 1041, 1251 (KBr disk).

Mass Spectrum. Principal peaks at m/z 504, 473, 429, 505, 221, 474, 84, 430.

Quantification. SPECTROFLUORIMETRY. In serum—J. M. Steyn, *J. Chromat.*, 1979, 164; *Biomed. Appl.*, 6, 487–494.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or whole blood: fluorescence detection—K. M. Wolfram and T. D. Bjornsson, *J. Chromat.*, 1980, 183; *Biomed. Appl.*, 9, 57–64. In plasma: sensitivity 2 ng/ml, UV detection—J. Rosenfeld *et al.*, *J. Chromat.*, 1982, 231; *Biomed. Appl.*, 20, 216–221.

Disposition in the Body. Readily absorbed after oral administration. Eliminated mainly in the faeces; excretion may be delayed due to enterohepatic circulation. Small amounts are excreted in the urine as the glucuronide conjugate.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 100 mg given to 6 subjects, peak serum concentrations of about 2 µg/ml were attained in 1 hour (F. Nielsen-Kudsk and A. K. Pederson, *Acta pharmac. tox.*, 1979, 44, 391–399).

Following oral administration of 50 mg three times a day to 10 subjects, maximum steady-state plasma concentrations of 0.4 to 2.6 µg/ml (mean 1.4) were reported; trough concentrations were 0.1 to 1.5 µg/ml (mean 0.7). In 10 subjects given 75 mg twice daily, the corresponding maximum and minimum steady-state concentrations were 0.5 to 4 µg/ml (mean 1.7) and 0.1 to 2.6 µg/ml (mean 0.9) (C. Mahony *et al.*, *J. clin. Pharmac.*, 1983, 23, 123–126).

HALF-LIFE. Plasma half-life, about 12 hours.

VOLUME OF DISTRIBUTION. About 2.5 litres/kg.

CLEARANCE. Plasma clearance, about 2 ml/min/kg.

PROTEIN BINDING. In plasma, more than 90%.

Dose. 300 to 600 mg daily (antithrombotic); 150 mg daily (anti-anginal).

Dipyrrone

Analgesic

Synonyms. Aminopyrine-sulphonate Sodium; Analginum; Metamizol; Methampyrone; Natrium Novaminsulfonicum; Noramidazophenum; Noraminophenazonum; Novamidazofen; Sodium Noramidopyrine Methanesulphonate; Sulpyrine. **Proprietary Names.** Novalgin(e); Novaminsulfon. It is an ingredient of Isaverin (vet.).

Sodium *N*-(2,3-dimethyl-5-oxo-1-phenyl-3-pyrazolin-4-yl)-*N*-methylaminomethanesulphonate monohydrate
 $C_{13}H_{16}N_3NaO_4S \cdot H_2O = 351.4$
CAS—68-89-3 (anhydrous); 5907-38-0 (monohydrate)

A white or yellowish-white crystalline powder. M.p. 172°.

Soluble 1 in 1.5 of water and 1 in 30 of ethanol; very slightly soluble in chloroform; practically insoluble in ether.

Colour Tests. Ferric Chloride—violet; Folin-Ciocalteu Reagent—blue; Liebermann's Test (100°)—blue; Mandelin's Test—brown; Nitrous Acid—transient blue.

Thin-layer Chromatography. *System TA*—Rf 84; *system TB*—Rf 00; *system TC*—Rf 01. (Acidified iodoplatinate solution, white.)

Gas Chromatography. *System GA*—RI 1983.

High Pressure Liquid Chromatography. *System HD*— k' 0.1; *system HW*— k' 0.45.

Ultraviolet Spectrum. Aqueous acid—258 nm ($A_1^1 = 266$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1672, 1064, 1179, 1163, 1208, 1639 (KBr disk).

Mass Spectrum. Principal peaks at m/z 56, 42, 83, 57, 77, 51, 97, 54.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: detection limits 1 µg/ml for dipyrone and 250 ng/ml for 4-methylaminophenazone, UV detection—G. Asmardi and F. Jamali, *J. Chromat.*, 1983, 277; *Biomed. Appl.*, 28, 183–189.

Disposition in the Body. Rapidly absorbed after oral administration and extensively metabolised. The major metabolites are 4-methylaminophenazone, 4-aminophenazone, 4-formylaminophenazone, and 4-acetylaminophenazone. About 70% of a dose is excreted in the urine in 24 hours as metabolites.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 1 g given to 12 slow acetylators and 11 rapid acetylators (determined with reference to dapsone), the following mean peak plasma concentrations (µg/ml, time in hours) were reported:

	Slow acetylators	Rapid acetylators
4-Acetylaminophenazone	1.6 (16.1)	4.4 (10.0)
4-Aminophenazone	2.7 (6.7)	1.6 (3.2)
4-Formylaminophenazone	1.8 (7.7)	2.5 (6.6)
4-Methylaminophenazone	10.0 (1.6)	11.0 (1.2)

(M. Levy *et al.*, *Eur. J. clin. Pharmac.*, 1984, 27, 453–458).

TOXICITY. The estimated minimum lethal dose is 5 g, but fatalities from acute poisoning are rare.

HALF-LIFE. Plasma half-life, 4-acetylaminophenazone about 10.6 hours, 4-aminophenazone about 5 hours, 4-formylaminophenazone about 10 hours, and 4-methylaminophenazone about 3.3 hours.

Dose. 0.5 to 1 g up to 3 times daily.

Diquat

Synonym. Deiquat

1,1'-Ethylene-2,2'-bipyridylium ion

$C_{12}H_{12}N_2 = 184.2$

CAS—2764-72-9

Herbicide

Diquat Dibromide

Proprietary Names. Aquacide; Reglone. It is an ingredient of Pathclear and Weedol.

$C_{12}H_{12}Br_2N_2 = 344.0$

CAS—85-00-7

Yellow crystals. M.p. about 335°.

Soluble in water.

Note. Unless otherwise stated, the analytical information given below refers to diquat dibromide. For information on the monoene and diene reduction products for GC-MS analysis, see under Quaternary Ammonium Herbicides, p. 80.

Colour Test. Sodium Dithionite—green.

Thin-layer Chromatography. System TA—Rf 00. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GK—monoene reduction product retention time 0.40, diene reduction product retention time 0.49, both relative to caffeine.

Ultraviolet Spectrum. Aqueous acid—310 nm ($A_1^1 = 518$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1522, 1498, 1140, 1166, 1097, 1632 (KBr disk).

Mass Spectrum. Principal peaks at m/z 83, 108, 96, 54, 111, 192, 84, 55 (monoene reduction product); 54, 108, 81, 190, 111, 135, 83, 80 (diene reduction product).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In urine: diquat and paraquat, detection limit <1 µg/ml, UV detection—R. Gill *et al.*, *J. Chromat.*, 1983, 255, 483–490.

Disposition in the Body. Absorbed from the gastro-intestinal tract; slightly absorbed through the skin.

TOXICITY. Diquat produces similar adverse effects to those of paraquat except that it does not seem to cause the progressive fibrosis in the lungs. A fatality after ingestion of about 2 g has been reported and the ingestion of about 20 to 50 ml of a 20% concentrate has caused death within 2 to 7 days. The maximum permissible atmospheric concentration is 0.5 mg/m³ (as the dibromide) and the maximum acceptable daily intake (as the dichloride) is 5 µg/kg.

A young man drank several mouthfuls of a 20% concentrate of diquat and died 7 days later. The following postmortem concentrations were reported: blood 0.6 µg/ml, heart 0.11 µg/g, kidney 1.19 µg/g, liver 0.33 µg/g, lung 0.56 µg/g, and spleen 1.04 µg/g (H. Schönborn *et al.*, *Arch. Tox.*, 1971, 27, 204–216).

A 44-year-old woman ingested an unknown quantity of diquat and died about 16 hours after being found. The following postmortem concentrations were reported: kidney 11.6 µg/g and liver 5.1 µg/g (L. K. Pannell and B. M. Thomson, *Bull. int. Ass. forens. Toxicol.*, 1981, 16(2), 24–25).

Disopyramide

Anti-arrhythmic

Proprietary Names. Durbis (capsules); Rythmodan (capsules).

4-Di-isopropylamino-2-phenyl-2-(2-pyridyl)butyramide

$C_{21}H_{29}N_3O = 339.5$

CAS—3737-09-5

A white powder. M.p. about 95°.

Soluble 1 in 200 of water, 1 in 10 of ethanol, 1 in 5 of chloroform, and 1 in 5 of ether.

Disopyramide Phosphate

Proprietary Names. Dirythmin; Durbis (injection); Norpace; Rythmodan (injection and tablets); Rythmodul.

$C_{21}H_{29}N_3O_4 \cdot H_3PO_4 = 437.5$

CAS—22059-60-5

A white powder. M.p. about 205°, with decomposition.

Soluble 1 in 20 of water and 1 in 50 of ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 8.4.

Thin-layer Chromatography. *System TA*—Rf 45; *system TB*—Rf 07; *system TC*—Rf 08.

Gas Chromatography. *System GA*—RI 2495; *system GF*—RI 2910.

High Pressure Liquid Chromatography. *System HA*—disopyramide k' 2.4, *N*-monodesisopropylidisopyramide k' 1.8.

Ultraviolet Spectrum. Aqueous acid—263 nm, 269 nm ($A_1^1 = 199$ a); aqueous alkali—261 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1664, 1585, 697, 1163, 1562, 760 (KBr disk).

Mass Spectrum. Principal peaks at m/z 195, 212, 114, 30, 194, 72, 44, 43 (no peaks above 240).

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 100 ng/ml, FID—E. N. Foster and P. R. Reid, *J. Chromat.*, 1979, 178, 571–574. In plasma, urine or postmortem tissues: FID—R. W. Michalek *et al.*, *J. analyt. Toxicol.*, 1982, 6, 255–257. In serum: sensitivity 100 ng/ml for disopyramide and the desalkyl metabolite, AFID—J. E. Bredesen, *Clin. Chem.*, 1980, 26, 638–640.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: disopyramide and the desalkyl metabolite, detection limit 50 ng/ml, UV detection—C. Charette *et al.*, *J. Chromat.*, 1983, 274; *Biomed. Appl.*, 25, 219–230.

REVIEW. For a comparison of GC, HPLC and GC-MS methods, see J. W. Vasiliades *et al.*, *Clin. Chem.*, 1979, 25, 1900–1904.

Disposition in the Body. Rapidly and almost completely absorbed after oral administration and widely distributed throughout the body; bioavailability about 80%. The major metabolite, *N*-monodesisopropylidisopyramide, is about one half as active as disopyramide. Up to about 50 to 60% of a dose is excreted in the urine in 5 days as unchanged drug, with about 20 to 30% as the desalkyl metabolite; about 10 to 15% of a dose is eliminated in the faeces.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 2 to 5 µg/ml.

After a single oral dose of 100 mg of disopyramide phosphate to 6 subjects, peak plasma concentrations of 1.8 to 3.6 µg/ml (mean 2.7) were attained in about 2 hours (R. E. Ranney *et al.*, *Archs int. Pharmacodyn. Thé.*, 1971, 191, 162–188).

Following oral daily doses averaging 6 mg/kg to 63 subjects, mean steady-state plasma concentrations of 3.3 µg/ml for disopyramide and 0.99 µg/ml for the desalkyl metabolite were reported; plasma concentrations were higher in 17 subjects with renal dysfunction (mean 4.3), but lower in subjects concurrently taking enzyme-inducing drugs (M. Aitio, *Br. J. clin. Pharmac.*, 1981, 11, 369–376).

TOXICITY. Toxic effects are usually associated with plasma concentrations greater than about 8 µg/ml.

In a fatality attributed to disopyramide overdosage, the following postmortem concentrations were reported for disopyramide and the desalkyl metabolite, respectively: blood 26.6 and 5.9 µg/ml, bile 349 and 145 µg/ml, kidney 147 and 6.7 µg/g, liver 35.8 and 11.2 µg/g (W. H. Anderson *et al.*, *J. forens. Sci.*, 1980, 25, 33–39).

In 3 fatalities due to disopyramide overdose, postmortem blood concentrations of 8.5, 34, and 114 µg/ml were reported; the dose was estimated to be about 6 to 7 g in 2 of the cases. In a further 2 fatalities, antemortem plasma concentrations, determined 9 hours and 3 hours after ingestion, respectively, were 4.3 and 35 µg/ml (A. M. Hayler *et al.*, *Lancet*, 1978, *i*, 968–969).

In a fatality due to the ingestion of about 15 g of disopyramide, the following postmortem tissue concentrations were reported: blood 57 µg/ml, brain 29 µg/g, liver 115 µg/g, urine 1500 µg/ml (R. W. Michalek *et al.*, *J. analyt. Toxicol.*, 1982, 6, 255–257).

HALF-LIFE. Plasma half-life, disopyramide 3 to 11 hours (dose-dependent), increased in subjects with renal impairment; desalkyl metabolite about 13 hours.

VOLUME OF DISTRIBUTION. About 0.7 litre/kg (dose-dependent); unbound drug about 2 litres/kg.

CLEARANCE. Plasma clearance, about 0.5 to 2 ml/min/kg (dose-dependent); unbound drug about 6 ml/min/kg.

PROTEIN BINDING. In plasma, disopyramide about 35 to 80% (concentration-dependent), desalkyl metabolite about 30 to 70% (concentration-dependent); considerable intersubject variation occurs.

NOTE. For reviews of disopyramide see R. C. Heel *et al.*, *Drugs*, 1978, 15, 331–368, and A. Karim *et al.*, *J. Pharmacokin. Biopharm.*, 1982, 10, 465–494.

Dose. 300 to 800 mg daily.

Distigmine Bromide

Anticholinesterase

Synonyms. Bispyridostigmine Bromide; Hexamarium Bromide.

Proprietary Name. Ubretid

1,1' - Dimethyl - 3,3' - [NN' - hexamethylenebis(methyl-carbamoyloxy)]dipyridinium dibromide

$C_{22}H_{32}Br_2N_4O_4 = 576.3$

CAS—15876-67-2

A crystalline powder. Decomposes at 149°.

Freely **soluble** in water.

Thin-layer Chromatography. *System TA*—Rf 00. (*Acidified iodoplatinate solution*, positive.)

Ultraviolet Spectrum. Aqueous acid—270 nm ($A_1^1 = 160$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1735, 1255, 1170, 1507, 1135, 1295 (KBr disk).

Disposition in the Body. Poorly absorbed after oral administration. Less than 5% of an oral dose is excreted in the urine in 24 hours, compared to 50% of an intramuscular dose.

Dose. 5 to 20 mg daily, by mouth.

Disulfiram

Alcohol Deterrent

Synonyms. Éthylthiourame; TTD.

Proprietary Names. Antabus(e); Espéral; Ro-Sulfiram-500.

Tetraethylthiuram disulphide

$C_{10}H_{20}N_2S_4 = 296.5$

CAS—97-77-8

A white powder. M.p. 69° to 73°.

Practically **insoluble** in water; soluble 1 in 65 of ethanol, 1 in 2 of chloroform, and 1 in 20 of ether; soluble in acetone.

Colour Tests. Palladium Chloride—orange.

Dissolve 50 mg in 5 ml of ethanol and add 1 ml of *potassium cyanide solution*—yellow → green → blue-green.

Thin-layer Chromatography. *System TA*—Rf 71; *system TB*—Rf 38; *system TC*—Rf 78.

Gas Chromatography. *System GA*—RI 2141.

Infra-red Spectrum. Principal peaks at wavenumbers 1267, 1193, 1492, 1147, 966, 913 (Nujol mull).

Mass Spectrum. Principal peaks at m/z 116, 88, 29, 44, 60, 148, 56, 27.

Quantification. GAS CHROMATOGRAPHY. In blood: disulfiram and metabolites, sensitivity 10 ng/ml using head-space analysis and FPD—A. M. Sauter and J. P. von Wartburg, *J. Chromat.*, 1977, 133, 167–172.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: disulfiram and metabolites, sensitivity 200 ng/ml, UV detection—J. C. Jensen and M. D. Faiman, *J. Chromat.*, 1980, 181; *Biomed. Appl.*, 7, 407–416. In plasma: disulfiram and dithiocarbamate metabolites, sensitivity 50 ng/ml, UV detection—P. D. Masso and P. A. Kramer, *J. Chromat.*, 1981, 224; *Biomed. Appl.*, 13, 457–464.

Disposition in the Body. Disulfiram produces hypersensitivity to alcohol by inhibiting the oxidation of acetaldehyde, the primary metabolite of alcohol; the concentrations of acetaldehyde in the blood and expired air are increased by 5 to 10 times. Disulfiram is incompletely absorbed after oral administration; the maximum effect usually occurs about 12 hours after ingestion, possibly because it is highly lipid soluble and is likely to be initially localised in fat. The metabolites include diethyldithiocarbamic acid, methyl diethyldithiocarbamate, diethylamine, carbon disulphide and inorganic sulphate; glucuronide conjugation may occur. Up to about 20% of a dose is eliminated unchanged in the faeces, up to 50% of a dose may be excreted from the lungs as carbon disulphide, and the remainder is slowly excreted as metabolites in the urine; about 20% of a dose is still present in the body up to 7 days after ingestion.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 250 mg to 15 subjects, mean peak plasma concentrations of 0.38 µg/ml of disulfiram, 0.77 µg/ml of diethyldithiocarbamic acid, 0.30 µg/ml of methyl diethyldithiocarbamate, and 1.7 µg/ml of diethylamine were attained in about 9 hours; a mean peak plasma concentration of 22 µg/ml of carbon disulphide was reported at 6 hours; there was considerable intersubject variability in the plasma concentrations (M. D. Faiman *et al.*, *Clin. Pharmac. Ther.*, 1984, 36, 520–526).

TOXICITY. Severe toxic reactions may occur after administration of disulfiram if the blood concentration of acetaldehyde is greater than 5 µg/ml; with very high concentrations of alcohol in the blood the administration of as little as 0.5 to 1 g of disulfiram has proved fatal in some cases. Fatalities due to disulfiram-induced hepatitis have been reported and there have also been reports of severe phenytoin intoxication after simultaneous administration.

In a fatality due to ingestion of disulfiram and alcohol, postmortem blood concentrations of 8 µg/ml of sodium diethyldithiocarbamate and 9600 µg/ml of ethanol were reported (F. Martens and A. Heyndrickx, *Bull. int. Ass. forens. Toxicol.*, 1975, 11(2), 18–19).

HALF-LIFE. Plasma half-life, disulfiram about 7 hours, diethyldithiocarbamic acid about 15 hours, carbon disulphide about 9 hours.

NOTE. For a review of disulfiram see J. F. Brien *et al.*, *Drug Met. Rev.*, 1983, 14, 113–126.

Dose. 800 mg on the first day, reducing to a maintenance dose of 100 to 200 mg daily.

Disulphamide

Diuretic

Synonym. Disulfamide

Proprietary Names. Diluen; Toluidrin.

5-Chlorotoluene-2,4-disulphonamide

$C_7H_5ClN_2O_4S_2 = 284.7$

CAS—671-88-5

A white or creamy-white crystalline powder. M.p. about 260°.

Soluble 1 in 500 of cold water, 1 in 50 of boiling water, 1 in 50 of ethanol, and 1 in 1000 of ether; slightly soluble in chloroform.

Ultraviolet Spectrum. Aqueous acid—235 nm ($A_1^1 = 336$ b), 276 nm, 285 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1320, 1172, 1552, 965, 675, 1550 (KBr disk).

Dose. Disulphamide has been given in doses of 100 to 200 mg daily.

Dithranol

Dermatological Agent

Synonyms. Anthralin; Dioxyanthranol.

Proprietary Names. Anthra-Derm; Antraderm; Dithrocream; Lasan. It is an ingredient of Dithrolan, Psoradrate, Psorin, and Stie-Lasan.

1,8-Dihydroxy-9-anthrone

$C_{14}H_{10}O_3 = 226.2$

CAS—1143-38-0

A yellow to yellowish-brown crystalline powder. M.p. 175° to 181°.

Practically **insoluble** in water; slightly soluble in ethanol and ether; soluble in acetone and chloroform.

Caution. Dithranol is a powerful irritant and should be kept away from the eyes and tender parts of the skin.

Dithranol Triacetate

Synonym. Dithranol Acetate

Proprietary Name. Exolan (cream)

$C_{20}H_{16}O_6 = 352.3$

CAS—16203-97-7

Ultraviolet Spectrum. Aqueous alkali—276 nm ($A_1^1 = 490$ b); methanol—256 nm ($A_1^1 = 467$ b), 288 nm ($A_1^1 = 358$ b), 360 nm ($A_1^1 = 418$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1598, 1278, 1615, 1222, 1168, 1635 (KCl disk).

Use. Topically in concentrations of 0.05 to 1%.

Diuron

Herbicide

Proprietary Names. Karmex. It is an ingredient of Dexuron and Krovar.

1-(3,4-Dichlorophenyl)-3,3-dimethylurea

$C_9H_{10}Cl_2N_2O = 233.1$

CAS—330-54-1

Crystals. M.p. 158° to 159°.

Practically **insoluble** in water; soluble in acetone; sparingly soluble in hydrocarbon solvents.

Colour Tests. Liebermann's Test—orange; Marquis Test—pink-orange.

Gas Chromatography. Two decomposition products are formed on-column. *System GA*—3,4-dichloroaniline RI 1323; *system GK*—3,4-dichloroaniline retention time 0.36 and 3,4-dichlorophenyl isocyanate retention time 0.13, both relative to caffeine.

Ultraviolet Spectrum. Ethanol—250 nm ($A_1^1 = 1124$ b), 287 nm.

Mass Spectrum. Principal peaks at m/z 72, 44, 73, 42, 232, 187, 124, 45.

Dixrazine

Tranquilliser

Proprietary Name. Esucos

2-(2-{4-[2-Methyl-3-(phenothiazin-10-yl)propyl]piperazin-1-yl}ethoxy)ethanol

$C_{24}H_{33}N_3O_2S = 427.6$

CAS—2470-73-7

A white to slightly greyish or yellowish powder.

Very slightly **soluble** in water; soluble in ethanol, chloroform, and ether.

Dissociation Constant. pK_a 7.8 (25°).

Ultraviolet Spectrum. Methanol—255 nm ($A_1^1 = 980$ b), 305 nm.

Mass Spectrum. Principal peaks at m/z 212, 42, 187, 45, 70, 180, 56, 98.

Quantification. GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In plasma or serum: sensitivity 400 pg/ml—G. Brante *et al.*, *Eur. J. clin. Pharmac.*, 1981, 20, 307–310.

Dose. 12.5 to 75 mg daily.

Dobutamine

Sympathomimetic

(±)-4-{2-[3-(4-Hydroxyphenyl)-1-methylpropylamino]ethyl}-pyrocatechol

$C_{18}H_{23}NO_3 = 301.4$

CAS—34368-04-2

Dobutamine Hydrochloride

Proprietary Name. Dobutrex

$C_{18}H_{23}NO_3 \cdot HCl = 337.8$

CAS—52663-81-7

A white powder. M.p. 189° to 191°.

Sparingly **soluble** in water and ethanol; soluble in methanol and pyridine.

Dissociation Constant. pK_a 9.5.

Colour Tests. Ammoniacal Silver Nitrate—black; *p*-Dimethyl-aminobenzaldehyde—orange/violet; Ferric Chloride—green; Folin-Ciocalteu Reagent—blue; Methanolic Potassium Hydroxide—brown-pink; Millon's Reagent—red; Nessler's Reagent—black; Palladium Chloride—orange → brown; Potassium Dichromate—green-brown.

Thin-layer Chromatography. System TA—Rf 52; system TB—Rf 00; system TC—Rf 01.

Ultraviolet Spectrum. Aqueous acid—279 nm ($A_1^1 = 131$ b); aqueous alkali—236 nm, 292 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1520, 1280, 1266, 1190, 1200, 1220 (dobutamine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 58, 107, 30, 178, 77, 56, 57, 137.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In equine plasma: detection limit 100 pg/ml, electrochemical detection—G. E. Hardee and J. W. Lai, *Analyt. Lett. (Part B)*, 1983, 16, 69–75.

Disposition in the Body. Inactive after oral administration. After intravenous administration, it is rapidly metabolised by glucuronide conjugation and 3-*O*-methylation to inactive metabolites which are excreted in the urine, mostly in the first 2 hours.

HALF-LIFE. Plasma half-life, about 2 minutes.

Dose. Usually 2.5 to 10 $\mu\text{g/kg/min}$ of dobutamine hydrochloride, by intravenous infusion.

Docusate Sodium

Anionic Surfactant

Synonyms. Dioctyl Sodium Sulphosuccinate; DSS; Sodium Dioctyl Sulphosuccinate.

Proprietary Names. Aerosol OT; Afko-Lube; Audinorm; Bu-Lax; Colace; Comfolax; Constiban; Dilax; Dioctyl; Dio-Medicone; Disonate; Doxinate; Molcer; Regulex; Soliwax; Waxedol. It is an ingredient of Dorbantyl, Dulcodos, Klyx, Migrave, and Normax.

Sodium 1,4-bis(2-ethylhexyl) sulphosuccinate

$\text{C}_{20}\text{H}_{37}\text{NaO}_7\text{S} = 444.6$

CAS—10041-19-7 [1,4-bis(2-ethylhexyl) sulphosuccinate]; 577-11-7 (sodium salt)

White, hygroscopic, waxy masses or flakes.

Slowly **soluble** 1 in 70 of water, higher concentrations forming a thick gel; soluble 1 in 3 of ethanol, 1 in 1 of chloroform, and 1 in 1 of ether.

Docusate Calcium

Synonym. Dioctyl Calcium Sulphosuccinate

Proprietary Names. Surfak. It is an ingredient of Doxidan.

$\text{C}_{40}\text{H}_{74}\text{CaO}_{14}\text{S}_2 = 883.2$

CAS—128-49-4

A white amorphous solid.

Soluble 1 in 3300 of water; freely soluble in ethanol, chloroform, and ether.

Docusate Potassium

Synonym. Dioctyl Potassium Sulphosuccinate

Proprietary Names. Dialose; Kasof; Rectalad.

$\text{C}_{20}\text{H}_{37}\text{KO}_7\text{S} = 460.7$

CAS—7491-09-0

A white amorphous solid.

Sparingly **soluble** in water; soluble in ethanol; very soluble in light petroleum.

Colour Tests. To 5 ml of a 0.1% solution add 1 ml of *dilute sulphuric acid*, 10 ml of chloroform, and 0.2 ml of *dimethyl yellow solution*, and shake—the chloroform layer is coloured red. Add 50 mg of cetrinide and shake—the colour of the chloroform layer changes to yellow.

Infra-red Spectrum. Principal peaks at wavenumbers 1724, 1250, 1052, 1020, 1612, 1086.

Dose. 50 to 500 mg daily as a laxative.

Dodecyl Gallate

Antioxidant

Synonym. Lauryl Gallate

Proprietary Names. Progallin LA. It is an ingredient of Embanox 7.

Dodecyl 3,4,5-trihydroxybenzoate

$\text{C}_{19}\text{H}_{30}\text{O}_5 = 338.4$

CAS—1166-52-5

A white or creamy-white powder. M.p. 96° to 97.5°.

Practically **insoluble** in water; soluble 1 in 3.5 of ethanol, 1 in 60 of chloroform, and 1 in 4 of ether.

Colour Tests. Ammoniacal Silver Nitrate—black; Ferric Chloride—blue; Folin-Ciocalteu Reagent—blue; Methanolic Potassium Hydroxide—orange; Nessler's Reagent—black.

Ultraviolet Spectrum. Methanol—275 nm ($A_1^1 = 300$ b).

Dofamium Chloride*Cationic Disinfectant**Synonym.* Phenamylum Chloride

Dimethyl [2 - (N - methyl dodecanamido)ethyl] [(phenyl-carbamoyl)methyl]ammonium chloride

 $C_{25}H_{44}ClN_3O_2 = 454.1$ *CAS*—54063-35-3

A white crystalline powder.

Soluble in water.**Colour Test.** Mandelin's Test—red → brown.**Thin-layer Chromatography.** *System TA*—Rf 03. (*Acidified iodoplatinate solution*, positive.)**Gas Chromatography.** *System GA*—RI 1676, 1898, and 1974.**Ultraviolet Spectrum.** Aqueous acid—244 nm ($A_1^1 = 242$ b).**Infra-red Spectrum.** Principal peaks at wavenumbers 1670, 1626, 760, 1538, 1592, 1298.**DOM***Hallucinogen**Synonym.* 2,5-Dimethoxy-4-methylamphetamine

2,5-Dimethoxy-4,α-dimethylphenethylamine

 $C_{12}H_{19}NO_2 = 209.3$ *CAS*—15588-95-1

DOM is reported to be the active principle of the hallucinogenic preparation known as STP. (STP has also been used as a synonym for DOM.)

Melting-points of 59° and 70° have been reported. Practically **insoluble** in water; soluble in chloroform.**Colour Test.** Marquis Test—yellow.**Thin-layer Chromatography.** *System TA*—Rf 51; *system TB*—Rf 16; *system TC*—Rf 17. (*Dragendorff spray*, positive; *FPN reagent*, positive; *acidified iodoplatinate solution*, positive; *Marquis reagent*, yellow; *ninhydrin spray*, positive; *acidified potassium permanganate solution*, positive.)**Gas Chromatography.** *System GA*—RI 1616.**High Pressure Liquid Chromatography.** *System HC*—k' 1.13.**Ultraviolet Spectrum.** Aqueous acid—289 nm ($A_1^1 = 221$ b).**Infra-red Spectrum.** Principal peaks at wavenumbers 1208, 1041, 1541, 1515, 1634, 1094.**Mass Spectrum.** Principal peaks at m/z 44, 166, 151, 57, 43, 91, 135, 209.**Disposition in the Body.** About 20% of an ingested dose is excreted in the urine unchanged in 24 hours; peak urinary excretion occurs 3 to 6 hours after ingestion.REFERENCE. S. H. Snyder *et al.*, *Science*, 1967, 158, 669–670.**Domiphen Bromide***Cationic Disinfectant**Synonym.* Phenododecinium Bromide*Proprietary Name.* Bradosol

It consists chiefly of dodecyldimethyl(2-phenoxyethyl)-ammonium bromide

 $C_{22}H_{40}BrNO = 414.5$ *CAS*—13900-14-6 (domiphen); 538-71-6 (bromide)Colourless or faintly yellow crystalline flakes. M.p. 106° to 116°. **Soluble** 1 in less than 2 of water and of ethanol, and 1 in 30 of acetone.

Colour Test. Dissolve 10 mg in 10 ml of water, add 0.1 ml of a 0.5% aqueous eosin solution and 100 ml of water—pink.

Thin-layer Chromatography. System TA—Rf 05. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2310.

Ultraviolet Spectrum. Methanol—268 nm ($A_1^1 = 30$ a), 277 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1228, 752, 1500, 1600, 689, 1080 (KBr disk).

Dose. Lozenges containing 500 µg of domiphen bromide are available.

Dopamine

Sympathomimetic

Synonym. 3-Hydroxytyramine

4-(2-Aminoethyl)pyrocatechol

$C_8H_{11}NO_2 = 153.2$

CAS—51-61-6

Crystals.

Dopamine Hydrochloride

Proprietary Names. Intropin; Revimine; Revivan.

$C_8H_{11}NO_2 \cdot HCl = 189.6$

CAS—62-31-7

A white crystalline powder. M.p. about 241°, with decomposition.

Soluble in water and ethanol.

Dissociation Constant. pK_a 8.8, 10.6 (20°).

Colour Tests. Ammoniacal Silver Nitrate—orange-brown/black; *p*-Dimethylaminobenzaldehyde—orange/violet; Ferric Chloride—green; Folin-Ciocalteu Reagent—blue; Marquis Test—brown-violet; Methanolic Potassium Hydroxide—blue → orange → brown; Nessler's Reagent—black; Potassium Dichromate—green → brown (30 s).

Thin-layer Chromatography. System TA—Rf 18, streaking. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 2175.

High Pressure Liquid Chromatography. System HA—k' 2.7 (tailing peak).

Ultraviolet Spectrum. Aqueous acid—280 nm ($A_1^1 = 178$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1503, 1287, 1190, 1174, 813, 1115 (KBr disk).

Quantification. See under Levodopa.

Disposition in the Body. Dopamine is a naturally occurring catecholamine and is considered to be the metabolic precursor of noradrenaline. It is inactivated after oral administration. It is excreted mainly as 3,4-dihydroxyphenylacetic acid (DOPAC) and 3-methoxy-4-hydroxyphenylacetic acid (homovanillic acid); noradrenaline and 3-methoxytyramine are also metabolites. Dopamine is a metabolite of levodopa.

Dose. Initially 2 to 5 µg/kg/min of dopamine hydrochloride, by intravenous infusion.

Dothiepin

Antidepressant

Synonym. Dosulepin

3-(Dibenzo[*b,e*]thiepin-11(6*H*)-ylidene)-*NN*-dimethylpropylamine

$C_{19}H_{21}NS = 295.4$

CAS—113-53-1

**Dothiepin Hydrochloride**

Proprietary Name. Prothiaden

$C_{19}H_{21}NS \cdot HCl = 331.9$

CAS—897-15-4

A white to faintly yellow crystalline powder. M.p. about 224°, with decomposition.

Soluble 1 in 2 of water, 1 in 8 of ethanol, and 1 in 2 of chloroform; practically insoluble in ether.

Partition Coefficient. Log *P* (octanol/pH 7.4), 2.8.

Colour Tests. Liebermann's Test—red-brown; Mandelin's Test—green; Marquis Test—brown; Sulphuric Acid—violet.

Thin-layer Chromatography. *System TA*—Rf 51; *system TB*—Rf 50; *system TC*—Rf 42. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—dothiepin RI 2380, monodesmethyldothiepin RI 2390, dothiepin sulphoxide RI 2450; *system GF*—dothiepin RI 2770, dothiepin sulphoxide RI 2820.

High Pressure Liquid Chromatography. *System HA*—dothiepin *k'* 3.2, dothiepin sulphoxide *k'* 4.6 (tailing peak), monodesmethyldothiepin *k'* 2.2; *system HF*—*k'* 3.60.

Ultraviolet Spectrum. Aqueous acid—230 nm ($A_1^1 = 770$ a), 303 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 763, 727, 747, 1252, 963, 717 (dothiepin hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at *m/z* 58, 236, 40, 202, 235, 203, 42, 44; desmethyldothiepin 44, 204, 203, 202, 41, 221, 57, 55; dothiepin sulphoxide 58, 44, 31, 59, 57, 42, 45, 40.

Quantification. GAS CHROMATOGRAPHY. In plasma: detection limit 4 ng, AFID—L. A. Gifford *et al.*, *J. Chromat.*, 1975, 105, 107–113.

GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In plasma or whole blood: dothiepin, monodesmethyldothiepin and dothiepin sulphoxide, limit of detection 1 ng/ml—K. P. Maguire *et al.*, *J. Chromat.*, 1981, 222; *Biomed. Appl.*, 11, 399–408.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or serum: dothiepin and monodesmethyldothiepin, limit of detection 10 ng/ml, UV detection—R. R. Brodie *et al.*, *J. int. med. Res.*, 1977, 5, 387–390.

Disposition in the Body. Well absorbed after oral administration. The main metabolic reactions are demethylation to monodesmethyldothiepin (northiaden) and oxidation to dothiepin sulphoxide. About 50 to 60% of a dose is excreted in the urine in 24 hours, mainly as metabolites, and 15 to 40% of a dose is eliminated in the faeces in the same period. Enterohepatic circulation has been reported.

THERAPEUTIC CONCENTRATION. Plasma concentrations vary considerably between individual subjects.

Following a single oral dose of 75 mg to 7 subjects, peak plasma concentrations of 0.03 to 0.07 µg/ml (mean 0.05) of dothiepin and 0.003 to 0.02 µg/ml (mean 0.01) of monodesmethyldothiepin were attained in about 3 hours and 6 hours respectively. Peak blood concentrations of dothiepin sulphoxide of 0.03 to 0.15 µg/ml (mean 0.08) were reported in 4 subjects at 5 hours (K. P. Maguire *et al.*, *Br. J. clin. Pharmac.*, 1981, 12, 405–409).

Following oral administration of 25 mg given 3 times a day to 5 subjects for 12 days, minimum steady-state serum concentrations of 0.02 to 0.06 µg/ml (mean 0.04) of dothiepin, and < 0.01 to 0.05 µg/ml (mean 0.02) of monodesmethyldothiepin, were reported (B. R. S. Nakra *et al.*, *J. int. med. Res.*, 1977, 5, 391–397).

TOXICITY. Fatalities have been associated with blood concentrations of 1 to 5 to 19 µg/ml.

In 7 deaths attributed to dothiepin overdose, the following postmortem tissue concentrations were reported: blood 0.3 to 2.5 µg/ml (mean 1.5), bile 12 to 268 µg/ml (mean 117, 4 cases), liver 2 and 14 µg/g (2 cases), liver blood 0.6, 2.9, and 23.5 µg/ml (3 cases), urine 0.4 to 5.1 µg/ml (mean 3.2, 5 cases) (A. E. Robinson *et al.*, *J. analyt. Toxicol.*, 1979, 3, 3–13 and A. E. Robinson *et al.*, *Z. Rechtsmed.*, 1974, 74, 261–266).

A 36-year-old female was admitted to hospital 3 hours after the ingestion of 2 to 3 g of dothiepin with alcohol. After 24 hours, following treatment by haemoperfusion, she appeared to be recovering but toxic symptoms reappeared after 48 hours followed by death 56 hours after ingestion. The following plasma concentrations were reported (µg/ml):

Hours after ingestion	Dothiepin	Monodesmethyldothiepin
4.5	2.51	0
6.0	1.88	0.13
17.5	1.07	0.32
57.5*	4.54	1.28

*postmortem

(L. Bloodworth *et al.*, *Postgrad. med. J.*, 1984, 60, 442–444).

HALF-LIFE. Plasma half-life, dothiepin 11 to 40 hours (mean 22), monodesmethyldothiepin 22 to 60 hours (mean 33), dothiepin sulphoxide 13 to 35 hours (mean 20).

DISTRIBUTION IN BLOOD. Plasma : whole blood ratio, about 1.4.

NOTE. For a review of the pharmacokinetics of tricyclic antidepressants see G. Molnar and R. N. Gupta, *Biopharm. Drug Disp.*, 1980, 1, 283-305.

Dose. 75 to 150 mg of dothiepin hydrochloride daily; up to 225 mg daily has been given.

Doxapram

Respiratory Stimulant

1-Ethyl-4-(2-morpholinoethyl)-3,3-diphenylpyrrolidin-2-one

$C_{24}H_{30}N_2O_2 = 378.5$

CAS—309-29-5

Doxapram Hydrochloride

Proprietary Names. Dopram; Doxapril.

$C_{24}H_{30}N_2O_2 \cdot HCl \cdot H_2O = 433.0$

CAS—113-07-5 (anhydrous); 7081-53-0 (monohydrate)

A white crystalline powder. M.p. about 220°.

Soluble 1 in 50 of water; sparingly soluble in ethanol; soluble in chloroform; practically insoluble in ether.

Colour Tests. Liebermann's Test—orange; Mandelin's Test—blue.

Thin-layer Chromatography. System TA—Rf 64; system TB—Rf 20; system TC—Rf 70. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2906; system GC—RI 2230.

High Pressure Liquid Chromatography. System HA—k' 0.4.

Ultraviolet Spectrum. Aqueous acid—253 nm, 259 nm ($A_1^{1\%}$ = 12 c), 265 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1683, 753, 710, 1253, 696, 764 (doxapram hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 100, 113, 56, 101, 87, 378, 194, 91.

Quantification. GAS CHROMATOGRAPHY. In plasma: detection limit 10 ng/ml, AFID—R. H. Robson and L. F. Prescott, *J. Chromat.*, 1977, 143; *Biomed. Appl.*, 1, 527-529.

Disposition in the Body. Readily absorbed after oral administration; bioavailability about 60%. The major metabolite is the 2-ketomorpholino derivative.

THERAPEUTIC CONCENTRATION.

Following an intravenous injection of 1.5 mg/kg to 6 subjects, plasma concentrations of 1.6 to 4.3 µg/ml (mean 2.6) were reported after 2 minutes declining to 0.6 to 1.5 µg/ml (mean 0.9) at 2 hours. Following intravenous infusion of 6.5 mg/kg to 6 subjects, peak plasma concentrations of 3.3 to 5.2 µg/ml (mean 4.1) were reported at the end of the infusion; peak concentrations of the 2-ketomorpholino metabolite of 1.1 to 2.0 µg/ml (mean 1.6) were attained 0.2 to 2 hours after the end of the infusion (J. A. Clements *et al.*, *Eur. J. clin. Pharmac.*, 1979, 16, 411-416).

HALF-LIFE. Plasma half-life, about 7 hours.

VOLUME OF DISTRIBUTION. About 3 litres/kg.

CLEARANCE. Plasma clearance, about 5 ml/min/kg.

Dose. 1 to 1.5 mg/kg of doxapram hydrochloride by intravenous injection.

Doxepin

Antidepressant

A mixture of the *cis*- and *trans*-isomers of 3-(dibenz[b,e]oxepin-11(6*H*)-ylidene)-*NN*-dimethylpropylamine.

$C_{19}H_{21}NO = 279.4$

CAS—1668-19-5

An oily liquid.

Doxepin Hydrochloride

Proprietary Names. Adapin; Aponal; Quitaxon; Sinequan; Sinquan.

$C_{19}H_{21}NO \cdot HCl = 315.8$

CAS—1229-29-4

A white crystalline powder. M.p. 185° to 191°.

Soluble 1 in 1.5 of water, 1 in 1 of ethanol, and 1 in 2 of chloroform; very slightly soluble in ether.

Dissociation Constant. pK_a 9.0 (25°).

Partition Coefficient. Log P (octanol/pH 7.4), 2.4.

Colour Tests. Liebermann's Test—black; Mandelin's Test—brown; Marquis Test—brown; Sulphuric Acid—orange.

Thin-layer Chromatography. System TA —Rf 51; system TB —Rf 52; system TC —Rf 37. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA —doxepin RI 2217, monodesmethyldoxepin RI 2235; system GF —RI 2570.

High Pressure Liquid Chromatography. System HA —doxepin k' 3.7, monodesmethyldoxepin k' 2.2; system HF — k' 2.27.

Ultraviolet Spectrum. Aqueous acid—292 nm ($A_1^1 = 231$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 750, 1006, 768, 1198, 1290, 1219 (doxepin hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 58, 220, 219, 59, 191, 189, 42, 205.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 10 ng/ml, FID—J. E. O'Brien and O. N. Hinsvark, *J. pharm. Sci.*, 1976, 65, 1068–1069. In plasma: sensitivity 2 ng/ml for doxepin and 1 ng/ml for monodesmethyldoxepin, AFID—

M. T. Rosseel *et al.*, *J. pharm. Sci.*, 1978, 67, 802–805. In plasma: sensitivity 2.5 ng/ml, ECD—J. E. Wallace *et al.*, *J. analyt. Toxicol.*, 1978, 2, 44–49.

GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In blood, urine or tissues: doxepin and monodesmethyldoxepin—G. de Groot *et al.*, *J. analyt. Toxicol.*, 1978, 2, 13–17.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: detection limit 5 ng/ml for doxepin and monodesmethyldoxepin, UV detection—R. D. Faulkner and C. Lee, *J. pharm. Sci.*, 1983, 72, 1165–1167.

RADIOIMMUNOASSAY. In serum or plasma: doxepin and monodesmethyldoxepin, sensitivity 2.5 ng/ml—R. Virtanen *et al.*, *Acta pharmac. tox.*, 1980, 47, 274–278.

Disposition in the Body. Well absorbed after oral administration, but undergoes extensive first-pass demethylation; bioavailability 15 to 45%. Other metabolic reactions include N -oxidation, aromatic hydroxylation, and glucuronic acid conjugation. Monodesmethyldoxepin is an active metabolite. Less than 1% of a dose is excreted in the urine as unchanged drug in 24 hours.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.02 to 0.15 $\mu\text{g/ml}$.

After a single oral dose of 75 mg given to 7 subjects, peak plasma concentrations of 0.01 to 0.05 $\mu\text{g/ml}$ (mean 0.03) of doxepin were attained in 2 to 4 hours and peak plasma concentrations of 0.005 to 0.014 $\mu\text{g/ml}$ (mean 0.01) of monodesmethyldoxepin were reported at 2 to 10 hours (V. E. Ziegler *et al.*, *Clin. Pharmac. Ther.*, 1978, 23, 573–579).

Daily oral doses of 75 to 200 mg given to 5 subjects, produced steady-state plasma concentrations of 0.05 to 0.15 $\mu\text{g/ml}$ of doxepin; in two of these subjects plasma concentrations for monodesmethyldoxepin of 0.09 and 0.10 $\mu\text{g/ml}$ were reported (J. E. O'Brien and O. N. Hinsvark, *J. pharm. Sci.*, 1976, 65, 1068–1069).

TOXICITY. Doses in excess of 500 mg are likely to produce severe toxic effects and the estimated minimum lethal dose is 1 g. Blood concentrations greater than 0.1 $\mu\text{g/ml}$ may be associated with toxic reactions and fatalities have been associated with blood concentrations of 1 to 8 to 18 $\mu\text{g/ml}$.

In 5 deaths due to overdosage of doxepin, the postmortem blood concentrations ranged from 9 to 19 $\mu\text{g/ml}$ (mean 13) and in 3 of these cases, liver concentrations of 71, 75, and 500 $\mu\text{g/g}$ were reported (J. S. Oliver and A. A. Watson, *Medicine, Sci. Law*, 1974, 14, 280–283).

In a report of 4 fatalities attributed to overdose of doxepin, the following postmortem blood and tissue concentrations, $\mu\text{g/ml}$ or $\mu\text{g/g}$ (mean), were found:

	Doxepin	Monodesmethyldoxepin
Blood	0.7–29 (9.3)	0.1–6.2 (1.7)
Bile	38–195 (95)	1.0–19 (7.1)
Brain	9–21 (14)	1.5–22 (7.2)
Kidney	3.3–19 (12)	0.5–9.0 (3.0)
Liver	22–38 (32)	1.2–20 (7.5)
Urine	2.1–12 (7.5)	0.7–6.4 (2.8)

(G. de Groot *et al.*, *J. analyt. Toxicol.*, 1978, 2, 18–20).

HALF-LIFE. Plasma half-life, doxepin 8 to 25 hours (mean 17), monodesmethyldoxepin 33 to 80 hours (mean 51).

VOLUME OF DISTRIBUTION. About 20 litres/kg.

CLEARANCE. Plasma clearance, about 15 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, doxepin about 0.8 but there is considerable intersubject variation; monodesmethyldoxepin about 0.6.

PROTEIN BINDING. In plasma, about 80%.

NOTE. For a review of the pharmacokinetics of tricyclic antidepressants see G. Molnar and R. N. Gupta, *Biopharm. Drug Disp.*, 1980, 1, 283–305.

Dose. The equivalent of 30 to 300 mg of doxepin daily.

Doxorubicin

Antineoplastic

Synonyms. Adriamycin; 14-Hydroxydaunorubicin.(1*S*,3*S*)-3-Glycolyl-1,2,3,4,6,11-hexahydro-3,5,12-trihydroxy-10-methoxy-6,11-dioxonaphthacen-1-yl 3-amino-2,3,6-trideoxy- α -L-lyxopyranoside $C_{27}H_{29}NO_{11}$ = 543.5

CAS—23214-92-8

An antibiotic isolated from *Streptomyces peucetius* var. *caesius*.**Doxorubicin Hydrochloride***Proprietary Names.* Adriamycin; Adriblastin(a); Adriblastine. $C_{27}H_{29}NO_{11} \cdot HCl$ = 580.0

CAS—25316-40-9

An orange-red, hygroscopic, crystalline powder. M.p. 204° to 205°, with decomposition.

Soluble in water and methanol; soluble 1 in 75 of ethanol; practically insoluble in chloroform, ether, and other organic solvents.**Caution.** Doxorubicin hydrochloride is irritant; avoid contact with skin and mucous membranes.**Dissociation Constant.** pK_a 8.2, 10.2.**Colour Tests.** Mandelin's Test—green; Marquis Test—violet.**Thin-layer Chromatography.** *System TA*—Rf 12. (Visible red streak).**Ultraviolet Spectrum.** Aqueous acid—233 nm, 253 nm, 290 nm; aqueous alkali—253 nm; methanol—233 nm (A_1^1 = 702 b), 253 nm, 290 nm.**Infra-red Spectrum.** Principal peaks at wavenumbers 1282, 990, 1010, 1587, 1612, 1204 (doxorubicin hydrochloride).**Dose.** 1.2 to 2.4 mg/kg, intravenously, as a single dose every 3 weeks.**Doxycycline**

Antibiotic

Synonym. Doxycycline Monohydrate*Proprietary Names.* Doxin; Doxitard; Doxychel; Vibramycin-D; Vibravenös.6-Deoxy-5 β -hydroxytetracycline monohydrate $C_{22}H_{24}N_2O_8 \cdot H_2O$ = 462.5

CAS—564-25-0 (anhydrous); 17086-28-1 (monohydrate)

A yellow crystalline powder.

Very slightly **soluble** in water; sparingly soluble in ethanol; practically insoluble in chloroform and ether; freely soluble in dilute acids and alkali hydroxides.**Doxycycline Hydrochloride***Synonyms.* Doxycycline Hyclate; Doxycyclini Chloridum.*Proprietary Names.* Doxatet; Doxychel; Doxylar; Dumoxin; Idocyklin; Nordox; Vibramycin(e); Vibra-Tabs; Vibraveineuse. $C_{22}H_{24}N_2O_8 \cdot HCl \cdot \frac{1}{2}C_2H_5OH \cdot \frac{1}{2}H_2O$ = 512.9CAS—10592-13-9 ($C_{22}H_{24}N_2O_8 \cdot HCl$); 24390-14-5 ($C_{22}H_{24}N_2O_8 \cdot HCl \cdot \frac{1}{2}C_2H_5OH \cdot \frac{1}{2}H_2O$)

A yellow crystalline powder. M.p. about 200°, with decomposition.

Soluble 1 in 3 of water, 1 in 60 of ethanol, and 1 in 4 of methanol; practically insoluble in chloroform and ether.**Dissociation Constant.** pK_a 3.5, 7.7, 9.5 (20°).**Partition Coefficient.** Log *P* (octanol/pH 7.5), −0.2.**Colour Tests.** Benedict's Reagent—red; Formaldehyde-Sulphuric Acid—yellow; Mandelin's Test—green → yellow; Marquis Test—yellow; Sulphuric Acid—yellow.**Thin-layer Chromatography.** *System TA*—Rf 12, streaking. (Acidified iodoplatinate solution, positive.)**Ultraviolet Spectrum.** Aqueous acid—269 nm (A_1^1 = 412 b), 346 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1580, 1613, 1660, 1244, 1220, 1040 (doxycycline hydrochloride, KBr disk).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum or urine: detection limit 50 ng/ml in serum, UV detection—A. P. De Leenheer and H. J. C. Nelis, *J. pharm. Sci.*, 1979, 68, 999–1002.

Disposition in the Body. Readily and almost completely absorbed after oral administration; peak plasma concentrations are attained in about 2 hours. It does not appear to be significantly metabolised. About 40% of a dose is excreted in the urine unchanged in 72 hours (about 24% in the first 24 hours).

HALF-LIFE. Plasma half-life, about 22 hours.

PROTEIN BINDING. In plasma, about 82 to 90%.

NOTE. For a review of doxycycline see B. A. Cunha *et al.*, *Ther. Drug Monit.*, 1982, 4, 115–135.

Dose. The equivalent of 100 to 200 mg of doxycycline daily; a one-day course of 300 to 600 mg has also been given.

Doxylamine

Antihistamine

Synonym. Histadoxylamine

NN-Dimethyl-2-[α -methyl- α -(2-pyridyl)benzyloxy]ethylamine

$C_{17}H_{22}N_2O = 270.4$

CAS—469-21-6

A liquid. B.p. about 140°.

Doxylamine Succinate

Proprietary Names. Decapryn; Hoggar N; Mereprine; Unisom. It is an ingredient of Bendectin, Debendox, Nethaprin, and Syndol.

$C_{17}H_{22}N_2O \cdot C_4H_6O_4 = 388.5$

CAS—562-10-7

A white or creamy-white powder. M.p. 103° to 108°.

Soluble 1 in 1 of water, 1 in 2 of ethanol, 1 in 2 of chloroform, and 1 in 370 of ether.

Dissociation Constant. pK_a 4.4, 9.2.

Colour Tests. Cyanogen Bromide—orange-pink; Liebermann's Test—red-orange; Marquis Test—violet; Sulphuric Acid—pink.

Thin-layer Chromatography. *System TA*—Rf 48; *system TB*—Rf 41; *system TC*—Rf 10. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 1906; *system GF*—RI 2170.

High Pressure Liquid Chromatography. *System HA*— k' 4.4.

Ultraviolet Spectrum. Aqueous acid—261 nm ($A_1^1 = 335$ a). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 700, 1590, 1123, 1086, 1041, 751 (KBr disk).

Mass Spectrum. Principal peaks at m/z 58, 71, 72, 167, 182, 42, 180, 59.

Quantification. GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In plasma: sensitivity 100 ng/ml—A. Cailleux *et al.*, *J. chromatogr. Sci.*, 1981, 19, 163–176.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: detection limit 5 ng/ml, UV detection—K. J. Kohlhof *et al.*, *J. pharm. Sci.*, 1983, 72, 961–962.

Dose. Usually up to 100 mg of doxylamine succinate daily.

Droperidol

Tranquilliser

Proprietary Names. Dehydrobenzperidol; Dridol; Droleptan; Inapsine. It is an ingredient of Innovar and Thalmonal.

1-[1-[3-(4-Fluorobenzoyl)propyl]-1,2,3,6-tetrahydro-4-pyridyl]benzimidazolin-2-one

$C_{22}H_{22}FN_3O_2 = 379.4$

CAS—548-73-2

A white to light tan-coloured, amorphous or microcrystalline powder, which gradually darkens on exposure to light. M.p. 144° to 148°.

Practically **insoluble** in water; soluble 1 in 140 of ethanol, 1 in 4 of chloroform, and 1 in 500 of ether.

Dissociation Constant. pK_a 7.6.

Colour Test. Mandelin's Test—blue → green.

Thin-layer Chromatography. *System TA*—Rf 67; *system TB*—Rf 02; *system TC*—Rf 48. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 3430.

High Pressure Liquid Chromatography. *System HA*— k' 0.6.

Ultraviolet Spectrum. Aqueous acid—248 nm ($A_1^1 = 443$ a), 276 nm; aqueous alkali—246 nm, 288 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1685, 1705, 1595, 1230, 752, 1156 (KBr disk).

Mass Spectrum. Principal peaks at m/z 246, 165, 42, 123, 199, 247, 214, 108.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 30 ng/ml, FID—M. P. Quaglio *et al.*, *Boll. chim.-farm.*, 1982, 121, 276–284.

Disposition in the Body. Absorbed after oral administration. About 75% of a dose is excreted in the urine with less than 10% as unchanged drug; about 22% of a dose is eliminated in the faeces.

HALF-LIFE. Plasma half-life, about 2 to 3 hours.

PROTEIN BINDING. In plasma, about 85 to 90%.

Dose. 5 to 20 mg every 4 to 8 hours.

Dropropizine

Cough Suppressant

Proprietary Name. Ribex

3-(4-Phenylpiperazin-1-yl)propane-1,2-diol

$C_{13}H_{20}N_2O_2 = 236.3$

CAS—17692-31-8

A white crystalline powder. M.p. 108° to 109°.

Soluble in chloroform and in dilute acetic acid.

Colour Tests. Liebermann's Test—red-orange; Mandelin's Test—orange (slow).

Cold *nitric acid* gives a red colour.

Thin-layer Chromatography. System TA—Rf 65. (Acidified iodoplatinate solution, strong reaction.)

Gas Chromatography. System GA—RI 2112.

Ultraviolet Spectrum. Aqueous acid—238 nm ($A_1^1 = 330$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1595, 1238, 1500, 760, 1060, 925 (KBr disk).

Dose. Dropropizine has been given in doses of 90 to 120 mg daily.

Drostanolone Propionate

Anabolic Steroid

Synonym. Dromostanolone Propionate

Proprietary Names. Drolban; Masterid; Masteril; Masteron; Permastril.

2 α -Methyl-3-oxo-5 α -androstan-17 β -yl propionate

$C_{23}H_{36}O_3 = 360.5$

CAS—58-19-5 (drostanolone); 521-12-0 (propionate)

A white to creamy-white crystalline powder. M.p. 127° to 133°. Practically **insoluble** in water; soluble 1 in 30 of ethanol, 1 in 2 of chloroform, and 1 in 20 of ether.

Infra-red Spectrum. Principal peaks at wavenumbers 1715, 1200, 1735, 1035, 1087, 1265 (KBr disk).

Dose. Usually 100 mg thrice weekly, by intramuscular injection.

Dyclonine

Local Anaesthetic

4'-Butoxy-3-piperidinopropiophenone

$C_{18}H_{27}NO_2 = 289.4$

CAS—586-60-7

Dyclonine Hydrochloride

Synonym. Dyclocaïne Chloride

Proprietary Name. Dyclone

$C_{18}H_{27}NO_2 \cdot HCl = 325.9$

CAS—536-43-6

White crystals or white crystalline powder. M.p. 173° to 178°.

Soluble 1 in 60 of water, 1 in 24 of ethanol, and 1 in 2.3 of chloroform; soluble in acetone; practically insoluble in ether.

Colour Tests. Aromaticity (Method 2)—yellow/orange; Liebermann's Test (100°)—orange.

Thin-layer Chromatography. *System TA*—Rf 60; *system TB*—Rf 49; *system TC*—Rf 40; *system TL*—Rf 25. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 1678.

High Pressure Liquid Chromatography. *System HR*— k' 2.78.

Ultraviolet Spectrum. Aqueous acid—282 nm ($A_1^1 = 580$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1178, 1605, 1229, 1672, 1575, 965 (dyclonine hydrochloride, KBr disk).

Use. Dyclonine hydrochloride is applied as a 0.5 or 1% solution.

Dydrogesterone

Progestational Steroid

Synonyms. Dehydropregesterone; Didrogesteron; Isopregnenone.

Proprietary Names. Duphaston; Gynorest; Terolut.

9 β ,10 α -Pregna-4,6-diene-3,20-dione

$C_{21}H_{28}O_2 = 312.5$

CAS—152-62-5

A white to pale yellow crystalline powder. M.p. 167° to 171°.

Practically **insoluble** in water; soluble 1 in 40 to 1 in 52 of ethanol, 1 in 17 of acetone, 1 in 2 of chloroform, and 1 in 140 of ether.

Colour Tests. Antimony Pentachloride—orange; Naphthol-Sulphuric Acid—orange-red; Sulphuric Acid—orange (green-yellow fluorescence under ultraviolet light).

Thin-layer Chromatography. *System TP*—Rf 86; *system TQ*—Rf 53; *system TR*—Rf 96; *system TS*—Rf 98. (p-Toluenesulphonic acid solution, positive.)

Ultraviolet Spectrum. Dehydrated alcohol—286 nm ($A_1^1 = 838$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1660, 1622, 1697, 1581, 1232, 1197 (KBr disk).

Mass Spectrum. Principal peaks at m/z 43, 91, 227, 268, 312, 79, 55, 77.

Disposition in the Body. Rapidly absorbed after oral administration. The major metabolites are 20 α -hydroxydydrogesterone and 21-hydroxydydrogesterone. About 50% of a dose is excreted in the urine in 24 hours, as metabolites.

Dose. Usually 20 to 30 mg daily.

Ecgonine*Synonym.* Laevo-ecgonine(1*R*,2*R*,3*S*,5*S*)-3-Hydroxytropine-2-carboxylic acid $C_9H_{15}NO_3 = 185.2$

CAS—481-37-8

M.p. 198°, with decomposition; the dry substance melts at 205°. **Soluble** in water; slightly soluble in ethanol; practically insoluble in ether.

Dissociation Constant. pK_a 2.8, 11.1.

Thin-layer Chromatography. System TA—Rf 17. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—not eluted.

High Pressure Liquid Chromatography. System HA— k' 1.1.

Ultraviolet Spectrum. Ethanol—275 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1688, 1210, 1200, 1223, 1134, 1179 (ecgonine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 82, 97, 42, 83, 96, 57, 94, 55.

Disposition in the Body. Ecgonine and its methyl ester are metabolites of cocaine.

*Alkaloid***Econazole***Antifungal*1-[2,4-Dichloro- β -(4-chlorobenzyloxy)phenethyl]imidazole $C_{18}H_{15}Cl_3N_2O = 381.7$

CAS—27220-47-9

M.p. 87°.

Econazole Nitrate

Proprietary Names. Ecostatin; Epi-Pevaryl; Gyno-Pevaryl; Pevaryl. It is an ingredient of Econacort.

 $C_{18}H_{15}Cl_3N_2O \cdot HNO_3 = 444.7$

CAS—24169-02-6; 68797-31-9

A white crystalline powder. M.p. about 164°, with decomposition.

Very slightly **soluble** in water and ether; soluble 1 in 125 of ethanol, 1 in 60 of chloroform, and 1 in 25 of methanol.

Ultraviolet Spectrum. Methanolic acid—265 nm ($A_1^{1\%} = 12$ b), 271 nm ($A_1^{1\%} = 12.5$ a), 280 nm ($A_1^{1\%} = 7.6$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1090, 1310, 805, 825, 1010, 1040 (econazole nitrate, KBr disk).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 200 ng/ml, UV detection—R. R. Brodie *et al.*, *J. Chromat.*, 1978, 155, 209–213.

Disposition in the Body. About 10% of a topical dose is absorbed and after vaginal application about 5% of the dose is absorbed. Following oral administration, about 40% of the dose is excreted in the urine and 30% is eliminated in the faeces, in 5 days.

BLOOD CONCENTRATION.

A mean peak plasma concentration of 2.6 μ g/ml has been reported 2.5 hours after oral administration of 250 mg of econazole to 8 subjects (R. C. Heel *et al.*, *Drugs*, 1978, 16, 177–201).

Uses. Econazole nitrate is applied topically in a concentration of 1%, or as pessaries.

Ecothiophate Iodide*Anticholinesterase*

Synonyms. Diethoxyphosphinylthiocholine Iodide; Echothiophate Iodide; Echothiophate Iodide; Ecostigmine Iodide.

Proprietary Names. Echodide; Phospholine Iodide; Phospholinjodid.

(2-Diethoxyphosphinylthioethyl)trimethylammonium iodide

 $C_9H_{23}INO_3PS = 383.2$

CAS—6736-03-4 (ecothiophate); 513-10-0 (iodide)

A white, hygroscopic, crystalline powder. M.p. about 119°, with decomposition.

Soluble 1 in 1 of water, 1 in 25 of ethanol, and 1 in 3 of methanol; practically insoluble in chloroform and ether.

Colour Test. Palladium Chloride—orange.

Thin-layer Chromatography. System TA—Rf 02. (Acidified iodoplatinate solution, positive.)

Use. As a 0.03 to 0.25% ophthalmic solution.

Edrophonium Chloride

Anticholinesterase

Proprietary Name. Tensilon

Ethyl(3-hydroxyphenyl)dimethylammonium chloride

$C_{10}H_{16}ClNO = 201.7$

CAS—312-48-1 (edrophonium); 116-38-1 (chloride)

A white crystalline powder. M.p. 165° to 170°, with decomposition.

Soluble 1 in 0.5 of water and 1 in 5 of ethanol; practically insoluble in chloroform and ether.

Colour Test. Mandelin's Test—blue-green.

Thin-layer Chromatography. System TA—Rf .07. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—273 nm ($A_1^1 = 110$ a); aqueous alkali—240 nm ($A_1^1 = 550$ b), 294 nm ($A_1^1 = 170$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1609, 690, 1217, 1495, 934, 1280 (KBr disk).

Disposition in the Body.

THERAPEUTIC CONCENTRATION.

Following intravenous injections of 100 µg/kg to 5 subjects, plasma concentrations of 0.8 to 3.9 µg/ml (mean 1.6) were reported at 2 minutes, declining to 0.038 to 0.056 µg/ml (mean 0.048) at 1 hour (T. N. Calvey *et al.*, *Clin. Pharmac. Ther.*, 1976, 19, 813–820).

TOXICITY. The estimated minimum lethal dose is 100 mg.

HALF-LIFE. Plasma half-life, about 0.5 hour.

Dose. 2 to 10 mg intravenously, in the diagnosis of myasthenia gravis.

Embutramide

Narcotic Analgesic

Proprietary Name. It is an ingredient of Tanax (vet.).

N-(β,β-Diethyl-*m*-methoxyphenethyl)-4-hydroxybutyramide

$C_{17}H_{27}NO_3 = 293.4$

CAS—15687-14-6

Crystals. M.p. 70°.

Colour Tests. Mandelin's Test—brown; Marquis Test—blue.

Thin-layer Chromatography. System TA—Rf 72. (Acidified potassium permanganate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—271 nm ($A_1^1 = 50$ b), 276 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1652, 1248, 1037, 1595, 1562, 1063 (KBr disk).

Quantification. ULTRAVIOLET SPECTROPHOTOMETRY. In blood or urine—E. Bertol *et al.*, *J. pharm. biomed. Analysis*, 1983, 1, 373–377.

Disposition in the Body.

TOXICITY.

In 3 fatalities due to the injection of a preparation containing embutramide and mebezonium iodide, the following postmortem concentrations ($\mu\text{g/ml}$) were reported:

	Embutramide	Mebezonium iodide
Blood	3.0, 15.5, 12.1	4.5, 6.0, 7.5
Urine	2.0, 6.3, 4.5	0.8, 2.0, 1.8

(E. Bertol *et al.*, *idem.*).

Emepromonium Bromide

Anticholinergic

Proprietary Names. Cetiprin; Uro-Ripirin.

Ethylidimethyl(1-methyl-3,3-diphenylpropyl)ammonium bromide

$\text{C}_{20}\text{H}_{28}\text{BrN} = 362.4$

CAS—27892-33-7 (emepromonium); 3614-30-0 (bromide)

A white crystalline powder. M.p. 201° to 206° .

Soluble in water, ethanol, and chloroform.

Colour Test. Liebermann's Test—brown.

Thin-layer Chromatography. System TA—Rf 05. (Acidified iodoplatinate solution, strong reaction.)

Gas Chromatography. System GA—RI 1973.

High Pressure Liquid Chromatography. System HA—k' 5.2.

Ultraviolet Spectrum. Aqueous acid—253 nm, 258 nm ($A_1^1 = 13$ a), 268 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 708, 699, 752, 1102, 742, 1134 (KBr disk).

Quantification. GAS CHROMATOGRAPHY. In serum: sensitivity 200 $\mu\text{g/ml}$, ECD—P. Hartvig *et al.*, *J. pharm. Sci.*, 1976, 65, 1707–1709.

Disposition in the Body. Poorly absorbed after oral administration; less than 5% of a dose is excreted in the urine in 24 hours, partly as metabolites. After intramuscular administration, about 30% of a dose is excreted in the urine in 3 days and 45% is eliminated in the faeces in the same period.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 150 mg to 5 subjects, peak serum concentrations of 0.017 to 0.10 $\mu\text{g/ml}$ were attained in about 2 hours (J. Vessman *et al.*, *Acta pharm. suec.*, 1970, 7, 363–372).

HALF-LIFE. Plasma half-life, about 7 to 11 hours.

Dose. 200 to 600 mg daily.

Emetine

Anti-amoebic

Synonyms. Ipecine; Methylcephaeline.

6',7',10,11-Tetramethoxyemetan

$\text{C}_{29}\text{H}_{40}\text{N}_2\text{O}_4 = 480.6$

CAS—483-18-1

An alkaloid present in ipecacuanha, the dried root, or rhizome and roots, of *Cephaelis ipecacuanha* (= *Uragoga ipecacuanha*) (Rubiaceae) or *C. acuminata*.

A white amorphous powder. M.p. 74° .

Slightly **soluble** in water; soluble in ethanol, chloroform, and ether.

Emetine Hydrochloride

Synonym. Emetine Dihydrochloride

$\text{C}_{29}\text{H}_{40}\text{N}_2\text{O}_4 \cdot 2\text{HCl} \cdot 7\text{H}_2\text{O} = 679.7$

CAS—316-42-7 (anhydrous); 7083-71-8 (hydrate)

A white or very slightly yellow, crystalline powder. M.p. 235° to 255°, after drying.

Soluble 1 in 8 of water, 1 in 12 of ethanol (90%), and 1 in 4 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 7.4, 8.3 (25°).

Colour Test. Liebermann's Test—black.

Thin-layer Chromatography. System TA—Rf 54; system TB—Rf 09; system TC—Rf 34. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2505.

High Pressure Liquid Chromatography. System HA— k' 7.1 (tailing peak).

Ultraviolet Spectrum. Aqueous acid—230 nm ($A_1^1 = 341$ a), 282 nm ($A_1^1 = 158$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1514, 1256, 1228, 1110, 1200, 1150 (KBr disk).

Mass Spectrum. Principal peaks at m/z 192, 206, 272, 480, 288, 246, 205, 191.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 10 ng/ml, fluorescence detection—S. J. Bannister *et al.*, *J. Chromat.*, 1979, 176, 381–390. In blood or urine: sensitivity 5 ng/ml, fluorescence detection—D. J. Crouch *et al.*, *J. analyt. Toxicol.*, 1984, 8, 63–65.

Disposition in the Body. Rapidly absorbed after oral administration and after injection; concentrated in the liver, kidneys, lungs, and spleen. It is excreted only very slowly in the urine and detectable concentrations are found up to 60 days after treatment.

TOXICITY. The minimum lethal dose is 150 mg.

In a fatality which occurred after chronic ingestion of about 70 mg of emetine daily for 3 months, the following postmortem tissue concentrations were reported: blood 2.4 µg/g, bile 1.9 µg/g, kidney 7.4 µg/g, liver 14 µg/g (A. G. Adler *et al.*, *J. Am. med. Ass.*, 1980, 243, 1927–1928).

Dose. Up to 60 mg of emetine hydrochloride daily, subcutaneously or intramuscularly, for no longer than 10 days.

Emylcamate

Tranquilliser/Muscle Relaxant

1-Ethyl-1-methylpropyl carbamate

$C_7H_{15}NO_2 = 145.2$

CAS—78-28-4

A white crystalline powder. M.p. 56° to 58°.

Soluble 1 in 250 of water; freely soluble in ethanol and ether.

Gas Chromatography. System GA—RI 1105.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1690, 1610, 1041, 1170, 1150, 1010 (KCl disk).

Mass Spectrum. Principal peaks at m/z 73, 43, 84, 55, 69, 41, 44, 85.

Dose. Emylcamate was formerly given in doses of 600 to 800 mg daily.

Enallypropymal

Barbiturate

5-Allyl-5-isopropyl-1-methylbarbituric acid

$C_{11}H_{16}N_2O_3 = 224.3$

CAS—1861-21-8

Crystals. M.p. 56° to 57°.

Soluble in organic solvents.

Thin-layer Chromatography. System TD—Rf 71; system TE—Rf 58; system TF—Rf 71; system TH—Rf 87.

Gas Chromatography. System GA—RI 1561.

High Pressure Liquid Chromatography. System HG— k' 8.65; system HH— k' 6.96.

Ultraviolet Spectrum. Borax buffer 0.05M (pH 9.2)—245 nm ($A_1^1 = 329$ b); M sodium hydroxide (pH 13)—244 nm ($A_1^1 = 362$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1689, 1718, 1550, 1640, 1285, 672.

Mass Spectrum. Principal peaks at m/z 181, 41, 182, 39, 124, 53, 138, 97.

Endosulfan

Pesticide

Synonym. Benzoepin

Proprietary Name. Thiodan

1,4,5,6,7,7-Hexachloro-8,9,10-trinorborn-5-en-2,3-ylene dimethyl sulphite

$C_9H_6Cl_6O_3S = 406.9$

CAS—115-29-7; 959-98-8 (α); 33213-65-9 (β)

Endosulfan is a mixture of 2 stereoisomers: the α -isomer, m.p. 109° , accounts for about 70% of the technical grade and the β -isomer, m.p. 213° , for about 30%.

The technical grade is a brownish crystalline solid. M.p. 70° to 100° .

Practically **insoluble** in water; moderately soluble in most organic solvents.

Gas Chromatography. System GA—RI 2085; system GK—retention time 1.10 relative to caffeine.

Mass Spectrum. Principal peaks at m/z 195, 36, 237, 41, 241, 75, 239, 170.

Quantification. GAS CHROMATOGRAPHY. In blood or tissues: ECD or FID—A. Coutselinis *et al.*, *Forens. Sci.*, 1976, 8, 251–254.

GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In serum, urine or tissues: detection limit 2 ng for α -endosulfan—J. Demeter *et al.*, *Quant. Mass Spectrom. Life Sci.*, 1978, 2, 471–481.

Disposition in the Body.

TOXICITY.

In 3 fatalities attributed to the ingestion of endosulfan, the following postmortem tissue concentrations were reported: blood 4, 7, and 8 $\mu\text{g/ml}$; brain 0.25, 0.28, and 0.3 $\mu\text{g/g}$; kidney 2.4, 2.8, and 3.2 $\mu\text{g/g}$; liver 0.8, 1.4, and 1 $\mu\text{g/g}$ (A. Coutselinis *et al.*, *Forens. Sci.*, 1978, 11, 75).

Endrin

Insecticide

1,2,3,4,10,10-Hexachloro-6,7-epoxy-1,4,4a,5,6,7,8,8a-octa-hydro-1,4:5,8-dimethanonaphthalene

$C_{12}H_8Cl_6O = 380.9$

CAS—72-20-8

A white crystalline solid. M.p. about 230° , with decomposition. Practically **insoluble** in water; sparingly soluble in ethanol.

Colour Tests. Nitric-Sulphuric Acid—pink; Sulphuric Acid—Fuming Sulphuric Acid—pink-orange.

Gas Chromatography. System GA—RI 2183; system GK—retention time 1.19 relative to caffeine.

Infra-red Spectrum. Principal peaks at wavenumbers 851, 750, 724, 1049, 889, 1010 (Nujol mull).

Mass Spectrum. Principal peaks at m/z 67, 81, 263, 36, 79, 82, 261, 265.

Quantification. COLORIMETRY. In blood, urine or tissues: sensitivity 4 µg/ml—R. T. Sane and S. S. Kamat, *Forens. Sci. Int.*, 1981, 18, 63–66.

Enflurane

General Anaesthetic

Synonym. Methylflurether

Proprietary Names. Alyrane; Efrane; Ethrane.

2-Chloro-1,1,2-trifluoroethyl difluoromethyl ether

$C_3H_2ClF_5O = 184.5$

CAS—13838-16-9

A colourless volatile liquid. B.p. 55.5° to 57.5°. Relative density 1.516 to 1.519.

Gas Chromatography. System GA—RI 462; system GI—retention time 8.3 min.

Quantification. GAS CHROMATOGRAPHY. In blood: detection limit 1.5 µg/ml, TCD—M. S. Miller and A. J. Gandolfi, *Anesthesiology*, 1979, 51, 542–544.

Disposition in the Body. Readily absorbed on inhalation. About 50% of a dose is exhaled unchanged in 18 hours and more than 80% is exhaled in 5 days. Less than 5% of a dose is excreted in the urine as non-volatile metabolites. Difluoromethoxydifluoroacetic acid has been identified as a urinary metabolite.

THERAPEUTIC CONCENTRATION.

In 10 subjects receiving anaesthesia with 0.5 to 2.5% v/v of enflurane, a mean peak venous blood concentration of 95 µg/ml was attained in 30 minutes, declining to 0.5 µg/ml at 90 minutes after discontinuation of anaesthesia (I. M. Corall *et al.*, *Br. J. Anaesth.*, 1977, 49, 881–885).

A mean peak serum-fluoride concentration of 0.2 µg/ml was attained 3 hours after induction in 18 subjects receiving 0.6 to 2% v/v of enflurane (P. Duvaldestin *et al.*, *Clin. Pharmac. Ther.*, 1981, 29, 61–64).

HALF-LIFE. About 36 hours.

Dose. For induction of anaesthesia, up to 4% of the vapour by inhalation; maintenance, 0.5 to 3%.

Enoxolone

Dermatological Agent

Synonyms. Glycyrrhetic Acid; Glycyrrhetic Acid.

Proprietary Names. PO 12. It is an ingredient of Biosone GA.

3β-Hydroxy-11-oxo-olean-12-en-30-oic acid

$C_{30}H_{46}O_4 = 470.7$

CAS—471-53-4

A white or faintly cream-coloured powder. M.p. 296°.

Very sparingly **soluble** in water; soluble in ethanol and ether; freely soluble in chloroform.

Colour Tests. Antimony Pentachloride—orange-brown → violet; Naphthol-Sulphuric Acid—red-brown/orange; Sulphuric Acid—yellow.

Thin-layer Chromatography. System TD—Rf 21; system TE—Rf 07; system TF—Rf 46.

Ultraviolet Spectrum. Aqueous acid—254 nm; aqueous alkali—260 nm ($A_1^1 = 338$ b).

Mass Spectrum. Principal peaks at m/z 303, 262, 135, 175, 41, 55, 43, 95.

Disposition in the Body. Enoxolone is a metabolite of carbenoxolone.

Use. Has been used topically in a concentration of 2%.

Ephedrine

Sympathomimetic

Synonym. Hydrated Ephedrine

Proprietary Names. It is an ingredient of Asmapax and Franol Expect.

(1R,2S)-2-Methylamino-1-phenylpropan-1-ol hemihydrate

$C_{10}H_{15}NO \cdot \frac{1}{2}H_2O = 174.2$

CAS—50906-05-3

An alkaloid obtained from species of *Ephedra*, or prepared synthetically.

Colourless crystals or white crystalline powder or granules which decompose on exposure to light. M.p. 40° to 43° without previous drying; in warm weather it slowly volatilises.

Soluble 1 in 20 of water and 1 in less than 1 of ethanol; soluble in chloroform with turbidity due to separation of water; soluble in ether.

Anhydrous Ephedrine

Synonym. Ephedrine

$C_{10}H_{15}NO = 165.2$

CAS—299-42-3

Unctuous deliquescent colourless crystals, or white crystalline powder. It rapidly absorbs carbon dioxide and decomposes on exposure to light. M.p. about 38°.

Soluble 1 in 20 of water; very soluble in ethanol; soluble in chloroform; freely soluble in ether.

Ephedrine Hydrochloride

Synonyms. Ephedrinum Chloratum; *l*-Ephedrinum Hydrochloricum.

Proprietary Names. It is an ingredient of many proprietary preparations—see *Martindale, The Extra Pharmacopoeia*, 28th Edn.

$C_{10}H_{15}NO \cdot HCl = 201.7$

CAS—50-98-6

Colourless crystals or white crystalline powder. M.p. 217° to 220°.

Soluble 1 in 3 to 1 in 4 of water and 1 in 14 to 1 in 17 of ethanol; very slightly soluble in chloroform; practically insoluble in ether.

Ephedrine Sulphate

Proprietary Names. Ectasule Minus. It is an ingredient of Enuretrol, Expansyl, and Franol Plus.

$(C_{10}H_{15}NO)_2 \cdot H_2SO_4 = 428.5$

CAS—134-72-5

Fine white crystals or powder which darken on exposure to light. M.p. 258°, with decomposition.

Soluble 1 in 1.3 of water and 1 in 90 of ethanol.

Dissociation Constant. pK_a 9.6 (25°).

Partition Coefficient. Log P (octanol), 1.0.

Colour Test. Liebermann's Test—red-orange.

Thin-layer Chromatography. System *TA*—Rf 30; system *TB*—Rf 05; system *TC*—Rf 05. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, brown; ninhydrin spray, positive; acidified potassium permanganate solution, positive.)

Gas Chromatography. System *GA*—ephedrine RI 1363, norephedrine RI 1313; system *GB*—ephedrine RI 1386, norephedrine RI 1353; system *GC*—ephedrine RI 1467, norephedrine RI 1383.

High Pressure Liquid Chromatography. System *HA*—ephedrine k' 1.0, norephedrine k' 0.9; system *HB*—ephedrine k' 5.68, norephedrine k' 3.87; system *HC*—ephedrine k' 1.79, norephedrine k' 0.70.

Ultraviolet Spectrum. Aqueous acid—251 nm, 257 nm ($A_1^1 = 12$ a), 263 nm. No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 994, 699, 754, 1049, 1242, 670 (ephedrine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 58, 146, 56, 105, 77, 42, 106, 40; norephedrine 44, 77, 79, 51, 45, 42, 107, 105.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: sensitivity 2 ng/ml in plasma, ECD—K. K. Midha *et al.*, *J. pharm. Sci.*, 1979, 68, 557–560.

Disposition in the Body. Readily absorbed after oral or percutaneous administration. Metabolised by *N*-demethylation to norephedrine (phenylpropanolamine) and by oxidative deamination followed by conjugation. Accumulates in the liver, lungs, kidneys, spleen, and brain. About 90% of a dose is excreted in the urine in 24 hours, with about 55 to 75% of the dose as unchanged drug, 8 to 20% as norephedrine, and 4 to 13% as deaminated metabolites such as benzoic acid, hippuric acid, and 1-phenylpropane-1,2-diol. In acidic urine, excretion of unchanged drug is increased slightly, whereas in alkaline urine, about 20 to 35% of the dose is excreted unchanged and the proportion of norephedrine is increased. Ephedrine is a metabolite of methylephedrine.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.035 to 0.08 $\mu\text{g/ml}$.

After a single oral dose of 22 mg of the hydrochloride to 10 subjects, peak plasma concentrations of 0.04 to 0.14 $\mu\text{g/ml}$ (mean 0.08) were attained; after daily oral doses of 33 mg of the hydrochloride to 10 subjects, peak plasma concentrations of 0.07 to 0.12 $\mu\text{g/ml}$ (mean 0.08) were obtained (J. F. Costello *et al.*, *Br. J. clin. Pharmac.*, 1975, 2, 180P–181P).

TOXICITY. The estimated minimum lethal dose in children up to 2 years of age is 200 mg and for adults 2 g but fatalities are rare. Single doses of up to 400 mg have been given without causing serious toxic effects.

HALF-LIFE. Plasma half-life, 3 to 11 hours but may be increased when the urine is alkaline and decreased when it is acid.

Dose. 45 to 240 mg of ephedrine hydrochloride or sulphate daily.

Epithiazide

Diuretic

Synonym. Epitizide

Proprietary Name. It is an ingredient of Thiaver.

6-Chloro-3,4-dihydro-3-(2,2,2-trifluoroethylthiomethyl)-2H-1,2,4-benzothiadiazine-7-sulphonamide 1,1-dioxide
 $\text{C}_{10}\text{H}_{11}\text{ClF}_3\text{N}_3\text{O}_4\text{S}_3 = 425.8$
CAS—1764-85-8

A white crystalline powder. M.p. 206° to 207°.

Practically **insoluble** in water; soluble in alkaline solutions.

Ultraviolet Spectrum. Aqueous acid—272 nm, 315 nm. (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 1176, 1314, 1167, 1126, 1603, 1269 (Nujol mull).

Dose. 8 to 12 mg daily.

Ergocalciferol

Vitamin

Synonyms. Calciferol; Irradiated Ergosterol; Viosterol; Vitamin D₂.

Proprietary Names. Deltar; Drisdol; Endo D; Farmobion D₂; Ostelin; Radiostol; Sterogyl-15; Vidue; Vigantolo.

Note. Ergocalciferol is also used as a rodenticide. It is an ingredient of Sorex C.R.

(5Z,7E,22E)-9,10-Secoergosta-5,7,10(19),22-tetraen-3β-ol

C₂₈H₄₄O = 396.7

CAS—50-14-6

Colourless or slightly yellow crystals, or white or slightly yellow crystalline powder. M.p. 113° to 119°.

Practically **insoluble** in water; soluble 1 in 2 of ethanol, 1 in 10 of acetone, 1 in 0.7 of chloroform, and 1 in 2 of ether.

Ultraviolet Spectrum. Ethanol—265 nm (A₁¹ = 475 b).

Infra-red Spectrum. Principal peaks at wavenumbers 973, 1059, 1079, 1712, 893, 1000 (KBr disk).

Quantification. See under Cholecalciferol.

Disposition in the Body. Well absorbed after oral administration; absorption may be decreased with impaired liver and biliary

function, and extensive enterohepatic circulation occurs. Metabolised by 25-hydroxylation in the liver followed by 1α- or 24-hydroxylation in the kidney; possibly conjugated with glucuronic acid or sulphate. Excreted mainly in the bile together with small amounts of metabolites in the urine; unchanged ergocalciferol does not appear to be excreted in the urine.

BLOOD CONCENTRATION. Normal serum concentrations of 25-hydroxyergocalciferol are about 0.01 to 0.04 µg/ml but there are considerable intersubject and seasonal variations.

HALF-LIFE. About 40 days.

PROTEIN BINDING. In blood, bound to α- and β-lipoproteins.

Dose. 0.025 to 5 mg daily.

Ergometrine

Ergot Alkaloid

Synonyms. Ergobasine; Ergonovine.

N-[(S)-2-Hydroxy-1-methylethyl]-D-lysergamide

C₁₉H₂₃N₃O₂ = 325.4

CAS—60-79-7

Colourless crystals. Solutions in water give a blue fluorescence. M.p. 162°.

Slightly **soluble** in water; more soluble in ethanol; sparingly soluble in chloroform.

Ergometrine Maleate

Synonyms. Ergometrinhydrogenmaleate; Ergonovine Bimaleate; Ergonovine Maleate.

Proprietary Names. Ergomine; Ergotrate; Ermaleate; Ermetrine. It is an ingredient of Syntometrine.

C₁₉H₂₃N₃O₂·C₄H₄O₄ = 441.5

CAS—129-51-1

A white or yellowish, slightly hygroscopic, microcrystalline powder. It darkens with age and on exposure to light. Solutions in water and ethanol give a blue fluorescence. M.p. about 185°, with decomposition.

Soluble 1 in 40 of water and 1 in 100 of ethanol; practically insoluble in chloroform and ether.

Ergometrine Tartrate

Synonym. Ergonovinum Tartaricum

(C₁₉H₂₃N₃O₂)₂·C₄H₆O₆ = 800.9

CAS—129-50-0

White or slightly reddish-yellow, very light, matted masses of acicular crystals.

Soluble in water and ethanol; slightly soluble in chloroform and ether.

Dissociation Constant. pK_a 6.8 (20°).

Partition Coefficient. Log P (ether), −0.9.

Colour Tests. p-Dimethylaminobenzaldehyde—violet; Marquis Test—brown.

Thin-layer Chromatography. System TA—Rf 57; system TB—Rf 00; system TC—Rf 12; system TL—Rf 08; system TM—Rf 26. (Van Urk reagent, blue.)

High Pressure Liquid Chromatography. System HA— k' 0.4; system HP— k' 0.50.

Ultraviolet Spectrum. Aqueous acid—313 nm ($A_1^1 = 240$ a); aqueous alkali—310 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1634, 754, 748, 1044, 1212, 1541.

Mass Spectrum. Principal peaks at m/z 221, 72, 325, 54, 196, 55, 207, 181.

Disposition in the Body. More rapidly absorbed from the gastrointestinal tract than ergotamine. Metabolised by hydroxylation and glucuronic acid conjugation and possibly *N*-demethylation. Peak plasma concentrations are attained within 60 to 90 minutes and are more than tenfold those achieved with an equivalent dose of ergotamine. It is less toxic than ergotamine. Ergometrine has been reported to be detected unchanged in urine up to 8 hours after injection, the maximum concentration usually occurring 2 to 3 hours after an injection. It is mainly excreted in the bile as 12-hydroxyergometrine glucuronide.

Dose. 0.4 to 1.5 mg of ergometrine maleate daily, by mouth; doses of 200 to 500 µg are given intramuscularly.

Ergotamine

Ergot Alkaloid

12'-Hydroxy-2'-methyl-5'-benzylergotaman-3',6',18-trione
 $C_{33}H_{35}N_5O_5 = 581.7$
 CAS—113-15-5

Hygroscopic crystals which darken and decompose on exposure to air, heat, and light. M.p. 212° to 214°, with decomposition. Practically **insoluble** in water; slightly soluble in ethanol; freely soluble in chloroform.

Ergotamine Tartrate

Proprietary Names. Ergomar; Ergostat; Gynergen(e); Lingraine. It is an ingredient of Cafergot, Effergot, and Migril.

$(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6 = 1313$

CAS—379-79-3

Colourless crystals or white or yellowish-white crystalline powder. M.p. about 180°, with decomposition.

Soluble 1 in about 500 of water and 1 in 500 of ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 6.4 (24°).

Colour Tests. *p*-Dimethylaminobenzaldehyde—violet; Mandelin's Test—violet-brown; Marquis Test—brown.

Thin-layer Chromatography. System TA—Rf 63; system TB—Rf 01; system TC—Rf 34; system TL—Rf 23; system TM—Rf 48. (Van Urk reagent, blue.)

Gas Chromatography. System GA—RI 2366.

High Pressure Liquid Chromatography. System HA— k' 0.4; system HP— k' 9.58.

Ultraviolet Spectrum. Aqueous acid—316 nm ($A_1^1 = 133$ a); aqueous alkali—310 nm ($A_1^1 = 148$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1631, 1712, 750, 1208, 1136, 1160 (KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 125, 44, 70, 91, 41, 40, 244, 153 (no peaks above 250).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or serum: ergotamine and methylergometrine, detection limit 100 pg/ml, fluorescence detection—P. O. Edlund, *J. Chromat.*, 1981, 226; *Biomed. Appl.*, 15, 107–115.

RADIOIMMUNOASSAY. In plasma—H. F. Schran *et al.*, *Clin. Chem.*, 1979, 25, 1928–1933.

Disposition in the Body. Poorly absorbed after oral administration; the extent and rate of absorption is increased if caffeine is administered concurrently. Ergotamine is rapidly metabolised in the liver and is excreted mainly in the bile as metabolites; only traces of unchanged drug are excreted in the urine or faeces.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 2 mg of ergotamine tartrate administered to 11 subjects, peak plasma concentrations of 0.0001 to 0.0009 µg/ml (mean 0.0006) were attained in 0.5 to 3 hours; following an intramuscular dose of 0.5 mg given to 10 subjects, peak plasma concentrations of 0.0009 to 0.004 µg/ml (mean 0.002) were attained in about 0.5 hour (V. Ala-Hurula *et al.*, *Eur. J. clin. Pharmac.*, 1979, 15, 51–55).

TOXICITY. Ergotamine is highly toxic; in large repeated doses it can produce all the symptoms of ergot poisoning. Fatal poisoning has occurred after the oral administration of 26 mg of ergotamine over a period of several days, and also following single injections of only 0.5 to 1.5 mg.

In 12 cases of non-fatal ergotamine overdose, plasma concentrations of 0 to 0.003 µg/ml (mean 0.0008) were reported 1.7 to 5 hours after ingestion (D. Lamb *et al.*, *Human Toxicol.*, 1983, 2, 424).

HALF-LIFE. Plasma half-life, about 2 hours.

VOLUME OF DISTRIBUTION. About 2 litres/kg.

CLEARANCE. Plasma clearance, about 5 to 18 ml/min/kg (mean 11).

Dose. Not more than 8 mg of ergotamine tartrate in a day or 12 mg in any one week.

Ergotoxine

Ergot Derivative

Synonym. Ecboline

Ergotoxine is a mixture of the 3 isomorphous alkaloids ergocornine, ergocristine, and ergocryptine.

$C_{31}H_{39}N_5O_5 = 561.7$

CAS—8006-25-5

Crystals. M.p. 190°, with decomposition.

Practically **insoluble** in water; soluble in ethanol; very soluble in chloroform; slightly soluble in ether.

Ergotoxine Esylate

Synonym. Ergotoxine Ethanesulphonate

$C_{31}H_{39}N_5O_5 \cdot C_2H_5SO_3H = 671.8$

CAS—8047-28-7

Colourless crystals which decompose at 209°.

Sparingly **soluble** in water; more soluble in ethanol.

Colour Test. *p*-Dimethylaminobenzaldehyde—violet.

Thin-layer Chromatography. System TA—Rf 66; system TB—Rf 01; system TC—Rf 62; system TL—Rf 48; system TM—Rf 67. (Acidified potassium permanganate solution, strong reaction; Van Urk reagent, blue.)

Gas Chromatography. System GA—ergocristine RI 2495, ergocryptine RI 2184.

High Pressure Liquid Chromatography. System HA—ergocornine k' 0.4, ergocristine k' 0.3, ergocryptine k' 0.4; system HP—ergocornine k' 10.2, ergocristine k' 17.3, ergocryptine k' 15.2.

Infra-red Spectrum. Principal peaks at wavenumbers 1639, 1721, 758, 1534, 1212, 1294 (KBr disk).

Mass Spectrum. Principal peaks at m/z 43, 70, 29, 71, 27, 154, 41, 267; ergocornine 43, 70, 71, 54, 44, 154, 267, 55; ergocristine 70, 125, 71, 91, 153, 267, 154, 221; ergocryptine 43, 70, 71, 154, 41, 209, 69, 267.

Dose. Ergotoxine esylate was formerly given parenterally in doses of 0.5 to 1 mg.

Erythromycin

Antibiotic

Proprietary Names. Abbotcine; Bram-mycin; Emu-V; E-Mycin (tablets); Eratrex; Eryc; Erycen; Erycinum (tablets); Erythromid; Ilocap; Ilotycin; Retcin; Robimycin.

$C_{37}H_{67}NO_{13} = 733.9$

CAS—114-07-8 (erythromycin A)

An antimicrobial substance produced by the growth of certain strains of *Streptomyces erythreus*. It is a mixture consisting largely of erythromycin A with lesser amounts of erythromycins B and C.

White or slightly yellow, slightly hygroscopic, crystals or powder. M.p. about 135°.

Soluble 1 in 1000 of water, less soluble at higher temperatures; soluble 1 in 5 of ethanol, 1 in 6 of chloroform, and 1 in 5 of ether.

Erythromycin Estolate

Synonyms. Erythromycin Propionate Lauryl Sulphate; Propionyl Erythromycin Lauryl Sulphate.

Proprietary Names. Eromycin; Ilosone; Neo-Erycinum; Novorythro; Propiocine; Togiren.

$C_{40}H_{71}NO_{14} \cdot C_{12}H_{26}O_4S = 1056$
CAS—3521-62-8

A white crystalline powder. M.p. 135° to 138°.

Practically **insoluble** in water; soluble 1 in 2 of ethanol, 1 in 15 of acetone, and 1 in 10 of chloroform.

Erythromycin Ethylsuccinate

Proprietary Names. Abbotcin(e); Anamycin; Arpimycin; EES; E-Mycin E; Eromerzin; Erythrocin IM; Erythrocin; Erythroped; Pediamycin; Wyamycin E.

$C_{43}H_{75}NO_{16} = 862.1$
CAS—1264-62-6

A white or slightly yellow crystalline powder.

Very slightly **soluble** in water; freely soluble in ethanol and chloroform.

Erythromycin Gluceptate

Synonym. Erythromycin Glucoheptonate

Proprietary Names. Erycinum; Ilotycin Gluceptate.

$C_{37}H_{67}NO_{13} \cdot C_7H_{14}O_8 = 960.1$
CAS—23067-13-2

A white, slightly hygroscopic powder.

Freely **soluble** in water, ethanol, and methanol; slightly soluble in chloroform; practically insoluble in ether.

Erythromycin Lactobionate

Proprietary Names. Abbotcin; Erythrocin I.V. Lactobionate; Erythrocin Lactobionate.

$C_{37}H_{67}NO_{13} \cdot C_{12}H_{22}O_{12} = 1092$
CAS—3847-29-8

White or slightly yellow crystals or powder.

Freely **soluble** in water, ethanol, and methanol; slightly soluble in chloroform; practically insoluble in ether.

Erythromycin Propionate

Proprietary Names. Ery 500; Propiocine.

$C_{40}H_{71}NO_{14} = 790.0$
CAS—134-36-1

A white powder.

Slightly **soluble** in water; freely soluble in ethanol and chloroform.

Erythromycin Stearate

Proprietary Names. Abbotcin(e); Bristamycin; Dowmycin-E; E-Mycin (capsules); Erostin; Erypar; Erythrocin(e); Ethril; Ethryn; Novorythro; Pfizer-E.

$C_{37}H_{67}NO_{13} \cdot C_{18}H_{36}O_2 = 1018$
CAS—643-22-1

White or slightly yellow crystals or powder.

Practically **insoluble** in water; partly soluble in ethanol, chloroform, and ether.

Dissociation Constant. pK_a 8.9.

Colour Test. Marquis Test—brown.

Infra-red Spectrum. Principal peaks at wavenumbers 1050, 1168, 1074, 1010, 1108, 1734 (KBr disk).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: erythromycin and erythromycin ethylsuccinate, detection limits <10 ng/ml, derivatisation and fluorescence detection—K. Tsuji, *J. Chromat.*, 1978, 158, 337–348.

Disposition in the Body. Erythromycin base is destroyed by gastric acid; erythromycin stearate is hydrolysed in the intestine and absorbed as free erythromycin; the estolate is absorbed as the ester and then hydrolysed. About 5 to 10% of a dose is excreted in the urine unchanged and large amounts of unchanged drug are excreted in the bile.

THERAPEUTIC CONCENTRATION.

Following single oral doses of 250 mg, 500 mg, and 1 g of a preparation containing enteric-coated pellets of erythromycin base to 23 subjects, mean peak serum concentrations of 1.9, 3.8, and 6.5 µg/ml, respectively, were attained in about 2 hours. After a single oral dose of 500 mg of erythromycin stearate to the same subjects, a mean peak serum concentration of 2.9 µg/ml was attained in about 2 hours (K. Josefsson *et al.*, *Br. J. clin. Pharmac.*, 1982, 13, 685–691).

Following oral administration of 250 mg of erythromycin four times a day to 16 subjects, maximum and minimum steady-state plasma concentrations of 1.7 and 0.45 µg/ml were reported on the third day, compared to 1.34 and 0.58 µg/ml respectively, following repeated oral administration of erythromycin estolate (A. R. DiSanto *et al.*, *J. clin. Pharmac.*, 1980, 20, 437–443).

HALF-LIFE. Plasma half-life, about 1 to 3 hours (dose-dependent).

VOLUME OF DISTRIBUTION. About 0.7 litre/kg.

CLEARANCE. Plasma clearance, about 7 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 0.43.

PROTEIN BINDING. In plasma, erythromycin about 70 to 80%, erythromycin propionate about 90 to 99%, erythromycin stearate about 90%.

Dose. 1 to 4 g daily.

Etafedrine

Sympathomimetic

Synonym. Ethylephedrine

(–)-2-(Ethylmethylamino)-1-phenylpropan-1-ol

$C_{12}H_{19}NO = 193.3$

CAS—48141-64-6

Etafedrine Hydrochloride

Proprietary Name. It is an ingredient of Nethaprin and Nethaprin Dospan.

$C_{12}H_{19}NO \cdot HCl = 229.7$
CAS—5591-29-7

Crystals. M.p. 183° to 184°.

Soluble 1 in 1.5 of water and 1 in 8 of ethanol.

Thin-layer Chromatography. *System TA*—Rf 44; *system TB*—Rf 35; *system TC*—Rf 09. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. *System GA*—RI 1519; *system GB*—RI 1510; *system GC*—RI 1737.

High Pressure Liquid Chromatography. *System HA*— k' 1.9.

Ultraviolet Spectrum. Aqueous acid—251 nm, 257 nm ($A_1^1 = 10$ a), 263 nm. (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 697, 1051, 1020, 1000, 740, 1115 (KBr disk).

Mass Spectrum. Principal peaks at m/z 86, 58, 87, 42, 56, 77, 44, 43.

Dose. 80 to 200 mg of etafedrine hydrochloride daily.

Etamiphylline

Xanthine Bronchodilator

Synonym. Etamphyllin

7-(2-Diethylaminoethyl)theophylline

$C_{13}H_{21}N_5O_2 = 279.3$

CAS—314-35-2

A waxy solid. M.p. 75°.

Very **soluble** in water; slightly soluble in ethanol and ether.

Etamiphylline Camsylate

Synonym. Diétamiphylline Camphosulfonate

Proprietary Names. Camphophylline; Millophylline.

$C_{23}H_{37}N_5O_6S = 511.6$

CAS—19326-29-5

A white crystalline powder. M.p. 198° to 202°.

Very **soluble** in water; soluble in ethanol and chloroform; very slightly soluble in ether.

Colour Test. Amalic Acid Test—yellow/pink.

Thin-layer Chromatography. *System TA*—Rf 54; *system TB*—Rf 12; *system TC*—Rf 39. (Acidified iodoplatinate solution, positive.)

High Pressure Liquid Chromatography. *System HA*—k' 1.2.

Ultraviolet Spectrum. Water—274 nm ($A_1^1 = 320$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1656, 1706, 748, 1543, 1220, 1600.

Mass Spectrum. Principal peaks at m/z 86, 109, 30, 151, 87, 81, 99, 58.

Dose. 0.3 to 1.2 g of etamiphylline camsylate daily.

Wavelength

Etenzamide

Analgesic

Synonyms. Aethoxybenzamidum; Ethbenzamide; Ethenzamide; Ethylsalicylamide; Salicylamide *o*-Ethyl Ether.

Proprietary Name. Trancalgyl

2-Ethoxybenzamide

$C_9H_{11}NO_2 = 165.2$

CAS—938-73-8

A white crystalline powder. M.p. 131° to 134°.

Practically **insoluble** in cold water; slightly soluble in boiling water and in ether; soluble in ethanol and acetone; freely soluble in chloroform.

Colour Tests. Liebermann's Test—brown; Mandelin's Test—green-brown; Marquis Test—red; Nessler's Reagent—brown-orange (weak).

Thin-layer Chromatography. System *TA*—Rf 64; system *TB*—Rf 03; system *TC*—Rf 59. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System *GA*—RI 1542.

High Pressure Liquid Chromatography. System *HD*— k' 0.55; system *HW*— k' 4.6.

Ultraviolet Spectrum. Aqueous acid—234 nm ($A_1^1 = 540$ c), 293 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1634, 1233, 753, 1276, 1114, 1587 (KBr disk).

Mass Spectrum. Principal peaks at m/z 120, 92, 105, 148, 150, 121, 133, 65.

Dose. Etenzamide has been given in doses of up to 4 g daily.

Ethacridine

Disinfectant

6,9-Diamino-2-ethoxyacridine

$C_{15}H_{15}N_3O = 253.3$

CAS—442-16-0

Orange crystals. M.p. 226°.

Ethacridine Lactate

Synonyms. Acrinol; Acrinol Lactate; Aethacridinium Lacticum; Lactoacridine.

Proprietary Names. Metifex; Rivanol.

$C_{15}H_{15}N_3O \cdot C_3H_5O_3 = 343.4$

CAS—1837-57-6

A yellow crystalline powder. It forms yellow fluorescent solutions. M.p. about 245°, with decomposition.

Slowly **soluble** 1 in 15 of water, 1 in 9 of boiling water, and 1 in about 150 of ethanol.

Colour Test. Marquis Test—orange → red.

Thin-layer Chromatography. System *TA*—Rf 60. (Van Urk reagent, yellow.)

Ultraviolet Spectrum. Aqueous acid—268 nm ($A_1^1 = 2062$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1113, 1630, 1495, 1226, 1591, 1034 (KBr disk).

Dose. Ethacridine lactate has been given, by mouth, in doses of 200 to 600 mg daily.

Ethacrynic Acid

Diuretic

Synonyms. Etacrynic Acid; Etacrynsäure.

Proprietary Names. Edecril; Edecrin(e) (tablets); Hydromedin (tablets).

[2,3-Dichloro-4-(2-ethylacryloyl)phenoxy]acetic acid

$C_{13}H_{12}Cl_2O_4 = 303.1$

CAS—58-54-8

A white crystalline powder. M.p. about 123°.

Very slightly **soluble** in water; soluble 1 in 1.6 of ethanol, 1 in 6 of chloroform, and 1 in 3.5 of ether.

Caution. Ethacrynic acid, especially in the form of dust, is irritating to the skin, eyes, and mucous membranes.

Ethacrynate Sodium

Synonyms. Etacrynate Sodium; Sodium Etacrynate; Sodium Ethacrynate.

Proprietary Names. Edecrin(e) (injection); Hydromedin (injection).

$C_{13}H_{11}Cl_2NaO_4 = 325.1$

CAS—6500-81-8

Dissociation Constant. pK_a 3.5 (20°).

Thin-layer Chromatography. System *TD*—Rf 03; system *TE*—Rf 04; system *TF*—Rf 06.

Gas Chromatography. *System GA*—not eluted.

Ultraviolet Spectrum. Acid methanol—270 nm ($A_1^{15} = 115$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1726, 1249, 1279, 1077, 1586, 1661 (KBr disk).

Mass Spectrum. Principal peaks at m/z 247, 189, 249, 191, 243, 55, 29, 245.

Quantification. GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In plasma: detection limit 10 to 20 ng/ml—W. Stuber *et al.*, *J. Chromat.*, 1982, 227; *Biomed. Appl.*, 16, 193–198.

Disposition in the Body. Readily absorbed after oral administration and distributed to the liver and kidneys. After intravenous administration, 60% is excreted in the urine and 30% in the bile in 24 hours; urinary excretion is pH-dependent and the material excreted in the urine consists of unchanged drug, a cysteine conjugate, and a third unstable metabolite, in approximately equal proportions.

TOXICITY. Thrombocytopenia and fatal agranulocytosis have been reported during chronic treatment.

HALF-LIFE. Plasma half-life, 0.5 to 1 hour.

PROTEIN BINDING. In plasma, significantly bound.

Dose. Usually 50 to 150 mg daily; maximum of 400 mg daily.

Ethambutol

Antituberculous Agent

Synonym. EMB

(+)-(R,R)-NN'-Ethylenebis(2-aminobutan-1-ol)

$C_{10}H_{24}N_2O_2 = 204.3$

CAS—74-55-5

M.p. 88°.

Ethambutol Hydrochloride

Proprietary Names. Dexambutol; EMB-Fatol; Etibi; Myambutol. It is an ingredient of Mynah.

$C_{10}H_{24}N_2O_2 \cdot 2\text{HCl} = 277.2$

CAS—1070-11-7

A white, crystalline, hygroscopic powder. M.p. 199° to 204°.

Soluble 1 in 1 of water, 1 in 4 of ethanol, 1 in 850 of chloroform, and 1 in 9 of methanol; very slightly soluble in ether.

Dissociation Constant. pK_a 6.3, 9.5 (20°).

Thin-layer Chromatography. *System TA*—Rf 30; *system TB*—Rf 03; *system TC*—Rf 02. (Acidified potassium permanganate solution, positive.)

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1090, 1061, 1142, 987, 1050, 1009 (KBr disk).

Mass Spectrum. Principal peaks at m/z 102, 30, 72, 44, 116, 55, 173, 71.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 10 ng/ml, ECD—C. S. Lee and L. H. Wang, *J. pharm. Sci.*, 1980, 69, 362–363.

GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In plasma: detection limit 36 ng/ml—M. R. Holdiness *et al.*, *J. Chromat.*, 1981, 224, 415–422.

Disposition in the Body. Readily absorbed after oral administration. About 50 to 70% of a dose is excreted in the urine as unchanged drug in 24 hours, and up to 15% may be excreted as inactive aldehyde and carboxylic acid metabolites; up to 20% of an oral dose may be eliminated in the faeces.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 2.5 to 6.5 $\mu\text{g/ml}$.

After a single oral dose of 15 mg/kg to 6 subjects, peak plasma concentrations of 3.2 to 5.6 $\mu\text{g/ml}$ (mean 4) were attained in 2 to 4 hours (C. S. Lee *et al.*, *Clin. Pharmac. Ther.*, 1977, 22, 615–621).

TOXICITY. Toxic effects are usually associated with plasma concentrations greater than 6 $\mu\text{g/ml}$.

In a fatality due to the ingestion of ethambutol and rifampicin, the following postmortem concentrations were reported for ethambutol and rifampicin, respectively: blood 84 and 182 $\mu\text{g/ml}$, urine 6800 and 3300 $\mu\text{g/ml}$; low concentrations of ethanol were also detected (D. B. Jack *et al.*, *Lancet*, 1978, 2, 1107–1108).

HALF-LIFE. Plasma half-life, about 10 to 15 hours.

CLEARANCE. Plasma clearance, about 9 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 0.6 to 0.9.

PROTEIN BINDING. In plasma, about 10 to 40% (concentration-dependent).

Dose. 15 to 25 mg/kg of ethambutol hydrochloride daily; 50 mg/kg has been given twice weekly.

Ethamivan*Respiratory Stimulant*

Synonyms. Etamivan; Vanillic Acid Diethylamide; Vanillic Diethylamide.

Proprietary Names. Clairvan; Vandid.

NN-Diethylvanillamide

$C_{12}H_{17}NO_3 = 223.3$

CAS—304-84-7

A white crystalline powder. M.p. 94° to 99° .

Soluble 1 in 100 of water, 1 in 2 of ethanol, 1 in 1.5 of chloroform, and 1 in 50 of ether.

Colour Tests. Ferric Chloride—green; Folin-Ciocalteu Reagent—blue; Liebermann's Test—black.

Thin-layer Chromatography. System TD—Rf 38; system TE—Rf 40; system TF—Rf 35.

Gas Chromatography. System GC—RI 2409.

Ultraviolet Spectrum. Aqueous acid—280 nm ($A_1^1 = 153$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1608, 1270, 1585, 1240, 1300, 1543 (KBr disk).

Mass Spectrum. Principal peaks at m/z 151, 72, 223, 123, 222, 152, 52, 29.

Dose. Ethamivan has been given intravenously in doses of up to 10 ml of a 5% solution; doses of 40 to 240 mg daily have been given by mouth.

Ethanol*Central Depressant*

Synonyms. Alcohol; Ethyl Alcohol.

$CH_3 \cdot CH_2OH = 46.07$

CAS—64-17-5

Ethanol of the *British Pharmacopoeia* is Dehydrated Alcohol (Absolute Alcohol) which contains 99.4 to 100% v/v of C_2H_5O , sp. gr. 0.7904 to 0.7935 ($20^{\circ}/20^{\circ}$). Ethanol (96%) of the *B.P.* contains 96.0 to 96.6% v/v of C_2H_5O , sp. gr. 0.8062 to 0.8087 ($20^{\circ}/20^{\circ}$). Rectified Spirit is ethanol (90%). In the *United States Pharmacopoeia*, Alcohol contains 94.9 to 96.0% v/v of C_2H_5O , sp. gr. 0.812 to 0.816 (15.56°).

A clear, colourless, mobile, volatile, readily inflammable, hygroscopic liquid. Ethanol (96%) boils at about 78° .

Miscible with water, chloroform, and ether.

Industrial Methylated Spirit

Synonym. IMS

A mixture of ethanol, of an appropriate strength, 95 parts by volume with wood naphtha 5 parts by volume.

Note. Two other classes of methylated spirits are recognised in the United Kingdom: mineralised methylated spirits and denatured ethanol. Mineralised methylated spirits is ethanol of an appropriate strength, 90 parts by volume mixed with wood naphtha 9.5 parts by volume and crude pyridine 0.5 parts by volume, and to every 2000 litres of this mixture is added 7.5 litres of mineral naphtha (petroleum oil) and 3.0 g of methyl violet. Denatured ethanol is ethanol, of a strength not less than 85% v/v, 98 parts by volume mixed with propanol 2 parts by volume, and to the resulting mixture is added denatonium benzoate 10 μ g/ml, or solid quassin 120 μ g/ml, or sucrose octa-acetate 4000 μ g/ml.

Surgical Spirit (*B.P.*) is a mixture of castor oil 2.5 ml, diethyl phthalate 2 ml, and methyl salicylate 0.5 ml, diluted to 100 ml with industrial methylated spirit.

Rubbing Alcohol (*U.S.P.*) is a mixture of acetone 8 volumes, methyl isobutyl ketone 1.5 volumes, and Alcohol 100 volumes; the mixture contains not less than 3550 μ g/ml of sucrose octa-acetate, or 14 μ g/ml of denatonium benzoate.

Colour Test. Potassium Dichromate (Method 2)—green.

Gas Chromatography. System GA—RI 421; system GI—retention time 1.9 min.

Mass Spectrum. Principal peaks at m/z 31, 45, 29, 27, 46, 43, 30, 42.

Quantification. ALCOHOL DEHYDROGENASE METHOD. In blood: sensitivity 500 μ g/ml—A. Poklis and M. A. Mackell, *Clin. Chem.*, 1982, 28, 2125–2127.

GAS CHROMATOGRAPHY. In blood or urine: direct injection, FID—B. R. Manno and J. E. Manno, *J. analyt. Toxicol.*, 1978, 2, 257–261. In biological materials: head-space analysis, sensitivity ethanol 125 μ g, acetaldehyde 1 μ g, FID—C. L. Mendenhall *et al.*, *J. Chromat.*, 1980, 190, 197–200.

GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In plasma: sensitivity 5 ng—W. E. Pereira *et al.*, *Clinica chim. Acta*, 1974, 51, 109–112.

REVIEWS. In breath—M. F. Mason and K. M. Dubowski, *J. forens. Sci.*, 1976, 21, 9–41. In blood—R. H. Cravey and N. C. Jain, *J. chromatogr. Sci.*, 1974, 12, 209–213, and P. Fabiani, *Pharm. Biol.*, 1979, 13, 39–40.

Disposition in the Body. Readily absorbed from the stomach and small intestine after oral administration but absorption may be delayed by the presence of food; rapidly distributed throughout the body fluids. Metabolised in the liver by alcohol dehydrogenase to acetaldehyde and then further oxidised to acetate and carbon dioxide. More than 90% is metabolised and is excreted by the lungs and in the urine, saliva, sweat, and other secretions together with unchanged alcohol. The body can metabolise about 10 to 15 ml per hour. The rate of metabolism may be accelerated following repeated excessive use.

BLOOD CONCENTRATION.

After administration of 15, 30, 45, and 60 ml of 95% ethanol to 8 fasting subjects, peak blood concentrations of 25 to 290 μ g/ml (mean 199), 180 to

620 µg/ml (mean 440), 410 to 860 µg/ml (mean 680) and 630 to 1120 µg/ml (mean 860) respectively were attained in 0.3, 0.5, 0.8 and 1 hour (P. K. Wilkinson *et al.*, *J. Pharmacokinet. Biopharm.*, 1977, 5, 207–224). After administration of 0.5 g/kg of ethanol to 4 subjects, blood-acetaldehyde concentrations of 0.02 to 0.06 µg/ml were reported after 40 to 80 minutes (J. M. Christensen *et al.*, *Clinica chim. Acta*, 1981, 116, 389–395).

TOXICITY. The minimum lethal dose is about 500 ml of 50% v/v spirit ingested in about 1 hour. In the United Kingdom it is illegal to be in charge of a motor vehicle with a concentration greater than 800 µg/ml in the blood or 1070 µg/ml in the urine or 35 µg/ml in the breath. Toxic effects are associated with blood concentrations of 840 to 2400 to 4500 µg/ml, and subjects with concentrations of 3000 µg/ml or more are considered to be clinically drunk. Blood concentrations of 2250 to 4000 to 6030 µg/ml have been associated with fatalities. The maximum permissible atmospheric concentration is 1000 ppm.

In 10 fatalities due to the ingestion of ethanol, the following postmortem tissue concentrations were reported: blood 4230 to 17660 µg/ml (mean 7410), bile 1250 to 27950 µg/ml (mean 7860), brain 3100 to 9120 µg/g (mean 4430), kidney 2850 to 10430 µg/g (mean 4830), liver 2450 to 11610 µg/g (mean 4470), urine 4850 to 9400 µg/ml (mean 6190) (G. Christopoulos *et al.*, *J. Chromat.*, 1973, 87, 455–472).

HALF-LIFE. Plasma half-life, dose-dependent.

VOLUME OF DISTRIBUTION. About 0.6 litre/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 1.2.

SALIVA. Plasma: saliva ratio, about 0.93.

PROTEIN BINDING. In plasma, not significantly bound.

Ethanolamine

Sclerosing Agent

Synonyms. Aethanolaminum; Hydroxyethylamine; Monoethanolamine; Olamine.

Proprietary Name. Ethamolin (oleate)

2-Aminoethanol

$\text{NH}_2 \cdot \text{CH}_2 \cdot \text{CH}_2\text{OH} = 61.08$

CAS—141-43-5

A clear, colourless or pale yellow, viscous liquid. Wt per ml 1.014 to 1.023 g. B.p. about 170°.

Miscible with water, ethanol, and chloroform; slightly soluble in ether.

Dissociation Constant. pK_a 9.4 (25°).

Gas Chromatography. System GA—RI 780.

Mass Spectrum. Principal peaks at m/z 42, 31, 61, 43, 29, 27, 44, 41.

Dose. Ethanolamine Oleate Injection (B.P.) is administered intravenously in a dose of 2 to 5 ml.

Ethchlorvynol

Hypnotic

Synonym. β -Chlorovinyl Ethyl Ethynyl Carbinol

Proprietary Name. Placidyl

1-Chloro-3-ethylpent-1-en-4-yn-3-ol

$\text{C}_7\text{H}_9\text{ClO} = 144.6$

CAS—113-18-8

A colourless to yellow, slightly viscous liquid which darkens on exposure to air and light. Wt per ml about 1.072 g. Refractive index, at 20°, 1.4770 to 1.4805.

Practically **immiscible** with water; miscible with ethanol, chloroform, ether, and most other organic solvents.

Colour Test. Ammoniacal Silver Nitrate—white precipitate/yellow.

Gas Chromatography. System GA—RI 1030; system GI—retention time 35.2 min.

Infra-red Spectrum. Principal peaks at wavenumbers 935, 950, 830, 1010, 1063, 980.

Mass Spectrum. Principal peaks at m/z 115, 117, 89, 53, 109, 51, 91, 39.

Quantification. ULTRAVIOLET SPECTROPHOTOMETRY. In blood, serum or urine—J. E. Wallace *et al.*, *Clin. Chem.*, 1974, 20, 159–162.

Gas Chromatography. In blood or urine: detection limit 1 µg/ml, FID—H. H. McCurdy, *J. analyt. Toxicol.*, 1977, 1, 164–165. In plasma or urine: sensitivity 2 µg/ml, FID—R. J. Flanagan and T. D. Lee, *J. Chromat.*, 1977, 137, 119–126.

REVIEW. For an evaluation of gas chromatographic and colorimetric methods see R. R. Bridges and T. A. Jennison, *J. analyt. Toxicol.*, 1984, 8, 263–268.

Disposition in the Body. Rapidly absorbed after oral administration. It is extensively metabolised; the major metabolite found in the blood and urine of poisoned patients is 1-chloro-3-ethynylpent-1-ene-3,4-diol; other metabolites include 1-chloro-3-ethynylpent-1-ene-3,5-diol and 1-chloro-3-ethylpent-1-ene-3,4-diol. Ethchlorvynol is highly localised in the tissues, particularly in adipose tissue, and is released very slowly. Less than 0.1% of a dose is excreted in the urine in 24 hours as unchanged drug or its glucuronide conjugate.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 5 to 20 µg/ml.

Following a single oral dose of 500 mg to 8 subjects, a mean peak plasma concentration of 6.5 µg/ml was attained in 1 hour (L. M. Cummins *et al.*, *J. pharm. Sci.*, 1971, 60, 261–263).

TOXICITY. The estimated minimum lethal dose is 15 g, although death has occurred after the acute ingestion of 2.5 g. Plasma

concentrations greater than about 20 µg/ml are associated with toxic effects. Prolonged use of ethchlorvynol may lead to dependence of the barbiturate-alcohol type.

In a review of 13 fatalities due to overdosage with ethchlorvynol, postmortem blood concentrations were in the range 14 to 400 µg/ml (mean 119) (C. J. Rehling, *Poison Residues in Human Tissues*, in *Progress in Chemical Toxicology*, Vol. 3, A. Stolman (Ed.), New York, Academic Press, 1967, pp. 363-386).

In 3 fatalities due to ethchlorvynol, the following postmortem tissue concentrations were reported: blood 85, 22 and 66 µg/ml; brain 57, -, 285 µg/g; kidney 54, 63, and 860 µg/g; liver 70, 60, and 507 µg/g; adipose tissue 1040 and 142 µg/g (2 cases) (R. H. Cravey and R. C. Baselt, *J. forens. Sci.*, 1968, 13, 532-536 and C. L. Winek, *Forens. Sci. Int.*, 1981, 17, 219-224).

HALF-LIFE. Plasma half-life, 19 to 32 hours (mean 23), increased in overdose cases.

VOLUME OF DISTRIBUTION. About 2 to 3 litres/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 1.1.

PROTEIN BINDING. In plasma, about 60%.

Dose. 0.2 to 1 g, as a hypnotic.

Ethebenecid

Uricosuric

Synonym. Etebenecid

4-Diethylsulphamoylbenzoic acid

$C_{11}H_{15}NO_5S = 257.3$

CAS—1213-06-5

Crystals. M.p. 192° to 194°.

Dissociation Constant. pK_a 3.3 (25°).

Ultraviolet Spectrum. Methanol—246 nm ($A_1^1 = 460$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1694, 729, 1162, 1282, 1298, 934.

Dose. Ethebenecid has been given in doses of 1 to 3 g daily.

Ether

General Anaesthetic

Synonyms. Diethyl Oxide; Ethyl Ether; Ethyl Oxide.

Diethyl ether

$(C_2H_5)_2O = 74.12$

CAS—60-29-7

A clear, colourless, volatile, inflammable, very mobile liquid.

B.p. 34° to 36°.

Soluble 1 in 10 to 1 in 12 of water; miscible with ethanol and chloroform.

Anaesthetic Ether (*B.P.*) is highly purified ether containing not more than 0.002% w/v of a stabiliser such as propyl gallate or hydroquinone.

Solvent Ether (*B.P.*) is not so highly purified and is without a stabiliser.

Caution. Ether is very volatile and inflammable, and mixtures of its vapour with oxygen, nitrous oxide, or air at certain concentrations are explosive. It should not be used in the presence of an open flame or any electrical apparatus liable to produce a spark; precautions should be taken against the production of static electrical discharge. Explosive peroxides

are generated by the atmospheric oxidation of solvent ether and it is dangerous to distil a sample which contains peroxides.

Gas Chromatography. *System GA*—RI 515; *system GI*—retention time 5.9 min.

Mass Spectrum. Principal peaks at m/z 31, 59, 29, 45, 74, 27, 41, 43.

Disposition in the Body. Absorbed into the circulation after inhalation; the blood:gas partition coefficient is high (about 12). About 90% of a dose is slowly exhaled unchanged and very little is metabolised; a small amount may be excreted unchanged in the urine. Acetaldehyde is believed to be a minor metabolite.

THERAPEUTIC CONCENTRATION. In plasma, during anaesthesia, usually in the range 500 to 1500 µg/ml.

TOXICITY. The estimated minimum lethal oral dose is 30 ml; the maximum permissible atmospheric concentration is 400 ppm. Atmospheric concentrations of 2000 ppm may cause dizziness and 100 000 ppm may be rapidly fatal.

In four elderly persons who died after being given ether with other medication, ether concentrations (µg/ml or µg/g) immediately after operation were: blood 600, 3750, 2880, 190; brain 700, 610, 2720, 310; liver 400, 1280, 260, 230; lung 200, 1580, 210, -; in the second case the urine contained 340 µg/ml (J. E. Campbell, *J. forens. Sci.*, 1960, 5, 501-549).

Dose. For induction of anaesthesia, 10 to 20% of the vapour by inhalation; maintenance, 3 to 10%.

Ethiazide

Diuretic

6-Chloro-3-ethyl-3,4-dihydro-2H-1,2,4-benzothiadiazine-7-sulphonamide 1,1-dioxide

$C_9H_{12}ClN_3O_4S_2 = 325.8$

CAS—1824-58-4

Crystals. M.p. 269° to 270°.

Thin-layer Chromatography. *System TD*—Rf 11; *system TE*—Rf 50; *system TF*—Rf 50.

Ultraviolet Spectrum. Aqueous acid—272 nm ($A_1^1 = 345$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1163, 1172, 1603, 1312, 781, 1510 (Nujol mull).

Mass Spectrum. Principal peaks at m/z 296, 298, 205, 221, 64, 63, 41, 125.

Dose. Usually 5 to 10 mg daily.

Ethinamate

Hypnotic

Proprietary Names. Valamin; Valmid.

1-Ethynylcyclohexyl carbamate

$C_9H_{13}NO_2 = 167.2$

CAS—126-52-3

A white powder. M.p. 94° to 98° .

Soluble 1 in 400 of water and 1 in about 3 of ethanol; freely soluble in chloroform and ether.

Colour Test. Ammoniacal Silver Nitrate—yellow/brown.

Thin-layer Chromatography. *System TA*—Rf 76; *system TD*—Rf 49; *system TE*—Rf 74; *system TF*—Rf 59. (Furfuraldehyde reagent, positive; acidified potassium permanganate solution, positive.)

Gas Chromatography. *System GA*—RI 1363.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1713, 1041, 1694, 1030, 1052, 1250 (KBr disk).

Mass Spectrum. Principal peaks at m/z 91, 81, 106, 78, 39, 95, 68, 43.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: ethinamate and *trans*-4-hydroxyethinamate, sensitivity 500 ng/ml for ethinamate in plasma, FID—J. W. Kleber *et al.*, *J. pharm. Sci.*, 1977, 66, 992–994.

Disposition in the Body. Rapidly absorbed after oral administration. Metabolized by hydroxylation to 4-hydroxyethinamate, which exists as stereoisomers, and conjugated with glucuronic acid. About 40% of a dose is excreted in the urine in 24 hours as *trans*-4-hydroxyethinamate or its glucuronide conjugate; only a small amount is excreted unchanged in the urine; 3- and 2-hydroxyethinamate have also been detected in urine.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 5 to 10 $\mu\text{g/ml}$.

After a single oral dose of 1 g to 8 subjects, peak blood concentrations of 3.8 to 11.7 $\mu\text{g/ml}$ (mean 6.5) were attained in 1 to 2 hours (J. M. Clifford *et al.*, *Clin. Pharmac. Ther.*, 1974, 16, 376–389).

TOXICITY. The estimated minimum lethal dose is 15 g but recovery has occurred after ingestion of as much as 28 g. Prolonged use of ethinamate may lead to dependence of the barbiturate-alcohol type. Blood concentrations greater than 100 $\mu\text{g/ml}$ have been associated with fatalities.

HALF-LIFE. Plasma half-life, about 2 hours.

Dose. 0.5 to 1 g, as a hypnotic.

Ethinylestradiol

Oestrogen

Synonyms. Ethinyl Estradiol; Etinilestradiol.

Proprietary Names. Edrol; Estigyn; Estinyl; Farmacyrol; Feminone; Gynolett; Lynoral; Primogyn C; Progyon C.

Ethinylestradiol is an ingredient of many oral contraceptives—see *Martindale, The Extra Pharmacopoeia*, 28th Edn.

19-Nor-17 α -pregna-1,3,5(10)-trien-20-yne-3,17 β -diol

$C_{20}H_{24}O_2 = 296.4$

CAS—57-63-6

A fine, white to slightly yellowish-white, crystalline powder. There are two forms, one melts at 141° to 146° and the other at 180° to 186° .

Practically **insoluble** in water; soluble 1 in 6 of ethanol, 1 in 20 of chloroform, and 1 in 4 of ether.

Caution. Ethinylestradiol is a powerful oestrogen. Contact with the skin or inhalation should be avoided.

Colour Tests. Ammoniacal Silver Nitrate—white precipitate/yellow; Antimony Pentachloride—brown→black; Liebermann's Test—black; Naphthol-Sulphuric Acid—brown-red/pink; Sulphuric Acid—red-orange.

Thin-layer Chromatography. *System TP*—Rf 72; *system TQ*—Rf 30; *system TR*—Rf 40; *system TS*—Rf 40, streaking may occur.

Gas Chromatography. *System GA*—RI 2719.

Ultraviolet Spectrum. Ethanol—281 nm ($A_1^1 = 70$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1252, 1505, 1298, 1285, 1020, 1060 (KBr disk).

Mass Spectrum. Principal peaks at m/z 213, 160, 159, 296, 133, 145, 212, 157.

Dose. 10 to 150 μg daily; up to 2 mg daily may be given.

Ethinamide

Antituberculous Agent

Synonym. Etionamida

Proprietary Names. Trecator; Trescatyl.

2-Ethylpyridine-4-carbothioamide

$C_8H_{10}N_2S = 166.2$

CAS—536-33-4

A bright yellow crystalline powder, darkening on exposure to light. M.p. 158° to 165° .

Practically **insoluble** in water; soluble 1 in 30 of ethanol, 1 in 45 of acetone, 1 in 350 of chloroform, and 1 in 600 of ether; soluble in methanol.

Colour Tests. Nessler's Reagent—brown-orange; Palladium Chloride—brown.

Thin-layer Chromatography. *System TA*—Rf 65; *system TB*—Rf 00; *system TC*—Rf 36. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 1756.

Ultraviolet Spectrum. Aqueous acid—230 nm ($A_1^1 = 635$ a), 275 nm; aqueous alkali—277 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1588, 808, 865, 1275, 1140, 880 (KBr disk).

Mass Spectrum. Principal peaks at m/z 166, 165, 167, 138, 133, 105, 60, 106.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma, serum or urine: detection limit 10 ng/ml, UV detection—P. J. Jenner and G. A. Ellard, *J. Chromat.*, 1981, 225; *Biomed. Appl.*, 14, 245–251.

Disposition in the Body. Readily absorbed after oral administration and widely distributed throughout the body. Peak plasma concentrations are attained 2 to 3 hours after a dose. It is extensively metabolised and is excreted in the urine mainly as metabolites with little unchanged drug. The metabolites include ethionamide sulphoxide, 2-ethylisonicotinic acid, and 2-ethylisonicotinamide.

Dose. 0.5 to 1 g daily.

Ethisterone

Progestational Steroid

Synonyms. Aethisteron; Anhydrohydroxyprogesterone; Ethinyltestosterone; Praegnin; Pregneninolone; Pregnin.

Proprietary Names. Etherone; Gestone-Oral. It is an ingredient of Trimone Sublets.

17 β -Hydroxy-17 α -pregn-4-en-20-yn-3-one

C₂₁H₂₈O₂ = 312.5

CAS—434-03-7

A white, slightly hygroscopic, crystalline powder. M.p. 272° to 276°.

Practically **insoluble** in water; soluble 1 in 1000 of ethanol, 1 in 750 of acetone, 1 in 110 of chloroform, 1 in 3000 of ether, and 1 in 35 of pyridine.

Thin-layer Chromatography. System TP—Rf 78; system TQ—Rf 39; system TR—Rf 80; system TS—Rf 00.

Ultraviolet Spectrum. Dehydrated alcohol—240 nm ($A_1^1 = 520$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1660, 1060, 1235, 1612, 1127, 723 (KBr disk).

Mass Spectrum. Principal peaks at m/z 122, 121, 91, 147, 161, 43, 107, 120.

Dose. 25 to 100 mg daily.

Ethoheptazine

Narcotic Analgesic

Synonym. Heptacyclazine

Ethyl 1-methyl-4-phenylperhydroazepine-4-carboxylate

C₁₆H₂₃NO₂ = 261.4

CAS—77-15-6

A liquid.

Ethoheptazine Citrate

Proprietary Names. Zactane. It is an ingredient of Ecuagesico, Equagesic, Zactipar, Zactirin, Zactrin, and Zamintol.

C₁₆H₂₃NO₂·C₆H₈O₇ = 453.5

CAS—6700-56-7

A white powder. M.p. about 140°.

Soluble in water and ethanol; practically insoluble in ether.

Dissociation Constant. pK_a 8.5.

Colour Test. Marquis Test—orange.

Thin-layer Chromatography. System TA—Rf 40; system TB—Rf 45; system TC—Rf 19. (*Dragendorff spray*, positive; *acidified iodoplatinate solution*, positive; *Marquis reagent*, orange; *acidified potassium permanganate solution*, positive.)

Gas Chromatography. System GA—RI 1857; system GB—RI 1882; system GC—RI 1630; system GF—RI 2110.

High Pressure Liquid Chromatography. System HA— k' 3.3; system HC— k' 1.55.

Ultraviolet Spectrum. Aqueous acid—251 nm, 257 nm ($A_1^1 = 8$ c), 263 nm. No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1727, 1193, 1094, 695, 1248, 1030 (KBr disk).

Mass Spectrum. Principal peaks at m/z 57, 58, 70, 42, 44, 188, 84, 43.

Quantification. GAS CHROMATOGRAPHY. In plasma or postmortem tissues: sensitivity 1 μ g/ml, AFID—R. H. Drost *et al.*, *J. Chromat.*, 1983, 277; *Biomed. Appl.*, 28, 352–355.

Disposition in the Body. Readily absorbed after oral administration; peak blood concentrations are attained within 1 hour of a dose. It is extensively metabolised and is excreted in the urine.

TOXICITY. The estimated minimum lethal dose is 1 g.

In a fatality due to the ingestion of an unknown amount of ethoheptazine, the following postmortem concentrations were reported: blood 15 µg/g, brain 4.5 µg/g, kidney 2.4 µg/g, liver 10.0 µg/g, spleen 3.1 µg/g (R. H. Drost *et al.*, *ibid.*).

Dose. 225 to 600 mg of ethoheptazine citrate daily.

Ethomoxane

Tranquilliser

N-Butyl-8-ethoxy-1,4-benzodioxan-2-ylmethylamine

$C_{15}H_{23}NO_3 = 265.4$

CAS—3570-46-5

A liquid.

Ethomoxane Hydrochloride

$C_{15}H_{23}NO_3 \cdot HCl = 301.8$

CAS—6038-78-4

Crystals. M.p. 196° to 197°.

Colour Tests. Mandelin's Test—red-brown; Marquis Test—red-violet.

Thin-layer Chromatography. System *TA*—Rf 60; system *TB*—Rf 34; system *TC*—Rf 47. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System *GA*—RI 1975.

Ultraviolet Spectrum. Aqueous acid—267 nm ($A_1^1 = 23.5$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1120, 1279, 1594, 1493, 1097, 1252 (KBr disk).

Mass Spectrum. Principal peaks at m/z 86, 44, 30, 265, 41, 180, 29, 87.

Ethopropazine

Anticholinergic

Synonyms. Isothazine; Phenopropazine; Profenamine.

10-(2-Diethylaminopropyl)phenothiazine

$C_{19}H_{24}N_2S = 312.5$

CAS—522-00-9

Crystals. M.p. 53° to 55°.

Ethopropazine Hybenzate

Synonym. Profenamine Hibenzate

$C_{19}H_{24}N_2S \cdot C_{14}H_{10}O_4 = 554.7$

A white crystalline powder. M.p. about 188°, with decomposition.

Practically **insoluble** in water; slightly soluble in methanol.

Ethopropazine Hydrochloride

Proprietary Names. Lysivane; Parsidol; Parsitan.

$C_{19}H_{24}N_2S \cdot HCl = 348.9$

CAS—1094-08-2

A white crystalline powder, which darkens in colour on exposure to light. M.p. about 210°, with decomposition.

Soluble 1 in 225 of water, 1 in 35 of ethanol, and 1 in 7 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 9.6 (20°).

Partition Coefficient. Log *P* (octanol), 4.8.

Colour Tests. Formaldehyde-Sulphuric Acid—red-violet; Forrester Reagent—pink; FPN Reagent—orange→yellow; Liebermann's Test—red-brown; Mandelin's Test—green→violet; Marquis Test—violet.

Thin-layer Chromatography. System *TA*—Rf 67; system *TB*—Rf 64; system *TC*—Rf 47. (Dragendorff's spray, positive; FPN reagent, pink; acidified iodoplatinate solution, positive; Marquis reagent, orange; ninhydrin spray, positive.)

Gas Chromatography. System *GA*—RI 2357; system *GF*—RI 2775.

High Pressure Liquid Chromatography. *System HA*— k' 2.4.

Ultraviolet Spectrum. Aqueous acid—250 nm ($A_1^1 = 881$ a), 299 nm; aqueous alkali—253 nm, 302 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 748, 1248, 1590, 1282, 1568, 1125 (KBr disk).

Mass Spectrum. Principal peaks at m/z 100, 101, 44, 72, 198, 180, 42, 29.

Dose. 50 to 500 mg of ethopropazine hydrochloride daily.

Ethosuximide

Anticonvulsant

Synonym. Ethosuccinimide

Proprietary Names. Emeside; Ethymal; Petnidan; Pyknolepsinum; Suxinutin; Zarondan; Zarontin.

2-Ethyl-2-methylsuccinimide

$C_7H_{11}NO_2 = 141.2$

CAS—77-67-8

A white powder or waxy solid. M.p. 46° to 52° .

Soluble 1 in 4.5 of water and 1 in less than 1 of ethanol, chloroform, and ether.

Dissociation Constant. pK_a 9.5 (20°).

Colour Test. Koppanyi–Zwicker Test—violet.

Thin-layer Chromatography. *System TA*—Rf 70; *system TD*—Rf 50; *system TE*—Rf 57; *system TF*—Rf 56.

Gas Chromatography. *System GA*—ethosuximide RI 1206, 3-hydroxyethosuximide RI 1320, 1-hydroxyethylethosuximide RI 1370; *system GE*—ethosuximide retention time 0.18 relative to phenytoin.

High Pressure Liquid Chromatography. *System HE*— k' 0.91.

Ultraviolet Spectrum. Aqueous acid—244 nm ($A_1^1 = 9.9$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1700, 1777, 1208, 1130, 1303, 730 (KBr disk).

Mass Spectrum. Principal peaks at m/z 113, 70, 55, 42, 41, 39, 85, 69.

Quantification. GAS CHROMATOGRAPHY. In plasma or serum: sensitivity 500 ng/ml, ECD—J. E. Wallace *et al.*, *Clin. Chem.*, 1979, 25, 252–255. In plasma or urine: ethosuximide and phensuximide, sensitivity 2.5 μ g/ml, FID—E. van der Kleijn *et al.*, *J. Pharm. Pharmac.*, 1973, 25, 324–327.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or serum: ethosuximide and other anticonvulsants, sensitivity about 2 μ g/ml, UV detection—J. A. Christofides and D. E. Fry, *Clin. Chem.*, 1980, 26, 499–501. In serum: ethosuximide and other anticonvulsants, sensitivity 1 μ g/ml, UV detection—P. M. Kabra *et al.*, *J. analyt. Toxicol.*, 1978, 2, 127–133.

Disposition in the Body. Readily absorbed after oral administration. Metabolised by hydroxylation to 3-hydroxyethosuximide and 1-hydroxyethylethosuximide; the latter is further oxidised to produce 2-acetyl-2-methylsuccinimide; an additional metabolite, 2-carboxymethyl-2-methylsuccinimide has also been reported. None of the metabolites are pharmacologically active. About 25% of a dose is excreted in the urine in 24 hours as 1-hydroxyethylethosuximide glucuronide and about 14% as the unconjugated metabolite. Up to about 20% of a dose is excreted as unchanged drug in the urine over a 9-day period.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 40 to 100 μ g/ml.

After a single oral dose of 500 mg to 5 children, peak plasma concentrations of 28 to 51 μ g/ml (mean 39) were attained in 3 to 7 hours (R. A. Buchanan *et al.*, *J. clin. Pharmac.*, 1969, 9, 393–398).

Steady-state serum concentrations of 31 to 68 μ g/ml (mean 49) were reported in 5 young adults receiving daily oral doses of 1 g (E. B. Solow and J. B. Green, *Clinica chim. Acta*, 1971, 33, 87–90).

TOXICITY. The estimated minimum lethal dose is 5 g. Toxic effects may be observed at plasma concentrations greater than about 100 μ g/ml.

In a fatality involving ethosuximide, the following postmortem tissue concentrations were reported: blood 250 μ g/ml, liver 280 μ g/g, urine 120 μ g/ml; phenobarbitone was also detected (M. Rousseau *et al.*, *Bull. int. Ass. forens. Toxicol.*, 1980, 15(2), 5–6).

HALF-LIFE. Plasma half-life, 40 to 60 hours in adults and about 30 hours in children.

VOLUME OF DISTRIBUTION. About 0.7 litre/kg.

SALIVA. Plasma: saliva ratio, about 1.1.

PROTEIN BINDING. In plasma, not significantly bound.

Dose. 0.5 to 2 g daily.

Ethotoin*Proprietary Name.* Peganone

3-Ethyl-5-phenylhydantoin

 $C_{11}H_{12}N_2O_2 = 204.2$

CAS—86-35-1

Anticonvulsant

A white crystalline powder. M.p. about 90°.

Practically **insoluble** in water; soluble 1 in 4 of dehydrated alcohol, 1 in 1.5 of chloroform, and 1 in 25 of ether.**Dissociation Constant.** pK_a 8.5.**Thin-layer Chromatography.** System TD—Rf 53.**Gas Chromatography.** System GA—RI 1800; system GE—retention time 0.57 relative to phenytoin.**High Pressure Liquid Chromatography.** System HE— k' 2.81.**Ultraviolet Spectrum.** Dehydrated alcohol—259 nm ($A_1^1 = 11$ b), 265 nm ($A_1^1 = 8$ b).**Infra-red Spectrum.** Principal peaks at wavenumbers 1716, 700, 760, 820, 1780, 1100 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 104, 105, 204, 77, 78, 133, 51, 132.**Quantification.** GAS CHROMATOGRAPHY. In serum: detection limit 1 µg/ml, FID—N.-E. Larsen and J. Naestoft, *J. Chromat.*, 1974, 92, 157–161.GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In urine: ethosuximide and some metabolites, sensitivity 5 µg/ml—J. Naestoft and N.-E. Larsen, *J. Chromat.*, 1977, 143; *Biomed. Appl.*, 1, 161–169.**Disposition in the Body.** Readily absorbed after oral administration. Extensively metabolised by *N*-de-ethylation and ring cleavage, 5-hydroxylation, and *p*-hydroxylation of the phenyl ring. During chronic therapy, less than 5% of the dose is excretedin the urine in 24 hours as unchanged drug, together with 5 to 14% of the dose as desethylethotoin, 17 to 35% as 5-hydroxyethotoin, 14 to 32% as conjugated *p*-hydroxyethotoin, and small amounts of other phenyl-substituted oxidation products. 2-Phenylhydantoic acid may account for about 10% of the dose.**THERAPEUTIC CONCENTRATION.** In plasma, usually in the range 6 to 20 µg/ml.Following single oral doses of 500, 1500 and 2500 mg to 5 subjects, peak plasma concentrations of 9 to 15 µg/ml (mean 12), 30 to 59 µg/ml (mean 42) and 37 to 75 µg/ml (mean 54), respectively, were attained in about 1.5, 3.5 and 3.5 hours (M. C. Meyer *et al.*, *Clin. Pharmac. Ther.*, 1983, 33, 329–334).During daily oral dosing with 30 mg/kg to 7 subjects, minimum steady-state plasma concentrations of 4.5 to 14 µg/ml (mean 10) were reported; following daily oral treatment with 60 mg/kg to 6 subjects, minimum steady-state plasma concentrations of 14 to 50 µg/ml (mean 30) were reported (O. Sjö *et al.*, *Clin. exp. Pharmac. Physiol.*, 1975, 2, 185–192).**TOXICITY.** The estimated minimum lethal dose is 5 g.**HALF-LIFE.** Plasma half-life, 3 to 11 hours (dose-dependent).**Dose.** Initially 1 g daily, increasing to 2 to 3 g daily.**Ethoxazene***Analgesic**Synonyms.* *p*-Ethoxychrysoidine; Etoxazene.

4-(4-Ethoxyphenylazo)benzene-1,3-diylldiamine

 $C_{14}H_{16}N_4O = 256.3$

CAS—94-10-0

M.p. 117° to 120°.

Ethoxazene Hydrochloride*Proprietary Name.* Serenium $C_{14}H_{16}N_4O \cdot HCl = 292.8$

CAS—2313-87-3

A reddish powder.

Practically **insoluble** in water; soluble in boiling water and in ethanol.

Colour Test. Marquis Test—violet.

Thin-layer Chromatography. *System TA*—Rf 65; *system TB*—Rf 00; *system TC*—Rf 56. (*Dragendorff* spray, positive.)

Gas Chromatography. *System GA*—not eluted.

Ultraviolet Spectrum. Aqueous acid—261 nm ($A_1^1 = 308$ b), 310 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1245, 1624, 1635, 1600, 1185, 1501 (KBr disk).

Dose. Ethoxazene hydrochloride has been given in doses of 300 mg daily.

Ethoxzolamide

Carbonic Anhydrase Inhibitor

Synonym. Ethoxyzolamide

Proprietary Names. Cardrase; Ethamide; Glaucotensil; Redupresin.

6-Ethoxybenzothiazole-2-sulphonamide

$C_9H_{10}N_2O_3S_2 = 258.3$

CAS—452-35-7

A white or slightly yellow crystalline powder. M.p. 189° to 195°. Practically **insoluble** in water; slightly soluble in ethanol, chloroform, and ether.

Dissociation Constant. pK_a 8.1.

Partition Coefficient. Log *P* (octanol/pH 7.4), 2.2.

Colour Tests. Koppányi-Zwicker Test—violet; Liebermann's Test—yellow; Marquis Test—yellow.

Thin-layer Chromatography. *System TA*—Rf 76; *system TD*—Rf 43; *system TE*—Rf 43; *system TF*—Rf 65. (*Marquis* reagent, positive.)

Gas Chromatography. *System GA*—RI 2578.

Ultraviolet Spectrum. Aqueous acid—253 nm, 304 nm ($A_1^1 = 96$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1170, 1490, 1263, 824, 1224, 1036 (KBr disk).

Dose. In the treatment of glaucoma, 250 to 500 mg daily.

Ethyl Acetate

Flavouring Agent/Solvent

Synonym. Acetic Ether

$CH_3 \cdot CO \cdot O \cdot C_2H_5 = 88.11$

CAS—141-78-6

A colourless inflammable liquid. Sp. gr. 0.894 to 0.898. B.p. 77°. **Soluble** 1 in 15 of water; miscible with ethanol, chloroform, and ether.

Gas Chromatography. *System GA*—RI 596; *system GI*—retention time 9.4 min.

Mass Spectrum. Principal peaks at *m/z* 43, 61, 45, 70, 29, 27, 73, 42.

Ethyl Biscoumarate

Anticoagulant

Synonyms. Aethylis Biscoumacetas; BOEA; Ethyldicoumarol; Neodicumarinum.

Proprietary Names. Stabilène; Tromexan(e).

Ethyl bis(4-hydroxycoumarin-3-yl)acetate

$C_{22}H_{16}O_8 = 408.4$

CAS—548-00-5

A white to yellowish-white, fine crystalline powder. There are two forms, one melts at about 155° and the other at about 180°. Very slightly **soluble** in water; soluble in ethanol, chloroform, and ether.

Dissociation Constant. pK_a 3.1.

Colour Test. Sulphuric Acid—orange-yellow.

Thin-layer Chromatography. *System TD*—Rf 04; *system TE*—Rf 24; *system TF*—Rf 32. (*Acidified potassium permanganate* solution, positive.)

Ultraviolet Spectrum. Water—275 nm ($A_1^1 = 449$ b), 303 nm; aqueous alkali—311 nm ($A_1^1 = 622$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1653, 1600, 768, 1560, 754, 1730.

Mass Spectrum. Principal peaks at m/z 121, 318, 317, 173, 120, 362, 44, 31.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 100 ng/ml, UV detection—M. Arman and F. Jamali, *J. Chromat.*, 1983, 272; *Biomed. Appl.*, 23, 406–410.

Disposition in the Body. Readily absorbed after oral administration and extensively metabolised. About 5 to 15% of a dose is excreted in the urine as hydroxyethyl biscoumacetate and only traces are excreted unchanged.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 300 mg to 4 subjects, peak plasma concentrations of 10.2 to 12.4 µg/ml (mean 11.2) were attained in 1 to 1.5 hours (M. Arman and F. Jamali, *ibid.*).

HALF-LIFE. Plasma half-life, about 1 to 2 hours.

PROTEIN BINDING. In plasma, about 90%.

Dose. Maintenance, 300 to 600 mg daily.

Ethyl Gallate

Antioxidant

Proprietary Name. Progallin A

Ethyl 3,4,5-trihydroxybenzoate

$C_9H_{10}O_5 = 198.2$

CAS—831-61-8

A white to creamy-white crystalline powder. M.p. 151° to 154°.

Soluble 1 in 500 of water, 1 in 3 of ethanol, 1 in 3 of ether, and 1 in 3 of propylene glycol.

Colour Test. Ferric Chloride—violet-black → blue-black.

Ultraviolet Spectrum. Methanol—275 nm ($A_1^1 = 540$ b).

Ethyl Hydroxybenzoate

Preservative

Synonyms. Aethylum Hydroxybenzoicum; Ethylis Paraoxybenzoas; Ethylparaben.

Proprietary Names. Nipagin A. It is an ingredient of Nipasept and Nipastat.

Ethyl *p*-hydroxybenzoate

$C_9H_{10}O_3 = 166.2$

CAS—120-47-8

Colourless crystals or white crystalline powder. M.p. 115° to 118°.

Soluble 1 in 1500 of water, 1 in 2 of ethanol, 1 in 1.2 of acetone, 1 in 10 of chloroform, and 1 in 3.5 of ether.

Sodium Ethyl Hydroxybenzoate

Proprietary Name. Nipagin A Sodium

$C_9H_9NaO_3 = 188.2$

CAS—35285-68-8

A white hygroscopic crystalline powder.

Soluble 1 in 2 of water and 1 in 3 of ethanol (50%).

Colour Test. Millon's Reagent—red.

Ultraviolet Spectrum. Aqueous acid—254 nm ($A_1^1 = 956$ b); aqueous alkali—295 nm ($A_1^1 = 1390$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1290, 1673, 1170, 1240, 1610, 1590 (KBr disk).

Ethyl Nicotinate

Topical Vasodilator

Proprietary Names. It is an ingredient of Cremathurm and Transvasin.

$C_8H_9NO_2 = 151.2$

CAS—614-18-6

A liquid. M.p. 8° to 9°. B.p. 225°.

Very soluble in water, ethanol, and ether.

Thin-layer Chromatography. System TA—Rf 00. (Acidified potassium permanganate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—261 nm ($A_1^1 = 341$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1286, 1724, 1110, 740, 1591, 1025 (KBr disk).

Use. Topically in concentrations of 1 to 2%.

Ethylene Glycol

Antifreeze/Solvent

Synonyms. Ethylene Alcohol; Glycol.

Ethane-1,2-diol

$HOCH_2 \cdot CH_2OH = 62.07$

CAS—107-21-1

A colourless, hygroscopic, syrupy liquid. Wt per ml about 1.114 g. F.p. about -13°. B.p. about 197°.

Miscible with water, ethanol, and acetone.

Gas Chromatography. System GA—RI 798; system GI—retention time 17.0 min (tailing peak).

Mass Spectrum. Principal peaks at m/z 31, 33, 29, 32, 43, 28, 27, 42.

Quantification. SPECTROFLUORIMETRY. In serum: sensitivity 50 µg/ml—J. M. Meola *et al.*, *Clin. Chem.*, 1980, 26, 1709.

GAS CHROMATOGRAPHY. In plasma: sensitivity 50 µg/ml, FID—D. W. Robinson and D. S. Reive, *J. analyt. Toxicol.*, 1981, 5, 69–72.

REVIEW. For a review of assay methods see D. J. Doedens, *Vet. Hum. Toxicol.*, 1983, 25, 96–101.

Disposition in the Body. Ethylene glycol is metabolised initially to glycoaldehyde and subsequently to lactic acid and oxalic acid. Calcium oxalate crystals are deposited in the kidneys and some oxalate may be excreted in the urine together with unchanged ethylene glycol.

TOXICITY. Ethylene glycol itself is probably non-toxic and the serious toxic effects are due to the metabolites. In adults the

minimum lethal dose is about 100 ml although survival has been reported after ingestion of 250 ml. Toxic effects are usually associated with plasma concentrations greater than 500 µg/ml. The maximum permissible atmospheric concentration of ethylene glycol vapour is 100 ppm.

In a fatal case of ethylene glycol poisoning the serum concentration 12 hours after ingestion was 1000 µg/ml and the urine concentration was 2700 µg/ml; in a second fatal case a serum concentration of 7100 µg/ml was found 6 hours after ingestion of 500 ml (D. A. L. Bowen *et al.*, *Medicine, Sci. Law*, 1978, 18, 102–107).

In 4 fatalities due to drinking varying amounts of antifreeze mixture, the volumes of ethylene glycol ingested and the postmortem blood concentrations were as follows: 150 ml, 80 µg/ml after 36 hours; 300 ml, 560 µg/ml after 18 hours; 500 ml, 600 µg/ml after 24 hours; 1500 ml, 4100 µg/ml after 28 hours (E. W. Walton, *Medicine, Sci. Law*, 1978, 18, 231–237).

A 51-year-old man ingested 600 ml of antifreeze solution but recovered after treatment. A blood concentration of 6500 µg/ml of ethylene glycol was reported 2½ hours after ingestion; pharmacokinetic studies indicated that the volume of distribution of ethylene glycol was about 0.8 litre/kg and the plasma half-life was about 3 hours (C. D. Peterson *et al.*, *New Engl. J. Med.*, 1981, 304, 21–23).

A 36-year-old man was admitted to hospital 6 hours after ingesting 500 ml of an antifreeze mixture containing ethylene glycol and methanol; initial serum concentrations were 1900 µg/ml for ethylene glycol and 1130 µg/ml for methanol; the subject recovered after treatment with ethanol and haemodialysis (N. P. Vites *et al.*, *Lancet*, 1984, 1, 562).

Ethylenediamine Hydrate *Pharmaceutical Adjuvant*

$\text{NH}_2 \cdot \text{CH}_2 \cdot \text{CH}_2 \cdot \text{NH}_2 \cdot \text{H}_2\text{O} = 78.11$

CAS—107-15-3 (anhydrous); 6780-13-8 (monohydrate)

A clear, colourless or slightly yellow, strongly alkaline liquid. It is hygroscopic and absorbs carbon dioxide from the air. It solidifies on cooling to a crystalline mass (m.p. 10°). Wt per ml about 0.96 g. B.p. about 120°.

Miscible with water and ethanol; soluble 1 in 130 of chloroform; slightly soluble in ether.

Caution. It is irritant to the skin and mucous membranes.

Dissociation Constant. pK_a 7.2, 10.0 (20°).

Colour Test. Dissolve 1 ml in 5 ml of water and to 3 drops of this solution add 2 ml of a 1% solution of copper sulphate and shake—violet-blue.

Mass Spectrum. Principal peaks at m/z 30, 42, 43, 27, 44, 29, 31, 41.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: detection limit 50 ng/ml in plasma, UV detection—I. A. Cotgreave and J. Caldwell, *Biopharm. Drug Disp.*, 1983, 4, 53–62.

Disposition in the Body. Absorbed after oral administration and rapidly metabolised.

Toxicity. The maximum permissible atmospheric concentration is 10 ppm.

Half-life. Plasma half-life, about 0.5 to 1 hour.

Reference. I. A. Cotgreave and J. Caldwell, *J. Pharm. Pharmacol.*, 1983, 35, 378–382.

Use. Ethylenediamine hydrate is used in the manufacture of aminophylline and in the preparation of aminophylline injections.

Ethylmorphine *Narcotic Analgesic*

3-O-Ethylmorphine

$\text{C}_{19}\text{H}_{23}\text{NO}_3 = 313.4$

CAS—76-58-4

Crystals. M.p. 199° to 201°.

Ethylmorphine Hydrochloride

Synonym. Chlorhydrate de Codéthyline

Proprietary Name. It is an ingredient of Natirose.

$\text{C}_{19}\text{H}_{23}\text{NO}_3 \cdot \text{HCl} \cdot 2\text{H}_2\text{O} = 385.9$

CAS—125-30-4 (anhydrous)

A white crystalline powder. M.p. about 123°, with decomposition.

Soluble 1 in 12 of water, 1 in 25 of ethanol, 1 in 1 of warm ethanol, and 1 in 250 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 8.2 (20°).

Colour Test. Marquis Test—yellow → violet → black.

Thin-layer Chromatography. System TA—Rf 40; system TB—Rf 07; system TC—Rf 22. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, blue-violet.)

Gas Chromatography. System GA—RI 2411.

High Pressure Liquid Chromatography. System HA— k' 3.7 (tailing peak); system HC— k' 1.06; system HS— k' 1.45.

Ultraviolet Spectrum. Aqueous acid—284 nm ($A_1^1 = 48$ a); aqueous alkali—281 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1064, 1045, 1129, 1499, 1185, 1264 (ethylmorphine hydrochloride, Nujol mull).

Mass Spectrum. Principal peaks at m/z 313, 162, 314, 124, 284, 59, 42, 243.

Quantification. GAS CHROMATOGRAPHY (CAPILLARY COLUMN). In blood, urine or postmortem tissues: AFID—P. Demedts *et al.*, *J. analyt. Toxicol.*, 1983, 7, 113–115.

Disposition in the Body. Absorbed after oral administration.

Toxicity. The estimated minimum lethal dose is 500 mg.

Ethylnoradrenaline

Sympathomimetic

Synonym. Ethylnorepinephrine

2-Amino-1-(3,4-dihydroxyphenyl)butan-1-ol

$C_{10}H_{15}NO_3 = 197.2$

CAS—536-24-3

Ethylnoradrenaline Hydrochloride

Proprietary Name. Bronkephrine

$C_{10}H_{15}NO_3 \cdot HCl = 233.7$

CAS—3198-07-0

A crystalline solid. M.p. 189° to 194°.

Soluble in water.

Dissociation Constant. pK_a 8.4 (25°).

Colour Tests. Ferric Chloride—green; Mandelin's Test—orange; Marquis Test—orange→brown; Nessler's Reagent—black.

Thin-layer Chromatography. *System TA*—Rf 42; *system TB*—Rf 01; *system TC*—Rf 02. (Acidified potassium permanganate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—278 nm ($A_1^{1\%} = 154$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1500, 1529, 1280, 1265, 1052, 1600 (KBr disk).

Mass Spectrum. Principal peaks at m/z 58, 41, 56, 30, 124, 65, 59, 93.

Dose. 1 to 2 mg of ethylnoradrenaline hydrochloride, subcutaneously or intramuscularly.

Ethylestrenol

Anabolic Steroid

Synonym. Ethylestrenol

Proprietary Names. Maxibolin; Orabolin; Orgabolin.

19-Nor-17 α -pregn-4-en-17 β -ol

$C_{20}H_{32}O = 288.5$

CAS—965-90-2

A white crystalline powder. M.p. about 89°.

Practically *insoluble* in water; soluble 1 in 9 of ethanol, 1 in 2 of chloroform, and 1 in 6 of ether.

Thin-layer Chromatography. *System TP*—Rf 79; *system TQ*—Rf 50; *system TR*—Rf 94; *system TS*—Rf 99.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 975, 994, 964, 1299, 1142, 1165 (Nujol mull).

Dose. Usually 2 to 4 mg daily.

Ethynodiol Diacetate

Progestational Steroid

Proprietary Names. Femulen; Lutometrodol. It is an ingredient of AlfamesE, Anoryol, Conova 30, Demulen, Metrulen, and Ovulen.

19-Nor-17 α -pregn-4-en-20-yne-3 β ,17 β -diol diacetate

$C_{24}H_{32}O_4 = 384.5$

CAS—1231-93-2 (ethynodiol); 297-76-7 (diacetate)

A white crystalline powder. M.p. 126° to 131°.

Very slightly *soluble* in water; soluble 1 in 15 of ethanol, 1 in 1 of chloroform, and 1 in 3.5 of ether.

Thin-layer Chromatography. *System TP*—Rf 83; *system TQ*—Rf 61; *system TR*—Rf 95; *system TS*—Rf 99.

Gas Chromatography. *System GA*—RI 2445 and 2779.

Infra-red Spectrum. Principal peaks at wavenumbers 1252, 1226, 1746, 1737, 1012, 1028 (KBr disk).

Dose. 0.5 to 6 mg daily.

Etidocaine*Local Anaesthetic* (\pm) -2-(*N*-Ethylpropylamino)butyro-2',6'-xylylidide $C_{17}H_{28}N_2O = 276.4$

CAS—36637-18-0

A white crystalline powder. M.p. 87° to 91°.

Soluble 1 in about 7000 of water; freely soluble in organic solvents.**Etidocaine Hydrochloride***Proprietary Name.* Duranest $C_{17}H_{28}N_2O \cdot \text{HCl} = 312.9$

CAS—36637-19-1

A white crystalline powder. M.p. 202° to 205°, with decomposition.

Soluble 1 in 10 of water and 1 in 5 of chloroform; practically insoluble in ether.**Dissociation Constant.** pK_a 7.9.**Ultraviolet Spectrum.** Aqueous acid—262 nm ($A_1^1 = 17$ a), 271 nm ($A_1^1 = 14$ a).**Infra-red Spectrum.** Principal peaks at wavenumbers 1650, 1520, 765, 1235, 1272, 1180 (KBr disk).**Quantification.** GAS CHROMATOGRAPHY. In plasma or urine: etidocaine and *N*-desalkyl metabolites, sensitivity 20 ng/ml, FID—D. J. Morgan *et al.*, *Eur. J. clin. Pharmac.*, 1977, 12, 359–365.**Disposition in the Body.** Rapidly absorbed into the circulation after epidural administration. Extensively metabolised by *N*-dealkylation, hydrolysis, and ring hydroxylation. Desethyletidocaine and despropyletidocaine are detectable in plasma. Less than 1% of a dose is excreted in the urine unchanged in 48 hours.**TOXICITY.** Plasma concentrations greater than 2 µg/ml may be associated with toxic effects.**HALF-LIFE.** Plasma half-life, after intravenous administration, about 2.5 hours, increased to about 6 hours after epidural administration.**VOLUME OF DISTRIBUTION.** About 2 litres/kg.**CLEARANCE.** Plasma clearance, about 15 ml/min/kg.**DISTRIBUTION IN BLOOD.** Plasma: whole blood ratio, 1.7.**PROTEIN BINDING.** In plasma, about 94%.**NOTE.** For a review of the pharmacokinetics of local anaesthetics see G. T. Tucker and L. E. Mather, *Clin. Pharmacokin.*, 1979, 4, 241–278.**Dose.** Etidocaine hydrochloride is administered by injection as 0.5 to 1.5% solutions; maximum dose, 300 mg.**Etilefrine***Sympathomimetic**Synonyms.* Ethyladrianol; Ethylnorphenylephrine.

2-Ethylamino-1-(3-hydroxyphenyl)ethanol

 $C_{10}H_{15}NO_2 = 181.2$

CAS—709-55-7

A white crystalline powder. M.p. 147° to 148°.

Soluble 1 in 25 of water and 1 in 15 of ethanol.**Etilefrine Hydrochloride***Proprietary Names.* Circupon RR; Effortil; Tonus-forte-Tablinen; Tri-Effortil. $C_{10}H_{15}NO_2 \cdot \text{HCl} = 217.7$

CAS—943-17-9

A white crystalline powder. M.p. 121°.

Freely soluble in water; soluble in ethanol; practically insoluble in chloroform.**Dissociation Constant.** pK_a 9.0, 10.2 (25°).

Colour Tests. Folin-Ciocalteu Reagent—blue; Liebermann's Test—black; Mandelin's Test—grey → green → brown; Marquis Test—red.

Thin-layer Chromatography. System TA—Rf 41; system TB—Rf 03; system TC—Rf 02. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 1685.

Ultraviolet Spectrum. Aqueous acid—272 nm ($A_1^1 = 102$ a); aqueous alkali—237 nm ($A_1^1 = 491$ b), 290 nm ($A_1^1 = 167$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1597, 1068, 797, 1305, 1279, 1222 (etilefrine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 58, 30, 59, 77, 29, 95, 65, 57.

Dose. Etilefrine hydrochloride has been given in doses of 15 to 50 mg daily.

Etisazole

Antifungal (Veterinary)

N-Ethyl-1,2-benzisothiazol-3-ylamine

$C_9H_{10}N_2S = 178.3$

CAS—7716-60-1

A white to slightly brown crystalline powder. M.p. 78°.

Etisazole Hydrochloride

Proprietary Name. Netrosylla

$C_9H_{10}N_2S \cdot HCl = 214.7$

CAS—7716-59-8

A crystalline powder. M.p. 182° to 186°.

Sparingly soluble in water; freely soluble in ethanol and methanol; slightly soluble in chloroform and ether.

Colour Test. Liebermann's Test—red-brown.

Thin-layer Chromatography. System TA—Rf 74. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 1668.

Ultraviolet Spectrum. Aqueous acid—232 nm ($A_1^1 = 1200$ b), 323 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1608, 1314, 1292, 772, 706, 1111 (KBr disk).

Etofenamate

Analgesic

Proprietary Name. Rheumon

2-(2-Hydroxyethoxy)ethyl *N*-($\alpha\alpha\alpha$ -trifluoro-*m*-tolyl)anthranilate

$C_{18}H_{18}F_3NO_4 = 369.3$

CAS—30544-47-9

A pale yellow viscous liquid.

Practically insoluble in water; soluble in organic solvents.

Ultraviolet Spectrum. Aqueous acid—284 nm ($A_1^1 = 287$ b), 349 nm ($A_1^1 = 165$ b).

Quantification. GAS CHROMATOGRAPHY. In plasma, tissues or urine: FID—H.-D. Dell *et al.*, *Arzneimittel-Forsch.*, 1981, 31, 17–21.

Disposition in the Body. Well absorbed from the gastro-intestinal tract and through the skin. The unchanged drug is found in small amounts in urine, together with hydroxylated derivatives of etofenamate and flufenamic acid.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 300 mg to 6 subjects, a mean peak plasma concentration of 10.0 $\mu\text{g/ml}$ was attained in 1 hour; following topical administration of 6 g to 6 subjects, a mean peak plasma concentration of 0.15 $\mu\text{g/ml}$ was attained in 2 hours (H.-D. Dell *et al.*, *Arzneimittel-Forsch.*, 1977, 27, 1322–1325).

HALF-LIFE. Plasma half-life, about 1.6 hours after ingestion and about 3.3 hours after topical administration.

Use. Topically in a concentration of 5%.

Etofylline

Xanthine Bronchodilator

Synonyms. Aethophyllinum; Hydroxyaethyltheophyllinum; Oxyetophylline.

Proprietary Names. Bio-Phyllin; Oxyphylline.

7-(2-Hydroxyethyl)theophylline

$C_9H_{12}N_4O_3 = 224.2$

CAS—519-37-9

A white crystalline powder. M.p. 161° to 166°.

Soluble in water; slightly soluble in ethanol; sparingly soluble in chloroform; practically insoluble in ether.

Gas Chromatography. System GA—RI 2090.

Ultraviolet Spectrum. Aqueous acid—270 nm ($A_1^1 = 416$ b).

Dose. Up to 1.5 g daily.

Etomidate

General Anaesthetic

Proprietary Name. Hypnomidat(e)

(+) -Ethyl 1-(α -methylbenzyl)imidazole-5-carboxylate $C_{14}H_{16}N_2O_2 = 244.3$

CAS—33125-97-2

A white or yellowish crystalline or amorphous powder. M.p. about 67°.

Dissociation Constant. pK_a 4.2.

Thin-layer Chromatography. System TA—Rf 67; system TB—Rf 26; system TC—Rf 71.

Gas Chromatography. System GA—RI 2008.

Ultraviolet Spectrum. Water—242 nm ($A_1^1 = 450$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1212, 1708, 712, 1112, 1132, 664 (KBr disk).

Mass Spectrum. Principal peaks at m/z 105, 104, 77, 79, 244, 106, 108, 27.

Quantification. GAS CHROMATOGRAPHY (CAPILLARY COLUMN). In plasma: detection limit 5 ng/ml, AFID—A. G. de Boer *et al.*, *J. Chromat.*, 1979, 162; *Biomed. Appl.*, 4, 591–595.

GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In plasma: sensitivity 1 ng/ml—M. J. Van Hamme *et al.*, *J. pharm. Sci.*, 1977, 66, 1344–1346.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: detection limit 2 ng/ml, UV detection—E. O. Ellis and P. R. Beck, *J. Chromat.*, 1982, 232; *Biomed. Appl.*, 21, 207–211.

Disposition in the Body. Rapidly distributed after intravenous injection. It is metabolised in the liver by hydrolysis and *N*-dealkylation to inactive metabolites. About 90% of a dose is excreted in the urine as the carboxylic acid derivative, together with mandelic acid and benzoic acid; less than 5% is excreted as unchanged drug.

THERAPEUTIC CONCENTRATION.

After intravenous injection of 0.3 mg/kg to 8 subjects, plasma concentrations of 0.22 to 0.41 μ g/ml (mean 0.32) were reported at 4 minutes (M. J. Van Hamme *et al.*, *Anesthesiology*, 1978, 49, 274–277).

HALF-LIFE. Plasma half-life, 2 to 11 hours (mean 5).

VOLUME OF DISTRIBUTION. About 4 to 5 litres/kg.

CLEARANCE. Plasma clearance, 9 to 18 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 0.62.

PROTEIN BINDING. In plasma, about 75%.

REFERENCE. M. J. Van Hamme *et al.*, *ibid.*

Dose. 300 μ g/kg intravenously, with supplementary doses of 100 to 200 μ g/kg, as required.

Etorphine

Narcotic Analgesic (Veterinary)

Synonym. 19-Propylorvinol

(6*R*,7*R*,14*R*)-7,8-Dihydro-7-(1-hydroxy-1-methylbutyl)-6-*O*-methyl-6,14-ethenomorphine $C_{25}H_{33}NO_4 = 411.5$

CAS—14521-96-1

M.p. 214° to 215°.

Soluble 1 in 30 000 of water; freely soluble in ethanol, chloroform, and ether.

Caution. It is dangerous to smell or taste this material.

Etorphine Hydrochloride

Proprietary Name. It is an ingredient of Immobilon.

 $C_{25}H_{33}NO_4 \cdot HCl = 448.0$

CAS—13764-49-3

A white microcrystalline powder. M.p. 266° to 267°.

Soluble 1 in 40 of water, 1 in 30 of ethanol, and 1 in 2200 of chloroform; practically insoluble in ether.

Partition Coefficient. Log *P* (octanol/pH 7.4), 1.9.

Colour Test. Marquis Test—blue-grey → yellow-brown.

Thin-layer Chromatography. System TA—Rf 73; system TB—Rf 07; system TC—Rf 61. (Acidified iodoplatinate solution, positive; Marquis reagent, grey; acidified potassium permanganate solution, positive.)

High Pressure Liquid Chromatography. System HA—*k'* 0.6; system HC—*k'* 1.11.

Ultraviolet Spectrum. Aqueous acid—289 nm ($A_1^1 = 37$ a); aqueous alkali—302 nm ($A_1^1 = 65$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1113, 1195, 1205, 1155, 1088, 1005.

Mass Spectrum. Principal peaks at m/z 44, 215, 411, 324, 45, 164, 42, 216.

Disposition in the Body.

TOXICITY. It is about 400 times more potent than morphine; several cases of poisoning, including one fatality, have been reported after accidental pricking of the skin with an injection needle.

Use. With acepromazine as a sedative for the control of large animals, and with methotrimeprazine as a neuroleptanalgesic in small animals.

Eucatropine

Anticholinergic

1,2,2,6-Tetramethyl-4-piperidyl mandelate
 $C_{17}H_{25}NO_3 = 291.4$
 CAS—100-91-4

Eucatropine Hydrochloride

$C_{17}H_{25}NO_3 \cdot HCl = 327.9$
 CAS—536-93-6

A white granular powder. M.p. 183° to 186°.

Very **soluble** in water; freely soluble in ethanol and chloroform; practically insoluble in ether.

Thin-layer Chromatography. System TA—Rf 46; system TB—Rf 18; system TC—Rf 13. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2026.

Ultraviolet Spectrum. Aqueous acid—252 nm, 258 nm ($A_1^1 = 6.8$ a), 264 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1720, 1235, 1740, 1295, 1145, 1262 (KBr disk).

Mass Spectrum. Principal peaks at m/z 124, 276, 58, 140, 56, 72, 125, 41.

Use. Eucatropine hydrochloride is used as a 2 to 10% ophthalmic solution.

Eugenol

Essential Oil

Synonyms. 4-Allylguaiacol; Caryophyllic Acid; Eugenic Acid.

4-Allyl-2-methoxyphenol

$C_{10}H_{12}O_2 = 164.2$

CAS—97-53-0

Eugenol is the principal constituent of clove oil.

A colourless or pale yellow liquid with an odour of clove. It darkens in colour with age or on exposure to air. Wt per ml 1.064 to 1.068 g. B.p. about 254°. Refractive index, at 20°, 1.540 to 1.542.

Practically **insoluble** in water; soluble 1 in 2 of ethanol (70%); miscible with ethanol, chloroform, and ether.

Dissociation Constant. pK_a 9.8 (20°).

Gas Chromatography. System GA—RI 1368.

Ultraviolet Spectrum. Aqueous alkali—246 nm ($A_1^1 = 552$ b), 296 nm ($A_1^1 = 262$ b); ethanol—232 nm ($A_1^1 = 406$ b), 282 nm ($A_1^1 = 193$ b).

Mass Spectrum. Principal peaks at m/z 164, 149, 131, 137, 103, 77, 133, 165.

Famprofazone

Analgesic

4 - Isopropyl - 1 - methyl - 5 - [N - methyl - N - (α - methylphenethyl)aminomethyl]-2-phenyl-4-pyrazolin-3-one

$C_{24}H_{31}N_3O = 377.5$

CAS—22881-35-2

A white crystalline powder. M.p. 132° to 133°. Practically **insoluble** in water; slightly soluble in dilute acetic acid.

Colour Tests. Liebermann's Test—red-orange; Marquis Test—orange.

Thin-layer Chromatography. System TA—Rf 72; system TB—Rf 37; system TC—Rf 74. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 3059.

High Pressure Liquid Chromatography. System HD— k' 2.5.

Ultraviolet Spectrum. Aqueous acid—243 nm, 279 nm ($A_1^1 = 248$ a).

Mass Spectrum. Principal peaks at m/z 286, 229, 91, 81, 287, 41, 77, 228.

Dose. Famprofazone has been given in doses of up to 150 mg daily.

Quantification. SPECTROFLUORIMETRY. In plasma: sensitivity 50 ng/ml—A. M. Pastorino, *Arzneimittel-Forsch.*, 1978, 28, 1728–1730.

Disposition in the Body. About 50% of a dose is excreted in the urine in 24 hours, mainly unchanged. Extensive biliary excretion has been reported.

THERAPEUTIC CONCENTRATION.

Following an intravenous dose of 70 mg to 5 subjects, the mean plasma concentration was $>10 \mu\text{g/ml}$ at 2 minutes and $2.2 \mu\text{g/ml}$ at 1 hour (J. D'Souza *et al.*, *J. Pharm. Pharmac.*, 1979, 31, 416–418).

HALF-LIFE. Plasma half-life, about 1 hour.

VOLUME OF DISTRIBUTION. About 0.3 litre/kg.

CLEARANCE. Plasma clearance, about 3 ml/min/kg.

PROTEIN BINDING. In plasma, about 17%.

Dose. Initially, the equivalent of 0.75 to 1 mg/kg of fazadinium, intravenously.

Fazadinium Bromide

Muscle Relaxant

Proprietary Name. Fazadon

1,1'-Azobis(3-methyl-2-phenyl-1*H*-imidazo[1,2-*a*]pyridinium) dibromide

$\text{C}_{28}\text{H}_{24}\text{Br}_2\text{N}_6 = 604.3$

CAS—36653-54-0 (fazadinium); 49564-56-9 (bromide)

A yellow solid. M.p. 215°.

Soluble in water.

Ultraviolet Spectrum. Aqueous acid—283 nm ($A_1^1 = 188$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1280, 1220, 1160, 1250, 760, 780 (Nujol mull).

Fenbendazole

Anthelmintic

Proprietary Name. Panacur (vet.)

Methyl 5-phenylthio-1*H*-benzimidazol-2-ylcarbamate

$\text{C}_{15}\text{H}_{13}\text{N}_3\text{O}_2\text{S} = 299.3$

CAS—43210-67-9

A light brownish-grey crystalline powder. M.p. 233°, with decomposition.

Practically **insoluble** in water; freely soluble in dimethyl sulphoxide.

Ultraviolet Spectrum. Aqueous acid—289 nm, 302 nm; aqueous alkali—238 nm, 312 nm; ethanol—296 nm ($A_1^1 = 416$ b).

Mass Spectrum. Principal peaks at m/z 267, 299, 266, 31, 51, 268, 29, 77.

Dose. Fenbendazole has been given in doses of 1 to 1.5 g.

Fenbufen

Analgesic

Proprietary Names. Cinopal; Lederfen.

4-(Biphenyl-4-yl)-4-oxobutyrac acid

$C_{16}H_{14}O_3 = 254.3$

CAS—36330-85-5

Crystals. M.p. about 180°.

Colour Tests. Liebermann's Test—red-brown; Marquis Test—orange→brown; Sulphuric Acid—yellow.

Thin-layer Chromatography. System TD—Rf 18; system TE—Rf 04; system TF—Rf 30; system TG—Rf 09.

Gas Chromatography. System GD—retention time of methyl derivative 1.79 relative to $n\text{-C}_{16}\text{H}_{34}$.

High Pressure Liquid Chromatography. System HD— k' 4.0; system HV—retention time 0.81 relative to meclofenamic acid.

Ultraviolet Spectrum. Aqueous alkali—285 nm ($A_1^1 = 835$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 764, 1674, 1708, 1242, 1268, 829 (KBr disk).

Mass Spectrum. Principal peaks at m/z 181, 152, 153, 254, 182, 151, 76, 127.

Quantification. GAS CHROMATOGRAPHY. In plasma: limit of detection, fenbufen 50 ng/ml, metabolites (i) and (ii) (see under Disposition) 100 ng/ml, FID—G. Cuisinaud *et al.*, *J. Chromat.*, 1978, 148, 509–513.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum or urine: fenbufen and metabolites, sensitivity 500 ng/ml in serum, 1 µg/ml in urine, UV detection—G. E. Van Lear *et al.*, *J. pharm. Sci.*,

1978, 67, 1662–1664. In serum: fenbufen and metabolites (i) and (ii), detection limit 500 ng/ml, UV detection—J. S. Fleitman *et al.*, *J. Chromat.*, 1982, 228; *Biomed. Appl.*, 17, 372–376.

Disposition in the Body. Readily absorbed after oral administration, and extensively metabolised to active metabolites. A number of metabolites have been identified including (i) 4-(biphenyl-4-yl)-4-hydroxybutyric acid, (ii) biphenyl-4-ylacetic acid, (iii) (4'-hydroxybiphenyl-4-yl)acetic acid, and (iv) 4-hydroxy-(4'-hydroxybiphenyl-4-yl)butyric acid. About 40% of a dose is excreted in the urine in 24 hours. The major urinary metabolites are metabolite (iii), about 11% of the dose, and metabolite (iv), about 17% of the dose; metabolites (i) and (ii) are excreted in amounts less than about 3% of the dose. Very little unchanged drug is excreted in the urine. Less than 2% of the dose is eliminated in the faeces in 24 hours.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 600 mg administered to 3 subjects, mean peak serum concentrations of 8.1 µg/ml of fenbufen and 64.9 µg/ml of metabolite (i) were attained in about 2 hours. A mean peak serum concentration of 13.2 µg/ml of metabolite (ii) was attained in about 8 hours (F. S. Chiccarelli *et al.*, *Arzneimittel-Forsch.*, 1980, 30, 728–735).

HALF-LIFE. Plasma half-life, fenbufen and metabolites (i) and (ii), about 10 hours.

PROTEIN BINDING. In plasma, fenbufen and metabolite (ii), more than 99%; metabolite (i), about 98%.

NOTE. For a review of the pharmacokinetics of fenbufen see R. N. Brogden *et al.*, *Drugs*, 1981, 21, 1-22.

Dose. 600 to 900 mg daily.

Fencamfamin

Central Stimulant

N-Ethyl-3-phenyl-8,9,10-trinorbornan-2-ylamine

$C_{15}H_{21}N = 215.3$

CAS—1209-98-9

Practically insoluble in water; soluble in chloroform.

Fencamfamin Hydrochloride

Proprietary Name. It is an ingredient of Reactivan.

$C_{15}H_{21}N \cdot HCl = 251.8$

CAS—2240-14-4

A white crystalline solid. M.p. 192°.

Soluble in water, ethanol, and chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 8.7 (25°).

Colour Tests. Liebermann's Test—red-orange; Marquis Test—orange.

Thin-layer Chromatography. *System TA*—Rf 54; *system TB*—Rf 62; *system TC*—Rf 34. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 1677; *system GB*—RI 1745; *system GC*—RI 2180.

High Pressure Liquid Chromatography. *System HA*— k' 1.3; *system HC*— k' 0.72.

Ultraviolet Spectrum. Aqueous acid—253 nm, 259 nm ($A_1^1 = 10$ a), 265 nm, 269 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 708, 756, 1042, 797, 738, 1492 (fencamfamin hydrochloride, Nujol mull).

Mass Spectrum. Principal peaks at m/z 98, 215, 58, 84, 91, 56, 71, 186.

Quantification. GAS CHROMATOGRAPHY. In urine: sensitivity 40 ng/ml for fencamfamin, 50 ng/ml for the desethyl metabolite, ECD—F. T. Delbeke and M. Debackere, *Biopharm. Drug Disp.*, 1981, 2, 17-30.

Disposition in the Body. Absorbed after oral administration. Metabolised by de-ethylation. About 10 to 30% of a dose is excreted in the urine as unchanged drug and desethylfencamfamin in 3 days. The extent and rate of excretion is dependent on the urinary pH.

HALF-LIFE. Derived from urinary excretion data, about 16 hours.

REFERENCE. F. T. Delbeke and M. Debackere, *ibid.*

Dose. Usually 30 mg of fencamfamin hydrochloride daily.

Fenclofenac

Analgesic

Proprietary Names. Feclan; Flenac; Gidalon.

[2-(2,4-Dichlorophenoxy)phenyl]acetic acid

$C_{14}H_{10}Cl_2O_3 = 297.1$

CAS—34645-84-6

A white powder. M.p. about 136°.

Slightly **soluble** in water, but less soluble in acid solutions; freely soluble in most organic solvents.

Dissociation Constant. pK_a 5.5.

Colour Tests. Liebermann's Test—orange (slow), (→ brown at 100°); Marquis Test—red (slow).

Thin-layer Chromatography. *System TG*—Rf 20.

Gas Chromatography. *System GD*—retention times of methyl derivative 1.55 and 1.26 relative to $n-C_{16}H_{34}$.

High Pressure Liquid Chromatography. *System HV*—retention time 0.91 relative to meclofenamic acid.

Ultraviolet Spectrum. Methanol—270 nm ($A_1^1 = 72$ b), 276 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1242, 1258, 1707, 1215, 1100, 772 (KBr disk).

Mass Spectrum. Principal peaks at m/z 296, 215, 217, 298, 216, 152, 181, 251.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 300 ng/ml, ECD—R. Henson *et al.*, *Eur. J. drug Met. Pharmacokinet.*, 1980, 5, 217–223.

Disposition in the Body. Well absorbed after oral administration. More than 90% of a dose is excreted in the urine in the form of conjugates of the drug and hydroxylated metabolites.

THERAPEUTIC CONCENTRATION.

A single oral dose of 600 mg to 9 subjects produced a mean peak plasma concentration of 63 µg/ml in 3 to 4 hours. Daily oral doses of 1200 mg to 5 subjects produced a mean steady-state plasma concentration of 87 µg/ml (R. Henson *et al.*, *ibid.*).

Following daily oral doses of 10 to 25 mg/kg to 18 children for 3 weeks, maximum steady-state plasma concentrations of 52 to 372 µg/ml (mean 120) were reported 2 to 8 hours after a dose (A.-L. Makela *et al.*, *Eur. J. clin. Pharmac.*, 1983, 25, 381–388).

HALF-LIFE. Plasma half-life, 15 to 40 hours (mean 26).

VOLUME OF DISTRIBUTION. About 0.2 litre/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 1.7.

PROTEIN BINDING. In plasma, about 99%.

Dose. 0.6 to 1.2 g daily.

Fendosal

Analgesic

Proprietary Name. Alnovin

5-(4,5-Dihydro-2-phenyl-3H-benz[e]indol-3-yl)salicylic acid

$C_{25}H_{19}NO_3 = 381.4$

CAS—53597-27-6

A yellow powder. M.p. 239° to 241°.

Practically **insoluble** in water; soluble 1 in 50 of ethanol; slightly soluble in alkaline solutions, and in propylene glycol.

Dissociation Constant. pK_a 3.1.

Ultraviolet Spectrum. Aqueous alkali—292 nm ($A_1^1 = 564$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1675, 1242, 1500, 1615, 1298, 765 (KBr disk).

Dose. Fendosal has been given in doses of 200 to 400 mg.

Fenethylamine

Xanthine Stimulant

Synonyms. Amfetyline; 7-Ethyltheophylline Amphetamine.

7-[2-(α -Methylphenethylamino)ethyl]theophylline

$C_{18}H_{23}N_5O_2 = 341.4$

CAS—3736-08-1

Practically **insoluble** in water; soluble in chloroform.

Fenethylamine Hydrochloride

Proprietary Name. Captagon

$C_{18}H_{23}N_5O_2 \cdot HCl = 377.9$

CAS—1892-80-4

A white crystalline powder.

Soluble in water.

Colour Tests. Marquis Acid Test—pink-orange/violet; Marquis Test—orange.

Thin-layer Chromatography. System TA—Rf 55; system TB—Rf 03; system TC—Rf 45. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2830.

High Pressure Liquid Chromatography. System HC— k' 0.27.

Ultraviolet Spectrum. Aqueous acid—275 nm ($A_1^1 = 242$ a). No alkaline shift. (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 1664, 1705, 1600, 1546, 746, 1219 (KBr disk).

Mass Spectrum. Principal peaks at m/z 250, 70, 207, 91, 251, 119, 148, 56.

Dose. Fenethylamine hydrochloride has been given in doses of 25 to 100 mg daily.

Fenfluramine

Anorectic

N-Ethyl- α -methyl-3-trifluoromethylphenethylamine

$C_{12}H_{16}F_3N = 231.3$

CAS—458-24-2

Practically insoluble in water; soluble in chloroform.

Fenfluramine Hydrochloride

Proprietary Names. Ponderal; Ponderax; Pondimin.

$C_{12}H_{16}F_3N \cdot HCl = 267.7$

CAS—404-82-0

A white crystalline powder. M.p. 168° to 172°.

Soluble 1 in 20 of water, 1 in 10 of ethanol, and 1 in 10 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 9.1 (25°).

Colour Test. Liebermann's Test (at 100°)—yellow.

Thin-layer Chromatography. *System TA*—Rf 48; *system TB*—Rf 41; *system TC*—Rf 16. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—fenfluramine RI 1222, norfenfluramine RI 1133; *system GB*—fenfluramine RI 1158, norfenfluramine RI 1066; *system GC*—fenfluramine RI 1621, norfenfluramine RI 1470.

High Pressure Liquid Chromatography. *System HA*—fenfluramine k' 1.3, norfenfluramine k' 1.0; *system HC*— k' 0.88.

Ultraviolet Spectrum. Aqueous acid—264 nm ($A_1^{1\%} = 22$ a), 271 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1165, 1116, 1070, 698, 793, 1202 (fenfluramine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 72, 44, 159, 73, 58, 42, 109, 56; norfenfluramine 44, 42, 159, 43, 45, 184, 41, 109.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: fenfluramine and norfenfluramine, detection limits fenfluramine 5 ng/ml and norfenfluramine 100 pg/ml in plasma, ECD—K. K. Midha *et al.*, *Can. J. pharm. Sci.*, 1979, 14, 18–21.

Disposition in the Body. Readily absorbed after oral administration and accumulates in the tissues. The major metabolite in the blood is the *N*-desethyl derivative, norfenfluramine, which is active. It is also metabolised by oxidation to *m*-trifluoromethylbenzoic acid which is conjugated with glycine to form *m*-trifluoromethylhippuric acid. The rate of elimination is influenced by urinary pH and urinary flow. In acidic urine about 23% of a dose is excreted unchanged, and about 17% as norfenfluramine in 48 hours; the remainder consists of *m*-trifluoromethylhippuric acid; in alkaline urine about 2% is excreted as unchanged drug and norfenfluramine; when the urinary pH is not controlled, 3 to 10% may be excreted as unchanged drug and 3 to 14% as norfenfluramine. Up to 5% of a dose is eliminated in the faeces as fenfluramine and norfenfluramine.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.05 to 0.15 μ g/ml.

There is considerable intersubject variation in plasma concentrations and it has been reported that the therapeutic effect (weight loss) is greater in

those patients who can tolerate higher plasma concentrations (more than 0.2 µg/ml) (J. A. Innes *et al.*, *Br. med. J.*, 1977, 2, 1322-1325).

A single oral dose of 60 mg administered to 5 subjects, resulted in a mean plasma concentration of 0.06 µg/ml of fenfluramine in 2 to 4 hours and 0.016 µg/ml of norfenfluramine in 4 to 6 hours. Steady-state plasma concentrations of 0.04 to 0.12 µg/ml of fenfluramine were attained in 3 to 4 days after daily administration of 60 mg, in divided doses, to 6 subjects; concentrations of norfenfluramine were similar (D. B. Campbell, *Br. J. Pharmacol.*, 1971, 43, 465P-466P).

TOXICITY. In adults the minimum lethal dose is probably in excess of 2 g but for young children as little as 200 mg may cause death. Toxic effects may be produced when the plasma concentration is greater than about 0.5 µg/ml, and death has occurred at concentrations above 6 µg/ml.

Three children aged 6 years, 3 years, and 1 year 9 months ingested between them about 4 g of fenfluramine hydrochloride. The youngest and the oldest child died; postmortem blood concentrations were 6.5 and 16 µg/ml respectively and liver concentrations were 48 and 136 µg/g; a urine concentration of 60 µg/ml was found in the younger child (R. G. Gold *et al.*, *Lancet*, 1969, 2, 1306).

A 13-year-old boy died after ingesting 2 g of fenfluramine hydrochloride; postmortem concentrations, µg/ml or µg/g, were:

	Fenfluramine	Norfenfluramine
Blood	6.5	0.75
Bile	64.5	10.2
Brain	42	5.3
Kidney	27.1	1.5
Liver	49	8.5
Urine	89	10

(M. R. Fleisher and D. B. Campbell, *Lancet*, 1969, 2, 1306-1307).

HALF-LIFE. Plasma half-life, 11 to 30 hours (mean 20).

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 0.74.

PROTEIN BINDING. In plasma, about 30%.

NOTE. For a review of fenfluramine see R. M. Pinder *et al.*, *Drugs*, 1975, 10, 241-323. For a review of fenfluramine poisoning see K. E. von Muhlendahl and E. G. Krienke, *Clin. Toxicol.*, 1979, 14, 97-106.

Dose. Initially 40 mg of fenfluramine hydrochloride daily, increasing to 60 to 120 mg daily.

Fenopropfen

Analgesic

(±)-2-(3-Phenoxyphenyl)propionic acid

C₁₅H₁₄O₃ = 242.3

CAS—31879-05-7

Fenopropfen Calcium

Proprietary Names. Fenopron; Fepron; Nalfon; Nalgésic; Progesic.

(C₁₅H₁₃O₃)₂Ca·2H₂O = 558.6

CAS—34597-40-5 (anhydrous); 53746-45-5 (dihydrate)

A white crystalline powder. M.p. 105° to 110°.

Soluble 1 in 400 to 1 in 500 of water, 1 in 15 of ethanol, and 1 in 300 of chloroform.

Dissociation Constant. pK_a 4.5 (25°).

Partition Coefficient. Log P (octanol/pH 7.4), 0.8.

Colour Tests. Liebermann's Test—red-brown; Marquis Test—pink.

Thin-layer Chromatography. System TD—Rf 42; system TE—Rf 09; system TF—Rf 53; system TG—Rf 16. (Ludy Tenger reagent, orange.)

Gas Chromatography. System GA—RI 2021; system GD—retention time of methyl derivative 1.31 relative to *n*-C₁₆H₃₄.

High Pressure Liquid Chromatography. System HD—k' 7.9.

Ultraviolet Spectrum. Aqueous acid—272 nm (A₁¹ = 72 a); methanol—273 nm (A₁¹ = 72 a), 280 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1562, 1225, 696, 1211, 1268, 1248 (fenopropfen calcium, KBr disk).

Mass Spectrum. Principal peaks at *m/z* 197, 241, 198, 77, 242, 104, 91, 103.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 250 ng/ml, FID—J. F. Nash *et al.*, *J. pharm. Sci.*, 1971, 60, 1062-1064.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 500 ng/ml, UV detection—R. J. Bopp *et al.*, *J. pharm. Sci.*, 1981, 70, 507-509.

Disposition in the Body. Readily absorbed after oral administration. About 90% of a dose is excreted in the urine in 24 hours, about 3% of the excreted material being unchanged drug, about 45% fenopropfen glucuronide, about 42% 4-hydroxyfenopropfen glucuronide, and about 2% free 4-hydroxyfenopropfen. About 2% of a dose is eliminated in the faeces in 24 hours.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 250 mg administered to 4 subjects, peak plasma concentrations of 23 to 31 µg/ml (mean 27) were attained in 0.5 to 2 hours (A. Rubin *et al.*, *J. pharm. Sci.*, 1971, 60, 1797-1801).

TOXICITY. Recovery has been reported after the ingestion of about 60 g.

HALF-LIFE. Plasma half-life, 2 to 3 hours.

VOLUME OF DISTRIBUTION. About 0.1 litre/kg.

PROTEIN BINDING. In plasma, about 99%.

NOTE. For a review of the pharmacological properties of fenopropfen see R. N. Brogden *et al.*, *Drugs*, 1977, 13, 241-265.

Dose. The equivalent of 0.9 to 2.4 g of fenopropfen daily.

Fenoterol

Sympathomimetic

1-(3,5-Dihydroxyphenyl)-2-(4-hydroxy- α -methylphenethyl-amino)ethanol

$C_{17}H_{21}NO_4 = 303.4$

CAS—13392-18-2

Fenoterol Hydrobromide

Proprietary Names. Berotec; Partusisten. It is an ingredient of Duovent.

$C_{17}H_{21}NO_4 \cdot HBr = 384.3$

CAS—1944-12-3

A white crystalline powder. M.p. about 230°, with decomposition.

Soluble 1 in 10 of water and 1 in 11 of ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 8.5, 10.0.

High Pressure Liquid Chromatography. System HA— k' 0.7.

Ultraviolet Spectrum. Aqueous acid—275 nm ($A_1^1 = 107$ a); aqueous alkali—295 nm ($A_1^1 = 190$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1605, 1510, 700, 1160, 1575, 1200 (fenoterol hydrobromide, KBr disk).

Disposition in the Body. Rapidly but incompletely absorbed after inhalation or oral administration. It undergoes extensive first-pass metabolism by sulphate conjugation. About 35% of an oral dose is excreted in the urine in 24 hours, mainly as the inactive sulphate conjugate, and less than 2% as unchanged drug; about 40% of an oral dose is eliminated in the faeces.

THERAPEUTIC CONCENTRATION.

After oral administration of 5 mg of tritiated fenoterol to 8 subjects, peak plasma radioactivity equivalent to about 0.04 µg/ml of fenoterol was attained in 2 hours; most of the radioactivity was due to metabolites. Following inhalation of a 200-µg or 500-µg metered-dose by 3 subjects, peak plasma radioactivity equivalent to about 0.0003 to 0.0004 µg/ml of fenoterol was reported (L. Buchelt and K. L. Rominger, *Med. Proc.*, 1972, 18, 15-20).

HALF-LIFE. Plasma half-life, about 6 to 7 hours.

NOTE. For a review of the pharmacokinetics of fenoterol see R. C. Heel *et al.*, *Drugs*, 1978, 15, 3-32.

Dose. Up to 360 µg of fenoterol hydrobromide every 4 hours, by aerosol inhalation; 15 to 20 mg daily has been given by mouth.

Fenpipramide

Antispasmodic (Veterinary)

2,2-Diphenyl-4-piperidinobutyramide

$C_{21}H_{26}N_2O = 322.4$

CAS—77-01-0

White crystals. M.p. 188°.

Practically **insoluble** in water; soluble in chloroform.

Fenpipramide Hydrochloride

Proprietary Name. It is an ingredient of Efosin.

$C_{21}H_{26}N_2O \cdot HCl \cdot H_2O = 376.9$

CAS—14007-53-5 (anhydrous)

A white crystalline powder.

Soluble in water, ethanol, and chloroform.

Colour Test. Liebermann's Test—orange.

Thin-layer Chromatography. System TA—Rf 54; system TB—Rf 05; system TC—Rf 16. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—253 nm, 259 nm ($A_1^1 = 12$ a), 265 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1618, 1684, 695, 712, 702, 764 (KBr disk).

Mass Spectrum. Principal peaks at m/z 98, 112, 99, 55, 42, 41, 211, 84.

Fenpiprane

Antispasmodic (Veterinary)

1-(3,3-Diphenylpropyl)piperidine

$C_{20}H_{25}N = 279.4$

CAS—3540-95-2

Crystals. M.p. 41° to 43°.
Practically **insoluble** in water; soluble in chloroform.

Fenpiprane Hydrochloride

Proprietary Name. It is an ingredient of Efosin.

$\text{C}_{20}\text{H}_{25}\text{N} \cdot \text{HCl} = 315.9$

CAS—3329-14-4

A white crystalline powder. M.p. 211° to 213°.

Soluble in water and chloroform.

Colour Tests. Liebermann's Test—brown; Mandelin's Test—green; Marquis Test—red.

Thin-layer Chromatography. *System TA*—Rf 61. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—259 nm ($A_1^1 = 16.7$ a), 268 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1492, 1631, 1092, 698, 1010, 1600 (KBr disk).

Fenproporex

Anorectic

Synonym. *N*-2-Cyanoethylamphetamine

Proprietary Names. Appetitzügler (hydrochloride); Perphoxen(e) (hydrochloride).

(±)-3-(α -Methylphenethylamino)propionitrile

$\text{C}_{12}\text{H}_{16}\text{N}_2 = 188.3$

CAS—15686-61-0; 18305-29-8 (hydrochloride)

Gas Chromatography. *System GA*—RI 1619.

Ultraviolet Spectrum. Aqueous acid—252 nm, 257 nm, 263 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 745, 1583, 697, 1019, 707, 1139 (fenproporex hydrochloride, KBr disk).

Dose. Fenproporex has been given as the hydrochloride in usual doses equivalent to 20 mg of the base daily.

Fentanyl

Narcotic Analgesic

Synonym. Phentanyl

N-(1-Phenethyl-4-piperidyl)propionanilide

$\text{C}_{22}\text{H}_{28}\text{N}_2\text{O} = 336.5$

CAS—437-38-7

Crystals. M.p. 83° to 84°.

Sparingly **soluble** in water.

Fentanyl Citrate

Proprietary Names. Fentanest; Leptanal; Sublimaze. It is an ingredient of Hypnorm (vet.), Innovar, and Thalamonal.

$\text{C}_{22}\text{H}_{28}\text{N}_2\text{O}_7 \cdot \text{C}_6\text{H}_8\text{O}_7 = 528.6$

CAS—990-73-8

White granules or a white glistening crystalline powder. M.p. 147° to 152°.

Soluble 1 in 40 of water, 1 in 140 of ethanol, 1 in 350 of chloroform, and 1 in 10 of methanol; slightly soluble in ether.

Caution. Avoid contact with skin and the inhalation of particles of fentanyl citrate.

Partition Coefficient. Log *P* (octanol/pH 7.4), 2.3.

Colour Test. Marquis Test—orange.

Thin-layer Chromatography. *System TA*—Rf 70; *system TB*—Rf 45; *system TC*—Rf 74. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 2650.

High Pressure Liquid Chromatography. *System HA*—*k'* 0.8; *system HC*—*k'* 1.11.

Ultraviolet Spectrum. Aqueous acid—251 nm, 257 nm ($A_1^1 = 13$ a), 263 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1660, 701, 1493, 1263, 1273, 1236 (KBr disk). (See below)

Mass Spectrum. Principal peaks at *m/z* 245, 146, 42, 189, 44, 105, 29, 43.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 20 pg/ml, AFID—J. A. Phipps *et al.*, *J. Chromat.*, 1983, 272; *Biomed. Appl.*, 23, 392–395.

RADIOIMMUNOASSAY. In plasma: sensitivity 60 pg/ml—M. Michiels *et al.*, *Eur. J. clin. Pharmac.*, 1977, 12, 153–158.

Disposition in the Body. Rapidly metabolised in the liver. Two metabolites, norfentanyl and despropionylfentanyl, have been detected in plasma at concentrations similar to those of fentanyl. About 70% of a dose is excreted in the urine in 72 hours, mostly as metabolites, with about 10 to 20% of a dose being excreted as unchanged drug in 48 hours. About 9% of a dose is eliminated in the faeces.

THERAPEUTIC CONCENTRATION.

Following intravenous injection of 0.2 mg to 6 subjects, plasma concentrations of about 0.002 µg/ml were reported after 2 minutes (M. Michiels *et al.*, *ibid.*).

Following a single intravenous dose of 60 µg/kg to 5 subjects, plasma concentrations of 0.03 to 0.2 µg/ml (mean 0.1) were reported at 1 minute, decreasing to 0.01 µg/ml at 1 hour (J. G. Bovill and P. S. Sebel, *Br. J. Anaesth.*, 1980, 52, 795–801).

TOXICITY. The estimated minimum lethal dose is 2 mg.

HALF-LIFE. Plasma half-life, about 1 to 6 hours (dose-dependent).

VOLUME OF DISTRIBUTION. About 3 litres/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 1.0.

PROTEIN BINDING. In plasma, about 80%.

NOTE. For a review of the pharmacokinetics of fentanyl see L. E. Mather, *Clin. Pharmacokinet.*, 1983, 8, 422–446.

Dose. Initially, the equivalent of 50 to 200 µg of fentanyl, intravenously; supplementary doses of 50 µg. With assisted respiration, an initial dose of up to 3500 µg may be given.

Fentictlor

Antifungal

Proprietary Names. ADT; Antimyck.

4,4'-Dichloro-2,2'-thiodiphenol

$C_{12}H_8Cl_2O_2S = 287.2$

CAS—97-24-5

A white crystalline powder. M.p. 176°.

Practically **insoluble** in water; freely soluble in ethanol.

Infra-red Spectrum. Principal peaks at wavenumbers 1269, 825, 1209, 818, 889, 1104.

Use. Fentictlor has been applied topically in concentrations of up to 2%.

Feprazone

Analgesic

Synonyms. Phenylprenazone; Prenazone.

Proprietary Names. Methrazone; Zepelin.

4-(3-Methylbut-2-enyl)-1,2-diphenylpyrazolidine-3,5-dione

$C_{20}H_{20}N_2O_2 = 320.4$

CAS—30748-29-9

A white crystalline powder. M.p. about 157°.

Practically **insoluble** in water; slightly soluble in ethanol and ether; soluble in acetone; readily soluble in chloroform.

Colour Tests. *p*-Dimethylaminobenzaldehyde—red/—; Liebermann's Test—brown-orange (→ brown at 100°).

Thin-layer Chromatography. System TG—Rf 45. (Chromic acid solution, yellow; Ludy Tenger reagent, orange; mercurous nitrate spray, positive.)

Gas Chromatography. System GA—RI 2380; system GD—retention time of methyl derivative 1.81 relative to *n*-C₁₆H₃₄; system GF—RI 2800.

High Pressure Liquid Chromatography. System HV—retention time 0.92 relative to meclofenamic acid.

Ultraviolet Spectrum. Methanolic alkali—266 nm ($A_1^1 = 700$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1715, 1300, 767, 1745, 715, 703 (KBr disk).

Mass Spectrum. Principal peaks at m/z 183, 77, 252, 320, 184, 41, 69, 51.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: detection limit, feprazone 100 ng/ml, 4-(3-hydroxymethyl)feprazone 200 ng/ml, UV detection—H. Spahn and E. Mutschler, *J. Chromat.*, 1982, 232; *Biomed. Appl.*, 21, 145–153.

Disposition in the Body. Absorbed after oral administration. Metabolised by hydroxylation to 4-(3-hydroxymethyl)feprazone. Less than 1% of a dose is excreted unchanged in the urine.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 400 mg to 8 subjects, peak plasma concentrations of 30.2 to 54.7 $\mu\text{g/ml}$ (mean 40.6) were attained in 4 to 8 hours; peak plasma concentrations of 1.09 to 3.60 $\mu\text{g/ml}$ (mean 1.9) of the 4-(3-hydroxymethyl) metabolite were reported at about 27 hours (H. Spahn and E. Mutschler, *Arzneimittel-Forsch.*, 1985, 35, 167–169).

HALF-LIFE. Plasma half-life, 6 to 30 hours (mean 20).

PROTEIN BINDING. In plasma, 90 to 99%.

Dose. 200 to 600 mg daily.

Flavoxate

Antispasmodic

2-Piperidinoethyl 3-methyl-4-oxo-2-phenyl-4*H*-chromene-8-carboxylate

$\text{C}_{24}\text{H}_{25}\text{NO}_4 = 391.5$

CAS—15301-69-6

Soluble in chloroform.

Flavoxate Hydrochloride

Proprietary Names. Genurin; Spasuret; Urispas.

$\text{C}_{24}\text{H}_{25}\text{NO}_4 \cdot \text{HCl} = 427.9$

CAS—3717-88-2

A creamy-white crystalline powder. M.p. 230° to 236°.

Soluble 1 in 150 of water, 1 in 500 of ethanol, 1 in 40 of chloroform, and 1 in 120 of methanol; practically insoluble in ether.

Colour Test. Liebermann's Test—yellow.

Thin-layer Chromatography. *System TA*—Rf 62; *system TB*—Rf 36; *system TC*—Rf 67. (Acidified iodoplatinate solution, strong reaction.)

Gas Chromatography. *System GA*—not eluted.

High Pressure Liquid Chromatography. *System HA*— k' 2.2.

Ultraviolet Spectrum. Aqueous acid—241 nm ($A_1^1 = 360$ b), 293 nm, 320 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1633, 1121, 1718, 1255, 759, 1272 (KBr disk).

Mass Spectrum. Principal peaks at m/z 98, 111, 99, 147, 55, 41, 42, 96.

Dose. 300 to 800 mg of flavoxate hydrochloride daily.

Floctafenine

Analgesic

Proprietary Name. Idarac

2,3 - Dihydroxypropyl *N* - (8 - trifluoromethyl - 4 - quinolyl)-anthranilate

$\text{C}_{20}\text{H}_{17}\text{F}_3\text{N}_2\text{O}_4 = 406.4$

CAS—23779-99-9

A yellowish-white powder. M.p. 175° to 179°.

Slightly **soluble** in water; soluble in ethanol; very slightly soluble in chloroform and ether; freely soluble in dimethylformamide and pyridine.

Ultraviolet Spectrum. Aqueous acid—233 nm ($A_1^1 = 547$ a), 348 nm ($A_1^1 = 450$ a); aqueous alkali—249 nm ($A_1^1 = 392$ b), 359 nm ($A_1^1 = 390$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1585, 1305, 1252, 1131, 1605, 1070 (KBr disk). (See below)

Quantification. THIN-LAYER CHROMATOGRAPHY-SPECTROPHOTOMETRY. In blood or urine: floctafenic acid and hydroxy-floctafenic acid—R. K. Lynn *et al.*, *J. clin. Pharmac.*, 1979, 19, 20–30.

Disposition in the Body. Absorbed after oral administration. It is rapidly metabolised to floctafenic acid which is thought to be responsible for most of the analgesic activity. About 25% of a dose is excreted in the urine as floctafenic acid and hydroxyfloctafenic acid in 48 hours.

THERAPEUTIC CONCENTRATION.

A single oral dose of 400 mg administered to 7 subjects, produced peak blood concentrations of floctafenic acid of 0.9 to 3.8 $\mu\text{g/ml}$ (mean 2.0) in 0.5 to 2.5 hours (R. K. Lynn *et al.*, *ibid.*).

PROTEIN BINDING. In plasma, floctafenic acid, extensively bound.

Dose. 0.8 to 1.6 g daily.

Fluanisone

Tranquilliser

Synonym. Haloanisone

Proprietary Names. Sedalande. It is an ingredient of Hypnorm (vet.).

4'-Fluoro-4-[4-(2-methoxyphenyl)piperazin-1-yl]butyrophenone

$C_{21}H_{25}FN_2O_2 = 356.4$

CAS—1480-19-9

An almost white to buff-coloured crystalline powder. M.p. 72° to 76°.

Practically **insoluble** in water; soluble 1 in 12 of ethanol, 1 in 1 of chloroform, and 1 in 22 of ether.

Colour Test. Mandelin's Test—brown.

Thin-layer Chromatography. *System TA*—Rf 73. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. *System GA*—RI 2732.

Ultraviolet Spectrum. Acid isopropyl alcohol—243 nm ($A_1^1 = 550$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1690, 1235, 1497, 1598, 1155, 750 (KBr disk).

Mass Spectrum. Principal peaks at m/z 205, 218, 123, 356, 219, 162, 95, 190.

Dose. Fluanisone has been given in doses of 5 to 7.5 mg daily.

Flucorolone Acetonide

Corticosteroid

Synonym. Flucoronide

Proprietary Name. Topilar

9 α ,11 β -Dichloro-6 α -fluoro-21-hydroxy-16 α ,17 α -isopropylidenedioxypregna-1,4-diene-3,20-dione

$C_{24}H_{29}Cl_2FO_5 = 487.4$

CAS—3693-39-8

A white crystalline powder. M.p. about 245°, with decomposition.

Practically **insoluble** in water; soluble in ethanol, chloroform, and methanol.

Ultraviolet Spectrum. Methanol—236 nm ($A_1^1 = 242$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1666, 1086, 1052, 1063, 1724, 1639.

Use. Topically as a 0.025% cream or ointment.

Flucloxacillin

Antibiotic

Synonym. Floxacillin

(6*R*)-6-[3-(2-Chloro-6-fluorophenyl)-5-methylisoxazole-4-carboxamido]penicillanic acid

$C_{19}H_{17}ClFN_3O_5S = 453.9$

CAS—5250-39-5

Flucloxacillin Sodium

Proprietary Names. Flopen; Floxapen (also as the magnesium salt); Heracillin; Ladropen; Stafoxil; Staphylex. It is an ingredient of Magnapen.

$C_{19}H_{16}ClFN_3NaO_5S \cdot H_2O = 493.9$

CAS—1847-24-1 (anhydrous); 34214-51-2 (monohydrate)

A white, hygroscopic, crystalline powder.

Soluble 1 in 1 of water, 1 in 8 of ethanol, 1 in 8 of acetone, and 1 in 2 of methanol.

Dissociation Constant. pK_a 2.7.

Ultraviolet Spectrum. Aqueous acid—268 nm, 274 nm, 344 nm; aqueous alkali—268 nm, 274 nm, 318 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1603, 1767, 1622, 1495, 1660, 794 (flucloxacillin sodium, KBr disk).

Dose. The equivalent of 1 to 2 g of flucloxacillin daily.

Flucytosine

Antifungal

Synonym. 5-Fluorocytosine

Proprietary Names. Alcobon; Ancobon; Ancotil.

4-Amino-5-fluoropyrimidin-2(1*H*)-one

$C_4H_4FN_3O = 129.1$

CAS—2022-85-7

A white crystalline powder. M.p. about 295°, with decomposition.

Soluble 1 in 67 of water; slightly soluble in ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 2.9, 10.7.

Ultraviolet Spectrum. Aqueous acid—286 nm ($A_1^1 = 709$ a); aqueous alkali—293 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1676, 1638, 1548, 1230, 1516, 1211 (KBr disk).

Dose. 50 to 200 mg/kg daily.

Fludrocortisone

Corticosteroid

Synonym. 9 α -Fluorohydrocortisone

Proprietary Name. Astonin-H

9 α -Fluoro-11 β ,17 α ,21-trihydroxypregn-4-ene-3,20-dione

C₂₁H₂₉FO₅ = 380.5

CAS—127-31-1

Crystals which decompose between 260° and 262°.

Very **soluble** in water.

Fludrocortisone Acetate

Synonym. 9 α -Fluorohydrocortisone 21-acetate

Proprietary Names. Florinef; Scherofluron.

C₂₃H₃₁FO₆ = 422.5

CAS—514-36-3

A white to pale yellow, hygroscopic, crystalline powder. There are two forms one of which melts at about 209° and the other at about 225°. A solution in dioxan is dextrorotatory.

Practically **insoluble** in water; soluble 1 in 50 of ethanol, 1 in 50 of chloroform, and 1 in 250 of ether.

Colour Tests. Antimony Pentachloride—orange; Naphthol-Sulphuric Acid—violet/brown; Sulphuric Acid—orange (green fluorescence under ultraviolet light.)

Thin-layer Chromatography. Fludrocortisone acetate: *system TP*—Rf 58; *system TQ*—Rf 12; *system TR*—Rf 30; *system TS*—Rf 00. (DPST solution.)

Ultraviolet Spectrum. Fludrocortisone acetate: dehydrated alcohol—240 nm (A_1^1 = 405 a).

Infra-red Spectrum. Principal peaks at wavenumbers 1651, 1271, 1714, 1736, 1246, 1041 (fludrocortisone acetate, KBr disk).

Dose. Usually 100 to 300 μ g of fludrocortisone acetate daily.

Flufenamic Acid

Analgesic

Proprietary Names. Arlef; Meralen; Sastridex; Surika.

N-(α α α -Trifluoro-*m*-tolyl)anthranilic acid

C₁₄H₁₀F₃NO₂ = 281.2

CAS—530-78-9

A pale yellow crystalline powder. M.p. 124° to 125°, with resolidification and remelting at 134° to 136°.

Practically **insoluble** in water; soluble 1 in 4 of ethanol, 1 in 7 of chloroform, and 1 in 3 of ether.

Dissociation Constant. pK_a 3.9.

Thin-layer Chromatography. *System TG*—Rf 37. (Chromic acid solution, blue.)

Gas Chromatography. *System GA*—RI 1950; *system GD*—retention time of methyl derivative 1.26 relative to *n*-C₁₆H₃₄.

High Pressure Liquid Chromatography. *System HD*—k' 19.7; *system HV*—retention time 1.00 relative to meclofenamic acid.

Ultraviolet Spectrum. Methanol—288 nm (A_1^1 = 593 a), 339 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1115, 1176, 1653, 1284, 1265, 1600 (KBr disk). Five polymorphic forms occur.

Mass Spectrum. Principal peaks at *m/z* 263, 281, 166, 92, 145, 167, 235, 139.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: flufenamic acid and mefenamic acid, detection limit 1 μ g/ml, UV detection—C. K. Lin *et al.*, *J. pharm. Sci.*, 1980, 69, 95–97.

Disposition in the Body. Readily absorbed after oral administration. Metabolised by hydroxylation and glucuronic acid conjugation. About 50% of a dose is excreted in the urine in 72 hours and about 36% is eliminated in the faeces. The material excreted in the urine consists mainly of conjugated flufenamic acid and free and conjugated 4'-hydroxyflufenamic acid with smaller amounts of the 5'-hydroxy and dihydroxy derivatives.

THERAPEUTIC CONCENTRATION.

Following oral administration of 200 mg three times daily for 4 days to 10 subjects, plasma concentrations of 0.3 to 17 µg/ml (mean 6.4) were reported 2 hours after the morning dose (R. A. Buchanan *et al.*, *Curr. ther. Res.*, 1969, 11, 533–538).

HALF-LIFE. Plasma half-life, about 3 hours.

PROTEIN BINDING. In plasma, extensively bound.

Dose. 400 to 600 mg daily.

Flugestone

Progestational Steroid (Veterinary)

Synonym. Flurogestone

9α-Fluoro-11β,17α-dihydroxypregn-4-ene-3,20-dione

C₂₁H₂₉FO₄ = 364.5

CAS—337-03-1

Flugestone Acetate

Proprietary Name. Chronogest

C₂₃H₃₁FO₅ = 406.5

CAS—2529-45-5

A white or creamy-white powder. M.p. 266° to 269°.

Very slightly **soluble** in water; soluble 1 in 23 of ethanol, 1 in 2.5 of chloroform, and 1 in 100 of methanol.

Ultraviolet Spectrum. Flugestone acetate: methanol—238 nm (A₁¹ = 425 b).

Flumethasone

Corticosteroid

Proprietary Name. Fluvet (vet.)

6α,9α-Difluoro-11β,17α,21-trihydroxy-16α-methylpregna-1,4-diene-3,20-dione

C₂₂H₂₈F₂O₅ = 410.5

CAS—2135-17-3

Flumethasone Pivalate

Synonym. Flumethasone Trimethylacetate

Proprietary Names. Locacorten; Locorten.

C₂₇H₃₆F₂O₆ = 494.6

CAS—2002-29-1

A white crystalline powder.

Practically **insoluble** in water; soluble 1 in 89 of ethanol, 1 in 350 of chloroform, and 1 in 2800 of ether.

Ultraviolet Spectrum. Methanol—238 nm (A₁¹ = 438 a).

Infra-red Spectrum. Principal peaks at wavenumbers 1664, 1623, 901, 1733, 1139, 1160 (flumethasone pivalate, KBr disk).

Use. Flumethasone pivalate is used topically in a concentration of 0.02%.

Flunitrazepam

Hypnotic

Proprietary Names. Narcozep; Rohypnol; Roipnol.

5-(2-Fluorophenyl)-1,3-dihydro-1-methyl-7-nitro-2H-1,4-benzodiazepin-2-one

C₁₆H₁₂FN₃O₃ = 313.3

CAS—1622-62-4

An almost white to pale yellow crystalline solid. M.p. about 170°.

Sparingly **soluble** in water; soluble 1 in 172 of ethanol, 1 in 3 of chloroform, 1 in 300 of ether, and 1 in 100 of methanol.

Dissociation Constant. pK_a 1.8.

Colour Test. Formaldehyde-Sulphuric Acid—orange.

Thin-layer Chromatography. *System TA*—Rf 63; *system TB*—Rf 10; *system TC*—Rf 72; *system TD*—Rf 54; *system TE*—Rf 77; *system TF*—Rf 48.

Gas Chromatography. *System GA*—flunitrazepam RI 2645, 7-amino-1-desmethylflunitrazepam RI 2825, 7-aminoflunitrazepam RI 2723, desmethylflunitrazepam RI 2740; *system GG*—flunitrazepam RI 3190.

High Pressure Liquid Chromatography. *System HI*—k' 3.15; *system HK*—k' 0.47.

Ultraviolet Spectrum. Methanol—252 nm (A₁¹ = 516 a), 308 nm (A₁¹ = 332 a).

Infra-red Spectrum. Principal peaks at wavenumbers 1697, 1620, 1490, 1528, 1107, 783 (KBr disk). (See below)

Mass Spectrum. Principal peaks at *m/z* 285, 312, 313, 286, 266, 238, 294, 284; 7-amino-1-desmethylflunitrazepam 269, 240, 241, 268, 270, 107, 121, 213; 7-aminoflunitrazepam 283, 44, 255, 282, 254, 284, 264, 256; desmethylflunitrazepam 298, 271, 299, 224, 272, 270, 252, 280.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 500 pg/ml, ECD—Y. C. Sumirtapura *et al.*, *Arzneimittel-Forsch.*, 1982, 32, 252–257.

**Flunixin**

Analgesic

2-(2-Methyl-3-trifluoromethylanilino)nicotinic acid

 $C_{14}H_{11}F_3N_2O_2 = 296.2$

CAS—38677-85-9

Crystals. M.p. 226° to 228°.

Flunixin Meglumine $C_{14}H_{11}F_3N_2O_2 \cdot C_7H_7NO_5 = 491.5$

CAS—42461-84-7

Colourless crystals. M.p. 135° to 137°.

Thin-layer Chromatography. System TG—Rf 33. (Ludy Tenger reagent, orange.)**Gas Chromatography.** System GD—retention time of methyl derivative 1.39 relative to $n\text{-C}_{16}\text{H}_{34}$.**High Pressure Liquid Chromatography.** System HV—retention time 0.99 relative to meclofenamic acid.**Ultraviolet Spectrum.** Aqueous acid—252 nm, 327 nm; aqueous alkali—281 nm ($A_1^1 = 490$ b).

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 1 ng/ml, UV detection—T. B. Vree *et al.*, *J. Chromat.*, 1977, 143; *Biomed. Appl.*, 1, 530–534.

RADIOIMMUNOASSAY. In plasma or whole blood: sensitivity 150 pg/ml—R. Dixon *et al.*, *J. pharm. Sci.*, 1981, 70, 230–231.

Disposition in the Body. Readily absorbed after oral administration; bioavailability 80 to 90%. The major metabolites are desmethylflunitrazepam and 7-aminoflunitrazepam which are active; other metabolites include 3-hydroxyflunitrazepam, 3-hydroxy-7-acetamidoflunitrazepam, and 7-amino-1-desmethylflunitrazepam. Flunitrazepam is excreted in the urine almost entirely as metabolites with less than 1% as unchanged drug. About 10% of a dose is eliminated in the faeces.

THERAPEUTIC CONCENTRATION.

After single oral doses of 1 mg and 2 mg given to 11 and 5 subjects, mean peak plasma concentrations of 0.0025 and 0.015 $\mu\text{g/ml}$, respectively, were attained in about 1 hour (R. S. J. Clarke *et al.*, *Br. J. Anaesth.*, 1980, 52, 437–445).

Following oral doses of 2 mg daily for 28 days given to 7 subjects, a mean peak plasma concentration of about 0.02 $\mu\text{g/ml}$ was reported 3 hours after the last dose (E. Wickstrom *et al.*, *Eur. J. clin. Pharmac.*, 1980, 17, 189–196).

HALF-LIFE. Plasma half-life, 10 to 70 hours (mean 25).

VOLUME OF DISTRIBUTION. About 4 litres/kg.

CLEARANCE. Plasma clearance, about 2 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 0.75.

PROTEIN BINDING. In plasma, about 78%.

NOTE. For a review of flunitrazepam see M. A. K. Mattila and H. M. Larni, *Drugs*, 1980, 20, 353–374.

Dose. 1 to 2 mg, as a hypnotic.

Infra-red Spectrum. Principal peaks at wavenumbers 1122, 1315, 1572, 1237, 1142, 1165.

Quantification. **HIGH PRESSURE LIQUID CHROMATOGRAPHY.** In equine plasma: detection limit 50 ng/ml, UV detection—G. E. Hardee *et al.*, *J. liq. Chromat.*, 1982, 5, 1991–2003.

Fluocinolone Acetonide

Corticosteroid

Synonym. 6 α ,9 α -Difluoro-16 α -hydroxyprednisolone Acetonide

Proprietary Names. Dermalar; Fluoderm; Fluonid; Jellin; Synalar; Synamol; Synandone; Synemol.

6 α ,9 α -Difluoro-11 β ,21-dihydroxy-16 α ,17 α -isopropylidenedioxy-pregna-1,4-diene-3,20-dione

$C_{24}H_{30}F_2O_6 = 452.5$

CAS—67-73-2

A white crystalline powder. M.p. about 270°, with decomposition. A solution in dioxan is dextrorotatory.

Practically **insoluble** in water; soluble 1 in 26 of dehydrated alcohol, 1 in 10 of acetone, 1 in 15 to 1 in 25 of chloroform, and 1 in 350 of ether; soluble in methanol.

Colour Tests. Naphthol-Sulphuric Acid—green/yellow; Sulphuric Acid—yellow (green fluorescence under ultraviolet light).

Thin-layer Chromatography. *System TP*—Rf 42; *system TQ*—Rf 08; *system TR*—Rf 10; *system TS*—Rf 01. (*DPST solution*.)

Ultraviolet Spectrum. Ethanol—240 nm ($A_1^1 = 360$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1669, 1074, 1629, 910, 1056, 1615 (KBr disk).

Use. Topically in concentrations of 0.01 to 0.2%.

Fluocinonide

Corticosteroid

Synonym. Fluocinolone Acetonide 21-Acetate

Proprietary Names. Lidemol; Lidex; Metosyn; Topsymin; Topsy(e).

6 α ,9 α -Difluoro-11 β ,21-dihydroxy-16 α ,17 α -isopropylidenedioxy-pregna-1,4-diene-3,20-dione 21-acetate

$C_{26}H_{32}F_2O_7 = 494.5$

CAS—356-12-7

A white to cream-coloured crystalline powder. M.p. about 300°, with decomposition.

Practically **insoluble** in water; soluble 1 in 70 of ethanol, 1 in 10 of acetone, and 1 in 10 of chloroform; very slightly soluble in ether.

Ultraviolet Spectrum. Methanol—240 nm ($A_1^1 = 360$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1670, 1240, 1730, 1750, 1070, 1635 (KBr disk).

Use. Topically in a concentration of 0.05%.

Fluocortolone

Corticosteroid

Synonym. 6 α -Fluoro-16 α -methyldehydrocorticosterone

Proprietary Names. Ultralan (tablets). It is an ingredient of Ultralanum.

6 α -Fluoro-11 β ,21-dihydroxy-16 α -methylpregna-1,4-diene-3,20-dione

$C_{22}H_{29}FO_4 = 376.5$

CAS—152-97-6

A white crystalline powder. M.p. 188° to 191°.

Practically **insoluble** in water; soluble 1 in 120 of ethanol; soluble in chloroform and ether.

Fluocortolone Hexanoate

Synonym. Fluocortolone Caproate

Proprietary Names. It is an ingredient of Ultradil Plain, Ultralan (cream and lotion), and Ultralanum.

$C_{28}H_{39}FO_5 = 474.6$

CAS—303-40-2

A white to creamy-white crystalline powder. M.p. about 244°.

Practically **insoluble** in water and ether; very slightly soluble in ethanol and methanol; soluble 1 in 18 of chloroform.

Fluocortolone Pivalate

Synonym. Fluocortolone Trimethylacetate

Proprietary Names. It is an ingredient of Ultradil Plain, Ultralan (cream and lotion), and Ultralanum Plain (cream).

$C_{27}H_{37}FO_5 = 460.6$

CAS—29205-06-9

A white to creamy-white crystalline powder. M.p. about 187°.

Practically **insoluble** in water; soluble 1 in 36 of ethanol and 1 in 3 of chloroform; freely soluble in dioxan; slightly soluble in ether.

Colour Tests. Antimony Pentachloride—green-yellow; Naphthol-Sulphuric Acid—red-brown/red-brown; Sulphuric Acid—orange-yellow.

Thin-layer Chromatography. Fluocortolone hexanoate: *system TP*—Rf 79; *system TQ*—Rf 39; *system TR*—Rf 88; *system TS*—Rf 00. (p-Toluenesulphonic acid solution, positive.) Fluocortolone pivalate: *system TP*—Rf 78; *system TQ*—Rf 35; *system TR*—Rf 89; *system TS*—Rf 58.

Ultraviolet Spectrum. Methanol—242 nm ($A_1^1 = 429$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1658, 1163, 1622, 1722, 1176, 1747 (fluocortolone hexanoate, KBr disk); 1662, 1159, 1725, 1619, 1605, 1285 (fluocortolone pivalate, KBr disk).

Dose. Fluocortolone has been given by mouth in doses of 5 to 60 mg daily.

Fluopromazine

Tranquilliser

Synonym. Triflupromazine

Proprietary Name. Vesprin (suspension)

NN - Dimethyl - 3 - (2 - trifluoromethylphenothiazin - 10 - yl) - propylamine

$C_{18}H_{19}F_3N_2S = 352.4$

CAS—146-54-3

A pale amber viscous oily liquid, which forms into large irregular crystals during prolonged storage. Practically **insoluble** in water.

Fluopromazine Hydrochloride

Proprietary Names. Psyquil; Siquil; Vesprin (injection and tablets).

$C_{18}H_{19}F_3N_2S \cdot HCl = 388.9$

CAS—1098-60-8

A white to pale tan crystalline powder. M.p. 170° to 178°.

Soluble 1 in less than 1 of water and of ethanol, and 1 in 1.7 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 9.2 (24°).

Colour Tests. Formaldehyde-Sulphuric Acid—red; Forrest Reagent—orange; FPN Reagent—orange; Mandelin's Test—red-brown; Marquis Test—red-violet.

Thin-layer Chromatography. *System TA*—Rf 54; *system TB*—Rf 49; *system TC*—Rf 35. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 2211; *system GF*—RI 2550.

High Pressure Liquid Chromatography. *System HA*— k' 2.7.

Ultraviolet Spectrum. Aqueous acid—256 nm ($A_1^1 = 874$ a), 305 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1117, 1316, 1159, 1237, 1075, 1030 (KBr disk).

Mass Spectrum. Principal peaks at m/z 58, 352, 86, 353, 85, 306, 42, 266.

Dose. 20 to 150 mg of fluopromazine hydrochloride daily.

Fluoroacetamide

Rodenticide

Synonym. Compound 1081

$FCH_2 \cdot CO \cdot NH_2 = 77.06$

CAS—640-19-7

A fine fluffy white powder which decomposes if heated appreciably above 100°.

Very **soluble** in water; relatively insoluble in organic solvents.

Colour Test. Nessler's Reagent—brown-orange.

Infra-red Spectrum. Principal peaks at wavenumbers 1667, 1036, 1117, 1020, 810, 1239 (Nujol mull).

Quantification. See under Fluoroacetic Acid.

Disposition in the Body. Rapidly absorbed after ingestion or through cuts and abrasions. It is converted to fluoroacetic acid and then to fluorocitric acid.

Toxicity. Fluoroacetamide is extremely toxic to animals and man but its lethal action is slower than sodium fluoroacetate.

Fluoroacetic Acid

Rodenticide

Synonyms. Fluoroethanoic Acid; Gifblaar Poison; Monofluoroacetic Acid.

$\text{FCH}_2 \cdot \text{COOH} = 78.04$

CAS—144-49-0

Fluoroacetic acid is the toxic principle of the South African plant gifblaar, *Dichapetalum cymosum* (= *Chailletia cymosa*) (Dichapetalaceae). Crystals. M.p. 33° to 35°. B.p. 165° to 168°.

Soluble in water and ethanol; practically insoluble in most common organic solvents.

Sodium Fluoroacetate

Synonyms. Compound 1080; Sodium Monofluoroacetate.

$\text{FCH}_2 \cdot \text{CO} \cdot \text{ONa} = 100.0$

CAS—62-74-8

A white hygroscopic powder which decomposes at about 200°.

Very **soluble** in water; relatively insoluble in organic solvents.

Quantification. GAS CHROMATOGRAPHY. In tissues: detection limit 100 ng/g, ECD—I. Okuno *et al.*, *J. Ass. off. analyt. Chem.*, 1982, 65, 1102–1105.

GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In tissues: detection limits 700 ng/g for fluoroacetamide, 100 ng/g for fluoroacetic acid—H. M. Stevens *et al.*, *Forens. Sci.*, 1976, 8, 131–137.

Disposition in the Body. Fluoroacetic acid and sodium fluoroacetate are absorbed rapidly through cuts and abrasions but less rapidly from intact skin. Sodium fluoroacetate is converted to fluorocitric acid which inhibits the citric acid cycle and leads to accumulation of citrate.

TOXICITY. Fluoroacetic acid and sodium fluoroacetate are extremely toxic to animals and man; the minimum lethal dose is about 5 mg/kg. Toxic effects are delayed for several hours following ingestion or absorption through the skin. The maximum permissible atmospheric concentration is 50 $\mu\text{g}/\text{m}^3$.

Fluorometholone

Corticosteroid

Proprietary Names. Delmeson; Efflumidex; FML; Oxylone.

9 α -Fluoro-11 β ,17 α -dihydroxy-6 α -methylpregna-1,4-diene-3,20-dione

$\text{C}_{22}\text{H}_{29}\text{FO}_4 = 376.5$

CAS—426-13-1

A white to yellowish-white crystalline powder. M.p. about 280°, with decomposition.

Practically **insoluble** in water; soluble 1 in 200 of ethanol and 1 in 2200 of chloroform; very slightly soluble in ether.

Ultraviolet Spectrum. Methanol—241 nm ($A_1^1 = 375$ a).

Use. Usually applied as a 0.025% cream or ointment and is also available as a 0.1% ophthalmic suspension.

Fluorouracil

Antineoplastic

Synonyms. 5-Fluorouracil; 5-FU.

Proprietary Names. Adrucil; Effluderm; Efudex; Efudix; Fluoroplex.

5-Fluoropyrimidine-2,4(1*H*,3*H*)-dione

$\text{C}_4\text{H}_3\text{FN}_2\text{O}_2 = 130.1$

CAS—51-21-8

A white crystalline powder which decomposes at about 282°.

Sparingly **soluble** in water; slightly soluble in ethanol; practically insoluble in chloroform and ether. Solutions discolour on storage.

Caution. Fluorouracil is irritant; avoid contact with skin and mucous membranes.

Dissociation Constant. pK_a 8.0, 13.0.

Partition Coefficient. Log *P* (octanol/pH 7.4), −1.0.

Ultraviolet Spectrum. Aqueous acid—266 nm ($A_1^1 = 552$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1653, 1242, 1718, 816, 1220, 1495 (KBr disk).

Dose. Initially 12 mg/kg daily intravenously, to a maximum of 1 g daily, for 3 or 4 days.

Fluoxymesterone

Androgen

Synonym. Fluorohydroxymethyltestosterone

Proprietary Names. Halotestin; Oratestin; Ora-Testryl; Testoral; Ultadren.

Note. Testoral is also used as a proprietary name for testosterone.

9 α -Fluoro-11 β ,17 β -dihydroxy-17 α -methylandro-4-en-3-one

$\text{C}_{20}\text{H}_{29}\text{FO}_3 = 336.4$

CAS—76-43-7

A white or creamy-white crystalline powder. M.p. about 278°. Practically **insoluble** in water; soluble 1 in 70 of ethanol and 1 in 200 of chloroform.

Colour Tests. Antimony Pentachloride—brown; Naphthol-Sulphuric Acid—green-yellow/yellow; Sulphuric Acid—yellow (green fluorescence under ultraviolet light).

Thin-layer Chromatography. System *TP*—Rf 51; system *TQ*—Rf 09; system *TR*—Rf 38; system *TS*—Rf 16, streaking may occur.

Ultraviolet Spectrum. Dehydrated alcohol—240 nm ($A_1^1 = 495$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1654, 867, 1036, 1247, 926, 1282 (KBr disk).

Mass Spectrum. Principal peaks at m/z 43, 71, 55, 79, 91, 109, 123, 336.

Dose. 2 to 10 mg daily; up to 30 mg daily may be given.

Flupenthixol

Tranquilliser

2 - {4 - [3 - (2 - Trifluoromethylthioxanthen - 9 - ylidene)propyl]-piperazin-1-yl}ethanol

$C_{23}H_{25}F_3N_2OS = 434.5$

CAS—2709-56-0

Flupenthixol Decanoate

Proprietary Names. Depixol (injection); Fluanxol Depot.

$C_{33}H_{43}F_3N_2O_2S = 588.8$

CAS—30909-51-4

A yellow oil.

Very slightly **soluble** in water; soluble in ethanol; freely soluble in chloroform and ether.

Flupenthixol Hydrochloride

Proprietary Names. Depixol (tablets); Émergil; Fluanxol (tablets).

$C_{23}H_{25}F_3N_2OS \cdot 2HCl = 507.4$

CAS—2413-38-9

A white or yellowish-white powder. M.p. 230° to 240°.

Soluble in water and ethanol; very slightly soluble in chloroform; practically insoluble in ether.

Partition Coefficient. Log *P* (octanol/pH 7.0), 3.0.

Colour Tests. Formaldehyde-Sulphuric Acid—red (orange fluorescence under ultraviolet light); Liebermann's Test—red; Mandelin's Test—red; Marquis Test—orange-red; Sulphuric Acid—orange (fluoresces under ultraviolet light).

Thin-layer Chromatography. System *TA*—Rf 62; system *TB*—Rf 05; system *TC*—Rf 33. (Acidified iodoplatinate solution, strong reaction.)

Gas Chromatography. System *GA*—not eluted.

High Pressure Liquid Chromatography. System *HA*—flupenthixol k' 1.2, flupenthixol sulphoxide k' 1.3.

Ultraviolet Spectrum. Aqueous acid—230 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1119, 1320, 1160, 1081, 1253, 1287 (KBr disk).

Mass Spectrum. Principal peaks at m/z 143, 70, 100, 144, 42, 98, 58, 56.

Quantification. RADIOIMMUNOASSAY. In serum: *cis*-flupenthixol, sensitivity 300 pg/ml—A. Jørgensen, *Life Sci.*, 1978, 23, 1533–1542.

Disposition in the Body. Readily absorbed after oral administration; bioavailability about 55%. Flupenthixol decanoate is very slowly absorbed from the site of intramuscular injection. Peak plasma concentrations are attained about 3 to 6 hours after oral administration and 3 to 7 days after intramuscular injection. The main metabolic reactions are sulfoxidation, side-chain *N*-dealkylation and glucuronic acid conjugation. *N*-Desalkylflupenthixol and flupenthixol sulphoxide are the major metabolites found in plasma (both are inactive). Numerous metabolites are excreted in the urine and faeces and there is evidence of enterohepatic circulation.

NOTE. For information on the pharmacokinetics of flupenthixol see A. Jørgensen, *Eur. J. clin. Pharmac.*, 1980, 18, 355–360.

Dose. For psychoses, the equivalent of 6 to 18 mg of flupenthixol daily, by mouth.

Fluphenazine

Tranquilliser

Synonym. Triflumethazine

2 - {4 - [3 - (2 - Trifluoromethylphenothiazin - 10 - yl)propyl]piperazin-1-yl}ethanol

 $C_{22}H_{26}F_3N_3OS = 437.5$

CAS—69-23-8

**Fluphenazine Decanoate***Proprietary Names.* Anatensol Decanoate; Dapotum D; Lyogen-Depot; Modecate; Prolixin Decanoate; Squalone Decanoate. $C_{32}H_{44}F_3N_3O_2S = 591.8$

CAS—5002-47-1

A pale yellow viscous liquid or a yellow crystalline oily solid.

Practically **insoluble** in water; miscible with dehydrated alcohol, chloroform, and ether.**Fluphenazine Enanthate***Synonym.* Fluphenazine Heptanoate*Proprietary Names.* Moditen (injection); Prolixin Enanthate; Squalone Enanthate. $C_{29}H_{38}F_3N_3O_2S = 549.7$

CAS—2746-81-8

A pale yellow to yellow-orange, clear to slightly turbid, viscous liquid or a yellow crystalline oily solid.

Practically **insoluble** in water; soluble 1 in less than 1 of ethanol and of chloroform, and 1 in 2 of ether.**Fluphenazine Hydrochloride***Proprietary Names.* Anatensol; Dapotum; Lyogen; Moditen (tablets); Omca; Pacinol; Permitil; Prolixin; Squalone. It is an ingredient of Motipress and Motival. $C_{22}H_{26}F_3N_3OS \cdot 2HCl = 510.4$

CAS—146-56-5

A white crystalline powder. M.p. about 230°.

Soluble 1 in 10 or less of water; slightly soluble in ethanol, acetone, and chloroform; practically insoluble in ether.**Dissociation Constant.** pK_a 3.9, 8.1.**Partition Coefficient.** Log P (octanol/pH 7.0), 3.5.**Colour Tests.** Formaldehyde-Sulphuric Acid—red; Forrester Reagent—orange; FPN Reagent—orange; Mandelin's Test—brown; Marquis Test—red.**Thin-layer Chromatography.** *System TA*—Rf 63; *system TB*—Rf 06; *system TC*—Rf 23. (*Dragendorff spray*, positive; *FPN reagent*, pink; *acidified iodoplatinate solution*, positive; *Marquis reagent*, brown; *ninhydrin spray*, positive.)**Gas Chromatography.** *System GA*—RI 3065.**High Pressure Liquid Chromatography.** *System HA*— k' 1.2.**Ultraviolet Spectrum.** Aqueous acid—256 nm ($A_1^1 = 690$ a), 306 nm.**Infra-red Spectrum.** Principal peaks at wavenumbers 1116, 767, 1245, 1144, 1084, 836 (fluphenazine hydrochloride, KBr disk).**Mass Spectrum.** Principal peaks at m/z 280, 143, 42, 70, 437, 406, 113, 56.**Quantification.** GAS CHROMATOGRAPHY. In plasma: sensitivity 500 pg/ml, AFID—J. I. Javaid *et al.*, *J. chromatogr. Sci.*, 1981,19, 439–443. In urine: free and conjugated fluphenazine, sensitivity 2 ng/ml, AFID—R. Whelpton and S. H. Curry, *J. Pharm. Pharmac.*, 1976, 28, 869–873.**GAS CHROMATOGRAPHY–MASS SPECTROMETRY.** In plasma: sensitivity 80 pg/ml—G. McKay *et al.*, *Biomed. Mass Spectrom.*, 1983, 10, 550–555.**HIGH PRESSURE LIQUID CHROMATOGRAPHY–RADIOIMMUNOASSAY.** In plasma: fluphenazine, related phenothiazines and metabolites, detection limit 160 pg for fluphenazine—S. A. Goldstein and H. Van Vunakis, *J. Pharmac. exp. Ther.*, 1981, 217, 36–43.**Disposition in the Body.** The hydrochloride is well absorbed after oral administration; the decanoate and enanthate are slowly absorbed from sites of injection. Fluphenazine is metabolised by sulfoxidation, hydroxylation, and conjugation with glucuronic acid or sulphate. Fluphenazine sulfoxide and 7-hydroxy-fluphenazine have been detected in urine and faeces. After an oral dose of the hydrochloride, 20% is excreted in the urine and 60% is eliminated in the faeces in 7 days; after an intramuscular dose of the enanthate, 26% is eliminated in the faeces and 14% excreted in the urine in 14 days; after an intramuscular dose of the decanoate, 17% is eliminated in the faeces and 6% excreted in the urine in 30 days.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 5 mg of fluphenazine hydrochloride to 6 subjects, peak plasma concentrations of 0.0003 to 0.001 µg/ml (mean 0.0006) were attained in 2.8 hours (K. K. Midha *et al.*, *Eur. J. clin. Pharmac.*, 1983, 25, 709–711).

Following daily oral doses of 20 mg of fluphenazine hydrochloride to 18 subjects, steady-state plasma concentrations of 0.0002 to 0.004 µg/ml were reported (J. I. Javadi *et al.*, *J. chromatogr. Sci.*, 1981, 19, 439–443).

HALF-LIFE. Plasma half-life, fluphenazine hydrochloride about 33 hours; fluphenazine decanoate about 5 to 12 days and fluphenazine enanthate about 3 to 4 days, following intramuscular injection.

PROTEIN BINDING. In plasma, about 99%.

Dose. Usually 1 to 5 mg of fluphenazine hydrochloride daily; up to 20 mg daily has been given.

Flurandrenolone*Corticosteroid*

Synonyms. Fludroxycortide; Fluorandrenolone; 6α-Fluoro-16α-hydroxyhydrocortisone 16,17-Acetonide; Flurandrenolide.

Proprietary Names. Cordran; Drenison; Haelan; Sermaka.

6α-Fluoro-11β,21-dihydroxy-16α,17α-isopropylidenedioxy-pregn-4-ene-3,20-dione

$C_{24}H_{33}FO_6 = 436.5$

CAS—1524-88-5

A white, fluffy, crystalline powder. M.p. 247° to 255°.

Practically **insoluble** in water and ether; soluble 1 in 72 of ethanol, 1 in 10 of chloroform, and 1 in 25 of methanol.

Colour Tests. Naphthol-Sulphuric Acid—green, brown dichroism/yellow; Sulphuric Acid—yellow (green fluorescence under ultraviolet light).

Ultraviolet Spectrum. Methanol—235 nm ($A_1^1 = 324$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1675, 1701, 1059, 1045, 1095, 1079 (KBr disk).

Use. Topically in concentrations of 0.0125 to 0.05%.

Flurazepam*Hypnotic*

7-Chloro-1-(2-diethylaminoethyl)-5-(2-fluorophenyl)-1,3-dihydro-2H-1,4-benzodiazepin-2-one

$C_{21}H_{23}ClFN_3O = 387.9$

CAS—17617-23-1

White crystals. M.p. 77° to 82°.

Soluble in chloroform.

Flurazepam Hydrochloride

Synonym. Flurazepam Dihydrochloride

Proprietary Names of Flurazepam Hydrochloride and Monohydrochloride. Dalmadorm; Dalmene; Felmane; Flunox; Remdue.

$C_{21}H_{23}ClFN_3O \cdot 2HCl = 460.8$

CAS—1172-18-5

An off-white to yellow crystalline powder. M.p. about 212°, with decomposition.

Soluble 1 in 2 of water, 1 in 4 of ethanol, 1 in 90 of chloroform, and 1 in 3 of methanol; very slightly soluble in ether.

Flurazepam Monohydrochloride

Proprietary Names. See above under flurazepam hydrochloride.

$C_{21}H_{23}ClFN_3O \cdot HCl = 424.3$

CAS—36105-20-1

A white crystalline powder.

Very **soluble** in water; freely soluble in ethanol; practically insoluble in ether.

Dissociation Constant. pK_a 1.9, 8.2.

Partition Coefficient. Log *P* (octanol/pH 7.4), 2.3.

Colour Test. Formaldehyde-Sulphuric Acid—pink.

Thin-layer Chromatography. System *TA*—Rf 62; system *TB*—Rf 30; system *TC*—Rf 48; system *TD*—Rf 03; system *TE*—Rf 74; system *TF*—Rf 03. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System *GA*—flurazepam RI 2785, *N*¹-desalkylflurazepam RI 2471, *N*¹-desalkyl-3-hydroxyflurazepam RI 2240, *N*¹-(2-hydroxyethyl)flurazepam RI 2688; system *GF*—flurazepam RI 3210; system *GG*—flurazepam RI 3220.

High Pressure Liquid Chromatography. System *HA*—flurazepam *k'* 1.3, *N*¹-desalkylflurazepam *k'* 0.1; system *HI*—*N*¹-desalkylflurazepam *k'* 5.19, *N*¹-(2-hydroxyethyl)flurazepam *k'* 4.27; system *HJ*—flurazepam *k'* 3.19; system *HK*—flurazepam *k'* 6.50, *N*¹-desalkylflurazepam *k'* 1.52, *N*¹-(2-hydroxyethyl)flurazepam *k'* 1.43.

Ultraviolet Spectrum. Aqueous acid—236 nm ($A_1^1 = 620$ b), 284 nm; aqueous alkali—231 nm ($A_1^1 = 856$ b), 312 nm ($A_1^1 = 53$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1672, 1613, 1316, 1211, 1171, 1100 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 86, 87, 99, 58, 84, 387, 315, 56; *N*¹-desalkylflurazepam 260, 259, 288, 287, 261, 289, 262, 290; didesethylflurazepam 30, 313, 246, 211, 273, 274, 302, 183; *N*¹-(2-hydroxyethyl)flurazepam 288, 273, 331, 287, 304, 290, 289, 275.

Quantification. SPECTROFLUORIMETRY. In blood or urine: flurazepam and metabolites, sensitivity 10 ng/ml—J. A. F. de Silva and N. Strojny, *J. pharm. Sci.*, 1971, 60, 1303–1314.

GAS CHROMATOGRAPHY. In blood or urine: limits of detection, *N*¹-(2-hydroxyethyl)flurazepam and flurazepam-*N*¹-ylacetic acid 300 pg/ml, flurazepam 500 pg/ml, *N*¹-desalkylflurazepam and *N*¹-desalkyl-3-hydroxyflurazepam 2 ng/ml, ECD—M. Hasegawa *et al.*, *Chem. pharm. Bull.*, 1975, 23, 1826–1833. In plasma: sensitivity, flurazepam 3 ng/ml, *N*¹-(2-hydroxyethyl)flurazepam 1 ng/ml, *N*¹-desalkylflurazepam 600 pg/ml, ECD—S. F. Cooper and D. Drolet, *J. Chromat.*, 1982, 231; *Biomed. Appl.*, 20, 321–331.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In urine: *N*¹-(2-hydroxyethyl)flurazepam, sensitivity 500 ng/ml, UV detection—R. E. Weinfeld and K. F. Miller, *J. Chromat.*, 1981, 223; *Biomed. Appl.*, 12, 123–130.

RADIOIMMUNOASSAY. In plasma: sensitivity 100 pg/ml—W. Glover *et al.*, *J. pharm. Sci.*, 1980, 69, 601–602.

Disposition in the Body. Readily absorbed after oral administration; about 70% of a dose is metabolised during the first pass through the liver. The major metabolites in blood are *N*¹-desalkylflurazepam and *N*¹-(2-hydroxyethyl)flurazepam which are both pharmacologically active and accumulate on daily administration; 7-chloro-5-(2-fluorophenyl)-1,3-dihydro-2-oxo-2*H*-1,4-benzodiazepin-1-acetaldehyde has also been detected in plasma. Other active metabolites found in urine include monodesethyl- and didesethylflurazepam and *N*¹-desalkyl-3-hydroxyflurazepam, but these are not detectable in blood. Up to 60% of a dose may be excreted in the urine in 48 hours, with about 40% of the dose as a glucuronide/sulphate conjugate of *N*¹-(2-hydroxyethyl)flurazepam and about 4% as conjugated *N*¹-desalkyl-3-hydroxyflurazepam and conjugated flurazepam-*N*¹-ylacetic acid; only trace amounts of unchanged flurazepam and the unconjugated metabolites are present. *N*¹-(Hydroxyethyl)-3-hydroxyflurazepam has also been detected. About 9% of a dose is eliminated in the faeces.

THERAPEUTIC CONCENTRATION. Flurazepam is rapidly metabolised and hence blood concentrations of the unchanged drug are low and quickly decrease; for normal doses the peak concentration is usually in the range 0.0005 to 0.03 µg/ml. The blood

concentration of *N*¹-desalkylflurazepam is usually in the range 0.04 to 0.06 µg/ml.

Following a single oral dose of 30 mg of flurazepam hydrochloride to 2 subjects, peak blood concentrations were attained as follows: flurazepam, 0.001 and 0.005 µg/ml at 3 hours; *N*¹-(2-hydroxyethyl)flurazepam 0.005 and 0.01 µg/ml at 3 hours; *N*¹-desalkylflurazepam, 0.010 and 0.012 µg/ml at 24 hours (J. A. F. de Silva *et al.*, *J. pharm. Sci.*, 1974, 63, 1837–1841).

Following daily oral doses of 15 mg to 18 subjects, steady-state plasma concentrations of *N*¹-desalkylflurazepam of 0.03 to 0.15 µg/ml (mean 0.08) were reported (D. J. Greenblatt *et al.*, *Clin. Pharmac. Ther.*, 1981, 30, 475–486).

TOXICITY. Blood concentrations greater than 0.2 µg/ml of flurazepam or 0.5 µg/ml of *N*¹-desalkylflurazepam may be toxic, and blood concentrations greater than 0.5 µg/ml of flurazepam may be fatal.

In a fatality attributed to flurazepam overdose, the following postmortem concentrations (µg/ml or µg/g) were reported for flurazepam, *N*¹-desalkylflurazepam, and *N*¹-(2-hydroxyethyl)flurazepam, respectively: blood 0.51, 0.14, 9; urine 7, 3.9, 98. The amount ingested was estimated to be more than 2.4 g (R. Aderjan and R. Mattern, *Arch. Tox.*, 1979, 43, 69–75).

In a 5-year-old child who died following the ingestion of flurazepam and phenobarbitone, the following postmortem tissue concentrations were reported for flurazepam, *N*¹-desalkylflurazepam and *N*¹-(2-hydroxyethyl)flurazepam, respectively: blood 3.2, 1.8 and 2.5 µg/ml; brain 0.8, 0.7 and 0.7 µg/g, kidney 0.9, 0.6 and 1.1 µg/g, liver 2.7, 3.1 and 3.5 µg/g. Phenobarbitone concentrations were consistent with a therapeutic dose and low concentrations of phenytoin were also detected (S. D. Ferrara *et al.*, *J. forens. Sci.*, 1979, 24, 61–69).

HALF-LIFE. Plasma half-life, flurazepam 2 to 3 hours, *N*¹-desalkylflurazepam 2 to 5 days, *N*¹-(2-hydroxyethyl)flurazepam 10 to 20 hours.

PROTEIN BINDING. In plasma, flurazepam about 97%, *N*¹-desalkylflurazepam about 98% and *N*¹-(2-hydroxyethyl)flurazepam about 90%.

NOTE. For a review of the pharmacokinetics of flurazepam see D. J. Greenblatt *et al.*, *Clin. Pharmac. Ther.*, 1975, 17, 1–14.

Dose. The equivalent of 15 to 30 mg of flurazepam, as a hypnotic.

Flurbiprofen

Analgesic

Proprietary Names. Cebutid; Froben.

2-(2-Fluorobiphenyl-4-yl)propionic acid

C₁₅H₁₃FO₂ = 244.3

CAS—5104-49-4

A colourless crystalline solid. M.p. about 110°.

Slightly **soluble** in water; freely soluble in most organic solvents.

Colour Tests. Liebermann's Test—brown; Marquis Test—red.

Thin-layer Chromatography. System TD—Rf 30; system TE—Rf 07; system TF—Rf 41; system TG—Rf 16. (Ludy Tenger reagent, orange.)

Gas Chromatography. System GA—RI 2032; system GD—retention time of methyl derivative 1.30 relative to $n\text{-C}_{16}\text{H}_{34}$.

High Pressure Liquid Chromatography. System HV—retention time 0.89 relative to meclofenamic acid.

Ultraviolet Spectrum. Aqueous acid—247 nm ($A_1^1 = 787$ b). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1695, 1220, 707, 930, 773, 960 (KBr disk).

Mass Spectrum. Principal peaks at m/z 199, 244, 200, 178, 179, 184, 183, 245.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 50 ng/ml, ECD—D. G. Kaiser *et al.*, *J. pharm. Sci.*, 1974, 63, 567–570.

GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In plasma: sensitivity 1 ng/ml—K. Kawahara *et al.*, *J. Chromat.*, 1981, 223; *Biomed. Appl.*, 12, 202–207.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: sensitivity 40 ng/ml, UV detection—B. G. Snider *et al.*, *J. pharm. Sci.*, 1981, 70, 1347–1349.

Disposition in the Body. Readily absorbed after oral administration. About 95% of a dose is excreted in the urine in 24 hours, mainly as the 4'-hydroxy, 3',4'-dihydroxy, and 4'-methoxy metabolites, which are excreted partly as conjugates; about 25% of a dose is excreted as unchanged drug.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 100 mg, administered to 6 subjects, peak serum concentrations of 9.1 to 16.6 $\mu\text{g/ml}$ (mean 12) were attained in about 1.5 hours (N. Cardoe *et al.*, *Curr. med. Res. Opinion*, 1977, 5, 21–25).

HALF-LIFE. Plasma half-life, 2 to 6 hours (mean 3.5).

VOLUME OF DISTRIBUTION. About 0.1 litre/kg.

CLEARANCE. Plasma clearance, about 0.3 ml/min/kg.

PROTEIN BINDING. In plasma, about 99%.

NOTE. For a review of the pharmacokinetics of flurbiprofen see R. N. Brogden *et al.*, *Drugs*, 1979, 18, 417–438.

Dose. 150 to 300 mg daily.

Fluspirilene

Tranquilliser

Proprietary Names. Imap; Redeptin.

8-[4,4-Bis(4-fluorophenyl)butyl]-1-phenyl-1,3,8-triazaspiro[4.5]decan-4-one

$\text{C}_{29}\text{H}_{31}\text{F}_2\text{N}_3\text{O} = 475.6$

CAS—1841-19-6

A white to yellowish, amorphous or crystalline powder. M.p. about 190°.

Practically **insoluble** in water; slightly soluble in ethanol and ether; sparingly soluble in acetone; freely soluble in chloroform.

Thin-layer Chromatography. System TA—Rf 69; system TB—Rf 04; system TC—Rf 59.

Gas Chromatography. System GA—RI 1017.

Ultraviolet Spectrum. Methanol—252 nm ($A_1^1 = 295$ a), 273 nm, 293 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1710, 1505, 1596, 1220, 743, 1230 (KBr disk). Polymorphism may occur.

Mass Spectrum. Principal peaks at m/z 244, 42, 72, 475, 109, 245, 85, 476.

Dose. Usually 2 to 8 mg weekly, by deep intramuscular injection; maximum of 20 mg weekly.

Folic Acid

Vitamin

Synonyms. Folacin; Folinisre; Pteroylglutamic Acid; Pteroylmonoglutamic Acid.

Proprietary Names. Folasac; Foldine; Folettes; Folsan; Folvite; Novofolacid. It is an ingredient of Co-Ferol, Fefol, Folex-350, Folvron, Hepanorm, Kelfolate, Pregaday, and Pregfol.

N-[4-(2-Amino-4-hydroxypteridin-6-ylmethylamino)benzoyl]-L(+)-glutamic acid

$C_{19}H_{19}N_7O_6 = 441.4$

CAS—59-30-3

A yellow to orange microcrystalline powder.

Practically **insoluble** in water, ethanol, chloroform, and ether. Soluble in dilute solutions of alkali hydroxides and carbonates, yielding a clear orange-brown solution; soluble in hydrochloric acid and in sulphuric acid, yielding very pale yellow solutions. Solutions are inactivated by ultraviolet light; alkaline solutions are sensitive to oxidation and acid solutions are sensitive to heat.

Dissociation Constant. pK_a 4.7, 6.8, 9.0 (30°).

Ultraviolet Spectrum. Aqueous alkali—256 nm ($A_1^1 = 549$ a), 283 nm ($A_1^1 = 539$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1686, 1602, 1636, 1191, 1567, 1225 (KBr disk).

Dose. 2.5 to 20 mg daily.

Formaldehyde

Disinfectant

Synonyms. Formic Aldehyde; Methanal; Methylene Oxide; Oxomethane.

$HCHO = 30.03$

A colourless inflammable gas.

Very **soluble** in water; slightly soluble in ethanol and ether.

Formaldehyde Solution

Synonyms. Formalin; Formol.

Proprietary Names. Emoform; Formitrol; Lysoform; Veracur.

CAS—50-00-0

An aqueous solution containing 34 to 38% w/w of CH_2O , with methanol as a stabilising agent.

A colourless liquid. Wt per ml about 1.08 g.

Miscible with water and ethanol; immiscible with chloroform and ether.

Colour Tests. Chromotropic Acid—red.

Add a little resorcinol to a solution containing formaldehyde, shake, then carefully add *sulphuric acid* to form a layer under the solution—red-violet ring at the junction of the two layers.

Mass Spectrum. Principal peaks at m/z 29, 30, 28, 31, 32, —, —, —.

Disposition in the Body. Rapidly metabolised in the body tissues to formic acid and methanol, especially in the liver and erythrocytes; the formic acid may then be excreted in the urine as formates, or metabolised to labile methyl groups.

Formaldehyde is a metabolite of methanol.

Toxicity. Formaldehyde is very irritant to mucous membranes and inhalation of the vapour causes intense irritation of the respiratory tract which may lead to bronchitis and pneumonia. Atmospheric concentrations of 2 to 3 ppm may cause mild irritation of the mucous membranes and exposure to concentrations of 10 to 20 ppm for only a few minutes may cause moderate to severe irritation. Adverse effects have been reported as a result of release of formaldehyde fumes from synthetic foam insulation. Few fatalities have been recorded but 30 ml of Formaldehyde Solution may be fatal in an adult. The maximum permissible atmospheric concentration is 2 ppm or 3 mg/m³.

In a fatality due to the ingestion of about 125 ml of Formaldehyde Solution, the following postmortem concentrations were reported: blood, methanol 0.4 µg/ml, formaldehyde, a trace; stomach contents, methanol 0.9 g, formaldehyde 4.5 g (B. Finkle, *Bull. int. Ass. forens. Toxicol.*, 1975, 11(2), 26).

In a fatality due to the ingestion of 120 ml of Formaldehyde Solution, the following blood concentrations were reported 0.5 hour after ingestion: formic acid 500 µg/ml, formaldehyde 4.8 µg/ml, methanol 420 µg/ml; after 17 hours they had declined to 300, 2 and 70 µg/ml respectively; death occurred approximately 28 hours after ingestion (J. T. Eells *et al.*, *J. Am. med. Ass.*, 1981, 246, 1237–1238).

Formic Acid

Synonym. Amino Acid

$HCOOH = 46.03$

CAS—64-18-6

A colourless liquid containing about 25% w/w of CH_2O_2 . Wt per ml about 1.05 g. B.p. about 101°.

Miscible with water, ethanol, and ether.

Dissociation Constant. pK_a 3.8 (25°).

Colour Test. When warmed with *sulphuric acid* in a tube, carbon monoxide is evolved; the gas can be ignited at the mouth of the tube and burns with a blue flame.

Mass Spectrum. Principal peaks at m/z 29, 46, 45, 28, 44, 30, 47, —.

Quantification. ULTRAVIOLET SPECTROPHOTOMETRY. In urine: determination at 340 nm before and after treatment with

formate dehydrogenase, sensitivity 500 ng/ml—G. Triebig and K. H. Schaller, *Clinica chim. Acta*, 1980, 108, 355–360.

GAS CHROMATOGRAPHY. In blood or urine: head-space analysis, sensitivity 5 µg/ml, FID—C. Abolin *et al.*, *Biochem. Med.*, 1980, 15, 209–218.

Disposition in the Body. Formic acid is an intermediate in normal metabolism; when administered it probably takes part in the metabolism of 1-carbon compounds to produce methyl groups; it is excreted in the urine and also undergoes oxidation to carbon dioxide. Together with formaldehyde, it is a metabolite of methanol and the two are probably mainly responsible for the effect of methanol on vision.

Formic acid concentrations of 2 to 30 µg/ml (mean 13) were reported in the urine of normal subjects (G. Triebig and K. H. Schaller, *Clinica chim. Acta*, 1980, 108, 355–360).

TOXICITY. The minimum lethal dose is about 30 ml. Formic acid is dangerously caustic to the skin. The maximum permissible atmospheric concentration is 5 ppm or 9 mg/m³; the estimated acceptable daily intake is up to 3 mg/kg.

Ingestion of more than 45 g was fatal in 14 out of 16 subjects (D. B. Jefferys and H. M. Wiseman, *Human Toxicol.*, 1983, 2, 423).

Three subjects who intentionally swallowed between 1 mouthful and 100 ml of descaling agents containing 40 to 55% v/v of formic acid, died 5 to 14 days after ingestion (R. B. Naik *et al.*, *Postgrad. med. J.*, 1980, 56, 451–456).

NOTE. Formic acid is the principal ingredient (about 60%) of several proprietary preparations used for descaling kettles.

Frusemide

Diuretic

Synonyms. Furosemide; Fursemide.

Proprietary Names. Aluzine; Diural; Diuresal; Drytal; Frusetic; Frusid; Fur-O-Ims; Furoside; Impugan; Lasilix; Lasix; Neo-Renal; Novosemide; Uritol. It is an ingredient of Diumide-K, Frumil, Frusene, Lasikal, Lasilactone, and Lasipressin.

4-Chloro-*N*-furfuryl-5-sulphamoylanthranilic acid

C₁₂H₁₁ClN₂O₅S = 330.7

CAS—54-31-9

A white or slightly yellow crystalline powder. M.p. about 206°, with decomposition.

Practically **insoluble** in water and chloroform; soluble 1 in 75 of ethanol, 1 in 15 of acetone, and 1 in 850 of ether; freely soluble in dimethylformamide and solutions of alkali hydroxides.

Dissociation Constant. pK_a 3.9 (20°).

Colour Tests. Koppanyi-Zwikker Test—violet; Liebermann's Test—black; Sulphuric Acid—yellow.

Thin-layer Chromatography. System TD—Rf 01; system TE—Rf 07; system TF—Rf 12; system TG—Rf 19. (Mercurous nitrate spray, positive; acidified potassium permanganate solution, positive; Van Urk reagent, pink-brown.)

Gas Chromatography. System GD—retention time of methyl derivative 2.64 relative to *n*-C₁₆H₃₄.

High Pressure Liquid Chromatography. System HV—retention time 0.45 relative to meclofenamic acid.

Ultraviolet Spectrum. Aqueous acid—235 nm (A₁¹ = 1333 a), 274 nm (A₁¹ = 600 a), 342 nm; aqueous alkali—271 nm (A₁¹ = 580 a), 333 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1143, 1668, 1565, 1240, 1590, 1260 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 81, 53, 330, 96, 82, 332, 64, 63.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: sensitivity 20 ng/ml, ECD—E. Keller *et al.*, *Eur. J. clin. Pharmac.*, 1981, 20, 27–33.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: detection limits 100 ng/ml in plasma and 500 ng/ml in urine,

fluorescence detection—A. L. M. Kerremans *et al.*, *J. Chromat.*, 1982, 229; *Biomed. Appl.*, 18, 129–139. In plasma or urine: frusemide and its glucuronide metabolite, sensitivity 8 ng/ml for frusemide in plasma, fluorescence detection—D. E. Smith *et al.*, *Drug Met. Disp.*, 1980, 8, 337–342.

Disposition in the Body. Rapidly but incompletely absorbed after oral administration; bioavailability about 65%. Up to 90% of an intravenous dose is excreted in the urine, mainly as unchanged drug with up to 14% of the dose as a glucuronide conjugate. 2-Amino-4-chloro-5-sulphamoylanthranilic acid has been reported as a metabolite in several studies, but in other cases it has not been detected and it has been suggested that it is an analytical artefact produced during acid extraction procedures. In normal subjects, about 6 to 18% of a dose is eliminated in the faeces after intravenous administration; this may be increased to about 60% in renal failure.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 80 mg to 8 fasting subjects, peak serum concentrations of 1.8 to 4.9 µg/ml (mean 2.3) were attained in 60 to 70 minutes (M. R. Kelly *et al.*, *Clin. Pharmac. Ther.*, 1974, 15, 178–186).

Plasma concentrations averaging 7.5 µg/ml were reported 10 minutes after an intravenous dose of 40 mg to 9 subjects (D. E. Smith *et al.*, *Drug Met. Disp.*, 1980, 8, 337–342).

HALF-LIFE. Plasma half-life, about 1 to 3 hours, increased in subjects with renal failure, congestive heart failure, liver disease, and in neonates (up to about 20 hours).

VOLUME OF DISTRIBUTION. About 0.1 to 0.2 litre/kg, increased in subjects with liver disease, nephrotic syndrome, and in neonates.

CLEARANCE. Plasma clearance, about 1 to 3 ml/min/kg, decreased in uraemia, heart failure, and neonates.

PROTEIN BINDING. In plasma, about 97%, decreased in patients with cirrhosis and uraemia.

NOTE. For reviews of frusemide pharmacokinetics see L. Z. Benet, *J. Pharmacokinet. Biopharm.*, 1979, 7, 1–27 and R. E. Cutler and A. D. Blair, *Clin. Pharmacokinet.*, 1979, 4, 279–296.

Dose. Usually 20 to 80 mg daily; in oliguria, maximum single dose of 2 g.

Furaltadone

Antibacterial (Veterinary)

Synonyms. Furmethonol; Nitrofurmethonum.

(±)-5-Morpholinomethyl-3-(5-nitrofurfurylideneamino)-2-oxazolidone

$C_{13}H_{16}N_4O_6 = 324.3$

CAS—139-91-3; 59302-14-6 (±)

A yellow crystalline powder. M.p. about 205°.

Soluble 1 in 2000 of water, 1 in 1000 of ethanol, and 1 in 300 of chloroform; practically insoluble in ether.

Colour Test. Marquis Test—yellow.

Thin-layer Chromatography. System TA—Rf 43; system TB—Rf 00; system TC—Rf 40. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—255 nm, 362 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1755, 1226, 1250, 1110, 1020, 1315 (KBr disk).

Mass Spectrum. Principal peaks at m/z 100, 56, 101, 42, 185, 184, 41, 128.

Furazolidone

Antimicrobial

Synonym. Nifurazolidonum

Proprietary Names. Coryzium (vet.); Furoxane; Furoxone; Neftin (vet.); Tricofuron.

3-(5-Nitrofurfurylideneamino)-2-oxazolidone

$C_8H_7N_3O_5 = 225.2$

CAS—67-45-8

A yellow crystalline powder. M.p. about 259°, with decomposition.

Very slightly **soluble** in water and ethanol; slightly soluble in chloroform; practically insoluble in ether.

Colour Test. Dissolve 1 mg in 1 ml of dimethylformamide with 0.05 ml of M ethanolic potassium hydroxide—deep blue.

Thin-layer Chromatography. System TA—Rf 44; system TB—Rf 00; system TC—Rf 47.

Ultraviolet Spectrum. After solution in dimethylformamide and dilution with water—259 nm, 367 nm ($A_1^1 = 754$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1227, 1739, 1015, 1250, 1101, 738 (Nujol mull). (See below)

Mass Spectrum. Principal peaks at m/z 87, 79, 51, 225, 42, 50, 86, 80.

Dose. 400 mg daily.

Fusidic Acid

Antibiotic

Proprietary Name. Fucidin (suspension)

ent-16 α -Acetoxy-3 β ,11 β -dihydroxy-4 β ,8 β ,14 α -trimethyl-18-nor-5 β ,10 α -cholesta-(17*Z*)-17(20),24-dien-21-oic acid hemihydrate

$C_{31}H_{48}O_6 \cdot \frac{1}{2}H_2O = 525.7$

CAS—6990-06-3 (anhydrous)

A white crystalline powder. M.p. about 193°.

Practically **insoluble** in water; soluble 1 in 5 of ethanol, 1 in 4 of chloroform, and 1 in 60 of ether.

Sodium Fusidate

Synonym. Fusidate Sodium

Proprietary Name. Fucidin(e) (tablets)

$C_{31}H_{47}NaO_6 = 538.7$

CAS—751-94-0

A white, slightly hygroscopic, crystalline powder.

Soluble 1 in 1 of water, 1 in 1 of ethanol, and 1 in 350 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 5.4.

Infra-red Spectrum. Principal peaks at wavenumbers 1267, 1547, 1706, 1238, 1020, 966 (sodium fusidate, KBr disk).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 500 ng/ml, UV detection—A. H. Hikal, *Int. J. Pharmaceut.*, 1983, 13, 297–301.

Dose. 1.5 to 3 g of sodium fusidate daily.

Gallamine Triethiodide

Muscle Relaxant

Synonym. Bencurine Iodide

Proprietary Name. Flaxedil

2,2',2''-(Benzene-1,2,3-triyltrioxy)tris(tetraethylammonium) tri-iodide

$C_{30}H_{60}I_3N_3O_3 = 891.5$

CAS—153-76-4 (gallamine); 65-29-2 (triethiodide)

A white, or faintly cream-coloured, hygroscopic powder. M.p. about 235°, with decomposition.

Soluble 1 in 0.6 of water, 1 in 115 of ethanol, and 1 in 1500 of chloroform; slightly soluble in acetone; practically insoluble in ether.

Thin-layer Chromatography. System TA—Rf 00; system TN—Rf 34; system TO—Rf 05. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2625.

Ultraviolet Spectrum. Aqueous acid—225 nm ($A_1^1 = 525$ a), 266 nm ($A_1^1 = 9$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1100, 1120, 1260, 1000, 780, 1600 (KBr disk).

Quantification. SPECTROFLUORIMETRY. In plasma: sensitivity 50 ng—M. I. Ramzan *et al.*, *Eur. J. clin. Pharmac.*, 1980, 17, 135–143.

Disposition in the Body. Slowly and incompletely absorbed after oral administration; absorbed after intramuscular administration but is generally given by the intravenous route. Small amounts enter the cerebrospinal fluid. Almost 100% of a dose is excreted unchanged in the urine in 24 to 30 hours. Negligible amounts are excreted in the bile.

HALF-LIFE. Plasma half-life, 2 to 3 hours; greatly increased in renal failure.

VOLUME OF DISTRIBUTION. About 0.3 litre/kg.

CLEARANCE. Plasma clearance, about 1.4 ml/min/kg.

Dose. 40 to 120 mg intravenously.

Gelsemine

Central Depressant

$C_{20}H_{22}N_2O_2 = 322.4$

CAS—509-15-9

An alkaloid present in gelsemium, the dried rhizome and roots of *Gelsemium sempervirens* (Loganiaceae).

Crystals. M.p. 178°.

Slightly **soluble** in water; soluble in ethanol, chloroform, and ether.

Colour Test. Mandelin's Test—red → green.

Thin-layer Chromatography. System TA—Rf 49. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2850.

Ultraviolet Spectrum. Aqueous acid—252 nm ($A_1^1 = 220$ b); aqueous alkali—268 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1715, 1620, 1100, 747, 759, 1237.

Disposition in the Body.

Toxicity. Death has been caused by the ingestion of 4 ml of a 1:1 fluid extract.

Gentamicin

Antibiotic

CAS—1403-66-3

A mixture of isomeric aminoglycoside antibiotics (gentamicin C_1 , gentamicin C_{1A} , and gentamicin C_2) produced by *Microspora purpurea*.

A white amorphous powder. M.p. 102° to 108°.

Freely soluble in water; sparingly soluble in ethanol and chloroform.

Gentamicin Sulphate

Proprietary Names. Alcomycin; Cidomycin; Garamycin; Genoptic; Gentalline; Gentican; Lugacin; Refobacin; Sulmycin.

CAS—1405-41-0

A white to buff-coloured powder.

Soluble in water; practically insoluble in ethanol, chloroform, and ether.

Colour Tests. Nessler's Reagent (100°)—black; Ninhydrin (heat for 4 min)—violet.

Ultraviolet Spectrum. Aqueous acid—247 nm; aqueous alkali—251 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1120, 1060, 1625, 1525, 1290, 880 (KBr disk).

Quantification. See also under Amikacin.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: gentamicin components C_1 , C_{1A} and C_2 , sensitivity 500 ng/ml, fluorescence detection—J. D'Souza and R. I. Ogilvie, *J. Chromat.*, 1982, 232; *Biomed. Appl.*, 21, 212–218.

IMMUNOASSAY. In serum: enzyme immunoassay, detection limit 100 ng/ml—P. J. Wills and R. Wise, *Antimicrob. Ag. Chemother.*, 1979, 16, 40–42. In serum: fluoroimmunoassay—A. J. Munro *et al.*, *J. antimicrob. Chemother.*, 1982, 9, 47–51.

REVIEW. For a review of methods for the determination of gentamicin in serum, see W. Hospes *et al.*, *Pharm. Weekbl., Sci. Edn*, 1982, 4, 32–37.

Disposition in the Body. Poorly absorbed after oral administration but rapidly absorbed after intramuscular injection; it is also absorbed systemically following topical application to wounds. In normal subjects it is rapidly excreted in the urine as unchanged drug, up to 80% of a dose being excreted in 24 hours. It accumulates in the tissues and there may be considerable intersubject variation in the pharmacokinetics. Gentamicin may be detected in serum and urine for several days after cessation of treatment.

THERAPEUTIC CONCENTRATION. During treatment the serum concentration should be in the range 4 to 12 µg/ml and should be monitored regularly, especially in patients who have renal insufficiency. During multiple dosing, the trough concentration immediately preceding a dose should not exceed 2 µg/ml.

A single intramuscular dose of 1 mg/kg given to 10 subjects, produced a mean peak serum concentration of 5.8 µg/ml in 0.5 to 1 hour (M. Chung *et al.*, *Antimicrob. Ag. Chemother.*, 1980, 17, 184–187).

TOXICITY. Toxic effects may be produced at serum concentrations of 12 µg/ml or more, or during chronic treatment, if the trough serum concentration exceeds 2 µg/ml.

HALF-LIFE. Plasma half-life, about 2 to 4 hours, increased in renal failure; a very long terminal elimination phase of several days has also been reported.

VOLUME OF DISTRIBUTION. About 0.2 litre/kg.

CLEARANCE. Plasma clearance, about 1 ml/min/kg.

PROTEIN BINDING. In plasma, less than 30%.

Dose. The equivalent of 3 to 5 mg/kg of gentamicin daily, given parenterally.

Gestronol Hexanoate

Progestational Steroid

Synonym. Gestonorone Caproate

Proprietary Name. Depostat

3,20-Dioxo-19-norpregn-4-en-17 α -yl hexanoate

$C_{26}H_{38}O_4 = 414.6$

CAS—1253-28-7

A white to creamy-white crystalline powder. M.p. 124° to 130°; a polymorph melting at 119° to 123° may also occur.

Soluble in ethanol and methanol; freely soluble in acetone and chloroform; sparingly soluble in ether.

Ultraviolet Spectrum. Methanol—240 nm ($A_1^1 = 415$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1733, 1667, 1715, 1266, 1250, 1618 (KBr disk).

Dose. 200 to 400 mg intramuscularly every 5 to 7 days.

Glafenine*Synonym.* Glaphenine*Proprietary Names.* Glifan; Glifanan.2,3-Dihydroxypropyl *N*-(7-chloro-4-quinolyl)anthranilate $C_{19}H_{17}ClN_2O_4 = 372.8$

CAS—3820-67-5

A white or slightly yellow crystalline powder. M.p. about 165°. Practically **insoluble** in water; slightly soluble in acetone and chloroform; soluble in dilute acids.

Ultraviolet Spectrum. Aqueous acid—345 nm ($A_1^1 = 467$ b).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: glafenine and metabolites, detection limits 500 ng/ml for glafenine and hydroxyglafenic acid, 200 ng/ml for glafenic acid, UV detection—M. C. Tournet *et al.*, *J. Chromat.*, 1981, 224; *Biomed. Appl.*, 13, 348–352.

Disposition in the Body. Absorbed after oral administration with peak plasma concentrations occurring about 1 to 2 hours after ingestion. It is hydrolysed to glafenic acid which is excreted in the urine as an acylglucuronide conjugate; glafenic acid is found in plasma at concentrations greater than those of unchanged drug. Small amounts of unconjugated *N*-oxide of glafenic acid, and hydroxyglafenic acid which is mainly conjugated, have also been found in urine.

TOXICITY. Plasma concentrations greater than 75 µg/ml may be associated with toxic effects.

HALF-LIFE. About 1 to 2 hours.**Dose.** Up to 1.2 g daily.*Analgesic***Dissociation Constant.** pK_a 5.3.

Colour Tests. Aromaticity (Method 2)—yellow/orange; Liebermann's Test (100°)—orange (15 s).

Thin-layer Chromatography. System TA—Rf 80. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Methanol—275 nm, 300 nm ($A_1^1 = 63$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1524, 1160, 1623, 1718, 1276, 823 (KBr disk).

**Glibenclamide***Antidiabetic**Synonyms.* Glybenclamide; Glyburide; Glycbenzcyclamide.*Proprietary Names.* Daonil; DiaBeta; Euglucon; Libanil; Malix; Miglucan.

1 - {4 - [2 - (5 - Chloro - 2 - methoxybenzamido)ethyl]benzenesulphonyl} - 3 - cyclohexylurea

 $C_{23}H_{28}ClN_3O_5S = 494.0$

CAS—10238-21-8

A white crystalline powder. M.p. 172° to 174°. Practically **insoluble** in water and ether; soluble 1 in 330 of ethanol, 1 in 36 of chloroform, and 1 in 250 of methanol.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 5 ng/ml, ECD—D. Castoldi and O. Tofanetti, *Clinica chim. Acta*, 1979, 93, 195–198.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: sensitivity 10 ng/ml, fluorescence detection—W. J. Adams *et al.*, *Analyt. Chem.*, 1982, 54, 1287–1291.

Disposition in the Body. Readily absorbed after oral administration; widely distributed throughout the body and metabolised mainly by 4-*trans*- and 3-*cis*-hydroxylation of the cyclohexyl ring. About 20 to 50% of a dose is excreted in the urine in 24 hours, mainly as metabolites; about 45 to 75% of a dose is eliminated in the faeces over a period of 5 days.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 5 mg to 2 subjects, peak plasma concentrations of 0.17 to 0.36 µg/ml were attained in 3 hours (L. Balant *et al.*, *Eur. J. clin. Pharmacol.*, 1975, 8, 63-69).

TOXICITY.

In a suicide attempt, a concentration of 0.6 µg/ml was found in the serum initially. After 84 hours the concentration had declined to <0.1 µg/ml (M. Berger *et al.*, *Dt. med. Wschr.*, 1977, 102, 586-587).

HALF-LIFE. Plasma half-life, 5 to 16 hours.

VOLUME OF DISTRIBUTION. About 0.3 litre/kg.

DISTRIBUTION IN BLOOD. Plasma : whole blood ratio, 2.

PROTEIN BINDING. In plasma, about 99%.

NOTE. For reviews of the pharmacokinetics of hypoglycaemic drugs see L. Balant, *Clin. Pharmacokinet.*, 1981, 6, 215-241 and J. E. Jackson and R. Bressler, *Drugs*, 1981, 22, 211-245.

Dose. 5 to 15 mg daily.

Glibornuride

Antidiabetic

Proprietary Names. Gluborid; Glutril.

1-[(2*S*,3*R*)-2-Hydroxyborn-3-yl]-3-tosylurea

C₁₈H₂₆N₂O₄S = 366.5

CAS—26944-48-9

Crystals. M.p. 186° to 189°.

Colour Tests. Koppanyi-Zwicker Test—violet; Mercurous Nitrate—black.

Thin-layer Chromatography. System TD—Rf 40; system TE—Rf 05; system TF—Rf 60.

Gas Chromatography. System GA—RI 1520, 1690, and 1780.

Ultraviolet Spectrum. Ethanol—257 nm, 264 nm ($A_1^{1\%} = 17$ a), 275 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1170, 1682, 1520, 1710, 1050, 1100 (KBr disk).

Mass Spectrum. Principal peaks at m/z 91, 155, 197, 65, 84, 39, 95, 41.

Quantification. SPECTROFLUORIMETRY. In plasma or serum: detection limit 40 ng/ml—R. Becker, *Arzneimittel-Forsch.*, 1977, 27, 102-104.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: sensitivity 500 ng/ml, UV detection—K. Harzer, *J. Chromat.*, 1980, 183; *Biomed. Appl.*, 9, 115-117.

Disposition in the Body. Readily absorbed after oral administration. Extensively metabolised by hydroxylation to a series of inactive or almost inactive compounds and by oxidation to a *p*-carboxy derivative. About 60 to 70% of a dose is excreted in the urine as metabolites; four hydroxylated derivatives account for about 75% of the urinary material, *p*-hydroxyglibornuride accounts for about 6%, and *p*-carboxyglibornuride for about 7%; the remainder of a dose is eliminated in the faeces.

THERAPEUTIC CONCENTRATION.

After an oral dose of 50 mg to 7 subjects, peak plasma concentrations of 1.6 to 3.4 µg/ml were attained in about 3 to 4 hours (G. Rentsch *et al.*, *Arzneimittel-Forsch.*, 1972, 22, 2209-2212).

HALF-LIFE. Plasma half-life, 5 to 11 hours (mean 8).

VOLUME OF DISTRIBUTION. 0.15 to 0.35 litre/kg.

PROTEIN BINDING. In plasma, about 95%.

NOTE. For reviews of the pharmacokinetics of sulphonylurea hypoglycaemic drugs, see L. Balant, *Clin. Pharmacokinet.*, 1981, 6, 215-241, and J. E. Jackson and R. Bressler, *Drugs*, 1981, 22, 211-245.

Dose. 12.5 to 75 mg daily.

Gliclazide*Proprietary Names.* Diamicon; Dramion.

1-(3-Azabicyclo[3.3.0]oct-3-yl)-3-tosylurea

 $C_{15}H_{21}N_3O_3S = 323.4$

CAS—21187-98-4

A crystalline solid. M.p. about 181°.

Dissociation Constant. pK_a 5.8.**Colour Tests.** Liebermann's Test—yellow; Mercurous Nitrate—black.**Ultraviolet Spectrum.** Aqueous acid—230 nm ($A_1^1 = 440$ b); aqueous alkali—263 nm ($A_1^1 = 20$ b).**Infra-red Spectrum.** Principal peaks at wavenumbers 1707, 1162, 920, 667, 1089, 997 (KBr disk).**Quantification.** HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: detection limit 200 ng/ml, UV detection—M. Kimura *et al.*, *J. Chromat.*, 1980, 183; *Biomed. Appl.*, 9, 467–473. In plasma: sensitivity 300 ng/ml, UV detection—M. Kimura *et al.*, *Chem. pharm. Bull.*, 1980, 28, 344–346.**Disposition in the Body.** Absorbed after oral administration. It is extensively metabolised by hydroxylation, *N*-oxidation, and oxidation to several inactive metabolites; the *p*-carboxy metabolite, which accounts for about 1% of the plasma concentration, has no hypoglycaemic activity but has some antithrombotic*Antidiabetic*activity. About 60 to 70% of a dose is excreted in the urine with less than 5% as unchanged drug. The *p*-carboxy and *N*-oxide metabolites account for about 40% of the dose. About 10 to 20% of the dose is eliminated in the faeces as metabolites.**THERAPEUTIC CONCENTRATION.**After a single oral dose of 80 mg to 23 subjects, peak plasma concentrations of 0.7 to 4.9 µg/ml were attained in about 4 hours. Following daily oral administration of 80 mg to 144 subjects, steady-state plasma concentrations of 0.3 to 8.2 µg/ml (mean 2.5) were reported (D. B. Campbell *et al.*, *Pharmacokinetics and Metabolism of Gliclazide, in Gliclazide and the Treatment of Diabetes*, H. Keen *et al.* (Ed.), London, Royal Society of Medicine, 1980, pp. 71–82).**HALF-LIFE.** Plasma half-life, 6 to 14 hours (mean 10).**PROTEIN BINDING.** In plasma, 85 to 95%.**REFERENCE.** D. B. Campbell *et al.*, *ibid.* See also B. Holmes *et al.*, *Drugs*, 1984, 27, 301–327.**Dose.** 40 to 320 mg daily.**Glipizide***Antidiabetic**Synonym.* Glydiazinamide*Proprietary Names.* Glibenese; Minidiab; Minodiab.

1 - Cyclohexyl - 3 - {4 - [2 - (5 - methylpyrazine - 2 - carboxamido)-ethyl]benzenesulphonyl}urea

 $C_{21}H_{27}N_5O_4S = 445.5$

CAS—29094-61-9

A white powder. M.p. about 205°.

Practically **insoluble** in water and ethanol; soluble in chloroform, dimethylformamide, and in dilute solutions of alkali hydroxides; sparingly soluble in acetone.**Colour Test.** Mercurous Nitrate—black.**Thin-layer Chromatography.** *System TA*—Rf 87; *system TB*—Rf 00; *system TC*—Rf 41.**Ultraviolet Spectrum.** Aqueous acid—276 nm ($A_1^1 = 231$ a). No alkaline shift.**Infra-red Spectrum.** Principal peaks at wavenumbers 1528, 1690, 1650, 1159, 1032, 900 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 150, 121, 56, 93, 39, 151, 66, 94.**Quantification.** HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: sensitivity 20 ng/ml, UV detection—E. Wåhlin-Boll and A. Melander, *J. Chromat.*, 1979, 164; *Biomed. Appl.*, 6, 541–546. RADIOIMMUNOASSAY. In plasma: sensitivity 1 ng/ml—E. Maggi *et al.*, *Eur. J. clin. Pharmac.*, 1981, 21, 251–255.**Disposition in the Body.** Readily absorbed after oral administration; bioavailability almost 100%. Metabolised by hydroxylation to form a number of inactive metabolites, principally the 4-*trans*-hydroxycyclohexyl and 3-*cis*-hydroxycyclohexyl derivatives. About 65 to 85% of a dose is excreted in the urine in 24 hours, with about 3 to 10% as unchanged drug, up to 80% as hydroxylated metabolites, mainly the 4-*trans*-hydroxycyclohexyl derivative, and about 1 to 2% as an *N*-acetamido metabolite; about 11% of a dose is eliminated in the faeces.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 5 mg given to 6 subjects, peak serum concentrations of 0.11 to 0.49 µg/ml (mean 0.33) were attained in about 1.6 hours (E. Wåhlin-Boll *et al.*, *Clin. Pharmacokinet.*, 1982, 7, 363-372).

HALF-LIFE. Plasma half-life, 2 to 6 hours.

VOLUME OF DISTRIBUTION. About 0.2 litre/kg.

CLEARANCE. Plasma clearance, about 0.6 ml/min/kg.

PROTEIN BINDING. In plasma, about 98%.

NOTE. For a review of the pharmacokinetics of glipizide see R. N. Brogden *et al.*, *Drugs*, 1979, 18, 329-353.

Dose. 2.5 to 30 mg daily.

Glolidone

Antidiabetic

Proprietary Name. Glurenorm

1-Cyclohexyl-3-{4-[2-(3,4-dihydro-7-methoxy-4,4-dimethyl-1,3-dioxo-2(1*H*)-isoquinolyl)ethyl]benzenesulphonyl}urea

$C_{27}H_{33}N_3O_6S = 527.6$

CAS—33342-05-1

A white or slightly yellow crystalline substance. M.p. about 178°. Practically **insoluble** in water; slightly soluble in ethanol and methanol; soluble in acetone and chloroform.

Colour Test. Koppanyi-Zwicker Test—violet.

Ultraviolet Spectrum. Methanol—311 nm ($A_1^1 = 50$ a); aqueous alkali—276 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1700, 1652, 1160, 1285, 1295, 1530 (KBr disk).

Quantification. RADIOIMMUNOASSAY. In plasma: sensitivity 1 ng/ml—Z. Kopitar and H. E. Kompa, *Arzneimittel-Forsch.*, 1975, 25, 1469-1472.

Disposition in the Body. Readily absorbed after oral administration. Extensively metabolised by hydroxylation and demethylation to inactive metabolites. Less than 5% of a dose is excreted in the urine and about 95% is eliminated in the faeces, via the bile.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 15 mg to 10 subjects, peak plasma concentrations of about 0.7 µg/ml, and peak blood concentrations of about 0.37 µg/ml were reported (Z. Kopitar, *Arzneimittel-Forsch.*, 1975, 25, 1455-1460).

HALF-LIFE. Plasma half-life, about 1.5 hours.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 1.9.

PROTEIN BINDING. In plasma, about 99%.

Dose. 15 to 180 mg daily.

Gloxazone

Anaplasmodostat (Veterinary)

3-Ethoxy-2-oxobutylaldehyde bis(thiosemicarbazone)

$C_8H_{16}N_6OS_2 = 276.4$

CAS—2507-91-7

A yellow powder.

Practically **insoluble** in water and ether; slightly soluble in chloroform.

Colour Test. Palladium Chloride—red.

Thin-layer Chromatography. System *TA*—Rf 77. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—329 nm; aqueous alkali—303 nm. (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 1587, 1079, 1228, 1259, 1575, 1022 (KBr disk).

Glutethimide

Hypnotic

Proprietary Names. Doriden(e); Dorimide.

2-Ethyl-2-phenylglutarimide

$C_{13}H_{15}NO_2 = 217.3$

CAS—77-21-4

Colourless crystals or white crystalline powder. M.p. 85° to 89°. Practically **insoluble** in water; soluble 1 in 5 of ethanol, 1 in less than 1 of chloroform, and 1 in 12 of ether; freely soluble in acetone.

Dissociation Constant. pK_a 9.2.

Colour Tests. Koppanyi-Zwicker Test—violet; Liebermann's Test—red-orange; Mercurous Nitrate—black.

Thin-layer Chromatography. System TA—Rf 75; system TD—Rf 63; system TE—Rf 78; system TF—Rf 62. (Dragendorff spray, weak reaction; acidified iodoplatinate solution, positive; mercuric chloride-diphenylcarbazone reagent, positive; mercurous nitrate spray, black.)

Gas Chromatography. System GA—glutethimide RI 1836, 4-hydroxyglutethimide RI 1875, 2-phenylglutarimide RI 1778; system GF—RI 2315.

High Pressure Liquid Chromatography. System HE— k' 7.97.

Ultraviolet Spectrum. Ethanol—252 nm, 258 nm ($A_1^{1\%} = 18$ a), 264 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1686, 1710, 1200, 1270, 1281, 704 (KBr disk).

Mass Spectrum. Principal peaks at m/z 189, 132, 117, 160, 91, 115, 103, 77; 4-hydroxyglutethimide 146, 233, 103, 133, 91, 117, 115, 77; 2-phenylglutarimide 104, 189, 103, 117, 78, 91, 51, 146.

Quantification. GAS CHROMATOGRAPHY. In plasma, tissues or urine: glutethimide and 4-hydroxyglutethimide, sensitivity 200 ng/ml for glutethimide and 500 ng/ml for 4-hydroxyglutethimide in plasma, FID—A. R. Hansen and L. J. Fischer, *Clin. Chem.*, 1974, 20, 236–242. In serum: sensitivity 250 ng/ml, FID—D. Kadar and W. Kalow, *J. Chromat.*, 1972, 72, 21–27.

GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In plasma or urine: glutethimide and six metabolites, sensitivity 50 ng/ml—K. A. Kennedy *et al.*, *Biomed. Mass Spectrom.*, 1978, 5, 679–685.

Disposition in the Body. Irregularly absorbed from the gastrointestinal tract; absorption is enhanced if alcohol is taken concomitantly. Widely distributed in body tissues and fat. Glutethimide is a racemate; the (+)-isomer is metabolised in the liver to 4-hydroxyglutethimide and the (–)-isomer to 2-(1-hydroxyethyl)-2-phenylglutarimide. 4-Hydroxyglutethimide is twice as active as glutethimide in animals but does not appear to contribute to the effects of single therapeutic doses in man; however it tends to accumulate in the plasma during intoxication and may contribute to the central nervous depression in overdose cases. Both hydroxylated metabolites are converted to glucuronides and undergo enterohepatic circulation; they are still being excreted in the urine after more than 48 hours. 2-Ethyl-2-(4-hydroxyphenyl)glutarimide is a major metabolite during chronic administration. Other metabolites include 2-phenylglutarimide, α -phenyl- γ -butyrolactone, and 2-ethyl-2-phenylglutaconimide which are pharmacologically active; numerous other mono- and dihydroxyphenyl metabolites have been isolated from human urine. Less than 2% of a dose is excreted unchanged in the urine.

in 24 hours. 2-Phenylglutarimide and 2-ethyl-2-phenylglutamide each account for about 2 to 4% of the dose as urinary excretion products and the remainder consists largely of glucuronide conjugates of the hydroxylated metabolites.

THERAPEUTIC CONCENTRATION.

Following single oral doses of 500 mg to 6 subjects, peak plasma concentrations of 2.8 to 7.1 µg/ml (mean 4.3) were attained in 1 to 6 hours (mean 2) (S. Curry *et al.*, *Clin. Pharmac. Ther.*, 1971, 12, 849-857).

TOXICITY. The estimated minimum lethal dose is 5 g although recoveries have occurred after the ingestion of up to 10 g. Blood concentrations of 3.4 to 27 to 48 µg/ml of glutethimide have been associated with toxic effects and concentrations of 25 to 48 to 90 µg/ml have been associated with fatalities. Postmortem blood concentrations of about 10 µg/ml may be indicative of poisoning if the survival time has been prolonged.

In a review of 11 fatalities, blood concentrations of glutethimide were reported to range from 10 to 97 µg/ml (mean 45) and liver concentrations from 63 to 141 µg/g (mean 89) (R. C. Baselt and R. H. Cravey, *J. analyt. Toxicol.*, 1977, 1, 81-103).

HALF-LIFE. Plasma half-life, 5 to 22 hours (mean 12); in acute intoxication the plasma half-life has an average value of about 40 hours but may exceed 100 hours.

VOLUME OF DISTRIBUTION. About 3 litres/kg.

PROTEIN BINDING. In plasma, about 54%.

Dose. Usually 250 to 500 mg, as a hypnotic.

Glyceryl Trinitrate

Anti-anginal Vasodilator

Synonyms. Glonoin; Nitroglycerin; Nitroglycerol; Trinitrin; Trinitroglycerin.

Proprietary Names. Cardabid; Coro-Nitro; Lénitral; Nitora; Nitro-Bid; Nitrocine; Nitrocontin; Nitroglyn; Nitrol; Nitrolin-gual; Nitrong; Nitro-SA; Nitrospan; Nitrostabilin; Nitrostat; Nitrovas; Percutol; Suscard Buccal; Sustac; Transiderm-Nitro; Trates; Tridil. It is an ingredient of Cardiac Dellipoids D 18 and Natirose.

Propane-1,2,3-triol trinitrate

$C_3H_5N_3O_9 = 227.1$

CAS—55-63-0

A colourless, slightly volatile, oily liquid. It explodes on rapid heating or on percussion. Wt per ml about 1.6 g.

Soluble 1 in 800 of water and 1 in 4 of ethanol; miscible with chloroform and ether.

Caution. In fatty or oily solution it is safe and stable but in alcoholic solution the substance must be handled with the utmost caution.

Colour Test. Ferrous Sulphate—red.

Thin-layer Chromatography. *System TD*—Rf 71; *system TE*—Rf 86; *system TF*—Rf 72.

Infra-red Spectrum. Principal peaks at wavenumbers 1647, 1279, 843, 1013, 903, 754.

Quantification. GAS CHROMATOGRAPHY (CAPILLARY COLUMN). In plasma: sensitivity 25 pg/ml, ECD—P. K. Noonan *et al.*, *J. pharm. Sci.*, 1984, 73, 923-927.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: limit of detection 500 pg/ml—R. J. Spangord and R. G. Keck, *J. pharm. Sci.*, 1980, 69, 444-446.

Disposition in the Body. Readily absorbed from the skin and mucous membranes; less readily absorbed after oral administration. It is rapidly metabolised in the body to dinitrates, which are active, and to inactive mononitrates. About 20% of a sublingual dose is excreted in the urine in 24 hours, mainly as the mononitrate.

THERAPEUTIC CONCENTRATION.

After sublingual administration of 0.3 mg to 1 subject, a blood concentration of about 0.001 µg/ml was attained in 3 minutes; following an oral dose of 6.5 mg or application of an ointment containing 16 mg of glyceryl trinitrate to the same subject, peak blood concentrations of about 0.0002 to 0.0003 µg/ml were reported, 20 to 60 minutes after the dose (H. P. Blumenthal *et al.*, *Br. J. clin. Pharmac.*, 1977, 4, 241-242).

Following sublingual administration of 0.5 mg to 6 subjects, a mean peak plasma concentration of 0.0014 µg/ml was attained in 3 minutes; after oral administration of 6.4 mg, a peak plasma concentration of 0.0026 µg/ml was reported at 2 to 4 hours, and after topical administration of 35 mg, a mean peak plasma concentration of 0.0025 µg/ml was attained in 1 hour. Plasma nitrate and nitrite concentrations were undetectable after sublingual administration; after oral administration peak plasma concentrations of about 0.5 µg/ml of nitrate and nitrite were attained in 5 and 2 hours respectively, and following topical administration, peak concentrations of about 0.7 µg/ml were reported at 5 hours and 1 hour respectively (A. Bashir *et al.*, *Br. J. clin. Pharmac.*, 1982, 14, 779-784).

TOXICITY. The estimated minimum oral lethal dose is 2 g and the maximum permissible atmospheric concentration is 0.2 ppm.

HALF-LIFE. Plasma half-life, after intravenous administration about 2 to 5 minutes; after sublingual administration about 5 minutes.

VOLUME OF DISTRIBUTION. About 3 litres/kg.

NOTE. For a review of the pharmacokinetics of organic nitrates, see M. G. Bogaert, *Clin. Pharmacokinet.*, 1983, 8, 410-421. For a review of intravenous glyceryl trinitrate see E. M. Sorkin *et al.*, *Drugs*, 1984, 27, 45-80.

Dose. Usually the equivalent of 0.5 to 1 mg of glyceryl trinitrate sublingually, repeated as required; doses of 5.2 to 38.4 mg daily are given by mouth as sustained-release tablets.

Glycopyrronium Bromide

Anticholinergic

Synonym. Glycopyrrolate

Proprietary Names. Asécryl; Robinul.

3 - (α - Cyclopentylmandeloyloxy) - 1,1 - dimethylpyrrolidinium bromide

$C_{19}H_{28}BrNO_3 = 398.3$

CAS—596-51-0

A white crystalline powder. M.p. 193° to 198°.

Soluble 1 in about 5 of water and 1 in 10 of ethanol; practically insoluble in chloroform and ether.

Colour Test. The following test is performed on glycopyrronium nitrate (see page 128): Liebermann's Test—black.

Thin-layer Chromatography. *System TA*—Rf 03. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 2120.

High Pressure Liquid Chromatography. *System HA*— k' 3.2 (tailing peak).

Ultraviolet Spectrum. Aqueous acid—252 nm, 258 nm ($A_1^1 = 7.1$ a), 264 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1738, 1225, 1164, 1178, 1115, 1192.

Dose. 2 to 12 mg daily.

Glymidine

Antidiabetic

Synonyms. Glidiazine Sodique; Glycodiazine; Sodium Glymidine.

Proprietary Names. Gondafon; Lycanol; Redul.

The sodium salt of *N*-[5-(2-methoxyethoxy)pyrimidin-2-yl]-benzenesulphonamide.

$C_{13}H_{14}N_3NaO_4S = 331.3$

CAS—3459-20-9

A white crystalline powder. M.p. about 223°.

Soluble in water; slightly soluble in ethanol.

Colour Tests. Koppanyi-Zwicker Test—pink-violet; Mercurous Nitrate—black.

Thin-layer Chromatography. *System TA*—Rf 76; *system TB*—Rf 00; *system TC*—Rf 65.

Gas Chromatography. *System GJ*—retention time of methyl derivative 0.53 relative to griseofulvin.

Ultraviolet Spectrum. Aqueous acid—273 nm, 299 nm; aqueous alkali—243 nm, 317 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1130, 1092, 1267, 1247, 691, 1220 (KBr disk).

Mass Spectrum. Principal peaks at m/z 244, 59, 77, 29, 43, 31, 45, 55.

Quantification. SPECTROFLUORIMETRY. In plasma (glymidine) or urine (desmethyl and carboxy metabolites): detection limit, 1 µg/ml for glymidine in plasma—H. Held *et al.*, *Arzneimittel-Forsch.*, 1970, 20, 1927–1929.

GAS CHROMATOGRAPHY. In blood: sensitivity 1.5 µg/ml, ECD—H. J. Schlicht *et al.*, *J. Chromat.*, 1978, 155, 178–181.

THIN-LAYER CHROMATOGRAPHY-SPECTROPHOTOMETRY. In plasma: glymidine and metabolites, sensitivity 2.5 µg/ml—J. C. Soyfer *et al.*, *Chim. Ther.*, 1969, 4, 131–135.

Disposition in the Body. Almost completely absorbed after oral administration. Metabolised by demethylation to an active metabolite and oxidation to an inactive carboxy derivative. About 85 to 95% of a dose is excreted in the urine in 48 hours, with less than 1% of the urinary material as unchanged drug, 20 to 40% as the desmethyl metabolite, and 60 to 80% as the carboxy metabolite; about 6% of a dose is eliminated in the faeces.

HALF-LIFE. Plasma half-life, about 2 to 6 hours, increased in subjects with hepatic disease.

PROTEIN BINDING. In plasma, about 80%.

REFERENCE. E. Gerhards *et al.*, *Arzneimittel-Forsch.*, 1964, 14, 394–402.

Dose. 0.5 to 2 g daily.

Griseofulvin

Antifungal

Synonym. Curling Factor

Proprietary Names. Fulcin; Fulvicin; Grifulvin V; Grisactin; Grisaltin; Grisefuline; Griseostatin; Grisovin; Gris-PEG; Lamoryl; Likuden M; Neo-Fulcin.

(2*S*,6'*R*)-7-Chloro-2',4,6-trimethoxy-6'-methylbenzofuran-2-spiro-1'-cyclohex-2'-ene-3,4'-dione

$C_{17}H_{17}ClO_6 = 352.8$

CAS—126-07-8

A white to pale cream-coloured powder. M.p. 217° to 224°.

Very slightly **soluble** in water; soluble 1 in 300 of dehydrated alcohol, 1 in 20 of acetone, and 1 in 25 of chloroform; soluble in dimethylformamide.

Colour Test. Dissolve 5 mg in 1 ml of *sulphuric acid* and add 5 mg of powdered potassium dichromate—red.

Gas Chromatography. *System GA*—RI 2700.

Ultraviolet Spectrum. Dehydrated alcohol—236 nm, 291 nm ($A_1^1 = 686$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1220, 1611, 1210, 1583, 1135, 800 (KBr disk).

Mass Spectrum. Principal peaks at m/z 138, 352, 215, 310, 214, 69, 321, 354.

Dose. 0.5 to 1 g daily.

Guaiphenesin

Expectorant

Synonyms. Glyceryl Guaiacolate; Glycerylguayacolum; Guaia-col Glycerol Ether; Guaiacyl Glyceryl Ether; Guaifenesin; Guajacolum Glycerolatum.

Proprietary Names. Balminil (expectorant); Broncho-Grippex; Corutol (expectorant); 2/G (expectorant); Gaipect; Glycotuss; Glytuss; Guaiatuss; Hytuss; Motussin; Myoscin 'E'; Reorganin; Resyl; Robitussin; Sedatuss (expectorant); S-T Expect; Tus-sanca.

It is an ingredient of many proprietary preparations—see *Martindale, The Extra Pharmacopoeia*, 28th Edn.

3-(2-Methoxyphenoxy)propane-1,2-diol

$C_{10}H_{14}O_4 = 198.2$

CAS—93-14-1

White or slightly grey crystals or crystalline aggregates. M.p. 78° to 82°.

Soluble 1 in 33 of water, 1 in 11 of ethanol, 1 in 11 of chloroform, and 1 in 100 of ether.

Colour Tests. Liebermann's Test—black; Mandelin's Test—grey-green; Marquis Test—violet.

Thin-layer Chromatography. *System TD*—Rf 11; *system TE*—Rf 37; *system TF*—Rf 17.

Gas Chromatography. *System GA*—RI 1650.

Ultraviolet Spectrum. Aqueous acid—273 nm ($A_1^1 = 125$ a). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1255, 1510, 740, 1230, 1125, 1020 (KBr disk).

Mass Spectrum. Principal peaks at m/z 124, 109, 198, 81, 77, 125, 52, 31.

Quantification. GAS CHROMATOGRAPHY. In plasma: detection limit 15 ng/ml, ECD—S. Singhawangcha *et al.*, *J. Chromat.*, 1980, 183; *Biomed. Appl.*, 9, 433–439. In blood: ECD—W. R. Maynard, jun., and R. B. Bruce, *J. pharm. Sci.*, 1970, 59, 1346–1348.

Disposition in the Body. Readily absorbed after oral administration. It is rapidly metabolised by oxidation to β -(2-methoxyphenoxy)lactic acid; about 40% of a dose is excreted as this metabolite in the urine in 3 hours.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 600 mg given to 3 subjects, a mean peak blood concentration of about 1.4 μ g/ml was attained in 15 minutes (W. R. Maynard, jun., and R. B. Bruce, *ibid.*).

TOXICITY.

In a fatality due to ingestion of cough syrup containing guaiphenesin and hydrocodone, postmortem blood concentrations of 14 and 3 μ g/ml respectively were reported (R. H. Cravey per R. C. Baselt, *Disposition of Toxic Drugs and Chemicals in Man*, 2nd Edn, Davis, California, Biomedical Publications, 1982, pp. 357–358).

HALF-LIFE. Blood half-life, about 1 hour.

VOLUME OF DISTRIBUTION. About 1 litre/kg.

Dose. 100 to 200 mg every 2 to 4 hours.

Guanethidine

Antihypertensive

1-[2-(Perhydroazocin-1-yl)ethyl]guanidine

$C_{10}H_{22}N_4 = 198.3$

CAS—55-65-2

**Guanethidine Monosulphate**

Synonym. Guanethidine Sulphate

Proprietary Names. Antipres; Ismelin. It is an ingredient of Esimil and Ganda.

$C_{10}H_{22}N_4 \cdot H_2SO_4 = 296.4$

CAS—645-43-2

A colourless crystalline powder. M.p. about 250°, with decomposition.

Soluble 1 in 1.5 of water; practically insoluble in ethanol, chloroform, and ether.

Dissociation Constant. pK_a 8.3, 11.4 (20°).

Thin-layer Chromatography. *System TA*—Rf 01; *system TB*—Rf 00; *system TC*—Rf 02; *system TN*—Rf 56; *system TO*—Rf 50. (*Dragendorff* spray, positive; *acidified iodoplatinate solution*, positive.)

Gas Chromatography. *System GA*—not eluted.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1030, 1143, 1127, 1070, 1050, 1630 (guanethidine sulphate, KBr disk).

Mass Spectrum. Principal peaks at m/z 126, 44, 30, 42, 41, 55, 43, 58.

Quantification. GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In plasma or urine: guanethidine and other guanido-containing drugs, sensitivity 100 ng/ml using FID and 1 ng/ml using MID—J. H. Hengstmann *et al.*, *Analyt. Chem.*, 1974, 46, 34–39.

RADIOIMMUNOASSAY. In plasma: sensitivity 4 ng/ml—L. J. Loeffler and A. W. Pittman, *J. pharm. Sci.*, 1979, 68, 1419–1423.

Disposition in the Body. Incompletely absorbed after oral administration; bioavailability about 20%. Up to about 25% of an oral dose is excreted in the urine in 24 hours as unchanged drug and two metabolites, guanethidine *N*-oxide and 2-(6-carboxyhexylamino)ethylguanidine; the proportion of metabolites to unchanged drug is variable. A total of about 40% of an

oral dose is excreted in the urine in 9 days and about 40 to 47% is eliminated in the faeces as unchanged drug in 6 days.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.008 to 0.017 µg/ml.

After a single oral 3H -labelled dose of 50 mg to 1 subject, a peak plasma-guanethidine concentration of 0.009 µg/ml was attained in 3 hours and was almost constant over the period 1 to 12 hours, declining slowly to about 0.003 µg/ml at 24 hours; a peak total metabolite concentration of about 0.04 µg/ml was reported at 2 to 4 hours (C. McMartin *et al.*, *Clin. Pharmac. Ther.*, 1970, 11, 423–431).

Following daily oral doses of 25 mg to 8 subjects, steady-state plasma-guanethidine concentrations of 0.003 to 0.016 µg/ml (mean 0.009) were reported; after oral doses of 37.5 mg daily to 8 subjects, the steady-state plasma-guanethidine concentrations ranged from 0.008 to 0.015 µg/ml (mean 0.011) (I. E. Walter *et al.*, *Clin. Pharmac. Ther.*, 1975, 18, 571–580).

HALF-LIFE. Plasma half-life, about 4 to 8 days.

PROTEIN BINDING. In plasma, not significantly bound.

NOTE. For a review of guanethidine disposition, see G. Lukas, *Drug Met. Rev.*, 1973, 2, 101–116.

Dose. Usually 10 to 100 mg of guanethidine monosulphate daily; up to 300 mg daily may be given.

Guanoclor

Antihypertensive

1-[2-(2,6-Dichlorophenoxy)ethylamino]guanidine

$C_9H_{12}Cl_2N_4O = 263.1$

CAS—5001-32-1

**Guanoclor Sulphate**

Proprietary Name. Vatenzol

$(C_9H_{12}Cl_2N_4O)_2 \cdot H_2SO_4 = 624.3$

CAS—551-48-4

A white crystalline powder. M.p. about 208°.

Soluble 1 in about 400 of water.

Colour Test. Mandelin's Test—violet → orange → brown-yellow.

Thin-layer Chromatography. *System TA*—Rf 0.3; *system TB*—Rf 0.0; *system TC*—Rf 0.0. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—272 nm ($A_1^1 = 14$ b), 278 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1672, 1134, 1652, 1050, 765, 1243 (KBr disk).

Mass Spectrum. Principal peaks at m/z 162, 43, 63, 164, 30, 44, 98, 42.

Dose. 10 to 120 mg of guanoclor sulphate daily; doses of 200 mg or more daily have been given.

Guanoxan

Antihypertensive

1-(1,4-Benzodioxan-2-ylmethyl)guanidine

$C_{10}H_{13}N_3O_2 = 207.2$

CAS—2165-19-7

Crystals. M.p. 164° to 165°.

Guanoxan Sulphate

$(C_{10}H_{13}N_3O_2)_2 \cdot H_2SO_4 = 512.5$

CAS—5714-04-5

A white crystalline powder. M.p. about 206°.

Soluble 1 in 50 of water.

Dissociation Constant. pK_a 12.3.

Colour Tests. Mandelin's Test—green, sometimes violet, depending on relative proportions of test material and reagent; Marquis Test—violet.

Thin-layer Chromatography. *System TA*—Rf 0.1; *system TB*—Rf 0.0; *system TC*—Rf 0.0. (Acidified potassium permanganate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—275 nm ($A_1^1 = 104$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1115, 1495, 1264, 1665, 1592, 748 (KBr disk).

Mass Spectrum. Principal peaks at m/z 30, 72, 43, 135, 121, 148, 52, 56.

Dose. 10 to 50 mg of guanoxan sulphate daily; doses of 120 mg or more daily have been given.

Halazone

Disinfectant

Synonym. Pantocide

4-(Dichlorosulphamoyl)benzoic acid

$C_7H_5Cl_2NO_4S = 270.1$

CAS—80-13-7

A white crystalline powder containing about 52% of 'available chlorine'. M.p. about 194°, with decomposition.

Very slightly soluble in water, chloroform, and ether; soluble 1 in 140 of ethanol; soluble in glacial acetic acid, and in aqueous solutions of alkali hydroxides and carbonates.

Ultraviolet Spectrum. Aqueous acid—237 nm; aqueous alkali—229 nm ($A_1^1 = 382$ b).

Mass Spectrum. Principal peaks at m/z 121, 65, 36, 185, 50, 38, 76, 39.

Halcinonide

Corticosteroid

Proprietary Names. Halciderm; Halcimat; Halog.

21-Chloro-9 α -fluoro-11 β -hydroxy-16 α ,17 α -isopropylidenedioxypregn-4-ene-3,20-dione

$C_{24}H_{32}ClFO_5 = 455.0$

CAS—3093-35-4

Crystals. M.p. 264° to 265°, with decomposition.

Ultraviolet Spectrum. Methanolic acid—238 nm ($A_1^1 = 370$ b). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1660, 1060, 1730, 1080, 1250, 1175 (KBr disk).

Mass Spectrum. Principal peaks at m/z 377, 43, 55, 246, 278, 59, 378, 41.

Use. Topically in concentrations of 0.025 to 0.1%.

Haloperidol*Tranquilliser*

Proprietary Names. Dozic; Fortunan; Haldol; Serenace; Serenase; Sigaperidol.

4-[4-(4-Chlorophenyl)-4-hydroxypiperidino]-4'-fluorobutyrophenone

$C_{21}H_{23}ClFNO_2 = 375.9$

CAS—52-86-8

A white to faintly yellowish, amorphous or microcrystalline powder. M.p. 147° to 152°.

Practically **insoluble** in water; soluble 1 in 50 to 1 in 60 of ethanol, 1 in 15 to 1 in 20 of chloroform, 1 in 200 of ether, and 1 in 55 of methanol.

Dissociation Constant. pK_a 8.3.

Partition Coefficient. Log P (octanol/pH 7.4), 4.3.

Colour Tests. Aromaticity (Method 2)—yellow/orange-red; Liebermann's Test—brown.

Thin-layer Chromatography. System TA—Rf 67; system TB—Rf 10; system TC—Rf 27. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2942.

High Pressure Liquid Chromatography. System HA— k' 1.2.

Ultraviolet Spectrum. Methanolic acid—245 nm ($A_1^1 = 340$ a). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 832, 1151, 1673, 1217, 1136, 1598 (KBr disk).

Mass Spectrum. Principal peaks at m/z 224, 42, 237, 226, 123, 206, 239, 56 (no peaks above 240).

Quantification. GAS CHROMATOGRAPHY. In serum or cerebrospinal fluid: sensitivity 500 pg/ml, AFID—D. R. Abernethy *et al.*, *J. Chromat.*, 1984, 307; *Biomed. Appl.*, 32, 194–199.

GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In serum: detection limit 100 pg—M. A. Moulin *et al.*, *J. Chromat.*, 1979, 178, 324–329.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or serum: haloperidol and reduced metabolite, sensitivity 1 ng/ml, electrochemical detection—E. R. Korpi *et al.*, *Clin. Chem.*, 1983, 29, 624–628.

RADIOIMMUNOASSAY. In plasma: sensitivity 400 pg/ml—F. J. Rowell *et al.*, *Clin. Chem.*, 1981, 27, 1249–1254.

Disposition in the Body. Readily absorbed after oral administration; bioavailability about 65%. Haloperidol is localised in the tissues and rapidly taken up by the brain. It is slowly excreted in the urine, about 40% of a dose being eliminated in 5 days with only about 1% of the dose as unchanged drug; about 15% of a dose is excreted in the bile. Metabolites which have been identified in urine are 4-fluorobenzoylpropionic acid and 4-fluorophenylacetic acid (the glycine conjugate of 4-fluorophenylacetic acid), both of which are inactive. Haloperidol is also metabolised by reduction of the ketone group to a secondary alcohol.

THERAPEUTIC CONCENTRATION. There is considerable intersubject variation in steady-state blood concentrations. However, for normal doses (up to 15 mg per day), the serum concentration is usually below 0.05 µg/ml.

Steady-state serum concentrations of 0.0008 to 0.033 µg/ml (mean 0.0065) were attained after daily oral administration of 1 to 14 mg (mean 6) to 34 patients (A. O. Forsman and R. Öhman, *Curr. ther. Res.*, 1977, 21, 396–411).

TOXICITY. The minimum lethal dose is probably in excess of 3 g. Toxic effects may appear with blood concentrations greater than about 0.05 µg/ml but there is considerable intersubject variation.

HALF-LIFE. Plasma half-life, 10 to 40 hours (mean 20).

VOLUME OF DISTRIBUTION. 10 to 30 litres/kg (mean 18).

CLEARANCE. Plasma clearance, 8 to 17 ml/min/kg (mean 12).

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 0.93.

PROTEIN BINDING. In plasma, about 90%.

Dose. 1 to 15 mg daily; up to 200 mg daily has been given.

Halopyramine*Antihistamine*

Synonyms. Chloropyramine; Chlortripeleennamine.

N-(4-Chlorobenzyl)-*N'*-dimethyl-*N*-(2-pyridyl)ethylenediamine

$C_{16}H_{20}ClN_3 = 289.8$

CAS—59-32-5

A yellow oil.

Halopyramine Hydrochloride

Proprietary Names. Synopen; Synpen.

$C_{16}H_{20}ClN_3 \cdot HCl = 326.3$

CAS—6170-42-9

A white powder. M.p. 172°.

Freely **soluble** in water, ethanol, and chloroform; practically insoluble in ether.

Colour Test. Cyanogen Bromide—yellow.

Thin-layer Chromatography. *System TA*—Rf 52; *system TB*—Rf 41; *system TC*—Rf 28. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 2234.

High Pressure Liquid Chromatography. *System HA*—k' 4.2.

Ultraviolet Spectrum. Aqueous acid—239 nm ($A_1^1 = 515$ a), 315 nm; aqueous alkali—248 nm, 313 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1494, 1598, 769, 1562, 1010, 1098 (KBr disk).

Mass Spectrum. Principal peaks at m/z 58, 125, 71, 72, 36, 127, 79, 219.

Dose. Halopyramine hydrochloride has been given in doses of up to 150 mg daily.

Halothane

General Anaesthetic

Synonyms. Alotano; Phthorothanum.

Proprietary Names. Fluothane; Rhodialothan; Somnothane.

2-Bromo-2-chloro-1,1,1-trifluoroethane

$CF_3 \cdot CHBrCl = 197.4$

CAS—151-67-7

A colourless, mobile, heavy, non-inflammable liquid. B.p. 49° to 51°. Refractive index, at 20°, 1.3695 to 1.3705.

Halothane contains thymol 0.01% w/w as a preservative.

Soluble 1 in 400 of water; miscible with dehydrated alcohol, chloroform, and ether.

Gas Chromatography. *System GA*—RI 533; *system GI*—retention time 8.5 min.

Mass Spectrum. Principal peaks at m/z 117, 198, 196, 119, 129, 67, 127, 98.

Quantification. GAS CHROMATOGRAPHY. In whole blood: direct injection, FID—W. J. Cole *et al.*, *Br. J. Anaesth.*, 1975, 47, 1043–1047. In blood: FID—M. K. Tham *et al.*, *Anesthesiology*, 1972, 37, 647–649. In plasma, serum or urine: trifluoroacetic acid (TFA) and bromide, detection limit, TFA 300 ng/ml in

plasma, 1 µg/ml in urine, FID—R. M. Maiorino *et al.*, *J. analyt. Toxicol.*, 1980, 4, 250–254. In blood or tissues: 2-chloro-1,1-difluoroethylene and 2-chloro-1,1,1-trifluoroethane, limit of detection 200 and 300 pg/ml, respectively, in blood, FID—R. M. Maiorino *et al.*, *J. Chromat.*, 1979, 164; *Biomed. Appl.*, 6, 63–72.

Disposition in the Body. Rapidly absorbed upon inhalation; blood:gas partition coefficient about 2.4. It accumulates in adipose tissue. About 60 to 80% of an absorbed dose is exhaled unchanged from the lungs in 24 hours and smaller amounts continue to be exhaled for several days or weeks. A variable amount is metabolised in the liver by debromination and dechlorination; replacement of a fluorine atom by a methoxy group followed by glucuronic acid conjugation occurs to a limited extent. Other metabolites which have been detected in expired air and in blood are 2-chloro-1,1,1-trifluoroethane and 2-chloro-1,1-difluoroethylene. Up to about 20% of a dose may be excreted in the urine as trifluoroacetic acid and its salts. Bromide ion is slowly excreted in the urine.

THERAPEUTIC CONCENTRATION. During surgical anaesthesia, concentrations in blood are usually in the range 22 to 84 µg/ml. Venous blood concentrations lag behind arterial concentrations during induction and decline less rapidly during recovery.

Blood concentrations ranging from 50.5 to 106.5 µg/ml were reported in 8 patients following anaesthesia with 1.5% halothane for 20 minutes. At recovery 10 minutes later the range was 22 to 30 µg/ml; traces were still detectable after 44 hours; bromide concentrations increased during the post-anaesthetic period (M. M. Atallah and I. C. Geddes, *Br. J. Anaesth.*, 1973, 45, 464–470).

Peak plasma-bromide concentrations occurred in surgical patients 2 to 3 days after anaesthesia and ranged from 52 to 180 µg/ml (J. H. Tinker *et al.*, *Anesthesiology*, 1976, 44, 194–196).

TOXICITY. The minimum lethal dose by ingestion or inhalation is about 10 ml although one case of recovery after the ingestion of 250 ml has been reported. Blood concentrations of 7 to 40 to 310 µg/ml have been associated with fatalities.

In one fatality involving the ingestion of 35 ml of halothane, the following postmortem tissue concentrations were reported: blood 650 µg/ml, brain 1560 µg/g, lung 500 µg/g, liver 880 µg/g, spleen 230 µg/g, urine 20 µg/ml; salicylate and an unidentified barbiturate were also present (J. A. E. Spencer and N. M. Green, *J. Am. med. Ass.*, 1968, 205, 702–703).

Dose. For induction of anaesthesia, 2 to 3% of the vapour by inhalation; maintenance, 0.5 to 1.5%.

Haloxon

Anthelmintic (Veterinary)

Proprietary Name. Equilox

Bis(2-chloroethyl) 3-chloro-4-methylcoumarin-7-yl phosphate

$C_{14}H_{14}Cl_3O_6P = 415.6$

CAS—321-55-1

A white powder. M.p. 88° to 93°.

Practically **insoluble** in water; soluble 1 in 9 of ethanol, 1 in 4 of acetone, and 1 in 2 of chloroform.

Ultraviolet Spectrum. After solution in dioxan and dilution with acid methanol—290 nm, 312 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1738, 1010, 1070, 1036, 1277, 1605 (KBr disk).

Halquinol

Antimicrobial

Synonyms. Chlorhydroxyquinoline; Chlorquinol.

Proprietary Names. Capitrol (chloroxine); Quixalin(e); Quixalud (vet.).

A mixture of the chlorinated products of quinolin-8-ol containing 57 to 74% of 5,7-dichloroquinolin-8-ol (chloroxine), 23 to 40% of 5-chloroquinolin-8-ol, and not more than 4% of 7-chloroquinolin-8-ol.

CAS—8067-69-4

A yellowish-white to yellowish-grey, voluminous powder.

Practically **insoluble** in water; soluble 1 in 250 of ethanol, 1 in 50 of chloroform, and 1 in 130 of ether; soluble in acids.

Colour Tests. Mandelin's Test—yellow; Marquis Test—yellow; Sulphuric Acid—yellow.

Thin-layer Chromatography. System TA—Rf 19, streaking. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 1743.

Ultraviolet Spectrum. Aqueous acid—258 nm ($A_1^1 = 2187$ a); aqueous alkali—259 nm, 343 nm; methanol—248 nm, 263 nm, 334 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1512, 1282, 812, 1200, 950, 785 (KBr disk).

Dose. 3 to 4 g daily for 5 days.

Harmaline

Hallucinogen

Synonyms. 3,4-Dihydroharmine

$C_{13}H_{14}N_2O = 214.3$

CAS—304-21-2

An alkaloid obtained from peganum, the dried seeds of *Peganum harmala* (Zygophyllaceae). It is also found, together with harmine, in the South American hallucinogenic drink 'caapi', also known as 'Yagé' and 'ayahuasca'.

M.p. 249° to 250°, with decomposition.

Slightly **soluble** in water, ethanol, and ether.

Colour Tests. Mandelin's Test—green-brown; Marquis Test—brown-green.

Thin-layer Chromatography. System TA—Rf 38. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—256 nm; aqueous alkali—330 nm; methanol—260 nm ($A_1^1 = 288$ b), 344 nm ($A_1^1 = 468$ b).

Mass Spectrum. Principal peaks at m/z 213, 214, 170, 198, 169, 115, 63, 143.

Harman

Alkaloid

Synonyms. Aribine; Harmane; Loturine.

1-Methyl-9H-pyrido[3,4-b]indole

$C_{12}H_{10}N_2 = 182.2$

CAS—486-84-0

An alkaloid present in passion flower, the dried flowering and fruiting tops of *Passiflora incarnata* (Passifloraceae).

Crystals. M.p. about 238°.

Sparingly **soluble** in hot water; soluble in ethanol, chloroform, and ether.

Note. Harman may be found in tobacco smoke and in home-made wine. It may also be found as a putrefactive base, particularly in cases where embalming has taken place. It is a condensation product of tryptophan and acetaldehyde.

Colour Tests. Mandelin's Test—green; Marquis Test—green.

Thin-layer Chromatography. System TA—Rf 70. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 1952.

Ultraviolet Spectrum. Aqueous acid—245 nm ($A_1^1 = 1987$ a), 300 nm; aqueous alkali—232 nm, 284 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 751, 1317, 1235, 1504, 1245, 1567.

Mass Spectrum. Principal peaks at m/z 182, 57, 43, 55, 40, 69, 41, 181.

Harmine

Hallucinogen

7-Methoxy-1-methyl-9*H*-pyrido[3,4-*b*]indole

$C_{13}H_{12}N_2O = 212.3$

CAS—442-51-3

An alkaloid obtained from peganum, the dried seeds of *Peganum harmala* (Zygophyllaceae). Harmine is identical with an alkaloid known as banisterine or telepathine obtained from *Banisteria caapi* (Malpighiaceae) and with the alkaloid, yageine, from *Haemadictyon amazonicum* (Apocynaceae). It is also found, together with harmaline, in the South American hallucinogenic drink 'caapi', also known as 'Yagé' and 'ayahuasca'. Crystals. M.p. 261°, with decomposition or sublimation. Slightly soluble in water, ethanol, chloroform, and ether.

Dissociation Constant. pK_a 7.6 (20°).

Colour Tests. *p*-Dimethylaminobenzaldehyde—red; Mandelin's Test—blue→green; Marquis Test—orange.

Thin-layer Chromatography. *System TA*—Rf 63; *system TB*—Rf 00; *system TC*—Rf 22. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 2291.

High Pressure Liquid Chromatography. *System HA*— k' 0.8.

Ultraviolet Spectrum. Aqueous acid—247 nm ($A_1^1 = 1927$ a), 319 nm; aqueous alkali—243 nm, 275 nm, 300 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1165, 817, 1629, 1200, 1282, 1239 (KBr disk).

Mass Spectrum. Principal peaks at m/z 212, 169, 197, 213, 106, 211, 170, 168.

Heptabarbitone

Barbiturate

Synonym. Heptabarbital (distinguish from Heptobarbitalum)

Proprietary Name. Medomin(e)

5-(Cyclohept-1-enyl)-5-ethylbarbituric acid

$C_{13}H_{18}N_2O_3 = 250.3$

CAS—509-86-4

A white crystalline powder. M.p. 167° to 171°.

Very slightly soluble in water; soluble 1 in 30 of ethanol, 1 in 20 of acetone, and 1 in 75 of chloroform; soluble in solutions of alkali hydroxides.

Dissociation Constant. pK_a 7.5 (20°).

Partition Coefficient. Log *P* (octanol/pH 7.4), 2.2.

Colour Tests. Koppanyi-Zwicker Test—violet; Mercurous Nitrate—black; Vanillin Reagent—violet-red/colourless.

Thin-layer Chromatography. *System TD*—Rf 50; *system TE*—Rf 30; *system TF*—Rf 65; *system TH*—Rf 62. (Mercuric chloride-diphenylcarbazone reagent, positive; mercurous nitrate spray, black; acidified potassium permanganate solution, yellow-brown; Zwicker's reagent, pink.)

Gas Chromatography. *System GA*—heptabarbitone RI 2058, 3'-hydroxyheptabarbitone RI 2275, 3'-oxoheptabarbitone RI 2320; *system GF*—RI 2940.

High Pressure Liquid Chromatography. *System HG*— k' 9.90; *system HH*— k' 4.93.

Ultraviolet Spectrum. Borax buffer 0.05*M* (pH 9.2)—239 nm ($A_1^1 = 413$ a); *M* sodium hydroxide (pH 13)—255 nm ($A_1^1 = 326$ b). (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 1673, 1761, 1718, 1237, 1292, 1303 (KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 221, 43, 78, 93, 80, 41, 141, 39.

Quantification. See under Amylobarbitone.

Disposition in the Body. Readily absorbed after oral administration. Less than 1% of a dose is excreted unchanged in the urine. Major metabolites which have been identified in the urine are 3'-oxoheptabarbitone and 3'-hydroxyheptabarbitone.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 1 to 4 $\mu\text{g}/\text{ml}$.

After a single oral dose of 200 mg administered to 7 subjects, peak plasma concentrations of 1.3 to 2.4 $\mu\text{g}/\text{ml}$ (mean 1.9) were attained in 1.5 to 4 hours (D. D. Breimer *et al.*, *Eur. J. clin. Pharmac.*, 1975, 9, 169-178).

TOXICITY. The estimated minimum lethal dose is 2 g. Plasma concentrations greater than about 8 $\mu\text{g}/\text{ml}$ may produce toxic effects.

HALF-LIFE. Plasma half-life, 6 to 11 hours.

VOLUME OF DISTRIBUTION. About 1 litre/kg.

NOTE. For a review of the clinical pharmacokinetics of barbiturates, see D. D. Breimer, *Clin. Pharmacokinet.*, 1977, 2, 93-109.

Dose. 150 to 400 mg daily.

Heptachlor

Insecticide

1,4,5,6,7,8,8-Heptachloro-3a,4,7,7a-tetrahydro-4,7-methanoindene

$\text{C}_{10}\text{H}_5\text{Cl}_7 = 373.3$

CAS—76-44-8

The pure substance is a white crystalline solid and the technical grade is a soft, waxy solid which contains about 72% of heptachlor and 28% of related compounds. Heptachlor may be found as an impurity in chlordane. M.p. 95° to 96° (pure substance), 46° to 74° (technical grade).

Practically **insoluble** in water; soluble 1 in 22 of ethanol.

Gas Chromatography. System GA—RI 1880; system GK—retention time 0.85 relative to caffeine.

Mass Spectrum. Principal peaks at m/z 100, 272, 274, 270, 237, 102, 65, 276.

Heptaminol

Cardiac Stimulant/Vasodilator

6-Amino-2-methylheptan-2-ol

$\text{C}_8\text{H}_{19}\text{NO} = 145.2$

CAS—372-66-7

Heptaminol Hydrochloride

Proprietary Names. Coreptil; Cortensor; Eoden; Hept-a-myl; Heptylon.

$\text{C}_8\text{H}_{19}\text{NO}\cdot\text{HCl} = 181.7$

CAS—543-15-7

A white crystalline powder.

Very **soluble** in water; soluble in ethanol; practically insoluble in acetone and ether.

Thin-layer Chromatography. System TA—Rf 23; system TB—Rf 01; system TC—Rf 02. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 1118; system GB—RI 1084.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1529, 1537, 896, 1622, 1153, 1614 (KBr disk).

Mass Spectrum. Principal peaks at m/z 44, 43, 59, 56, 69, 55, 41, 113.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: sensitivity 100 ng/ml in plasma, fluorescence detection—R. R. Brodie *et al.*, *J. Chromat.*, 1983, 274; *Biomed. Appl.*, 25, 179–186.

Dose. Heptaminol hydrochloride has been given in doses of 0.3 to 1.6 g daily.

Heteronium Bromide

Anticholinergic

1,1-Dimethyl-3-(α -2-thienylmandeloyloxy)pyrrolidinium bromide

$C_{18}H_{22}BrNO_3S = 412.3$

CAS—7247-57-6

A white crystalline powder. M.p. 182° to 184°.

Very **soluble** in water and ethanol.

Thin-layer Chromatography. System TA—Rf 03. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—234 nm ($A_1^1 = 235$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1735, 1219, 1085, 1234, 1063, 700.

Hexachlorophane

Disinfectant

Synonym. Hexachlorophene

Proprietary Names. Hexaphenyl; Phaisohex; Phisocrub; Ster-Zac. It is an ingredient of Anacal.

2,2'-Methylenebis(3,4,6-trichlorophenol)

$C_{13}H_6Cl_6O_2 = 406.9$

CAS—70-30-4

A white or pale buff, crystalline powder. M.p. 161° to 167°.

Practically **insoluble** in water; soluble 1 in 3.5 of ethanol, 1 in less than 1 of acetone, and 1 in less than 1 of ether; soluble in chloroform, possibly with turbidity.

Dissociation Constant. pK_a 5.7.

Colour Tests. Ferric Chloride—violet (transient); Fuming Nitric Acid—orange-red/orange/orange-brown.

Gas Chromatography. System GA—RI 2807.

Ultraviolet Spectrum. Ethanol—299 nm ($A_1^1 = 155$ a); aqueous alkali—249 nm ($A_1^1 = 400$ b), 320 nm ($A_1^1 = 312$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1276, 1182, 737, 1139, 960, 1213 (KBr disk).

Quantification. GAS CHROMATOGRAPHY. In blood: ECD—W. Dodson *et al.*, *Clin. Chem.*, 1977, 23, 944–947. In blood or urine: ECD—R. S. Browning *et al.*, *J. pharm. Sci.*, 1968, 57, 2165–2166.

Disposition in the Body. Absorbed after oral administration and through the skin. Percutaneous absorption may be significant in premature infants and through damaged skin. After topical application, up to about 10% may be excreted in the urine over a period of 4 to 5 days.

BLOOD CONCENTRATION.

Cord-blood concentrations of 0.003 to 0.18 $\mu\text{g/ml}$ (mean 0.02) were reported in 50 neonates at birth. After washing once daily for 1 to 11 days with a 3% solution of hexachlorophane diluted with 50 to 100 ml of water, whole blood concentrations of 0.009 to 0.65 $\mu\text{g/ml}$ (mean 0.11) were attained (A. Curley *et al.*, *Lancet*, 1971, 2, 296–297).

After whole-body washing with 30 ml of a 3% skin-cleansing product once daily, blood concentrations in 36 adults reached a plateau of about

0.6 µg/ml after 3 to 5 weeks and decreased to about 0.3 to 0.4 µg/ml after 7 to 8 weeks (B. Calesnick *et al.*, *Toxic. appl. Pharmac.*, 1975, 32, 204–211).

TOXICITY. The estimated minimum lethal dose is 5 g. A number of deaths have occurred after accidental ingestion and also after chronic application for the treatment of burns. Repeated exposure of neonates and infants to high concentrations of hexachlorophane has been associated with spongy lesions of the brain. Fatalities have been associated with blood concentrations greater than 2 µg/ml although recovery has occurred after development of plasma concentrations up to 90 µg/ml.

In an epidemic of percutaneous poisoning which occurred in 1972 in infants and children due to exposure to a talcum powder accidentally contaminated with 6% of hexachlorophane, 36 children died. An antemortem serum concentration of 1.15 µg/ml was reported in 1 child and the following postmortem tissue concentrations were reported: brain 1 to 149 µg/g (mean 21, 23 cases), kidney 17 to 43 µg/g (mean 26, 4 cases), liver 12.5 to 1080 µg/g (mean 133, 25 cases), lung 10 to 67 µg/g (mean 30, 17 cases), and skin 1 to 392 µg/g (mean 52, 30 cases) (G. Martin-Bouyer *et al.*, *Lancet*, 1982, 1, 91–95).

Use. In soaps and creams at a concentration of 0.25 to 3%.

Hexamethonium Bromide

Antihypertensive

Synonyms. Hexamethone Bromide; Hexonium Bromide.
NN'-Hexamethylenebis(trimethylammonium) dibromide
 $C_{12}H_{30}Br_2N_2 = 362.2$
CAS—60-26-4 (hexamethonium); 55-97-0 (dibromide)

A white or creamy-white hygroscopic powder. M.p. about 280°, with decomposition.

Soluble 1 in less than 1 of water and 1 in 60 of ethanol; practically insoluble in chloroform and ether.

Hexamethonium Iodide

Synonym. Hexonium Iodide
Proprietary Name. Gastrometionio
 $C_{12}H_{30}I_2N_2 = 456.2$
CAS—870-62-2

A white, slightly hygroscopic, crystalline powder.

Soluble 1 in 2 of water; practically insoluble in ethanol.

Thin-layer Chromatography. *System TA*—Rf 00; *system TN*—Rf 36; *system TO*—Rf 10. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 913, 970, 1630, 945, 1063, 1000 (KBr disk).

Dose. Hexamethonium bromide has been given parenterally in doses of up to 500 mg daily.

Hexamine

Antibacterial (Urinary)

Synonyms. Aminoform; Esamina; Formine; Hexamethylenamine; Hexamethylenetetramine; Methenamine; Urotropine.

Proprietary Names. Antihydral; Urotropina.

1,3,5,7-Tetra-azatricyclo[3.3.1.1^{3,7}]decane

$C_6H_{12}N_4 = 140.2$

CAS—100-97-0

Colourless lustrous crystals or white crystalline powder. It sublimes at about 260° without melting.

Soluble 1 in 1.5 of water, 1 in 8 of ethanol (90%), 1 in 12 of chloroform, and 1 in 320 of ether.

Hexamine Hippurate

Synonym. Methenamine Hippurate

Proprietary Names. Hiprex; Urex.

$C_6H_{12}N_4 \cdot C_9H_9NO_3 = 319.4$

CAS—5714-73-8

A white crystalline powder. M.p. 105° to 110°.

Soluble in water and ethanol.

Hexamine Mandelate

Synonym. Methenamine Mandelate

Proprietary Names. Mandaze; Mandelamine; Methandine; Renelate; Sterine. It is an ingredient of G-500.

$C_6H_{12}N_4 \cdot C_8H_8O_3 = 292.3$

CAS—587-23-5

A white crystalline powder. M.p. about 127°, with decomposition.

Very soluble in water; soluble 1 in 10 of ethanol, 1 in 20 of chloroform, and 1 in 350 of ether.

Colour Test. Mix 100 mg with an equal amount of salicylic acid and heat with 1 ml of sulphuric acid—a red colour is produced.

Thin-layer Chromatography. *System TA*—Rf 30; *system TB*—Rf 04; *system TC*—Rf 13. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 1210.

Ultraviolet Spectrum. Aqueous acid—251 nm, 257 nm ($A_1^1 = 15.5$ b), 263 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1232, 812, 671, 1010, 1044, 724 (Nujol mull).

Mass Spectrum. Principal peaks at m/z 42, 140, 112, 41, 85, 43, 71, 141.

Quantification. **COLORIMETRY.** In urine: hexamine and formaldehyde, sensitivity 25 µg/ml for hexamine, 5 µg/ml for formaldehyde—R. Gollamudi *et al.*, *Biopharm. Drug Disp.*, 1979, 1, 27–36.

GAS CHROMATOGRAPHY. In serum or urine: sensitivity <5 µg/ml in serum—A.-L. Nieminen *et al.*, *J. Chromat.*, 1980, 181; *Biomed. Appl.*, 7, 11–16.

Disposition in the Body. Readily absorbed after oral administration and rapidly excreted unchanged in the urine. In acidic urine it is slowly hydrolysed, with the liberation of formaldehyde; this may also occur in the acid gastric secretions and 10 to 30% of a dose may be hydrolysed in the stomach.

Dose. Usually 2 g of hexamine hippurate or 4 g of hexamine mandelate daily.

Hexethal

Barbiturate

5-Ethyl-5-hexylbarbituric acid

$C_{12}H_{20}N_2O_3 = 240.3$

CAS—77-30-5

Hexethal Sodium

$C_{12}H_{19}N_2NaO_3 = 262.3$

CAS—144-00-3

A white or slightly yellowish powder.

Very **soluble** in water; soluble in ethanol; practically insoluble in ether. Aqueous solutions are unstable and decompose on standing.

Thin-layer Chromatography. System TD—Rf 53; system TE—Rf 44; system TF—Rf 67; system TH—Rf 74.

Gas Chromatography. System GA—RI 1858.

High Pressure Liquid Chromatography. System HG—k' 34.28; system HH—k' 20.39.

Ultraviolet Spectrum. Borax buffer 0.05M (pH 9.2)—238 nm ($A_1^1 = 423$ b); M sodium hydroxide (pH 13)—253 nm ($A_1^1 = 323$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1698, 1720, 1757, 1316, 1230, 850 (hexethal sodium).

Wavelength

Mass Spectrum. Principal peaks at m/z 156, 141, 55, 41, 157, 43, 98, 39.

Hexetidine

Antimicrobial

Proprietary Names. Collu-Hextril; Glypesin; Hexoral; Hextril; Oraldene; Steri/Sol.

5-Amino-1,3-bis(2-ethylhexyl)perhydro-5-methylpyrimidine

$C_{21}H_{45}N_3 = 339.6$

CAS—141-94-6

A viscous oil. Wt per ml about 0.87 g. Refractive index 1.466. Practically **insoluble** in water; miscible with ethanol, acetone, and chloroform.

Dissociation Constant. pK_a 8.3.

Thin-layer Chromatography. System TA—Rf 70. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2093.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1093, 854, 1300, 910, 1176, 1234 (thin film).

Mass Spectrum. Principal peaks at m/z 142, 57, 42, 197, 185, 339, 240, 226.

Use. As a 0.1% solution.

Hexobarbitone*Barbiturate*

Synonyms. Ciclobarbitol; Enhexymalum; Enimal; Hexobarbital; Methexenyl; Methyl-cyclohexenylmethyl-barbitursäure; Methylhexabarbitol.

Proprietary Names. Noctivane; Sombulex. It is an ingredient of Evidorm.

5-(Cyclohex-1-enyl)-1,5-dimethylbarbituric acid

$C_{12}H_{16}N_2O_3 = 236.3$

CAS—56-29-1

Colourless crystals or a white crystalline powder. M.p. 144° to 148°.

Very slightly **soluble** in water; soluble 1 in 45 of ethanol, 1 in 4 of chloroform, and 1 in 80 of ether; soluble in acetone and methanol.

Hexobarbitone Sodium

Synonyms. Enhexymalnatium; Hexenalum; Narcosolum Solubile; Sodium Hexobarbital; Soluble Hexobarbitone.

Proprietary Name. Evipan-Natrium

$C_{12}H_{15}N_2NaO_3 = 258.3$

CAS—50-09-9

A white, very hygroscopic powder. It discolours on exposure to air.

Very **soluble** in water, ethanol, acetone, and methanol; soluble in chloroform; very slightly soluble in ether. A solution in water slowly decomposes.

Dissociation Constant. pK_a 8.2 (20°).

Colour Tests. Koppanyi-Zwicker Test—violet; Mercurous Nitrate—black; Vanillin Reagent—brown/violet.

Thin-layer Chromatography. *System TD*—Rf 65; *system TE*—Rf 48; *system TF*—Rf 65; *system TH*—Rf 85. (Mercuric chloride–diphenylcarbazone reagent, positive; mercurous nitrate spray, black; acidified potassium permanganate solution, yellow-brown on violet.)

Gas Chromatography. *System GA*—RI 1857; *system GF*—RI 2380.

High Pressure Liquid Chromatography. *System HG*— k' 7.37; *system HH*— k' 5.67.

Ultraviolet Spectrum. Borax buffer 0.05M (pH 9.2)—243 nm ($A_1^1 = 331$ a); M sodium hydroxide (pH 13)—243 nm ($A_1^1 = 301$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1720, 1665, 1748, 1200, 1275, 1045 (KBr disk).

Mass Spectrum. Principal peaks at m/z 221, 81, 157, 80, 79, 155, 41, 77; 3'-oxohexobarbitone 250, 95, 39, 235, 66, 207, 41, 193.

Quantification. See under Amylobarbitone.

Disposition in the Body. Readily absorbed after oral administration. The sodium salt has a very short duration of action and is usually administered intravenously. Hexobarbitone is inactivated in the liver by *N*-demethylation and oxidation. About 32% of a dose is excreted in the urine in 24 hours as 3'-oxohexobarbitone, 5% as 3'-hydroxyhexobarbitone, and 18% as

1,5-dimethylbarbituric acid; less than 1% of a dose is excreted unchanged in the urine in 24 hours.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 1 to 5 µg/ml.

Following a single oral dose of 500 mg to 6 subjects, peak plasma concentrations of 4.9 to 10.9 µg/ml (mean 7) were attained in about 1 hour (N. P. E. Vermeulen *et al.*, *Br. J. clin. Pharmac.*, 1983, 15, 459–464).

TOXICITY. The estimated minimum lethal dose is 2 g. Plasma concentrations greater than about 8 µg/ml may produce toxic effects.

HALF-LIFE. Plasma half-life, 3 to 7 hours.

VOLUME OF DISTRIBUTION. About 1 litre/kg.

CLEARANCE. Plasma clearance, about 3.5 ml/min/kg.

PROTEIN BINDING. In plasma, 42 to 52%.

NOTE. For a review of the pharmacokinetics of barbiturates see D. D. Breimer, *Clin. Pharmacokinet.*, 1977, 2, 93–109.

Dose. 250 to 500 mg, as a hypnotic; up to 750 mg daily, as a sedative.

Hexobendine*Anti-anginal Vasodilator**NN'*-Ethylenebis(3-methylaminopropyl 3,4,5-trimethoxybenzoate) $C_{30}H_{44}N_2O_{10} = 592.7$

CAS—54-03-5

M.p. 75° to 77°.

Hexobendine Hydrochloride*Proprietary Names.* Reoxyl; Ustimon. $C_{30}H_{44}N_2O_{10} \cdot 2HCl = 665.6$

CAS—50-62-4

A white crystalline powder. M.p. 170° to 174°.

Soluble in water and chloroform; slightly soluble in ethanol; practically insoluble in ether.**Colour Tests.** Liebermann's Test—black; Mandelin's Test—violet.**Thin-layer Chromatography.** *System TA*—Rf 47; *system TB*—Rf 10; *system TC*—Rf 44. (*Acidified iodoplatinate solution*, positive.)**Gas Chromatography.** *System GA*—not eluted.**Ultraviolet Spectrum.** Aqueous acid—265 nm ($A_1^1 = 311$ a).**Infra-red Spectrum.** Principal peaks at wavenumbers 1123, 1219, 1703, 1585, 1497, 1171 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 296, 195, 58, 297, 253, 196, 212, 84.**Dose.** Hexobendine hydrochloride has been given in doses of 60 to 180 mg daily.**Hexocyclium Methylsulphate***Anticholinergic**Proprietary Names.* Tral; Traline.4-(β -Cyclohexyl- β -hydroxyphenethyl)-1,1-dimethylpiperazinium methylsulphate $C_{20}H_{33}N_2O \cdot CH_3SO_4 = 428.6$

CAS—6004-98-4 (hexocyclium); 115-63-9 (methylsulphate)

A white powder. M.p. 200° to 210°.

Soluble 1 in 2 of water; slightly soluble in chloroform; practically insoluble in ether.**Colour Tests.** Mandelin's Test—blue-violet; Marquis Test—violet.**Thin-layer Chromatography.** *System TA*—Rf 02. (*Acidified iodoplatinate solution*, positive.)**Ultraviolet Spectrum.** Aqueous acid—252 nm, 257 nm ($A_1^1 = 5.3$ b), 264 nm.**Infra-red Spectrum.** Principal peaks at wavenumbers 1224, 1005, 748, 1052, 700, 770 (KBr disk).**Dose.** Initially, 100 mg daily.**Hexoestrol***Oestrogen**Synonyms.* Dihydrostilboestrol; Hexanoestrol; Hexestrol; Synestrol; Synoestrol.*Proprietary Names.* Cycloestrol; Hormoestrol (tablets).*meso*-4,4'-(1,2-Diethylethylene)diphenol $C_{18}H_{22}O_2 = 270.4$ CAS—5635-50-7; 84-16-2 (*meso*)

Colourless crystals or white crystalline powder. M.p. 185° to 188°.

Very slightly **soluble** in water; soluble in ethanol, acetone, and ether; slightly soluble in chloroform.**Hexoestrol Dipropionate***Proprietary Names.* Hormoestrol (injection); Neoestrol. $C_{24}H_{30}O_4 = 382.5$

CAS—4825-53-0

A white crystalline powder. M.p. 127° to 128°.

Sparingly **soluble** in water; soluble in warm ethanol and ether.**Gas Chromatography.** *System GA*—RI 2402.**Ultraviolet Spectrum.** Ethanol—230 nm ($A_1^1 = 775$ b), 280 nm ($A_1^1 = 135$ a); aqueous alkali—242 nm ($A_1^1 = 965$ b), 297 nm ($A_1^1 = 175$ b). (See below)**Infra-red Spectrum.** Principal peaks at wavenumbers 1175, 1523, 1220, 840, 857, 1615 (KBr disk).**Dose.** Hexoestrol has been given in doses of 1 to 5 mg daily.

Hexoprenaline

Sympathomimetic

NN' - Hexamethylenebis[4 - (2 - amino - 1 - hydroxyethyl)-pyrocatechol]

$C_{22}H_{32}N_2O_6 = 420.5$

CAS—3215-70-1

Hexoprenaline Hydrochloride

Proprietary Name. Ipradol

$C_{22}H_{32}N_2O_6 \cdot 2HCl = 493.4$

CAS—4323-43-7

Crystals. M.p. 197° to 198°.

Hexoprenaline Sulphate

Proprietary Names. Etoscol; Ipradol.

$C_{22}H_{32}N_2O_6 \cdot H_2SO_4 = 518.6$

CAS—32266-10-7

A white crystalline powder. M.p. 214°, with decomposition.

Soluble in water and dilute hydrochloric acid; practically insoluble in ethanol.

Colour Tests. Ammoniacal Silver Nitrate—red → brown → black/—; Ferric Chloride—orange; Folin-Ciocalteu Reagent—blue; Mandelin's Test—orange-yellow; Marquis Test—red; Methanolic Potassium Hydroxide—orange → brown; Nessler's Reagent—black; Potassium Dichromate (Method 1)—green → brown (30 s); Sulphuric Acid—orange-yellow.

Thin-layer Chromatography. *System TA*—Rf 03; *system TB*—Rf 01; *system TC*—Rf 00. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—280 nm ($A_1^1 = 129$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1102, 1242, 1190, 1605, 1517, 1280 (hexoprenaline sulphate, KBr disk).

Mass Spectrum. Principal peaks at m/z 30, 27, 124, 56, 123, 87, 78, 41.

Dose. Hexoprenaline sulphate has been given in doses of 0.75 to 1.5 mg daily.

Hexyl Nicotinate

Topical Vasodilator

Proprietary Name. It is an ingredient of Transvasin.

n-Hexyl nicotinate

$C_{12}H_{17}NO_2 = 207.3$

CAS—23597-82-2

A pale yellow liquid.

Practically **insoluble** in water; soluble in ethanol, chloroform, and methanol.

Thin-layer Chromatography. System TA—Rf 70. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—260 nm ($A_1^1 = 268$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1724, 1276, 1111, 741, 1022, 1590 (KBr disk).

Use. Typically in a concentration of 2%.

Hexylcaine

Local Anaesthetic

2-Cyclohexylamino-1-methylethyl benzoate

$C_{16}H_{23}NO_2 = 261.4$

CAS—532-77-4

Hexylcaine Hydrochloride

Proprietary Name. Cyclaine

$C_{16}H_{23}NO_2 \cdot HCl = 297.8$

CAS—532-76-3

A white powder. M.p. 182° to 184°.

Soluble 1 in 17 of water; freely soluble in ethanol and chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 9.1.

Thin-layer Chromatography. System TA—Rf 01. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 1965.

Ultraviolet Spectrum. Aqueous acid—232 nm ($A_1^1 = 485$ a), 275 nm ($A_1^1 = 43$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1270, 1718, 1105, 710, 1068, 1022 (KBr disk).

Mass Spectrum. Principal peaks at m/z 112, 77, 105, 139, 55, 41, 96, 56.

Use. Hexylcaine hydrochloride has been used in concentrations of up to 5%.

Hexylresorcinol

Anthelmintic

Proprietary Name. Oxana

4-Hexylbenzene-1,3-diol

$C_{12}H_{18}O_2 = 194.3$

CAS—136-77-6

White or yellowish-white acicular crystals, crystalline plates or crystalline powder. It acquires a brownish-pink tint on exposure to light and air. M.p. 62° to 68°.

Soluble 1 in 2000 of water; freely soluble in ethanol, chloroform, and ether.

Caution. Hexylresorcinol is irritating to the oral mucosa, to the respiratory tract, and to the skin; ethanolic solutions have vesicant properties.

Colour Test. Ferric Chloride—green.

Gas Chromatography. System GA—RI 1777.

Ultraviolet Spectrum. Methanol—282 nm ($A_1^1 = 160$ c).

Infra-red Spectrum. Principal peaks at wavenumbers 970, 980, 1185, 1616, 1150, 1205 (KBr disk).

Disposition in the Body. Partly absorbed after oral administration. About 20 to 30% of a dose is rapidly excreted unchanged in the urine and the remainder is eliminated in the faeces.

Dose. 1 g as a single dose.

Histamine

Diagnostic Agent (Gastric Secretion)

Synonym. Ergotidine

2-(Imidazol-4-yl)ethylamine

$C_5H_9N_3 = 111.1$

CAS—51-45-6

Deliquescent acicular crystals. M.p. 83° to 84°.

Freely **soluble** in water, ethanol, and hot chloroform; sparingly soluble in ether.

Histamine Acid Phosphate

Synonyms. Histamine Diphosphate; Histamine Phosphate.

Proprietary Names. It is an ingredient of Akrotherm and Cremathurm.

$C_5H_9N_3 \cdot 2H_3PO_4 = 307.1$

CAS—51-74-1

Colourless crystals. M.p. 130° to 133°.

Soluble 1 in 4 of water; slightly soluble in ethanol; practically insoluble in ether.

Histamine Hydrochloride

Synonym. Histamine Dihydrochloride

$C_5H_9N_3 \cdot 2HCl = 184.1$

CAS—56-92-8

Hygroscopic colourless crystals or white crystalline powder. M.p. about 245°, with decomposition.

Very **soluble** in water; soluble in ethanol and acetone; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 5.9, 9.7 (25°).

Thin-layer Chromatography. *System TA*—Rf 13. (*Acidified iodoplatinate solution*, positive.)

Gas Chromatography. *System GA*—RI 1497.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 840, 1622, 1522, 1084, 802, 1577 (histamine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 82, 30, 81, 54, 28, 55, 83, 41.

Dose. Histamine acid phosphate is given subcutaneously, in a dose of 40 µg/kg, following administration of a large dose of an antihistamine.

Histapyrrodine

Antihistamine

N-Benzyl-*N*-phenyl-2-(pyrrolidin-1-yl)ethylamine

$C_{19}H_{24}N_2 = 280.4$

CAS—493-80-1

An oil.

Histapyrrodine Hydrochloride

Proprietary Name. Domistan

$C_{19}H_{24}N_2 \cdot HCl = 316.9$

CAS—6113-17-3

A white powder. M.p. 196°.

Colour Test. Mandelin's Test—red-violet.

Thin-layer Chromatography. *System TA*—Rf 60. (*Acidified iodoplatinate solution*, positive.)

High Pressure Liquid Chromatography. *System HA*— k' 3.0.

Ultraviolet Spectrum. Aqueous acid—250 nm ($A_1^1 = 141$ a), 295 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1513, 1604, 750, 698, 1500, 732.

Dose. Histapyrrodine hydrochloride has been given in doses of 50 to 150 mg daily.

Homatropine

Anticholinergic

(1*R*,3*r*,5*S*)-Tropan-3-yl (±)-mandelate

$C_{16}H_{21}NO_3 = 275.3$

CAS—87-00-3

Small white prismatic crystals or coarse crystalline powder. M.p. 99° to 100°.

Practically **insoluble** in water; soluble in ethanol, chloroform, and ether.

Homatropine Hydrobromide

Synonym. Tropyl Mandelate Hydrobromide

Proprietary Name. Homat

$C_{16}H_{21}NO_3 \cdot HBr = 356.3$

CAS—51-56-9

Colourless crystals or a white crystalline powder. M.p. 214° to 217°, with decomposition.

Soluble 1 in 6 of water, 1 in 60 of ethanol, and 1 in 420 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 9.9 (20°).

Thin-layer Chromatography. *System TA*—Rf 01; *system TB*—Rf 01; *system TC*—Rf 01. (*Acidified iodoplatinate solution*, positive.)

Gas Chromatography. *System GA*—RI 2072.

High Pressure Liquid Chromatography. *System HA*— k' 4.2 (tailing peak).

Ultraviolet Spectrum. Aqueous acid—252 nm, 258 nm ($A_1^1 = 7.3$ a), 264 nm. No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1730, 1172, 1030, 735, 1063, 1125 (KBr disk).

Mass Spectrum. Principal peaks at m/z 124, 107, 82, 83, 42, 77, 79, 94.

Use. Homatropine hydrobromide is used as a 2% ophthalmic solution.

Homatropine Methobromide

Anticholinergic

Synonyms. Homatropine Methylbromide; Methylhomatropinium Bromide.

Proprietary Names. Homapin; Mesopin; Novatrin.

(1*R*,3*r*,5*S*)-3-[(+)-Mandeloyloxy]-8-methyltropanium bromide

$C_{16}H_{21}NO_3 \cdot CH_3Br = 370.3$

CAS—80-49-9

A white powder. M.p. about 190°.

Very **soluble** in water; freely soluble in ethanol; practically insoluble in acetone and ether.

Thin-layer Chromatography. System TA—Rf 02. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—252 nm, 258 nm ($A_1^1 = 5.8$ b), 264 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1724, 1179, 1160, 1195, 1044, 935 (KBr disk).

Dose. Usually 12 to 40 mg daily.

Homidium Bromide

Trypanocide (Veterinary)

Synonym. Ethidium Bromide

3,8-Diamino-5-ethyl-6-phenylphenanthridinium bromide

$C_{21}H_{20}BrN_3 = 394.3$

CAS—1239-45-8

A dark purple crystalline or amorphous powder. M.p. 245°, with decomposition.

Soluble 1 in 20 of water and 1 in 750 of chloroform.

Colour Test. The following test is performed on homidium nitrate (see page 128): Mandelin's Test—yellow.

Thin-layer Chromatography. System TA—Rf 55. (Acidified potassium permanganate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—242 nm, 283 nm ($A_1^1 = 785$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1628, 1492, 1260, 1312, 836, 1077 (KBr disk).

Homochlorcyclizine

Antihistamine

1-(4-Chlorobenzhydryl)perhydro-4-methyl-1,4-diazepine

$C_{19}H_{23}ClN_2 = 314.9$

CAS—848-53-3

A white crystalline powder.

Soluble in dilute acetic acid.

Thin-layer Chromatography. System TA—Rf 28. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—233 nm ($A_1^1 = 457$ b), 258 nm, 263 nm, 270 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1135, 1010, 1600, 1618, 1630, 720 (KBr disk).

Dose. Homochlorcyclizine has been given in doses of 30 to 60 mg daily.

Hordenine

Sympathomimetic

4-(2-Dimethylaminoethyl)phenol

$C_{10}H_{15}NO = 165.2$

CAS—539-15-1

Hordenine occurs naturally in germinating barley and other Gramineae. Crystals. M.p. 117° to 118°. Slightly soluble in water; very soluble in ethanol, chloroform, and ether.

Hordenine Sulphate

(C₁₀H₁₅NO)₂·H₂SO₄·2H₂O = 464.6

CAS—622-64-0 (anhydrous); 6202-17-1 (dihydrate)

Crystals. M.p. 197°, and 210° after drying at 100°.

Soluble in water; slightly soluble in ethanol; practically insoluble in ether.

Colour Tests. Mandelin's Test—grey-green; Marquis Test—brown→green.

Thin-layer Chromatography. System TA—Rf 40; system TB—Rf 05; system TC—Rf 06. (Acidified potassium permanganate solution, positive.)

High Pressure Liquid Chromatography. System HB—k' 2.00.

Ultraviolet Spectrum. Aqueous acid—274 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1252, 1512, 820, 1612, 1270, 869 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 58, 42, 59, 30, 77, 107, 57, 51.

Hydralazine

Antihypertensive

Synonym. Hydrallazine

1-Hydrazinophthalazine

C₈H₈N₄ = 160.2

CAS—86-54-4

Yellow crystals. M.p. 172° to 173°.

Hydralazine Hydrochloride

Synonym. Apressinum

Proprietary Names. Apresolin(e); Dralzine.

C₈H₈N₄·HCl = 196.6

CAS—304-20-1

A white crystalline powder. M.p. about 275°, with decomposition.

Soluble 1 in 25 of water and 1 in 500 of ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 0.5, 7.1.

Colour Test. Nessler's Reagent—black.

Thin-layer Chromatography. System TA—Rf 51; system TB—Rf 38; system TC—Rf 11. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 1528.

Ultraviolet Spectrum. Water—240 nm (A₁¹ = 675 a), 260 nm (A₁¹ = 675 a), 304 nm, 315 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1665, 790, 1582, 1000, 810, 1175 (hydralazine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at *m/z* 160, 103, 89, 131, 115, 76, 161, 104.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: limit of detection 1 ng/ml for hydralazine and 200 pg/ml for hydralazine pyruvic acid hydrazone, fluorescence detection—P. A. Reece *et al.*, *J. Chromat.*, 1980, 181; *Biomed. Appl.*, 7, 427–440. In blood: sensitivity 1 ng/ml, UV detection—T. M. Ludden *et al.*, *J. pharm. Sci.*, 1983, 72, 693–695.

NOTE. Spectrophotometric and gas chromatographic assays have been shown to be non-selective due to interference from acid-labile hydrazones—see P. A. Reece *et al.*, *J. pharm. Sci.*, 1978, 67, 1150–1153 and T. M. Ludden *et al.*, *Clin. Pharmacokin.*, 1982, 7, 185–205.

Disposition in the Body. Readily absorbed after oral administration. It undergoes first-pass acetylation, the extent of which is genetically determined; bioavailability 30 to 35% in slow acetylators, 10 to 16% in rapid acetylators. The major metabolites are: 3-methyl-1,2,4-triazolo[3,4-*a*]phthalazine (MTP—the acetylation product); hydralazine pyruvic acid hydrazone (HPH) which is the major plasma metabolite; 4-(2-acetylhydrazino)phthalazin-1-one (*N*-AcHPZ) which is the major urinary metabolite; 3-hydroxymethyl-1,2,4-triazolo[3,4-*a*]phthalazine (3-OHMTP). About 65% of a dose is excreted in the urine in 24 hours. In rapid acetylators, about 30% is excreted as *N*-AcHPZ and 10 to 30% as conjugated 3-OHMTP; in slow acetylators, about 15 to 20% is excreted as *N*-AcHPZ and up to 10% as conjugated 3-OHMTP. Other metabolites include phthalazin-1-one (PZ), 1,2,4-triazolo[3,4-*a*]phthalazine (TP), 9-hydroxy-MTP, phthalazine, tetrazolo[5,1-*a*]phthalazine, and hydrazones of hydralazine formed with acetone and α-ketoglutaric acid. About 10% of a dose is eliminated in the faeces.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 1 mg/kg to 4 rapid acetylators, a mean peak plasma-hydralazine concentration of 0.05 μg/ml was attained in 0.4 hour and a mean peak plasma-HPH concentration of 0.26 μg/ml was attained in 0.6 hour; after the same dose was given to 4 slow acetylators the corresponding peak plasma concentrations were 0.17 μg/ml of hydralazine and 0.54 μg/ml of HPH in 0.3 hour and 1 hour respectively (A. Shepherd *et al.*, *Clin. Pharmac. Ther.*, 1980, 28, 804–811).

HALF-LIFE. Plasma half-life, hydralazine 0.4 to 2 hours, HPH about 4 hours, MTP about 1.5 to 2 hours.

VOLUME OF DISTRIBUTION. About 3 to 8 litres/kg.

NOTE. For a review of the pharmacokinetics of hydralazine see T. M. Ludden *et al.*, *Clin. Pharmacokinet.*, 1982, 7, 185-205.

Dose. 50 to 200 mg of hydralazine hydrochloride daily.

Hydrastine

Alkaloid

6,7-Dimethoxy-3-(5,6,7,8-tetrahydro-6-methyl-1,3-dioxolo-[4,5-g]isoquinolin-5-yl)isobenzofuran-1(3H)-one
 $C_{21}H_{21}NO_6 = 383.4$
 CAS—118-08-1

An alkaloid obtained from hydrastis, the dried rhizome and roots of golden seal, *Hydrastis canadensis* (Ranunculaceae). Crystals. M.p. 132°.

Practically **insoluble** in water; soluble 1 in 210 of ethanol, 1 in 1 of chloroform, and 1 in 245 of ether.

Hydrastine Hydrochloride

$C_{21}H_{21}NO_6 \cdot HCl = 419.9$

CAS—5936-28-7

A white or creamy-white hygroscopic powder. M.p. about 116°.

Soluble in water and ethanol; slightly soluble in chloroform.

Dissociation Constant. pK_a 6.2 (25°).

Colour Tests. Liebermann's Test—green; Mandelin's Test—red-brown → red.

Thin-layer Chromatography. System TA—Rf 61. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2988.

Ultraviolet Spectrum. Aqueous acid—294 nm ($A_1^1 = 195$ b); aqueous alkali—292 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1760, 1501, 1037, 1260, 1020, 1111 (KBr disk).

Dose. Hydrastine hydrochloride was formerly given in doses of 15 to 60 mg.

Hydrastinine

Alkaloid

5,6,7,8-Tetrahydro-6-methyl-1,3-dioxolo[4,5-g]isoquinolin-5-ol
 $C_{11}H_{13}NO_3 = 207.2$
 CAS—6592-85-4

An alkaloid produced by oxidation of hydrastine.

A white crystalline substance. M.p. 117°.

Slightly **soluble** in hot water; soluble in ethanol, chloroform, and ether.

Hydrastinine Hydrochloride

$C_{11}H_{13}NO_3 \cdot HCl = 225.7$

CAS—4884-68-8

Pale yellow crystals or crystalline powder. M.p. 212°, with decomposition. Very **soluble** in water and ethanol; sparingly soluble in chloroform and ether. Solutions in water show a blue fluorescence.

Colour Test. Mandelin's Test—orange → green.

Thin-layer Chromatography. System TA—Rf 00. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 1590.

Ultraviolet Spectrum. Aqueous acid—249 nm, 306 nm, 363 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1235, 1032, 1499, 925, 1075, 934 (KBr disk).

Dose. Hydrastinine hydrochloride was formerly given in doses of 15 to 60 mg.

Hydrochlorothiazide

Diuretic

Synonym. Chlorosulthiadil

Proprietary Names. Chlorzide; Delco-Retic; Dichlotride; Diurema; Diucen-H; Diuchlor H; Esidrex; Esidrix; Hydro-Aquil; HydroDIURIL; HydroSaluric; Hydro-Z; Hydrozide; Jen-Diril; Loxor; Loqua; Mictrin; Natrimax; Neo-Codema; Novohydrazide; Oretic; Ro-Hydrazide; Thiuretic; Urozide. It is an ingredient of Aldoril, Amilco, Co-Betaloc, Dyazide, Dytenzide, Esimil, Hydromet, Hydropses, Moducuren, Moduretic, Secadrex, Sotazide, and Tolerzide.

6-Chloro-3,4-dihydro-2H-1,2,4-benzothiadiazine-7-sulphonamide 1,1-dioxide

$C_7H_8ClN_3O_4S_2 = 297.7$

CAS—58-93-5

A white crystalline powder. M.p. about 268°, with decomposition.

Practically **insoluble** in water, chloroform, and ether; soluble 1 in 200 of ethanol and 1 in 20 of acetone; freely soluble in dimethylformamide and solutions of alkali hydroxides.

Dissociation Constant. pK_a 7.0, 9.2.

Colour Tests. Chromotropic Acid—violet, after dilution; Koppanyi–Zwicker Test—violet; Liebermann's Test—blue-green.

Thin-layer Chromatography. System TD—Rf 0.4; system TE—Rf 0.34; system TF—Rf 0.39. (Mercuric chloride–diphenylcarbazone reagent, positive.)

Gas Chromatography. System GA—not eluted.

High Pressure Liquid Chromatography. System HN— k' 0.70.

Ultraviolet Spectrum. Aqueous acid—272 nm ($A_1^1 = 644$ a), 318 nm; aqueous alkali—274 nm ($A_1^1 = 520$ a), 324 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1318, 1180, 1150, 1168, 1602, 1060 (KBr disk).

Mass Spectrum. Principal peaks at m/z 269, 205, 221, 297, 271, 62, 285, 124.

Quantification. GAS CHROMATOGRAPHY. In blood or plasma: sensitivity 5 ng/ml, ECD—E. Redalieu *et al.*, *J. pharm. Sci.*, 1978, 67, 726–728. In plasma, erythrocytes or urine: detection limit 10 ng/ml in plasma, ECD and FID—B. Lindström *et al.*, *J. Chromat.*, 1975, 114, 459–462.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: hydrochlorothiazide and chlorothiazide, sensitivity 10 ng/ml in plasma and 2 µg/ml in urine, UV detection—R. H. Barbhuiya *et al.*, *J. pharm. Sci.*, 1981, 70, 291–295.

Disposition in the Body. Rapidly but incompletely absorbed after oral administration; bioavailability about 70%. More than 95% of an intravenous dose is excreted unchanged in the urine. About 65% of an oral dose is excreted in the urine unchanged in 24 hours.

THERAPEUTIC CONCENTRATION.

Peak plasma concentrations of 0.18 to 0.43 µg/ml (mean 0.26) were attained in 2 to 4 hours, following a single oral dose of 50 mg given to 8 subjects (B. Beerman *et al.*, *Eur. J. clin. Pharmac.*, 1977, 12, 297–303).

Steady-state plasma concentrations of 0.05 to 0.16 µg/ml (mean 0.1) were achieved after daily oral doses of 75 mg to 8 subjects (B. Beerman and M. Groschinsky-Grind, *Eur. J. clin. Pharmac.*, 1978, 13, 195–201).

HALF-LIFE. Plasma half-life, 6 to 15 hours.

VOLUME OF DISTRIBUTION. About 3 litres/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 0.41.

PROTEIN BINDING. In plasma, about 40%.

NOTE. For a review of the pharmacokinetics of diuretics, see B. Beerman and M. Groschinsky-Grind, *Clin. Pharmacokin.*, 1980, 5, 221–245.

Dose. 25 to 200 mg daily.

Hydrocodone

Narcotic Analgesic/Antitussive

Synonym. Dihydrocodeinone

6-Deoxy-7,8-dihydro-3-O-methyl-6-oxomorphine

$C_{18}H_{21}NO_3 = 299.4$

CAS—125-29-1

M.p. 198°.

Practically **insoluble** in water; soluble in ethanol.

Hydrocodone Hydrochloride

Synonym. Dihydrocodeinone Hydrochloride

Proprietary Name. Dicodid (injection)

$C_{18}H_{21}NO_3 \cdot HCl \cdot 2\frac{1}{2}H_2O = 380.9$

CAS—25968-91-6 (anhydrous)

A white crystalline powder.

Soluble 1 in 2 of water; soluble in ethanol.

Hydrocodone Phosphate

$C_{18}H_{21}NO_3 \cdot \frac{1}{2}H_3PO_4 = 446.4$

CAS—34366-67-1

A white or yellowish-white crystalline powder.

Soluble in water; practically insoluble in ethanol, chloroform, and ether.

Hydrocodone Tartrate

Synonyms. Dihydrocodeinone Acid Tartrate; Hydrocodone Acid Tartrate; Hydrocodone Bitartrate; Hydrocone Bitartrate.

Proprietary Names. Codone; Corutol DH; Diconid (tablets); Hycodan; Hycon; Robidone. It is an ingredient of Hycomine.

$C_{18}H_{21}NO_3 \cdot C_4H_6O_6 \cdot 2\frac{1}{2}H_2O = 494.5$

CAS—143-71-5 (anhydrous); 34195-34-1 (hemipentahydrate).

White crystals or crystalline powder.

Soluble 1 in 10 of water and 1 in 150 of ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 8.3 (20°).

Colour Test. Marquis Test—yellow → brown → violet.

Thin-layer Chromatography. System TA—Rf 25; system TB—Rf 04; system TC—Rf 20. (*Dragendorff spray*, positive; *acidified iodoplatinate solution*, positive; *Marquis reagent*, violet.)

Gas Chromatography. System GA—RI 2440; system GC—RI 3028; system GF—RI 2930.

High Pressure Liquid Chromatography. System HA— k' 7.1 (tailing peak); system HC— k' 2.17.

Ultraviolet Spectrum. Aqueous acid—280 nm ($A_1^1 = 41$ a). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1720, 1270, 1500, 959, 1055, 800 (KBr disk).

Mass Spectrum. Principal peaks at m/z 299, 242, 59, 243, 42, 96, 70, 214.

Quantification. GAS CHROMATOGRAPHY. In serum: sensitivity 1 ng/ml, ECD—J. W. Barnhart and W. J. Caldwell, *J. Chromat.*, 1977, 130, 243–249. In postmortem blood: detection limit 100 ng/ml, AFID—G. Cimbura and E. Koves, *J. analyt. Toxicol.*, 1981, 5, 296–299.

GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In urine: hydrocodone and metabolites, sensitivity 10 ng/ml—E. J. Cone and W. D. Darwin, *Biomed. Mass Spectrom.*, 1978, 5, 291–295.

RADIOIMMUNOASSAY. In plasma: sensitivity 10 ng/ml—I. L. Honigberg and J. T. Stewart, *J. pharm. Sci.*, 1980, 69, 1171–1173.

Disposition in the Body. Absorbed after oral administration. Metabolised by demethylation and reduction of the 6-keto group. About 26% of a dose is excreted in the urine in 72 hours, with 12% of the dose as unchanged drug, 5% as norhydrocodone, 4% as conjugated hydromorphone, 3% as 6-hydrocodol, and 0.1% as conjugated 6-hydromorphol. Hydrocodol and hydromorphol exist as stereoisomers. The unconjugated metabolites are thought to be active.

Hydrocodone is a metabolite of codeine.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 10 mg of hydrocodone tartrate to 5 subjects, peak serum concentrations of 0.018 to 0.032 $\mu\text{g/ml}$ (mean 0.023) were attained in 1.5 hours (J. W. Barnhart and W. J. Caldwell, *J. Chromat.*, 1977, 130, 243–249).

TOXICITY. The estimated lethal dose is 200 mg. Fatalities have occurred at blood concentrations greater than 0.1 $\mu\text{g/ml}$.

In 2 fatalities due to the ingestion of hydrocodone and phenyltoloxamine, the following postmortem concentrations were reported: blood, hydrocodone 0.3 $\mu\text{g/ml}$ (both cases), bile, hydrocodone 14.3, – $\mu\text{g/ml}$, hydromorphone 98, 48 $\mu\text{g/ml}$; in the first case phenyltoloxamine was present in bile at a concentration of 0.4 $\mu\text{g/ml}$ (J. I. Park *et al.*, *J. forens. Sci.*, 1982, 27, 223–224).

HALF-LIFE. Plasma half-life, about 4 hours.

Dose. 15 to 40 mg of hydrocodone tartrate daily.

Hydrocortisone

Corticosteroid

Synonyms. Compound F; Cortisol; 17-Hydroxycorticosterone.

Note. Cortisol is also used as a proprietary name for cortisone acetate.

Proprietary Names. Cobadex; Cortenema; Cortril; Dioderm; Efcortelan; Hydrocortistab; Hydrocortisyl; Hydrocortone.

Hydrocortisone and its esters are ingredients of many proprietary preparations—see *Martindale, The Extra Pharmacopoeia*, 28th Edn.

11 β ,17 α ,21-Trihydroxypregn-4-ene-3,20-dione

$C_{21}H_{30}O_5 = 362.5$

CAS—50-23-7

A white crystalline powder. M.p. about 214°, with decomposition. A solution in dioxan is dextrorotatory. Practically **insoluble** in water and ether; soluble 1 in 40 of ethanol; slightly soluble in chloroform; very soluble in dioxan.

Hydrocortisone Acetate

Synonym. Hydrocortisone 21-Acetate

$C_{23}H_{32}O_6 = 404.5$

CAS—50-03-3

A white crystalline powder. M.p. about 220°, with decomposition.

Practically **insoluble** in water and ether; soluble 1 in 230 of ethanol; slightly soluble in chloroform.

Hydrocortisone Butyrate

Synonym. Hydrocortisone 17-Butyrate

$C_{25}H_{36}O_6 = 432.6$

CAS—13609-67-1

Hydrocortisone Cypionate

Synonyms. Hydrocortisone Cipionate; Hydrocortisone Cyclopentylpropionate.

$C_{29}H_{42}O_6 = 486.6$

CAS—508-99-6

A white crystalline powder.

Practically **insoluble** in water; soluble in ethanol; very soluble in chloroform; slightly soluble in ether.

Hydrocortisone Hydrogen Succinate

Synonyms. Cortisol Hemisuccinate; Hydrocortisone Hemisuccinate.

$C_{25}H_{34}O_8 = 462.5$

CAS—2203-97-6

A white crystalline powder. M.p. 170° to 173° or 210° to 214°.

Practically **insoluble** in water; soluble 1 in 40 of ethanol and 1 in 7 of dehydrated alcohol.

Hydrocortisone Sodium Phosphate

$C_{21}H_{29}Na_2O_8P = 486.4$

CAS—6000-74-4

A white or light yellow hygroscopic powder.

Soluble 1 in 4 of water; slightly soluble in ethanol; practically insoluble in chloroform and ether.

Hydrocortisone Sodium Succinate

Synonym. Hydrocortisone 21-Sodium Succinate

$C_{25}H_{35}NaO_8 = 484.5$

CAS—125-04-2

A white, hygroscopic, crystalline powder or amorphous solid. M.p. 169° to 171°.

Soluble 1 in 3 of water and 1 in 34 of ethanol; practically insoluble in chloroform and ether. It is unstable in aqueous solution.

Hydrocortisone Valerate

Synonym. Hydrocortisone 17-Valerate

$C_{26}H_{38}O_6 = 446.6$

CAS—57524-89-7

Dissociation Constant. Hydrocortisone sodium succinate, pK_a 5.1.

Colour Tests. Antimony Pentachloride—orange; Naphthol-Sulphuric Acid—yellow-brown/yellow-brown; Sulphuric Acid—green, orange dichroism (green fluorescence under ultraviolet light).

Thin-layer Chromatography. Hydrocortisone: *system TP*—Rf 27; *system TQ*—Rf 02; *system TR*—Rf 08; *system TS*—Rf 00. Hydrocortisone acetate: *system TP*—Rf 51; *system TQ*—Rf 11; *system TR*—Rf 38; *system TS*—Rf 00. Hydrocortisone hydrogen succinate: *system TP*—Rf 08; *system TQ*—Rf 00; *system TR*—Rf 00; *system TS*—Rf 00. Hydrocortisone sodium phosphate: *system TP*—Rf 00; *system TQ*—Rf 00; *system TR*—Rf 00; *system TS*—Rf 00. (DPST solution.)

High Pressure Liquid Chromatography. *System HT*— k' 5.8.

Ultraviolet Spectrum. Ethanol—240 nm ($A_1^1 = 435$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1640, 1702, 1610, 1232, 1042, 1115 (KBr disk).

Wavelength

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 5 ng/ml, UV detection—R. D. Toothaker *et al.*, *J. pharm. Sci.*, 1982, 71, 573–576.

Disposition in the Body. Hydrocortisone (cortisol) is the main glucocorticoid secreted by the adrenal cortex. It is administered parenterally as the sodium phosphate or sodium succinate ester in emergencies. Hydrocortisone is readily absorbed after oral administration and through the skin; hydrocortisone acetate is less well absorbed. It is metabolised in the liver and other tissues by reduction, hydroxylation, side-chain cleavage, and conjugation with glucuronic acid. About 90% of a dose is excreted in the urine in 24 hours; less than 1% is excreted unchanged, 40% is the 5 α - and 5 β - forms of tetrahydrocortisol and the 5 β - form of tetrahydrocortisone, 17% is a mixture of the 5 α - and 5 β - and 20 α - and 20 β -cortols and cortolones, and 6% is 11-hydroxy- and 11-keto-etiocholanolone; most of the metabolites are excreted as glucuronide conjugates; at plasma concentrations of greater than 0.2 μ g/ml, the amount of unchanged hydrocortisone excreted in the urine is increased.

BLOOD CONCENTRATION. Endogenous hydrocortisone exhibits a diurnal variation in plasma concentrations; in the morning, concentrations are in the approximate range 0.08 to 0.20 μ g/ml and in the evening, in the range 0.04 to 0.10 μ g/ml. Following a single intravenous injection of 40 mg to 6 subjects, a mean plasma concentration of 1.85 μ g/ml was reported at 10 minutes (R. D. Toothaker and P. G. Welling, *J. Pharmacokin. Biopharm.*, 1982, 10, 147–156).

HALF-LIFE. Plasma half-life, about 1.5 hours.

VOLUME OF DISTRIBUTION. About 0.3 litre/kg.

PROTEIN BINDING. In plasma, more than 90%.

Dose. 10 to 30 mg daily, by mouth. In the treatment of certain medical emergencies, the equivalent of 100 to 500 mg of hydrocortisone by intravenous injection, 3 or 4 times daily.

Hydroflumethiazide

Diuretic

Synonym. Trifluoromethylhydrothiazide

Proprietary Names. Di-Ademil; Diucardin; Hydrenox; Leodrine; Rontyl; Saluron. It is an ingredient of Aldactide, Rautrax, and Salutensin.

3,4-Dihydro-6-trifluoromethyl-2H-1,2,4-benzothiadiazine-7-sulphonamide 1,1-dioxide

$C_8H_8F_3N_3O_4S_2 = 331.3$

CAS—135-09-1

White or cream-coloured glistening crystals or crystalline powder. M.p. 270° to 275°.

Soluble 1 in 3000 of water, 1 in about 50 of ethanol, and 1 in 4 of acetone; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 8.5, 10.0 (20°).

Colour Tests. Chromotropic Acid—violet, after dilution; Koppanyi-Zwicker Test—violet; Liebermann's Test—blue-green.

Thin-layer Chromatography. System TD—Rf 0.7; system TE—Rf 0.4; system TF—Rf 0.7. (Location under ultraviolet light, violet fluorescence; acidified potassium permanganate solution, faint reaction.)

High Pressure Liquid Chromatography. System HN— k' 1.30.

Ultraviolet Spectrum. Aqueous acid—273 nm ($A_1^1 = 578$ a), 325 nm; aqueous alkali—274 nm, 333 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1151, 1180, 1125, 1052, 1300, 1525 (KBr disk).

Mass Spectrum. Principal peaks at m/z 303, 331, 239, 255, 30, 158, 64, 159.

Quantification. SPECTROFLUORIMETRY. In plasma or urine: detection limit 10 ng/ml in plasma and 100 ng/ml in urine—O. Brørs *et al.*, *Eur. J. clin. Pharmac.*, 1977, 11, 149–154.

THIN-LAYER CHROMATOGRAPHY—SPECTROFLUORIMETRY. In plasma or urine: detection limit 10 ng/ml in plasma and 500 ng/ml in urine—Y. Garceau *et al.*, *J. pharm. Sci.*, 1974, 63, 1793–1795.

Disposition in the Body. Incompletely but fairly rapidly absorbed after oral administration. During daily dosing, 50 to 70% of a dose is excreted in the 24-hour urine as unchanged drug and about 2% as 2,4-disulphamyl-5-trifluoromethylaniline (DTA).

THERAPEUTIC CONCENTRATION.

Following single oral doses of 100 mg to 12 subjects, peak plasma concentrations of 0.17 to 0.6 µg/ml (mean 0.4) were attained in 2 to 4 hours (G. Yakatan *et al.*, *J. clin. Pharmac.*, 1977, 17, 37–47).

HALF-LIFE. Derived from urinary excretion data, 5 to 18 hours (dose-dependent).

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 0.7.

PROTEIN BINDING. In plasma, about 75%.

Dose. 25 to 200 mg daily.

Hydromorphone

Narcotic Analgesic

Synonyms. 7,8-Dihydromorphinone; Dimorphone.

6-Deoxy-7,8-dihydro-6-oxomorphine

$C_{17}H_{19}NO_3 = 285.3$

CAS—466-99-9

A fine, white, crystalline powder. M.p. about 260°, with decomposition.

Slightly **soluble** in water; freely soluble in ethanol; very soluble in chloroform.

Hydromorphone Hydrochloride

Synonym. Dihydromorphinone Hydrochloride

Proprietary Name. Dilaudid

$C_{17}H_{19}NO_3 \cdot HCl = 321.8$

CAS—71-68-1

A white crystalline powder, which is affected by light. M.p. 305° to 315°, with decomposition.

Soluble 1 in 3 of water and 1 in 100 of ethanol (90%); practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 8.2 (20°).

Partition Coefficient. Log *P* (heptane/pH 7.4), −4.0.

Colour Tests. Mandelin's Test—violet → orange; Marquis Test—yellow → red → violet.

Thin-layer Chromatography. *System TA*—Rf 23; *system TB*—Rf 03; *system TC*—Rf 09. (*Dragendorff spray*, positive; *acidified iodoplatinate solution*, positive; *Marquis reagent*, violet.)

Gas Chromatography. *System GA*—RI 2467.

High Pressure Liquid Chromatography. *System HA*— k' 7.9 (tailing peak).

Ultraviolet Spectrum. Aqueous acid—280 nm ($A_1^1 = 50$ a); aqueous alkali—290 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1727, 1247, 1279, 1034, 757, 1500 (KBr disk).

Mass Spectrum. Principal peaks at m/z 285, 96, 229, 228, 70, 214, 115, 200.

Quantification. **GAS CHROMATOGRAPHY.** In urine: hydromorphone and metabolites, FID—E. J. Cone *et al.*, *J. pharm. Sci.*, 1977, 66, 1709–1713. In postmortem blood: limit of detection 100 ng/ml, AFID—G. Cimbura and E. Koves, *J. analyt. Toxicol.*, 1981, 5, 296–299.

GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In blood, serum or tissue homogenates: sensitivity 80 ng/ml—J. J. Saady *et al.*, *J. analyt. Toxicol.*, 1982, 6, 235–237.

RADIOIMMUNOASSAY. In plasma: sensitivity 2.5 ng/ml—I. L. Honigberg and J. T. Stewart, *J. pharm. Sci.*, 1980, 69, 1171–1173.

Disposition in the Body. Rapidly but incompletely absorbed after oral administration; bioavailability about 60% but there is considerable intersubject variation. About 6% of a dose is excreted in the urine in 24 hours as free hydromorphone with about 30% as conjugated hydromorphone and only traces of the active 6 α - and 6 β -hydroxy metabolites.

Hydromorphone is a metabolite of hydrocodone.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 4 mg to 6 subjects, peak plasma concentrations of 0.018 to 0.027 μ g/ml (mean 0.022) were attained in about 1 hour (J. J. Vallner *et al.*, *J. clin. Pharmacol.*, 1981, 21, 152–156).

TOXICITY. The estimated minimum lethal dose is 200 mg. Plasma concentrations greater than 0.1 μ g/ml may be toxic.

In a fatality attributed to hydromorphone overdose, the following tissue concentrations were reported: blood 1.2 μ g/ml, brain a trace, kidney 1.2 μ g/g, liver 0.4 μ g/g, urine 1.1 μ g/ml; diazepam was also detected (R. C. Baselt, *Bull. int. Ass. forens. Toxicol.*, 1978, 14(2), 20).

The following postmortem tissue concentrations were reported in a fatality due to an injected overdose of hydromorphone: blood 0.17 μ g/ml, bile 8.6 μ g/ml, kidney 0.13 μ g/g, liver 0.07 μ g/g (H. C. Walls, *Bull. int. Ass. forens. Toxicol.*, 1976, 12(3), 7–8).

HALF-LIFE. Plasma half-life, 1.5 to 4 hours.

VOLUME OF DISTRIBUTION. About 1 litre/kg.

Dose. 2 to 4 mg of hydromorphone hydrochloride every 4 to 6 hours.

Hydroquinidine

Anti-arrhythmic

Synonyms. Dihydrochinidin; Dihydroquinidine; Hydroconchinine.

(8*R*,9*S*)-10,11-Dihydro-6'-methoxycinchonan-9-ol

$C_{20}H_{26}N_2O_2 = 326.4$

CAS—1435-55-8

An alkaloid present in the bark of species of *Cinchona* (Rubiaceae). Crystals. M.p. about 169°.

Soluble in ethanol and ether.

Hydroquinidine Hydrochloride

$C_{20}H_{26}N_2O_2 \cdot HCl = 362.9$

CAS—1476-98-8

Colourless crystals. M.p. 273° to 274°.

Freely **soluble** in chloroform and methanol; less readily soluble in water and ethanol.

Colour Tests. Sulphuric Acid—yellow (fluoresces under ultra-violet light); Thalleioquin Test—green.

Thin-layer Chromatography. *System TA*—Rf 45; *system TB*—Rf 03; *system TC*—Rf 08. (*Acidified iodoplatinate solution*, positive.)

Gas Chromatography. *System GA*—RI 2810.

Ultraviolet Spectrum. Aqueous acid—250 nm ($A_1^1 = 1240$ b), 316 nm, 345 nm ($A_1^1 = 180$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1509, 1261, 1620, 1234, 854, 1030.

Mass Spectrum. Principal peaks at m/z 138, 326, 55, 110, 189, 82, 160, 139.

Dose. Usually 450 to 600 mg of hydroquinidine hydrochloride daily.

Hydroquinine

Alkaloid

Synonym. Dihydroquinine

(8*S*,9*R*)-10,11-Dihydro-6'-methoxycinchonan-9-ol

$C_{20}H_{26}N_2O_2 = 326.4$

CAS—522-66-7

An alkaloid present in the bark of species of *Cinchona* (Rubiaceae). Crystals. M.p. 173°.

Practically **insoluble** in water; soluble in ethanol, chloroform, and ether.

Colour Tests. Sulphuric Acid—yellow (fluoresces under ultra-violet light); Thalleioquin Test—green.

Thin-layer Chromatography. System TA—Rf 44; system TB—Rf 02; system TC—Rf 07. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 1450.

Ultraviolet Spectrum. Aqueous acid—250 nm ($A_1^1 = 915$ b), 316 nm, 345 nm ($A_1^1 = 167$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1240, 1225, 1507, 1623, 1026, 1132 (KBr disk).

Mass Spectrum. Principal peaks at m/z 138, 55, 189, 82, 41, 110, 326, 42.

Hydroquinone

Depigmenting Agent/Antioxidant

Synonyms. Hydroquinol; Quinol.

Proprietary Names. Eldopaque; Eldoquin; Phiaquin.

Benzene-1,4-diol

$C_6H_6O_2 = 110.1$

CAS—123-31-9

Fine white crystals, or white crystalline powder, which darken on exposure to light and air. M.p. 172° to 174°.

Soluble 1 in 17 of water, 1 in 4 of ethanol, 1 in 51 of chloroform, and 1 in 16 of ether.

Partition Coefficient. Log *P* (octanol/pH 7.4), 0.6.

Colour Tests. Ammoniacal Silver Nitrate—grey-yellow/brown; Benedict's Reagent—red; Ferric Chloride—green.

Gas Chromatography. System GA—RI 1220.

Ultraviolet Spectrum. Ethanol—295 nm ($A_1^1 = 282$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1210, 1192, 1520, 760, 1240, 813 (KBr disk).

Use. As a 2 to 5% ointment for depigmentation of the skin.

Hydroxocobalamin

Haemopoietic Vitamin

Synonyms. Vitamin B_{12a}; Vitamin B_{12b}.

Proprietary Names. Alpha Redisol; Alpha-Ruvite; Cobalin-H; Hydroxo B₁₂; Neo-Betalin 12; Neo-Cytamen; Novobedouze; Rubesol-LA; Sytobex-H.

*Co*α-[α-(5,6-Dimethylbenzimidazol-1-yl)]-*Co*β-hydroxocobamide

$C_{62}H_{89}CoN_{13}O_{15}P = 1346$

CAS—13422-51-0

Hydroxocobalamin occurs either as aquocobalamin chloride [α-(5,6-dimethylbenzimidazol-1-yl)aquocobamide chloride], $C_{62}H_{90}ClCoN_{13}O_{15}P$, or as aquocobalamin sulphate, $C_{124}H_{180}Co_2N_{26}O_{34}P_2S$.

Note. In acid solutions, hydroxocobalamin takes up a hydrogen ion which converts the hydroxyl group to a co-ordinated water molecule, and in this form it is known as aquocobalamin, which is basic and forms salts with acids. In solution, aquocobalamin exists in equilibrium with hydroxocobalamin and, since it is more stable in acid solution, it usually occurs commercially in the form of aquocobalamin (E. L. Smith *et al.*, *Analyst*, *Lond.*, 1962, 87, 183–186).

Dark red crystals or crystalline powder.

Soluble 1 in 50 of water and 1 in 100 of ethanol; practically insoluble in chloroform and ether.

Ultraviolet Spectrum. Acetic acid—274 nm, 351 nm.

Dose. Initially 0.25 to 1 mg, by intramuscular injection, daily or on alternate days.

Hydroxyamphetamine

Sympathomimetic

Synonym. Oxamphetamine

(±)-4-(2-Aminopropyl)phenol

$C_9H_{13}NO = 151.2$

CAS—103-86-6; 1518-86-1 (±)

Crystals. M.p. 125° to 126°.

Soluble in water, ethanol, and chloroform.

Hydroxyamphetamine Hydrobromide

Proprietary Name. Paredrine

$C_9H_{13}NO \cdot HBr = 232.1$

CAS—306-21-8; 140-36-3 (±)

A white crystalline powder. M.p. 189° to 192°.

Soluble 1 in 1 of water and 1 in 2.5 of ethanol; slightly soluble in chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 9.3 (25°).

Thin-layer Chromatography. *System TA*—Rf 35; *system TB*—Rf 02; *system TC*—Rf 02. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. *System GA*—RI 1320.

High Pressure Liquid Chromatography. *System HB*— k' 2.24; *system HC*— k' 1.11.

Ultraviolet Spectrum. Aqueous acid—275 nm ($A_1^1 = 103$ a); aqueous alkali—238 nm ($A_1^1 = 672$ b), 294 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1259, 1517, 1599, 1102, 813, 1111 (KBr disk).

Mass Spectrum. Principal peaks at m/z 44, 82, 80, 107, 77, 108, 81, 79.

Disposition in the Body. Readily absorbed after oral administration. About 90% of a dose is excreted in the urine in 24 hours as

free and conjugated hydroxyamphetamine, with about 4% of the dose as free and conjugated 4'-hydroxynorephedrine.

TOXICITY. The estimated minimum lethal dose, intranasally, in children up to 2 years of age is 200 mg, and in adults about 2 g.

Dose. Hydroxyamphetamine hydrobromide has been given in doses of 60 to 240 mg daily.

Hydroxychloroquine

Antimalarial

Synonym. Oxichlorochin

2-{*N*-[4-(7-Chloro-4-quinolylamino)pentyl]-*N*-ethylamino]-ethanol

$C_{18}H_{26}ClN_3O = 335.9$

CAS—118-42-3

Crystals. M.p. 89° to 91°.

Hydroxychloroquine Sulphate

Proprietary Names. Ercoquin; Plaquenil; Quensyl.

$C_{18}H_{26}ClN_3O \cdot H_2SO_4 = 433.9$

CAS—747-36-4

A white crystalline powder. There are 2 forms, one melting at about 198° and the other at about 240°.

Soluble 1 in 5 of water; practically insoluble in ethanol, chloroform, and ether.

Thin-layer Chromatography. *System TA*—Rf 45; *system TB*—Rf 00; *system TC*—Rf 02. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 2872.

Ultraviolet Spectrum. Aqueous acid—235 nm ($A_1^1 = 560$ a), 256 nm, 329 nm, 343 nm; aqueous alkali—253 nm, 330 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1579, 1608, 1530, 1050, 1150, 810 (KBr disk).

Mass Spectrum. Principal peaks at m/z 102, 245, 247, 304, 305, 306, 58, 126.

Quantification. ULTRAVIOLET SPECTROPHOTOMETRY. In blood or urine—R. A. Dalley and D. Hainsworth, *J. forens. Sci. Soc.*, 1965, 5, 99–101.

SPECTROFLUORIMETRY. In plasma—E. W. McChesney *et al.*, *Antibiotics Chemother.*, 1962, 12, 583–594.

Disposition in the Body. Rapidly and almost completely absorbed after oral administration. It is metabolised by de-ethylation. About 6% of a single dose is excreted in the urine over a period of 10 days and about 25% of a dose is eliminated in the faeces in 3 days as unchanged drug plus the de-ethylated metabolites. During daily therapy, less than 13% of a dose is excreted in the 24-hour urine with 8% of the dose as unchanged drug, 2% as desethylchloroquine, 2% as desethylhydroxychloroquine, and 0.5% as didesethylchloroquine.

THERAPEUTIC CONCENTRATION.

After an oral dose of hydroxychloroquine sulphate equivalent to 310 mg of the base to 6 subjects, peak plasma concentrations of 0.003 to 0.20 $\mu\text{g}/\text{ml}$ (mean 0.08) were attained in 3 hours. Following oral administration of hydroxychloroquine diphosphate equivalent to 1264 mg of the base to

3 subjects, peak plasma concentrations of 0.29 to 1.0 $\mu\text{g}/\text{ml}$ (mean 0.64) were attained in 3 hours and therapeutic concentrations greater than 0.01 $\mu\text{g}/\text{ml}$ were maintained for 240 hours (E. W. McChesney *et al.*, *ibid.*).

TOXICITY.

In a fatality due to the ingestion of at least 12 g, the following postmortem tissue concentrations were reported: blood 48 $\mu\text{g}/\text{ml}$, heart blood 61 $\mu\text{g}/\text{ml}$, liver 71 $\mu\text{g}/\text{g}$, urine 970 $\mu\text{g}/\text{ml}$ (R. A. Dalley and D. Hainsworth, *J. forens. Sci. Soc.*, 1965, 5, 99–101).

HALF-LIFE. Plasma half-life, about 3 days.

Dose. For an acute attack of malaria, 2 g of hydroxychloroquine sulphate given over three days (1.2 g on the first day). In rheumatoid arthritis, initially 400 to 800 mg daily.

Hydroxyephedrine

Sympathomimetic

Synonyms. *p*-Hydroxyephedrine; Methylsynephrine; Oxyephedrine.

1-(4-Hydroxyphenyl)-2-methylaminopropan-1-ol

$\text{C}_{10}\text{H}_{15}\text{NO}_2 = 181.2$

CAS—365-26-4

A crystalline powder. M.p. 152° to 154°.

Sparingly **soluble** in water, ethanol, and ether; freely soluble in dilute acids and sodium hydroxide solution.

Hydroxyephedrine Hydrochloride

$\text{C}_{10}\text{H}_{15}\text{NO}_2 \cdot \text{HCl} = 217.7$

CAS—942-51-8

A crystalline powder. M.p. 209° to 211°.

Soluble 1 in 3 of water and 1 in 10 of ethanol; sparingly soluble in acetone.

Colour Tests. Liebermann's Test—black; Mandelin's Test—green; Marquis Test—yellow.

Thin-layer Chromatography. System *TA*—Rf 35, streaking. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. System *GA*—RI 1682.

High Pressure Liquid Chromatography. System *HB*—k' 0.73.

Ultraviolet Spectrum. Aqueous acid—273 nm ($A_1^1 = 75$ b); aqueous alkali—242 nm ($A_1^1 = 760$ b), 290 nm ($A_1^1 = 131$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 980, 1238, 835, 1157, 1129, 792 (KBr disk).

Mass Spectrum. Principal peaks at m/z 58, 30, 59, 56, 77, —, —, —.

Dose. Hydroxyephedrine hydrochloride has been given in doses of 10 mg daily.

Hydroxyphenamate

Tranquilliser

Synonym. Oxyfenamate

Proprietary Name. Listica

2-Hydroxy-2-phenylbutyl carbamate

$C_{11}H_{15}NO_3 = 209.2$

CAS—50-19-1

A white crystalline powder. M.p. 55° to 57°.

Soluble 1 in 40 of water; soluble in ethanol and chloroform.

Thin-layer Chromatography. System *TA*—Rf 74. (*Van Urk* reagent, positive.)

Gas Chromatography. System *GA*—RI 1724.

Ultraviolet Spectrum. Aqueous acid—251 nm, 257 nm ($A_1^1 = 9.0$ a), 263 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1715, 1072, 700, 1603, 1110, 760 (KBr disk).

Mass Spectrum. Principal peaks at m/z 135, 57, 91, 77, 43, 119, 105, 180.

Dose. Hydroxyphenamate has been given in doses of 600 mg daily.

Hydroxyprogesterone

Progestational Steroid

17 α -Hydroxypregn-4-ene-3,20-dione

$C_{21}H_{30}O_3 = 330.5$

CAS—68-96-2

A crystalline powder. M.p. 222° to 223° with rapid heating; with slow heating it undergoes molecular rearrangement accompanied by partial resolidification and melts at 276°.

Hydroxyprogesterone Hexanoate

Synonyms. 17 AHPC; Hydroxyprogesterone Caproate.

Proprietary Names. Delalutin; Hyproval PA; Proluton Depot; Relutin.

$C_{27}H_{40}O_4 = 428.6$

CAS—630-56-8

A white or creamy-white crystalline powder. M.p. 120° to 124°.

Practically **insoluble** in water; soluble 1 in 10 of ethanol, 1 in 0.4 of chloroform, and 1 in 10 of ether.

Colour Tests. Antimony Pentachloride—orange; Naphthol-Sulphuric Acid—orange-red/blue, violet dichroism; Sulphuric Acid—yellow (green fluorescence under ultraviolet light).

Thin-layer Chromatography. Hydroxyprogesterone hexanoate: system *TP*—Rf 81; system *TQ*—Rf 55; system *TR*—Rf 99; system *TS*—Rf 90. (p-Toluenesulphonic acid solution, positive.)

Ultraviolet Spectrum. Hydroxyprogesterone hexanoate: dehydrated alcohol—240 nm ($A_1^1 = 395$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1728, 1670, 1177, 1188, 1716, 1224 (hydroxyprogesterone hexanoate, KBr disk).

Dose. Usually 250 to 500 mg of hydroxyprogesterone hexanoate weekly, by intramuscular injection.

Hydroxyquinoline

Antibacterial/Antifungal

Synonyms. Oxine; Oxyquinoline; 8-Quinolinol.

Quinolin-8-ol

$C_9H_7NO = 145.2$

CAS—148-24-3

A white or faintly yellow crystalline powder. M.p. 76°.

Soluble 1 in 1500 of water; soluble in ethanol, acetone, and chloroform.

Hydroxyquinoline Sulphate

Synonyms. Chinosolum; Oxyquinol; Oxyquinoline Sulphate.

Proprietary Name. Sérorhinol

$(C_9H_7NO)_2 \cdot H_2SO_4 = 388.4$

CAS—134-31-6

A light yellow powder. M.p. about 178°.

Soluble 1 in 1 of water and 1 in 100 of ethanol; practically insoluble in chloroform and ether.

Potassium Hydroxyquinoline Sulphate

Synonyms. Oxyquinol Potassium; Potassium Oxyquinoline Sulphate.

Proprietary Names. It is an ingredient of Auralgicin, Quinoderm, and Quinoped.

An equimolecular mixture of potassium sulphate and quinolin-8-ol sulphate, containing the equivalent of 50% of quinolin-8-ol.

A pale yellow microcrystalline powder. It partly liquefies at 172° to 184°. **Soluble** 1 in 2 of water; partly soluble in ethanol; practically insoluble in ether.

Dissociation Constant. pK_a 5.0, 9.9 (20°).

Colour Test. Ferric Chloride—green.

Thin-layer Chromatography. *System TA*—Rf 32, streaking. (*Acidified iodoplatinate solution*, positive.)

Ultraviolet Spectrum. Aqueous acid—251 nm ($A_1^1 = 3930$ a), 308 nm ($A_1^1 = 105$ a), 318 nm, 356 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1509, 779, 709, 1282, 1219, 1190.

Mass Spectrum. Principal peaks at m/z 145, 117, 122, 89, 105, 90, 63, 146.

Use. Potassium hydroxyquinoline sulphate is used topically in concentrations of 0.05 to 0.5%.

Hydroxystilbamidine

Antifungal/Antiprotozoal

Synonym. Oxistilbamidine

2-Hydroxystilbene-4,4'-dicarboxamidine

$C_{16}H_{16}N_4O = 280.3$

CAS—495-99-8

Yellow crystals. M.p. 235°.

Hydroxystilbamidine Isethionate

$C_{16}H_{16}N_4O_2 \cdot 2C_2H_5O_4S = 532.6$

CAS—533-22-2

A fine, yellow, crystalline powder, which decomposes on exposure to light. M.p. about 280°.

Soluble in water; slightly soluble in ethanol; practically insoluble in ether.

Colour Tests. Folin-Ciocalteu Reagent—blue; Liebermann's Test—black; Mandelin's Test—blue-green.

Thin-layer Chromatography. *System TA*—Rf 01; *system TB*—Rf 00; *system TC*—Rf 00. (*Acidified iodoplatinate solution*, positive.)

Ultraviolet Spectrum. Aqueous acid—344 nm ($A_1^1 = 1093$ a); aqueous alkali—310 nm ($A_1^1 = 811$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1196, 1028, 1667, 1597, 742, 1053 (hydroxystilbamidine isethionate, KBr disk).

Mass Spectrum. Principal peaks at m/z 96, 44, 43, 31, 45, 27, 78, 264.

Dose. 225 or 250 mg of hydroxystilbamidine isethionate daily or on alternate days, by intravenous infusion.

Hydroxyurea

Antineoplastic

Synonym. Hydroxycarbamide

Proprietary Names. Hydrea; Litalir.

$HO \cdot NH \cdot CO \cdot NH_2 = 76.05$

CAS—127-07-1

A white crystalline powder. It is hygroscopic and decomposes in the presence of moisture. M.p. above 133°, with decomposition. Freely **soluble** in water and hot ethanol; slightly soluble in ethanol.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1639, 1592, 1111, 1492, 812, 758 (KBr disk).

Dose. 20 to 30 mg/kg daily or 80 mg/kg every third day, by mouth.

Hydroxyzine

Antihistamine/Tranquilliser

2-{2-[4-(4-Chlorobenzhydryl)piperazin-1-yl]ethoxy}ethanol

$C_{21}H_{27}ClN_2O_2 = 374.9$

CAS—68-88-2

**Hydroxyzine Embonate**

Synonym. Hydroxyzine Pamoate

Proprietary Names. Masmoran; Vistaril (capsules and oral suspension).

$C_{21}H_{27}ClN_2O_2 \cdot C_{23}H_{16}O_6 = 763.3$

CAS—10246-75-0

A pale yellow powder.

Practically **insoluble** in water, chloroform, ether, and methanol; soluble 1 in 700 of ethanol and 1 in 10 of dimethylformamide.

Hydroxyzine Hydrochloride

Proprietary Names. Atarax; Atazina; Sedaril; Vistaril (injection). It is an ingredient of Cartrax, Enarax, and Vistrax.

$C_{21}H_{27}ClN_2O_2 \cdot 2HCl = 447.8$

CAS—2192-20-3

A white crystalline powder. M.p. about 200°, with decomposition.

Soluble 1 in 1 of water, 1 in 4.5 of ethanol, and 1 in 13 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 2.1, 7.1.

Thin-layer Chromatography. *System TA*—Rf 68; *system TB*—Rf 09; *system TC*—Rf 54. (*Dragendorff spray*, positive; *acidified iodoplatinate solution*, positive; *Marquis reagent*, green.)

Gas Chromatography. *System GA*—RI 2849.

High Pressure Liquid Chromatography. *System HA*— k' 1.4.

Ultraviolet Spectrum. Aqueous acid—232 nm ($A_1^1 = 416$ a), 258 nm, 263 nm, 270 nm. No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1082, 1130, 1005, 1149, 1063, 800 (KBr disk).

Mass Spectrum. Principal peaks at m/z 201, 203, 165, 45, 299, 166, 202, 56.

Quantification. GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In plasma: sensitivity 2 ng/ml—H. G. Fouda *et al.*, *J. pharm. Sci.*, 1979, 68, 1456–1458.

Disposition in the Body.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 100 mg of the hydrochloride given to 4 subjects, peak plasma concentrations of 0.074 to 0.089 $\mu\text{g/ml}$ (mean 0.083) were attained in 2 to 4 hours (H. G. Fouda *et al.*, *ibid.*).

TOXICITY.

A plasma concentration of 102.7 $\mu\text{g/ml}$ was reported 8.5 hours after the ingestion of about 500 mg of hydroxyzine by a 13-month-old child; the child recovered within 72 hours (B. E. Magera, *Pediatrics*, 1981, 67, 280–283).

In a fatality due to hydroxyzine, the following postmortem tissue concentrations were reported: blood 39 $\mu\text{g/ml}$, brain 163 $\mu\text{g/g}$, bile 122 $\mu\text{g/ml}$, liver 414 $\mu\text{g/g}$, urine 19 $\mu\text{g/ml}$ (G. R. Johnson, *J. analyt. Toxicol.*, 1982, 6, 69–70).

HALF-LIFE. Plasma half-life, about 3 hours.

Dose. 75 to 400 mg of hydroxyzine hydrochloride daily.

Hyoscyne

Anticholinergic

Synonym. Scopolamine

(–)-(1*S*,3*S*,5*R*,6*R*,7*S*)-6,7-Epoxytropan-3-yl (*S*)-tropate

$C_{17}H_{21}NO_4 = 303.4$

CAS—51-34-3

An alkaloid found in various solanaceous plants, particularly species of *Datura*, *Scopolia*, and *Duboisia*.

A viscous liquid which forms a crystalline monohydrate with a m.p. of 59°.

Soluble 1 in 10 of water; freely soluble in ethanol, chloroform, and ether.

Hyoscyne Hydrobromide

Synonyms. Scopolamine Bromhydrate; Scopolamine Hydrobromide.

Proprietary Names. Joy-rides; Quick Kwells; Scopos; Sereen. It is an ingredient of Omnopon-Scopolamine.

$C_{17}H_{21}NO_4 \cdot HBr \cdot 3H_2O = 438.3$

CAS—114-49-8 (anhydrous); 6533-68-2 (trihydrate)

Colourless transparent crystals or white crystalline powder; slightly efflorescent in dry air. M.p. about 197°, with decomposition.

Soluble 1 in 3.5 of water and 1 in 30 of ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 7.6 (23°).

Partition Coefficient. Log *P* (octanol/pH 7.4), 1.2.

Colour Test. Liebermann's Test—red-orange.

Thin-layer Chromatography. *System TA*—Rf 01; *system TB*—Rf 06; *system TC*—Rf 39. (*Dragendorff spray*, positive; *acidified iodoplatinate solution*, positive; *Marquis reagent*, pink.)

Gas Chromatography. *System GA*—RI 2303; *system GF*—RI 2885.

High Pressure Liquid Chromatography. *System HA*— k' 1.1.

Ultraviolet Spectrum. Aqueous acid—251 nm, 257 nm ($A_1^1 = 6.3$ a), 263 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1730, 853, 1166, 736, 705, 1047 (hyoscyne hydrobromide, KBr disk).

Mass Spectrum. Principal peaks at m/z 94, 138, 42, 108, 136, 41, 96, 97.

Quantification. GAS CHROMATOGRAPHY-MASS SPECTROMETRY. In plasma or urine: sensitivity 50 pg/ml—W. F. Bayne *et al.*, *J. pharm. Sci.*, 1975, 64, 288–291.

Disposition in the Body. Readily absorbed after oral administration and extensively metabolised. About 5% of an oral dose is excreted in the urine as unchanged drug.

THERAPEUTIC CONCENTRATION.

Following a single oral dose equivalent to 415 µg of hyoscine to 10 subjects, a mean peak plasma concentration of 0.0003 µg/ml was attained in 0.5 to 1 hour, decreasing to 50% of the peak concentration in 2 to 4 hours (C. Muir and R. Metcalfe, *J. pharm. biomed. Analysis*, 1983, 1, 363–367).

TOXICITY. The lethal dose in children may be as low as 10 mg but fatalities after hyoscine poisoning are rare.

PROTEIN BINDING. Bound to plasma proteins.

Dose. 0.6 to 2.4 mg of hyoscine hydrobromide daily.

Hyoscine Butylbromide

Anticholinergic

Synonyms. Butylscopolamonii Bromidum; Hyoscine-*N*-Butyl Bromide; Scopolamine Butylbromide.

Proprietary Name. Buscopan

(–)-(1*S*,3*s*,5*R*,6*R*,7*S*)-8-Butyl-6,7-epoxy-3-[(*S*)-tropoyloxy]tropanium bromide

$C_{21}H_{30}BrNO_4 = 440.4$

CAS—149-64-4

A white crystalline powder. M.p. 140° to 144°.

Soluble 1 in 1 of water, 1 in 50 of ethanol, and 1 in 5 of chloroform; practically insoluble in ether.

Colour Tests. Aromaticity (Method 2)—colourless/yellow; Liebermann's Test—orange.

Thin-layer Chromatography. System TA—Rf 08. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—252 nm ($A_1^1 = 3.7$ a), 258 nm ($A_1^1 = 4.6$ a), 264 nm ($A_1^1 = 3.6$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1175, 1721, 1052, 874, 1072, 709 (Nujol mull).

Disposition in the Body. Poorly absorbed after oral administration. About 90% of an oral dose is eliminated in the faeces and less than 10% is excreted in the urine. After intravenous administration, about 40% of a dose is excreted in the urine.

HALF-LIFE. Plasma half-life, about 8 hours.

PROTEIN BINDING. In plasma, about 10%.

Dose. 20 mg given parenterally, repeated if necessary; 80 mg daily, by mouth.

Hyoscine Methobromide

Anticholinergic

Synonyms. Epoxymethamine Bromide; Hyoscine Methylbromide; Methoscopolamine Bromide; Scopolamine Methylbromide.

Proprietary Names. Holopon; Pamine.

(–)-(1*S*,3*s*,5*R*,6*R*,7*S*)-6,7-Epoxy-8-methyl-3-[(*S*)-tropoyloxy]tropanium bromide

$C_{18}H_{24}BrNO_4 = 398.3$

CAS—155-41-9

White crystals or crystalline powder. M.p. about 225°, with decomposition.

Soluble 1 in 3 of water, 1 in 100 of ethanol, and 1 in 40 of methanol; practically insoluble in chloroform.

Colour Test. Aromaticity (Method 2)—colourless/yellow.

Ultraviolet Spectrum. Aqueous acid—253 nm ($A_1^1 = 3.7$ b), 258 nm ($A_1^1 = 4.4$ a), 264 nm ($A_1^1 = 3.4$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1718, 1180, 1174, 1042, 923, 858 (KBr disk).

Dose. 10 to 12.5 mg daily.

Hyoscine Methonitrate

Anticholinergic

Synonyms. Hyoscine Methylnitrate; Methscopolamine Nitrate; Methylhyoscini Nitras; Methylscopolamini Nitras; Scopolamine Methylnitrate.

Proprietary Name. Skopyl

(–)-(1*S*,3*s*,5*R*,6*R*,7*S*)-6,7-Epoxy-8-methyl-3-[(*S*)-tropoyloxy]tropanium nitrate

$C_{18}H_{24}N_2O_7 = 380.4$

CAS—6106-46-3

Colourless hygroscopic crystals or a white crystalline powder. M.p. 194° to 199°.

Soluble 1 in 1.5 of water and 1 in 40 of ethanol; practically insoluble in chloroform and ether.

Colour Tests. Aromaticity (Method 2)—colourless/violet (transient); Liebermann's Test—orange.

Thin-layer Chromatography. System TA—Rf 02. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—251 nm ($A_1^1 = 4.3$ a), 257 nm ($A_1^1 = 5.1$ a), 263 nm ($A_1^1 = 3.8$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1735, 1175, 1185, 1317, 860, 923 (KBr disk).

Dose. Up to 12 mg daily.

Hyoscyamine

Anticholinergic

Synonym. *l*-Hyoscyamine

Proprietary Name. Cystospaz

(-)-(1*R*,3*r*,5*S*)-Tropan-3-yl (*S*)-tropate

$C_{17}H_{23}NO_3 = 289.4$

CAS—101-31-5

An alkaloid obtained from various solanaceous plants, *Hyoscyamus muticus* and *Duboisia myoporoides* being the best sources. It is the laevo-isomer of atropine.

A white crystalline powder. M.p. 106° to 109°.

Soluble 1 in 280 of water, 1 in 1 of chloroform, and 1 in 48 of ether; freely soluble in ethanol.

Hyoscyamine Hydrobromide

Synonym. Hyoscyamine Bromhydrate

Proprietary Name. It is an ingredient of Natrirose.

$C_{17}H_{23}NO_3 \cdot HBr = 370.3$

CAS—306-03-6

White prismatic crystals or crystalline powder. M.p. about 149°.

Freely **soluble** in water; soluble 1 in 2.5 of ethanol and 1 in 1.7 of chloroform; very slightly soluble in ether.

Hyoscyamine Sulphate

Proprietary Names. Anaspaz; Cystospaz-M; Egacen(e); Egazil; Levsin; Levsinex; Peptard.

$(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot 2H_2O = 712.9$

CAS—620-61-1 (anhydrous); 6835-16-1 (dihydrate)

Colourless needles or a white deliquescent crystalline powder. M.p. about 203°, with decomposition.

Soluble 1 in 0.5 of water and 1 in 5 of ethanol; sparingly soluble in dehydrated alcohol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 9.7 (21°).

Colour Test. Liebermann's Test—red-orange.

Thin-layer Chromatography. System TA—Rf 18. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2192.

High Pressure Liquid Chromatography. System HA— k' 3.7 (tailing peak).

Ultraviolet Spectrum. Aqueous acid—252 nm ($A_1^1 = 6.2$ a), 258 nm ($A_1^1 = 8.2$ a), 264 nm ($A_1^1 = 6.2$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1738, 1160, 1025, 1145, 1225, 1050 (hyoscyamine hydrobromide, KBr disk).

Quantification. See under Atropine.

Dose. 0.6 to 1.2 mg daily.

Ibogaine

Alkaloid

(-)-7-Ethyl-6,6a,7,8,9,10,12,13-octahydro-2-methoxy-6,9-methano-5*H*-pyrido[1,2-*a*]azepino[4,5-*b*]indole

$C_{20}H_{26}N_2O = 310.4$

CAS—83-74-9

An alkaloid obtained from *Tabernanthe iboga* (Apocynaceae).

Crystals. M.p. 152° to 153°.

Practically **insoluble** in water; soluble in ethanol, chloroform, and ether.

Ibogaine Hydrochloride

$C_{20}H_{26}N_2O \cdot HCl = 346.9$

CAS—5934-55-4

Crystals. M.p. 299° to 300°, with decomposition.

Soluble in water, ethanol, and methanol; slightly soluble in chloroform; practically insoluble in ether.

Colour Tests. Liebermann's Test—black; Mandelin's Test—grey → violet; Marquis Test—grey → orange.

Thin-layer Chromatography. System TA—Rf 65; system TB—Rf 28; system TC—Rf 50. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2872.

High Pressure Liquid Chromatography. System HA— k' 2.1.

Ultraviolet Spectrum. Aqueous acid—278 nm ($A_1^1 = 212$ c).

Infra-red Spectrum. Principal peaks at wavenumbers 1490, 1210, 1140, 810, 1020, 835 (ibogaine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 136, 310, 135, 225, 149, 122, 155, 311.

Quantification. GAS CHROMATOGRAPHY. In urine: detection limit 5 ng, AFID—G. P. Cartoni and A. Giarusso, *J. Chromat.*, 1972, 71, 154–158.

Ibomal

Barbiturate

Synonyms. Bromoapobarbitone; Isopropyl-bromallyl-barbitur-säure; Propallylonal.

Proprietary Name. Noctal

5-(2-Bromoallyl)-5-isopropylbarbituric acid
 $C_{10}H_{13}BrN_2O_3 = 289.1$
 CAS—545-93-7

A white crystalline powder. M.p. 179° to 182°. Very slightly **soluble** in water; soluble in ethanol; slightly soluble in ether.

Dissociation Constant. pK_a 7.7 (20°).

Colour Test. Koppanyi–Zwicker Test—violet.

Thin-layer Chromatography. System TD—Rf 50; system TE—Rf 31; system TF—Rf 67; system TH—Rf 61.

Gas Chromatography. System GA—ibomal RI 1883, 5-(2-acetonyl)-5-isopropylbarbituric acid RI 1770.

High Pressure Liquid Chromatography. System HG— k' 4.01; system HH— k' 2.58.

Ultraviolet Spectrum. Borax buffer 0.05M (pH 9.2)—240 nm ($A_1^1 = 307$ a); M sodium hydroxide (pH 13)—257 nm ($A_1^1 = 240$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1700, 1722, 1210, 1300, 830, 1622.

Mass Spectrum. Principal peaks at m/z 167, 209, 43, 124, 39, 41, 53, 140.

Disposition in the Body. Metabolised by side-chain oxidation to 5-(2-acetonyl)-5-isopropylbarbituric acid. About 6 to 16% of a dose is slowly excreted in the urine as the metabolite with about 1 to 3% as unchanged drug; the metabolite is still detectable in urine 9 days after a single dose.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.3 to 10 $\mu\text{g/ml}$.

TOXICITY. Blood concentrations greater than about 10 $\mu\text{g/ml}$ may be toxic or lethal.

PROTEIN BINDING. In plasma, about 34%.

Dose. 100 to 400 mg, as a hypnotic.

Ibuprofen

Analgesic

Proprietary Names. Amersol; Apsifen; Brufen; Ebufac; Fenbid; Inabrin; Inflam; Librofem; Motrin; Nurofen; Paxofen; Proflex; Relcofen; Seclodin; Uniprofen.

2-(4-Isobutylphenyl)propionic acid

$C_{13}H_{18}O_2 = 206.3$

CAS—15687-27-1

A white powder or crystals. M.p. 75° to 78°.

Practically **insoluble** in water; soluble 1 in 1.5 of ethanol, 1 in 1 of chloroform, and 1 in 2 of ether.

Dissociation Constant. pK_a 4.4, 5.2.

Colour Tests. Liebermann's Test—brown-orange; Marquis Test—brown (\rightarrow orange at 100°).

Thin-layer Chromatography. System TD—Rf 46; system TE—Rf 07; system TF—Rf 54; system TG—Rf 18.

Gas Chromatography. System GA—RI 1631; system GD—retention time of methyl derivative 0.89 relative to $n\text{-C}_{16}\text{H}_{34}$.

High Pressure Liquid Chromatography. System HD— k' 15.1.

Ultraviolet Spectrum. Aqueous alkali—265 nm ($A_1^1 = 18.5$ a), 273 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1721, 1232, 779, 1185, 1273, 870 (KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 163, 161, 119, 91, 206, 117, 107, 164.

Quantification. GAS CHROMATOGRAPHY. In serum: sensitivity 500 ng/ml, FID—D. J. Hoffman, *J. pharm. Sci.*, 1977, 66, 749–750. In serum: sensitivity 100 ng/ml, ECD—D. G. Kaiser and R. S. Martin, *J. pharm. Sci.*, 1978, 67, 627–630.

GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In biological fluids: sensitivity 1 ng—J. B. Whitlam and J. H. Vine, *J. Chromat.*, 1980, 181; *Biomed. Appl.*, 7, 463–468.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In biological fluids: sensitivity, 1 μg/ml for ibuprofen in plasma, 5 μg/ml for ibuprofen or the hydroxy or carboxy metabolites in urine, UV detection—G. F. Lockwood and J. G. Wagner, *J. Chromat.*, 1982, 232; *Biomed. Appl.*, 21, 335–343.

Disposition in the Body. Readily and almost completely absorbed after oral administration. More than 60% of a dose is excreted in the urine in 24 hours, including about 9% of the dose as the 2-hydroxy metabolite, 2-[4-(2-hydroxy-2-methylpropyl)phenyl]propionic acid, about 17% as the conjugated hydroxy metabolite, about 16% as the 2-carboxy metabolite, 2-[4-(carboxypropyl)phenyl]propionic acid, and about 19% as the conjugated carboxy metabolite (both metabolites are inactive); less than 10% of a dose is excreted unchanged. The remainder of the dose is probably eliminated in the faeces after excretion in the bile; excretion is virtually complete within 24 hours.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 20 to 30 μg/ml.

After a single oral dose of 200 mg to 2 subjects, peak plasma concentrations of 18 and 24 μg/ml of ibuprofen were attained in 1.5 hours; peak plasma concentrations of the hydroxy and carboxy metabolites of 0.6 and 1 μg/ml, and 1.7 and 2.1 μg/ml, respectively, were attained in 3 hours; plasma concentrations after oral doses of 200 mg three times daily for 14 days were of the same order (R. Mills *et al.*, *Xenobiotica*, 1973, 3, 589–598).

TOXICITY.

In an attempted suicide involving the ingestion of 12 g of ibuprofen, an initial serum concentration of 840 μg/ml was reported; this declined to 220 μg/ml at 3 hours; chlorpheniramine was also detected in the urine. The subject was comatose but recovered within 24 hours (D. P. Hunt and R. J. Leigh, *Br. med. J.*, 1980, 281, 1458–1459).

In 2 overdoses due to ibuprofen, plasma concentrations of 400 and 711 μg/ml were reported about 1.5 hours after ingestion. In the first case, the estimated dose was 14 to 16 g; both subjects recovered (H. Court *et al.*, *Br. med. J.*, 1981, 282, 1073).

HALF-LIFE. Plasma half-life, about 2 hours.

VOLUME OF DISTRIBUTION. About 0.1 litre/kg.

PROTEIN BINDING. In plasma, about 99%.

Dose. 0.6 to 2.4 g daily.

Idobutal

Barbiturate

Synonym. *n*-Butylallylbarbituric Acid

5-Allyl-5-butylbarbituric acid

$C_{11}H_{16}N_2O_3 = 224.3$

CAS—3146-66-5

Crystals. M.p. 128°.

Slightly soluble in water; freely soluble in ethanol and ether.

Thin-layer Chromatography. System TD—Rf 55; system TE—Rf 41; system TF—Rf 69; system TH—Rf 71.

Gas Chromatography. System GA—RI 1698.

High Pressure Liquid Chromatography. System HG—k' 8.12; system HH—k' 4.77.

Ultraviolet Spectrum. Borax buffer 0.05M (pH 9.2)—239 nm ($A_1^1 = 434$ b); M sodium hydroxide (pH 13)—254 nm ($A_1^1 = 328$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1696, 1728, 1755, 835, 1290, 1207.

Mass Spectrum. Principal peaks at m/z 167, 41, 168, 124, 39, 97, 141, 67.

Idoxuridine

Antiviral

Synonyms. IDU; 5 IDUR.

Proprietary Names. Herplex; Idoxene; Iduviran; Kerecid; Ophthalmadine; Stoxil. It is an ingredient of Herpid and Iduridin.

2'-Deoxy-5-iodouridine

$C_9H_{11}IN_2O_5 = 354.1$

CAS—54-42-2

Colourless crystals or a white crystalline powder. It decomposes on heating with the liberation of iodine vapour.

Soluble 1 in 500 of water, 1 in 400 of ethanol, and 1 in 230 of methanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 8.3.

Colour Test. Iodine Test—positive.

Ultraviolet Spectrum. Aqueous acid—288 nm ($A_1^1 = 220$ a); aqueous alkali—279 nm ($A_1^1 = 162$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1667, 1259, 1096, 1605, 1289, 1070 (KBr disk).

Use. Solutions of idoxuridine in dimethyl sulfoxide are used topically in concentrations of 5 to 40%.

Imipramine

Antidepressant

3-(10,11-Dihydro-5H-dibenz[*b,f*]azepin-5-yl)-*NN*-dimethylpropylamine

$C_{19}H_{24}N_2 = 280.4$

CAS—50-49-7

Imipramine Embonate

Synonym. Imipramine Pamoate

Proprietary Name. Tofranil-PM

$(C_{19}H_{24}N_2)_2 \cdot C_{23}H_{16}O_6 = 949.2$

CAS—10075-24-8

A yellow powder.

Practically **insoluble** in water; soluble in ethanol, chloroform, and ether.

Imipramine Hydrochloride

Synonym. Imizine

Proprietary Names. Antipress; Berkamine; Imavate; Impril; Iramil; Janimine; Praminil; Presamine; Tofranil; W.D.D.

$C_{19}H_{24}N_2 \cdot HCl = 316.9$

CAS—113-52-0

A white or slightly yellow crystalline powder. M.p. 170° to 174°.

Soluble 1 in 2 of water, 1 in 1.5 of ethanol, and 1 in 1.5 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 9.5 (24°).

Partition Coefficient. Log *P* (octanol/pH 7.4), 2.5.

Colour Tests. Forrest Reagent—blue; FPN Reagent—blue; Liebermann's Test—blue; Mandelin's Test—blue (add water).

Thin-layer Chromatography. System *TA*—Rf 48; system *TB*—Rf 49; system *TC*—Rf 23. (*Dragendorff* spray, positive; *FPN* reagent, blue; acidified iodoplatinate solution, positive; *Marquis* reagent, blue.)

Gas Chromatography. System *GA*—imipramine RI 2223, desipramine RI 2242, 2-hydroxyimipramine RI 2540; system *GF*—RI 2540.

High Pressure Liquid Chromatography. System *HA*—imipramine k' 4.2, desipramine k' 2.1, 2-hydroxydesipramine k' 1.2, 2-hydroxyimipramine k' 3.1; system *HF*—imipramine k' 4.17, desipramine k' 3.60.

Ultraviolet Spectrum. Aqueous acid—251 nm ($A_1^1 = 298$ a); aqueous alkali—252 nm. (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 740, 747, 765, 1230, 1110, 756 (imipramine hydrochloride, KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 58, 235, 85, 234, 236, 195, 193, 208; desipramine 235, 195, 208, 44, 234, 193, 194, 71; 2-hydroxyimipramine 58, 251, 250, 211, 85, 42, 209, 296; 2-hydroxydesipramine 44, 209, 211, 250, 210, 224, 42, 251.

Quantification. GAS CHROMATOGRAPHY. In plasma: imipramine and desipramine, detection limit 10 ng/ml, AFID—S. Dawling and R. A. Braithwaite, *J. Chromat.*, 1978, 146; *Biomed. Appl.*, 3, 449–456.

GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In serum or plasma: imipramine and desipramine, sensitivity 4 ng/ml—D. Alkalay *et al.*, *Biomed. Mass Spectrom.*, 1979, 6, 200–204.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: imipramine, desipramine and the 2-hydroxy metabolites, sensitivity

5 ng/ml, electrochemical detection—R. F. Suckow and T. B. Cooper, *J. pharm. Sci.*, 1981, 70, 257–261. In plasma or serum: imipramine and desipramine, sensitivity 5 ng/ml, UV detection—P. M. Kabra *et al.*, *Clinica chim. Acta*, 1981, 111, 123–132.

REVIEW. Comparison of GC, GC-MS and RIA methods—K. K. Midha *et al.*, *J. analyt. Toxicol.*, 1980, 4, 237–243.

Disposition in the Body. Readily absorbed after oral administration and widely distributed throughout the tissues; bioavailability about 50%, but there is considerable intersubject variation. Imipramine undergoes considerable first-pass metabolism, mainly by demethylation to the primary active metabolite desipramine. Other major metabolic reactions include hydroxylation at the 2- or 10-positions followed by conjugation. The extent of 2-hydroxylation appears to be genetically determined. 2-Hydroxyimipramine and 2-hydroxydesipramine appear to be active. A large number of metabolites have been identified in the urine and less than 10% of a dose is excreted unchanged. A total of about 40% of a dose is excreted in the urine in 24 hours and about 70% in 72 hours. Of the urinary material, up to 40% consists of free and conjugated 2-hydroxydesipramine, up to about 25% is free and conjugated 2-hydroxyimipramine, and about 15% is free and conjugated 2-hydroxyiminodibenzyl;

small amounts of didesmethylimipramine, free iminodibenzyl, and 10-hydroxydesipramine are also found. The excretion of unchanged drug and unconjugated metabolites is pH-dependent and is increased in acid urine. About 20% of a dose is eliminated in the faeces.

THERAPEUTIC CONCENTRATION. Plasma concentrations vary considerably between individual subjects; therapeutic effect has been correlated with plasma concentrations of imipramine plus desipramine greater than 0.1 µg/ml.

Following a single oral dose of 50 mg to 8 subjects, peak plasma concentrations of 0.010 to 0.083 µg/ml (mean 0.03) of imipramine and 0.004 to 0.014 µg/ml (mean 0.008) of desipramine were attained in about 3.4 hours, and 4.8 hours respectively (N. Sistovaris *et al.*, *J. Chromat.*, 1983, 277; *Biomed. Appl.*, 28, 273–281).

After daily oral doses of 50 to 300 mg (mean 100) to 24 subjects, the following steady-state plasma concentrations were reported: imipramine 0.01 to 0.11 µg/ml (mean 0.05), desipramine 0.02 to 0.33 µg/ml (mean 0.09), 2-hydroxyimipramine 0 to 0.02 µg/ml (mean 0.01), 2-hydroxydesipramine 0 to 0.06 µg/ml (mean 0.03), didesmethylimipramine 0 to 0.04 µg/ml (mean 0.007) (L. F. Gram *et al.*, *Clin. Pharmac. Ther.*, 1983, 33, 335–342).

TOXICITY. In adults the estimated minimum lethal dose is 1 g, although fatalities have occurred with less and patients have survived the ingestion of as much as 5 g. In children, as little as 350 mg may be fatal. Blood concentrations greater than 0.5 µg/ml (imipramine and desipramine) may cause toxic effects and imipramine concentrations of 0.8 to 4.5 to 13 µg/ml have been associated with fatalities.

In 5 fatalities attributed to overdose with imipramine, the following postmortem concentrations were found: blood 0.3 to 4.1 µg/ml (mean 2.7), bile 19.2 to 71.7 µg/ml (mean 46, 4 cases), liver blood 0.2 to 9.6 µg/ml (mean 4.6), urine 0.8 to 12.7 µg/ml (mean 5.3, 3 cases) (A. E. Robinson *et al.*, *J. analyt. Toxicol.*, 1979, 3, 3–13).

A 49-year-old female was found dead after having ingested 33 tablets equivalent to 925 mg of imipramine; blood and tissue concentrations were as follows: blood 14 µg/ml, bile 88 µg/ml, brain 25 µg/g, liver 75 µg/g (K. D. Singh *et al.*, *Bull. int. Ass. forens. Toxicol.*, 1978, 14(2), 21).

In 2 fatalities due to imipramine overdose, the following postmortem tissue concentrations were reported (µg/ml or µg/g):

	Imipramine	Desipramine
Blood	10, 3	3, trace
Kidney	9, —	6, —
Liver	16, 46	10, 13
Urine	—, 64	—, 13

(A. E. Hodda, *Bull. int. Ass. forens. Toxicol.*, 1974, 10(3), 8–9).

HALF-LIFE. Plasma half-life, imipramine 8 to 20 hours, increased in children, elderly subjects, and after overdose; desipramine 10 to 35 hours.

VOLUME OF DISTRIBUTION. 10 to 20 litres/kg.

CLEARANCE. Plasma clearance, about 15 ml/min/kg, decreased in elderly subjects.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 0.98.

PROTEIN BINDING. In plasma, 85 to 95%.

NOTE. For a review of the pharmacokinetics of tricyclic antidepressants see G. Molnar and R. N. Gupta, *Biopharm. Drug Disp.*, 1980, 1, 283–305.

Dose. 30 to 200 mg of imipramine hydrochloride daily; up to 300 mg daily has been given.

Imolamine

Anti-anginal Vasodilator

2-(5-Imino-3-phenyl-1,2,4-oxadiazolin-4-yl)triethylamine

C₁₄H₂₀N₄O = 260.3

CAS—318-23-0

In blood, plasma or urine: sensitivity 25 ng/ml in plasma, 50 ng/ml in blood and urine, UV detection—R. L. Choi *et al.*, *J. Chromat.*, 1982, 230; *Biomed. Appl.*, 19, 181–187. In urine: indapamide and 4-chloro-3-sulphamoylbenzoic acid, sensitivity 25 ng/ml, UV detection—P. Pietta *et al.*, *J. Chromat.*, 1982, 228; *Biomed. Appl.*, 17, 377–381.**Disposition in the Body.** Rapidly absorbed after oral administration. It is extensively metabolised and about 60% of a dose is slowly excreted in the urine over a period of 8 days with less than 5% as unchanged drug. About 20% of a dose is slowly eliminated in the faeces.**THERAPEUTIC CONCENTRATION.**Following a single oral dose of 5 mg to 22 subjects, a mean peak plasma concentration of 0.26 µg/ml was attained in about 2 to 3 hours (P. E. Grebow *et al.*, *Eur. J. clin. Pharmac.*, 1982, 22, 295–299).Following daily oral doses of 2.5 mg to 6 subjects, steady-state plasma concentrations of 0.02 to 0.05 µg/ml (mean 0.03) were attained in 3 days (D. B. Campbell *et al.*, *Curr. med. Res. Opinion*, 1977, 5, Suppl. 1, 13–24).**HALF-LIFE.** Plasma half-life, about 15 hours.**PROTEIN BINDING.** In plasma, about 80%.**NOTE.** For a review of indapamide see M. Chaffman *et al.*, *Drugs*, 1984, 28, 189–235.**Dose.** 2.5 to 5 mg daily.**Indomethacin***Analgesic**Proprietary Names.* Amuno; Artracin; Confortid; Imbrilon; Indocid; Indocin; Indoflex; Indolar; Mobilan; Rheumacin.

[1-(4-Chlorobenzoyl)-5-methoxy-2-methylindol-3-yl]acetic acid

 $C_{19}H_{16}ClNO_4 = 357.8$

CAS—53-86-1

A white to yellow-tan, crystalline powder. M.p. about 158° to 162°. It exhibits polymorphism.

Practically **insoluble** in water; soluble 1 in 50 of ethanol, 1 in 30 of chloroform, and 1 in about 40 of ether; soluble in acetone.**Dissociation Constant.** pK_a 4.5.**Partition Coefficient.** Log *P* (octanol/pH 7.4), −1.0.**Colour Tests.** Liebermann's Test—black; Mandelin's Test—grey; Marquis Test—orange; Sulphuric Acid—orange.**Thin-layer Chromatography.** *System TD*—Rf 16; *system TE*—Rf 06; *system TF*—Rf 20; *system TG*—Rf 20. (Chromic acid solution, grey-brown; acidified potassium permanganate solution, positive.)**Gas Chromatography.** *System GA*—RI 2685; *system GD*—retention times of methyl derivative 1.55 and 0.49 relative to n -C₁₆H₃₄.**High Pressure Liquid Chromatography.** *System HD*— k' 6.95; *system HV*—retention time 0.87 relative to meclofenamic acid.**Ultraviolet Spectrum.** Methanolic acid—318 nm ($A_1^1 = 180$ a); aqueous alkali—230 nm, 279 nm ($A_1^1 = 213$ a). (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 1681, 1228, 1218, 1706, 1299, 1065 (KBr disk).

Mass Spectrum. Principal peaks at m/z 139, 141, 357, 111, 359, 140, 113, 75.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: indomethacin and desmethylin domethacin, sensitivity 10 ng/ml, ECD—P. Guissou *et al.*, *J. Chromat.*, 1983, 277; *Biomed. Appl.*, 28, 368–373.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: indomethacin and desmethylin domethacin, sensitivity 25 ng/ml for indomethacin in plasma, fluorescence detection—M. S. Bernstein and M. A. Evans, *J. Chromat.*, 1982, 229; *Biomed. Appl.*, 18, 179–187.

THIN-LAYER CHROMATOGRAPHY. In plasma or urine: sensitivity 30 ng/ml—I. Soendergaard and E. Steiness, *J. Chromat.*, 1979, 162; *Biomed. Appl.*, 4, 485–488.

RADIOIMMUNOASSAY. In plasma or urine: sensitivity 50 ng/ml—L. E. Hare *et al.*, *J. pharm. Sci.*, 1977, 66, 486–489.

Disposition in the Body. Readily and almost completely absorbed after oral administration. Indomethacin is subject to considerable enterohepatic circulation. Metabolic reactions include *O*-demethylation, *N*-deacetylation, and glucuronic acid conjugation, the major metabolites being desmethylin domethacin (DMI), deschlorobenzoylin domethacin (DBI), and desmethyl-deschlorobenzoylin domethacin (DMBI) and their glucuronides. These substances, together with unchanged indomethacin and its glucuronide, are excreted in both the urine (up to about 60% of the dose in 48 hours) and in the faeces (up to about 30% of the dose in 96 hours) in variable amounts. Expressed as a percentage of the dose, the average amounts excreted in the urine in 48 hours are: unchanged indomethacin 5 to 20% (dependent on urinary pH), indomethacin glucuronide 6 to 26%, DMI and its glucuronide 8 to 23%, DBI and its glucuronide 4 to 20%, DMBI and its glucuronide less than 3%; in the faeces the major metabolites found are DMBI (up to about 16%) and DMI (up to about 12%), with only small amounts of unchanged indomethacin and DBI.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.5 to 3 $\mu\text{g/ml}$.

After a single oral dose of 50 mg given to 20 subjects, peak plasma concentrations of 1.0 to 3.0 $\mu\text{g/ml}$ (mean 1.9) were attained in 1 to 4 hours (K. C. Kwan *et al.*, *J. Pharmacokinet. Biopharm.*, 1976, 4, 255–280). Steady-state plasma concentrations of 0.31 to 0.63 $\mu\text{g/ml}$ (mean 0.49) were attained in about 6 days after oral doses of 25 mg three times a day to 5 subjects (G. Alván *et al.*, *Clin. Pharmac. Ther.*, 1975, 18, 364–373).

TOXICITY. Toxic effects may be produced by plasma concentrations greater than 5 $\mu\text{g/ml}$.

HALF-LIFE. Plasma half-life, 3 to 15 hours.

VOLUME OF DISTRIBUTION. About 1 litre/kg.

CLEARANCE. Plasma clearance, 1 to 2 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 1.9.

PROTEIN BINDING. In plasma, 90 to 99%.

NOTE. For a review of the pharmacokinetics of indomethacin see L. Helleberg, *Clin. Pharmacokinet.*, 1981, 6, 245–258.

Dose. 50 to 200 mg daily.

Indoprofen

Analgesic

Synonym. Isindone

Proprietary Name. Flosint

2-[4-(1-Oxoindolin-2-yl)phenyl]propionic acid

$\text{C}_{17}\text{H}_{15}\text{NO}_3 = 281.3$

CAS—31842-01-0

A white crystalline powder. M.p. 212°.

Practically **insoluble** in water; very slightly soluble in chloroform; freely soluble in dimethylformamide; slightly soluble in methanol; sparingly soluble in 0.1M sodium hydroxide.

Dissociation Constant. pK_a 5.8.

Thin-layer Chromatography. System TG—Rf 08. (Ludy Tenger reagent, brown-black.)

Gas Chromatography. System GD—retention times of methyl derivative 2.27 and 2.07 relative to $n\text{-C}_{16}\text{H}_{34}$.

High Pressure Liquid Chromatography. System HD— k' 1.2; system HV—retention time 0.52 relative to meclofenamic acid.

Ultraviolet Spectrum. Methanol—282 nm ($A_1^1 = 505$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1680, 1510, 730, 1300, 1220, 1605 (KBr disk).

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 400 ng/ml, FID—R. V. Smith *et al.*, *J. pharm. Sci.*, 1977, 66, 132–134.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: sensitivity 500 ng/ml, UV detection—K. Lanbeck *et al.*, *J. Chromat.*, 1980, 182; *Biomed. Appl.*, 8, 262–266.

Disposition in the Body. Rapidly and almost completely absorbed after oral administration. About 80 to 90% of a dose is excreted in the urine in 24 hours as the glucuronide conjugate together with small amounts of unchanged drug and metabolites.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 100 mg given to 4 subjects, peak plasma concentrations of 6.9 to 14.3 $\mu\text{g/ml}$ were attained in 1 to 1.5 hours; following a single oral dose of 200 mg, peak plasma concentrations of 14.2 to 26.1 $\mu\text{g/ml}$ were reported at 0.5 to 2 hours (V. Tamassia *et al.*, *Eur. J. clin. Pharmac.*, 1976, 10, 257–262).

TOXICITY. Indoprofen was suspended from use in the United Kingdom in December 1983 because of reports of side-effects and fatalities.

HALF-LIFE. Plasma half-life, about 2 hours.

VOLUME OF DISTRIBUTION. About 0.1 litre/kg.

CLEARANCE. Plasma clearance, about 0.7 ml/min/kg.

PROTEIN BINDING. In plasma, about 99%.

Dose. Indoprofen has been given in doses of 200 to 800 mg daily.

Indoramin

Antihypertensive

N-[1-(2-Indol-3-ylethyl)-4-piperidyl]benzamide

$\text{C}_{22}\text{H}_{25}\text{N}_3\text{O} = 347.5$

CAS—26844-12-2

Indoramin Hydrochloride

Proprietary Name. Baratol

$\text{C}_{22}\text{H}_{25}\text{N}_3\text{O} \cdot \text{HCl} = 383.9$

CAS—33124-53-7 (xHCl)

Crystals. M.p. 250° to 253°.

Slightly soluble in water and chloroform; sparingly soluble in ethanol; soluble in methanol.

Dissociation Constant. pK_a 7.7.

Ultraviolet Spectrum. Ethanol—273 nm ($A_1^1 = 187$ b), 279 nm ($A_1^1 = 190$ b), 289 nm ($A_1^1 = 159$ b).

Infra-red Spectrum. Two major polymorphic forms exist. Principal peaks at wavenumbers 1640, 1535, 1316, 745, 1575, 715 (indoramin hydrochloride form I, Nujol mull); 1620, 1630, 1540, 1560, 740, 1317 (indoramin hydrochloride form II, Nujol mull).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 1 ng/ml, fluorescence detection—A. J. Swaisland, *Analyst, Lond.*, 1981, 106, 717–719.

Disposition in the Body. Readily absorbed after oral administration, but undergoes extensive first-pass metabolism to active metabolites. About 35% of a dose is excreted in the urine in 5 days, mainly as metabolites; less than 10% of a dose is excreted in the urine as unchanged drug; about 47% of a dose is eliminated in the faeces, mainly as metabolites; 6-hydroxyindoramin has been identified as a major metabolite. Other metabolites include acid-labile conjugates of indoramin and 6-hydroxyindoramin.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 50 mg to 6 middle-aged female subjects, peak plasma concentrations of 0.004 to 0.090 $\mu\text{g/ml}$ (mean 0.02) were attained in about 3 hours. After the same dose given to 5 elderly female subjects, peak plasma concentrations of 0.011 to 0.090 $\mu\text{g/ml}$ (mean 0.04) were attained after about 4 hours (H. M. Norbury *et al.*, *Eur. J. clin. Pharmac.*, 1984, 27, 247–249).

Following daily oral doses of 150 mg given to 5 subjects, steady-state plasma concentrations of 0.08 to 0.22 $\mu\text{g/ml}$ (mean 0.13) were reported (G. H. Draffan *et al.*, *Br. J. clin. Pharmac.*, 1976, 3, 489–495).

TOXICITY.

In a fatality attributed to indoramin overdose, an antemortem plasma concentration of 6.4 $\mu\text{g/ml}$ was reported together with an alcohol concentration of 2250 $\mu\text{g/ml}$ (R. Hunter, *Br. med. J.*, 1982, 285, 1011).

HALF-LIFE. Plasma half-life, 2 to 8 hours (mean 5), increased in elderly subjects.

VOLUME OF DISTRIBUTION. About 7 litres/kg.

CLEARANCE. Plasma clearance, about 20 ml/min/kg.

PROTEIN BINDING. In plasma, about 70 to 90% (concentration-dependent).

Dose. The equivalent of 50 to 200 mg of indoramin daily.

Inositol Nicotinate

Vasodilator

Synonyms. Hexanicotinoyl Inositol; Inositol Niacinate.

Proprietary Names. Dilcit; Dilexpal; Hexanicit; Hexopal; Linodil; Palohex; Vasodil.

meso-Inositol hexanicotinate

$\text{C}_{42}\text{H}_{30}\text{N}_6\text{O}_{12} = 810.7$

CAS—6556-11-2

A white crystalline powder. M.p. about 255°. Practically **insoluble** in water and most organic solvents; soluble 1 in 100 of chloroform; soluble in dilute acids.

Thin-layer Chromatography. System TA—Rf 57; system TB—Rf 01; system TC—Rf 43. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—261 nm ($A_1^1 = 352$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1272, 1734, 1102, 1593, 1025, 718 (KBr disk).

Dose. 1.5 to 4 g daily.

Insulin

Antidiabetic

Insulin is an amphoteric pancreatic protein which is extracted from beef or pork pancreas and purified by crystallisation. Insulin which is structurally identical with human insulin may be produced by chemical manipulation of animal insulin or by recombinant DNA technology.

CAS—9004-10-8

A white crystalline powder.

Slightly **soluble** in water; practically insoluble in ethanol, chloroform, and ether; soluble in dilute solutions of mineral acids and, with degradation, in solutions of alkali hydroxides.

Ultraviolet Spectrum. Aqueous acid—276 nm ($A_1^1 = 10.3$ a).

Quantification. ENZYME IMMUNOASSAY. In serum: sensitivity 5 μ U/ml—M. Yoshioka *et al.*, *Clin. Chem.*, 1979, 25, 35–38.

RADIOIMMUNOASSAY. In serum, subcutaneous fat, or tissues—S. J. Dickson *et al.*, *Forens. Sci.*, 1977, 9, 37–42. In serum: free, total, and antibody-bound insulin—W. D. Gennaro and J. D. Van Norman, *Clin. Chem.*, 1975, 21, 873–879.

Disposition in the Body. Insulin is an endogenous hormone secreted by the beta cells of the islets of Langerhans of the pancreas; it consists of two linked polypeptide chains. Ineffective after oral administration due to rapid inactivation by proteolytic enzymes, but well absorbed after subcutaneous or intramuscular injection. It circulates in the blood as a polymer with a molecular weight of 17 000 to 43 000 and is rapidly taken up by the tissues. About 50% of endogenous insulin in the portal vein is metabolised in a single passage through the liver. It is reduced to two separate chains by glutathione insulin transhydrogenase. The intact molecule or reduced chains may be metabolised by insulin-specific protease to peptides and amino acids. Insulin is filtered at the glomeruli but is reabsorbed and metabolised in the renal tubules, and only small amounts are excreted unchanged in the urine. It is also excreted in the bile.

THERAPEUTIC CONCENTRATION. In normal subjects, endogenous blood-insulin concentrations vary throughout the day. The fasting or basal concentration in the plasma is usually in the range of 5 to 40 μ U/ml (mean 17), with 50 to 100 μ U/ml in the portal vein. During absorption of food the peripheral blood concentration may increase by 10 to 15 times.

Serum-insulin concentrations were measured in 21 diabetics; the daily dose varied from 3 to 80 units (mean 36) and the treatment period from one month to 35 years. The concentration of free insulin in the serum was in the range 10 to 440 μ U/ml (mean 47) and total insulin (free and antibody-bound) varied from 67 to 17 020 μ U/ml (mean 2676) (W. D. Gennaro and J. D. Van Norman, *ibid.*).

TOXICITY.

A non-diabetic male, aged 32 years, was found unconscious after a self-administered injection of at least 980 units of lente and soluble insulins. On admission, the serum-insulin concentration was 1830 to 2010 μ U/ml. He died 9 days later and the following postmortem concentrations were reported: serum 42.5 μ U/ml and bile 768 μ U/ml (W. Q. Sturmer and R. S. Putman, *J. forens. Sci.*, 1972, 17, 514–521).

PROTEIN BINDING. In plasma, about 5% in normal subjects, but in diabetics the binding capacity may be extremely high due to formation of insulin-binding antibodies.

NOTE. For a review of the biochemistry and forensic aspects of insulin see S. M. Fletcher, *J. forens. Sci. Soc.*, 1983, 23, 5–17.

Dose. Usually 10 to 100 units or more, a day, subcutaneously.

Iprindole

Antidepressant

Synonym. Pramindole

3-(6,7,8,9,10,11-Hexahydro-5H-cyclo-oct[b]indol-5-yl)-NN-dimethylpropylamine

 $C_{19}H_{28}N_2 = 284.4$

In plasma: sensitivity 5 ng/ml, AFID—G. Caillé *et al.*, *Biopharm. Drug Disp.*, 1982, 3, 11–17.**Disposition in the Body.** Well absorbed after oral administration. It is slowly excreted in the urine, about 50% of a dose being eliminated in 3 days and it is still detectable one week after administration; only about 5% of a dose is excreted in the urine as unchanged drug.**THERAPEUTIC CONCENTRATION.**After a single oral dose of 60 mg given to 5 subjects, peak plasma concentrations of 0.05 to 0.09 $\mu\text{g/ml}$ (mean 0.07) were attained in 2 to 4 hours. Following oral administration of 30 mg three times daily to 4 subjects, plasma concentrations of 0.03 to 0.08 $\mu\text{g/ml}$ (mean 0.06) were reported 10 hours after the final daily dose on day 21 (G. Caillé *et al.*, *ibid.*).**HALF-LIFE.** Plasma half-life, about 35 to 70 hours (mean 52).**Dose.** The equivalent of 45 to 180 mg of iprindole daily.**Iproniazid**

Antidepressant (Monoamine Oxidase Inhibitor)

2'-Isopropylisonicotinohydrazide

 $C_9H_{13}N_3O = 179.2$

CAS—54-92-2

Crystals. M.p. 113°.

Soluble in water and ethanol.

Iproniazid Phosphate

Proprietary Name. Marsilid

 $C_9H_{13}N_3O \cdot H_3PO_4 = 277.2$

CAS—305-33-9

A white crystalline powder.

Soluble 1 in 5 of water and 1 in 90 of ethanol; practically insoluble in chloroform and ether.

Partition Coefficient. Log P (chloroform/pH 7.4), 0.**Colour Tests.** Cyanogen Bromide—orange-pink; Nessler's Reagent—black.**Thin-layer Chromatography.** System TA—Rf 69; system TB—Rf 01; system TC—Rf 23. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; acidified potassium permanganate solution, positive.)**Gas Chromatography.** System GA—RI 1593.**Ultraviolet Spectrum.** Aqueous acid—266 nm ($A_1^1 = 235$ c); aqueous alkali—242 nm, 307 nm.**Infra-red Spectrum.** Principal peaks at wavenumbers 975, 1090, 1672, 1110, 1065, 1025 (KBr disk). (See below)**Mass Spectrum.** Principal peaks at m/z 123, 31, 58, 106, 79, 43, 78, 51; isonicotinic acid 123, 51, 78, 106, 50, 52, 105, 39.

Quantification. GAS CHROMATOGRAPHY. In urine: FID—R. M. de Sagher *et al.*, *J. pharm. Sci.*, 1976, 65, 878–882.

Disposition in the Body. Readily absorbed after oral administration. It is excreted in the urine mainly as metabolites, principally isonicotinic acid, with up to 15% as unchanged drug.

HALF-LIFE. Plasma half-life, about 10 hours.

Dose. The equivalent of 25 to 150 mg of iproniazid daily.

Isoaminile

Cough Suppressant

4-Dimethylamino-2-isopropyl-2-phenylvaleronitrile

$C_{16}H_{24}N_2 = 244.4$

CAS—77-51-0

A liquid.

Isoaminile Citrate

Proprietary Names. Dimyrl; Peracon (citrate or cyclamate).

$C_{16}H_{24}N_2 \cdot C_6H_8O_7 = 436.5$

CAS—28416-66-2

Crystals. M.p. 63° to 64°.

Soluble in water.

Colour Tests. Liebermann's Test—red-orange; Sodium Picrate—orange.

Thin-layer Chromatography. System TA—Rf 68; system TB—Rf 58; system TC—Rf 54.

Gas Chromatography. System GA—RI 1830.

Ultraviolet Spectrum. Aqueous acid—252 nm, 258 nm ($A_1^1 = 7.3$ a), 264 nm.

Mass Spectrum. Principal peaks at m/z 72, 58, 71, 42, 73, 70, 56, 44.

Dose. 40 mg of isoaminile citrate 3 to 5 times daily.

Isocarboxazid Antidepressant (Monoamine Oxidase Inhibitor)

Proprietary Name. Marplan

2'-Benzyl-5-methylisoxazole-3-carbohydrazide

$C_{12}H_{13}N_3O_2 = 231.3$

CAS—59-63-2

A white or creamy-white crystalline powder. M.p. 105° to 108°. Slightly soluble in water; soluble 1 in 150 of ethanol, 1 in 3 of chloroform, and 1 in 50 of ether.

Dissociation Constant. pK_a 10.4.

Partition Coefficient. Log P (octanol/pH 7.4), 1.5.

Colour Tests. Liebermann's Test—red-orange; Nessler's Reagent—black.

Thin-layer Chromatography. System TA—Rf 71; system TB—Rf 17; system TC—Rf 74. (Dragendorff's spray, positive; FPN reagent, pink-yellow; acidified iodoplatinate solution, positive; Marquis reagent, brown; acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 1949.

Ultraviolet Spectrum. Aqueous alkali—274 nm ($A_1^1 = 240$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1670, 750, 705, 870, 815, 1595 (KBr disk).

Mass Spectrum. Principal peaks at m/z 91, 127, 106, 110, 43, 92, 65, 120; hippuric acid 105, 135, 51, 134, 77, 106, 50, 78.

Disposition in the Body. Rapidly absorbed after oral administration. Metabolised by oxidation to benzoic acid followed by glycine conjugation to form hippuric acid; an active metabolite, benzhydrazine, has been detected in animal studies but its formation in man has not been confirmed. About 60% of a dose is excreted in the urine in 24 hours and about 70% in 8 days; 90% of the excreted material is hippuric acid and about 2% is unchanged drug.

THERAPEUTIC CONCENTRATION. Peak plasma concentrations are attained about 4 hours after oral administration. Maximal therapeutic effects are attained within 5 to 10 days after beginning treatment.

TOXICITY. Toxic reactions from overdosage may occur in a matter of hours despite the long delay in onset of a therapeutic response. A fatality has been reported 24 hours after ingestion of 400 mg.

HALF-LIFE. Plasma half-life, about 36 hours.

Dose. 10 to 30 mg daily.

Isoetharine

Sympathomimetic

Synonym. *N*-Isopropylethylnoradrenaline

1-(3,4-Dihydroxyphenyl)-2-isopropylaminobutan-1-ol

$C_{13}H_{21}NO_3 = 239.3$

CAS—530-08-5

Isoetharine Hydrochloride

Synonym. Etyprenalinum Hydrochloridum

Proprietary Names. Asthmalitan Depot; Bronkosol; Numotac.

$C_{13}H_{21}NO_3 \cdot HCl = 275.8$

CAS—50-96-4

A white crystalline solid. M.p. 196° to 208°, with decomposition.

Soluble in water; sparingly soluble in ethanol; practically insoluble in ether.

Isoetharine Mesylate

Synonym. Isoetharine Methanesulphonate

Proprietary Names. Bronkometer. It is an ingredient of Bronchilator.

$C_{13}H_{21}NO_3 \cdot CH_4O_3S = 335.4$

CAS—7279-75-6

White crystals. M.p. 162° to 168°.

Freely soluble in water; soluble in ethanol; practically insoluble in acetone and ether.

Colour Tests. Ammoniacal Silver Nitrate—red/brown-orange; Ferric Chloride—green; Folin-Ciocalteu Reagent—blue; Mandelin's Test—brown; Marquis Test—yellow → orange; Methanolic Potassium Hydroxide—red → orange → yellow; Nessler's Reagent—black; Palladium Chloride—orange → brown; Potassium Dichromate (Method 1)—green → brown (30 s).

Thin-layer Chromatography. System TA—Rf 59; system TB—Rf 00; system TC—Rf 00. (Acidified potassium permanganate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—278 nm ($A_1^1 = 132$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1200, 1287, 1075, 1114, 1518, 1160 (KBr disk).

Mass Spectrum. Principal peaks at m/z 100, 58, 41, 101, 43, 56, 65, 30.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 500 pg/ml, electrochemical detection—G. B. Park *et al.*, *J. pharm. Sci.*, 1982, 71, 932–934.

Dose. 30 to 80 mg of isoetharine hydrochloride daily.

Isometheptene

Sympathomimetic

1,5, *N*-Trimethylhex-4-enylamine

$C_9H_{19}N = 141.3$

CAS—503-01-5

A colourless or slightly yellow oily liquid. B.p. 176° to 178°. Practically **insoluble** in water; soluble in ethanol, chloroform, and ether.

Isometheptene Hydrochloride

Proprietary Name. Octinum (injection)

$C_9H_{19}N \cdot HCl = 177.7$

CAS—6168-86-1

An almost white, very hygroscopic, crystalline powder. M.p. about 68°.

Soluble in water and ethanol.

Isometheptene Mucate

Synonym. Isometheptene Galactarate

Proprietary Names. Octinum (tablets). It is an ingredient of Midrid.

$(C_9H_{19}N)_2 \cdot C_6H_{10}O_8 = 492.7$

CAS—7492-31-1

A white crystalline powder. M.p. about 148°, with decomposition.

Freely **soluble** in water; soluble in ethanol; practically insoluble in chloroform and ether.

Colour Test. Mandelin's Test—brown.

Thin-layer Chromatography. System TA—Rf 24. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 1052; system GB—RI 994.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Mass Spectrum. Principal peaks at m/z 58, 55, 41, 44, 43, 128, 59, 56.

Dose. Isometheptene mucate has been given in doses of up to 520 mg daily.

Thin-layer Chromatography. System TA—Rf 47; system TB—Rf 01; system TC—Rf 11. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 1670.

Ultraviolet Spectrum. Aqueous acid—266 nm ($A_1^1 = 390$ a); aqueous alkali—298 nm.

Isoniazid

Antituberculous Agent

Synonyms. INAH; INH; Isonicotinic Acid Hydrazide; Isonicotinoylhydrazine; Isonicotinylhydrazide; Isonicotinylhydrazine; Tubazid.

Proprietary Names. Isotamine; Isotinyl; Neoteben; Niconyl; Nydrazid; Panazid; Rimifon; Teebaconin. It is an ingredient of Mynah, Rifinah, and Rimactazid.

Isonicotinohydrazide

$C_6H_7N_3O = 137.1$

CAS—54-85-3

Colourless crystals or white crystalline powder. M.p. 170° to 174°.

Soluble 1 in 8 of water, 1 in about 45 of ethanol, and 1 in 1000 of chloroform; very slightly soluble in ether.

Isoniazid Aminosalicylate

Synonym. Pasiniazid

Proprietary Names. Dipasic; Paraniazide.

$C_6H_7N_3O \cdot C_7H_7NO_3 = 290.3$

CAS—2066-89-9

Yellow crystals. M.p. 140° to 142°.

Soluble in water and methanol.

Dissociation Constant. pK_a 1.8, 3.5, 10.8 (20°).

Partition Coefficient. Log P (octanol/pH 7.4), -1.1 .

Colour Tests. Cyanogen Bromide—orange; Nessler's Reagent—black.

Infra-red Spectrum. Principal peaks at wavenumbers 1653, 1541, 1621, 676, 992, 845 (KBr disk).

Mass Spectrum. Principal peaks at m/z 106, 78, 51, 137, 50, 79, 107, 31; isonicotinic acid 123, 51, 78, 106, 50, 52, 105, 39.

Quantification. SPECTROFLUORIMETRY. In plasma: isoniazid and acetylisoniazid—W. A. Olson *et al.*, *Clin. Chem.*, 1977, 23, 745–748.

GAS CHROMATOGRAPHY. In urine: sensitivity 2 µg/ml for isoniazid and acetylisoniazid, 400 ng/ml for hydrazine, mono-acetylhydrazine and diacetylhydrazine, AFID—J. A. Timbrell *et al.*, *J. Chromat.*, 1977, 138, 165–172.

GAS CHROMATOGRAPHY-MASS SPECTROMETRY. In plasma: detection limit 100 ng/ml for isoniazid and acetylisoniazid, 50 ng/ml for hydrazine metabolites—B. H. Lauterburg *et al.*, *J. Chromat.*, 1981, 224; *Biomed. Appl.*, 13, 431–438.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: isoniazid and acetylisoniazid, limit of detection 100 ng/ml, UV detection—M. R. Holdiness, *J. liq. Chromat.*, 1982, 5, 707–714.

Disposition in the Body. Readily absorbed after oral administration; bioavailability about 80%. The main metabolic reaction is acetylation and the rate at which this occurs shows genetic variation, approximately 40% of the population being rapid acetylators and the remainder slow acetylators. Other metabolic reactions which occur are hydrolysis, glycine conjugation, hydrazone formation, and *N*-methylation. Metabolites include acetylisoniazid, isonicotinic acid, isonicotinylglycine, and mono- and diacetylhydrazine. All the metabolites are inactive with the exception of monoacetylhydrazine which is a reactive metabolite and is hepatotoxic. Up to about 70% of a dose is excreted in the urine in 24 hours, most being excreted in the first 12 hours. In slow acetylators, about 30% of the dose is excreted in the urine as unchanged drug, up to about 25% as acetylisoniazid, about 10% as isonicotinic acid, and about 8% as diacetylhydrazine. In rapid acetylators, about 10% of a dose is excreted as unchanged drug, up to 45% as acetylisoniazid, about 20% as isonicotinic acid, and about 25% as diacetylhydrazine. Small amounts of monoacetylhydrazine are also excreted in the urine. Less than 10% of a dose is eliminated in the faeces.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 3 to 10 µg/ml.

Following a single oral dose of 300 mg to 6 fasting subjects classified as slow acetylators, mean peak serum concentrations of 7.2 µg/ml of isoniazid and 1.7 µg/ml of acetylisoniazid were attained in 0.6 and 3.7 hour respectively. Following a single oral dose of 300 mg given to 4 rapid acetylators, mean peak serum concentrations of 7.2 µg/ml of isoniazid and 4.5 µg/ml of acetylisoniazid were attained in 0.4 hours and 2.6 hours, respectively (P. Männistö *et al.*, *J. antimicrob. Chemother.*, 1982, 10, 427–434).

TOXICITY. Serious toxic symptoms may occur with doses of 3 g or more. In children, toxic effects have occurred after ingestion of 0.9 g or more but a child has recovered after taking as much as 20 g. Toxic effects have been associated with plasma concentrations greater than 20 µg/ml.

A 16-year-old girl who had ingested an unknown quantity of isoniazid had a serum concentration of 127 µg/ml on admission to hospital and died 7 hours later. Two children aged 1½ and 2½ years had serum concentrations of 103 µg/ml and 35 µg/ml, respectively, on admission to hospital following ingestion of isoniazid and subsequently recovered (J. Miller *et al.*, *Am. J. Dis. Child.*, 1980, 134, 290–292).

A postmortem blood concentration of 150 µg/ml was reported in a fatality due to isoniazid overdose (A. C. McBay, *Bull. int. Ass. forens. Toxicol.*, 1968, 5(3), 2).

HALF-LIFE. Plasma half-life, about 1 hour in rapid acetylators and 3 to 5 hours in slow acetylators.

VOLUME OF DISTRIBUTION. About 0.8 litre/kg.

CLEARANCE. Plasma clearance, about 2.5 and about 7 ml/min/kg in slow and rapid acetylators, respectively.

PROTEIN BINDING. In plasma, not significantly bound.

NOTE. For a review of the pharmacokinetics of isoniazid see W. W. Weber and D. W. Hein, *Clin. Pharmacokinet.*, 1979, 4, 401–422.

Dose. Usually 4 to 5 mg/kg daily, by mouth, to a maximum of 300 mg daily.

Isoprenaline

Sympathomimetic

Synonyms. Isopropylarterenol; Isopropylnoradrenaline; Isoproterenol.

1-(3,4-Dihydroxyphenyl)-2-isopropylaminoethanol

$C_{11}H_{17}NO_3 = 211.3$

CAS—7683-59-2

Crystals. M.p. 155°.

Isoprenaline Hydrochloride

Synonym. Isoproterenol Hydrochloride

Proprietary Names. Aerolone; Isuprel; Norisodrine; Proterol; Saventrine. It is an ingredient of Brontisol, Duo-Autohaler, Medihaler-duo, and PIB.

$C_{11}H_{17}NO_3 \cdot HCl = 247.7$

CAS—51-30-9

A white crystalline powder. It gradually darkens on exposure to air and light. M.p. 165° to 170°, with decomposition.

Soluble 1 in less than 1 of water and 1 in about 50 of ethanol; practically insoluble in chloroform and ether. Aqueous solutions become pink to brownish-pink on standing exposed to air, and almost immediately so when made alkaline.

Isoprenaline Sulphate

Synonym. Isoproterenol Sulfate

Proprietary Names. Aleudrin(e); Ingelan; Iso-Autohaler; Medihaler Iso; Norisodrine. It is an ingredient of Intal Compound.

$(C_{11}H_{17}NO_3)_2 \cdot H_2SO_4 \cdot 2H_2O = 556.6$

CAS—299-95-6 (anhydrous); 6700-39-6 (dihydrate)

A white crystalline powder. It gradually darkens on exposure to light and air. M.p. about 128°, with decomposition.

Soluble 1 in 4 of water; slightly soluble in ethanol; practically insoluble in chloroform and ether. Aqueous solutions become pink to brownish-pink on standing exposed to air, and almost immediately so when made alkaline.

Dissociation Constant. pK_a 8.6, 10.1, 12.0 (20°).

Colour Tests. Ammoniacal Silver Nitrate—red → red-brown/brown; Ferric Chloride—green; Folin-Ciocalteu Reagent—blue; Mandelin's Test—brown; Marquis Test—brown → violet; Methanolic Potassium Hydroxide—orange → yellow; Nessler's Reagent—black; Potassium Dichromate—green → brown (30 s).

Thin-layer Chromatography. System TA—Rf 40; system TB—Rf 00; system TC—Rf 01. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 1730.

Ultraviolet Spectrum. Aqueous acid—279 nm ($A_1^1 = 134$ a); aqueous alkali—297 nm. (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 1246, 1293, 1535, 1230, 1040, 1607 (isoprenaline hydrochloride, KCl disk). (See below)

Mass Spectrum. Principal peaks at m/z 72, 44, 43, 124, 123, 30, 42, 41.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: detection limit 40 pg, fluorescence detection—Y. Kishimoto *et al.*, *J. Chromat.*, 1982, 231; *Biomed. Appl.*, 20, 121–127. In plasma or urine: sensitivity 1 ng/ml, electrochemical detection—R. C. Causon *et al.*, *J. Chromat.*, 1984, 306; *Biomed. Appl.*, 31, 257–268.

µg/ml of isoprenaline plus metabolites were attained within 90 minutes; in blood the major component was the sulphate ester together with small amounts of the methylated metabolite (M. E. Conolly *et al.*, *Br. J. Pharmac.*, 1972, 46, 458-472).

TOXICITY. Estimated minimum lethal dose for children, applied to mucous membranes, 100 mg.

HALF-LIFE. Plasma half-life, 3 to 7 hours.

VOLUME OF DISTRIBUTION. About 0.5 litre/kg.

PROTEIN BINDING. In plasma, about 68%.

Dose. 90 to 840 mg of isoprenaline hydrochloride daily, by mouth, as sustained-release tablets.

Isopropamide Iodide

Anticholinergic

Proprietary Names. Darbid; Priamide; Tyrimide. It is an ingredient of Combid, Eskornade, and Stelabid.

(3-Carbamoyl-3,3-diphenylpropyl)di-isopropylmethylammonium iodide

$C_{23}H_{33}IN_2O = 480.4$

CAS—7492-32-2 (isopropamide); 71-81-8 (iodide)

A white to pale yellow crystalline powder. M.p. about 181°.

Soluble 1 in 50 of water, 1 in 10 of ethanol, and 1 in 5 of chloroform; very slightly soluble in ether.

Colour Tests. Aromaticity (Method 2)—colourless/brown; Liebermann's Test—grey.

Thin-layer Chromatography. System TA—Rf 05. (Acidified iodoplatinate solution, positive.)

High Pressure Liquid Chromatography. System HA—k' 2.4 (tailing peak).

Ultraviolet Spectrum. Methanol—259 nm ($A_1^1 = 9.1$ a), 265 nm.

Disposition in the Body. Irregularly absorbed after oral or sublingual administration with extensive metabolism and conjugation occurring in the gut. Only about 10% of an inhaled dose reaches the lungs. Rapidly metabolised by 3-*O*-methylation and sulphate conjugation; 3-*O*-methylisoprenaline exhibits weak activity. After intravenous administration, about 90% of a dose is excreted in the urine in 24 hours, mostly as the conjugated 3-*O*-methyl metabolite, with up to about 15% of the dose as unchanged drug; after inhalation or oral administration, 68 to 94% of a dose is excreted as conjugated isoprenaline, with about 2 to 8% of a dose as the 3-*O*-methyl conjugate and less than 5% as unchanged drug or free 3-*O*-methylisoprenaline; small amounts of a dose are excreted in the bile, mainly as metabolites.

THERAPEUTIC CONCENTRATION.

After a dose of 500 µg administered by aerosol inhalation, plasma concentrations of about 0.0003 µg/ml were attained in 5 minutes in 2 subjects (E. W. Blackwell *et al.*, *Br. J. Pharmac.*, 1970, 39, 194P-195P).

After an oral dose of 0.2 mg/kg, plasma concentrations of about 0.5

Infra-red Spectrum. Principal peaks at wavenumbers 1650, 1576, 705, 769, 757, 1500 (KBr disk).

Mass Spectrum. Principal peaks at m/z 86, 114, 100, 44, 238, 115, 56, 72.

Dose. The equivalent of 5 to 10 mg of isopropamide every 12 hours.

Isopropyl Alcohol

Solvent

Synonyms. Alcohol Isopropylicus; Dimethyl Carbinol; Isopropanol; 2-Propanol; Secondary Propyl Alcohol.

Proprietary Names. Alcojel; Avantine; IPS.1; IPS/C; Sterets. It is an ingredient of Manusept.

Propan-2-ol

$(\text{CH}_3)_2 \cdot \text{CHOH} = 60.10$

CAS—67-63-0

A clear, colourless, mobile, volatile, inflammable liquid. Wt per ml 0.784 to 0.786 g. B.p. 81° to 83° . Refractive index, at 20° , 1.377 to 1.380.

Miscible with water, ethanol, chloroform, and ether.

Colour Test. Potassium Dichromate (Method 2)—green.

Gas Chromatography. System GA—RI 530; system GI—retention time 4 min.

Infra-red Spectrum. Principal peaks at wavenumbers 952, 1123, 1162, 819, 1111, 1298.

Mass Spectrum. Principal peaks at m/z 45, 43, 27, 41, 39, 29, 59, 44; acetone 43, 58, 59, 27, 42, 26, 39, 29.

Quantification. GAS CHROMATOGRAPHY. In blood—D. R. Daniel *et al.*, *J. analyt. Toxicol.*, 1981, 5, 110–112.

Disposition in the Body. Readily absorbed after oral administration and slowly absorbed through intact skin. Isopropyl alcohol is metabolised more slowly than ethanol; it is largely converted to acetone which is slowly excreted from the lungs and in the urine; acetone may be further metabolised to acetate, formate, and carbon dioxide; some unchanged isopropyl alcohol may be excreted in the urine together with its glucuronide conjugate, particularly after large doses.

TOXICITY. The estimated minimum lethal dose is 240 ml. Isopropyl alcohol is about twice as toxic as ethanol and the symptoms of intoxication are similar. Fatalities have been associated with blood concentrations greater than $1000 \mu\text{g/ml}$. The maximum permissible atmospheric concentration is 400 ppm. A dose of 16 ml has been ingested daily for 3 days without discomfort but marked depression has been observed following a dose of 23 ml. Recovery has followed treatment by haemodialysis in subjects with initial blood concentrations of up to $4400 \mu\text{g/ml}$ of isopropyl alcohol.

In a review of 31 fatalities attributed solely to isopropyl alcohol poisoning, postmortem blood concentrations ranged from 100 to $2500 \mu\text{g/ml}$ (mean 1400) for isopropyl alcohol and 400 to $3000 \mu\text{g/ml}$ (mean 1700) for acetone (C. B. Alexander *et al.*, *J. forens. Sci.*, 1982, 27, 541–548).

A woman who died about 3 hours after ingesting isopropyl alcohol was reported to have the following postmortem tissue concentrations: isopropyl alcohol, blood $3300 \mu\text{g/ml}$, brain $1800 \mu\text{g/g}$, urine $2000 \mu\text{g/ml}$; acetone, blood $1200 \mu\text{g/ml}$, brain $600 \mu\text{g/g}$, urine $700 \mu\text{g/ml}$ (R. H. Cravey, per R. C. Baselt, *Disposition of Toxic Drugs and Chemicals in Man*, 2nd Edn, Davis, California, Biomedical Publications, 1982, pp. 407–409).

In 4 fatalities due to the ingestion of isopropyl alcohol, the following antemortem or postmortem tissue concentrations were reported: blood 200 to $2000 \mu\text{g/ml}$ (mean 1300, 4 cases), brain $1000 \mu\text{g/g}$ (1 case), liver $1000 \mu\text{g/g}$ (1 case), spleen $1300 \mu\text{g/g}$ (1 case), urine 1500 and $1800 \mu\text{g/ml}$ (2 cases) (L. Adelson, *Am. J. clin. Path.*, 1962, 38, 144–151).

HALF-LIFE. Blood half-life, about 3 hours in subjects with acute intoxication.

Isopropylaminophenazone

Analgesic (Veterinary)

Synonym. Isopyrin

Note. The name Isopyrin has also been applied to isoniazid.

4-Isopropylamino-1,5-dimethyl-2-phenyl-4-pyrazolin-3-one

$\text{C}_{14}\text{H}_{19}\text{N}_3\text{O} = 245.3$

CAS—3615-24-5

Crystals. M.p. 80° .

Ultraviolet Spectrum. Aqueous acid—260 nm ($A_1^1 = 377$ b); aqueous alkali—271 nm ($A_1^1 = 334$ b); methanol—243 nm ($A_1^1 = 310$ b), 269 nm ($A_1^1 = 381$ b).

Isosorbide Dinitrate

Anti-anginal Vasodilator

Synonym. Sorbide Nitrate

Proprietary Names. Carvasin; Cedocard; Coronex; Dilatrate-SR; Iso-Bid; Iso D; Isoket; Isordil; Isotrate; Risordan; Soni-Slo; Sorbichew; Sorbid SA; Sorbidilat; Sorbitrate; Sorquad; Vascardin; Vasotrate.

1,4:3,6-Dianhydro-D-glucitol 2,5-dinitrate

$\text{C}_6\text{H}_8\text{N}_2\text{O}_8 = 236.1$

CAS—87-33-2

A white crystalline powder. M.p. about 70° .

Very slightly **soluble** in water; sparingly soluble in ethanol; very soluble in acetone; freely soluble in chloroform; soluble in methanol.

Caution. Isosorbide dinitrate may explode if subjected to percussion or excessive heat.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1062, 1618, 862, 1266, 1653, 1089 (isosorbide, Nujol mull).

Mass Spectrum. Principal peaks at m/z 43, 31, 29, 61, 60, 85, 73, 44.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: limit of detection 500 pg/ml, ECD—A. Sioufi and F. Pommier, *J. Chromat.*, 1982, 229; *Biomed. Appl.*, 18, 347–353.

GAS CHROMATOGRAPHY (CAPILLARY COLUMN). In plasma: detection limits 500 pg/ml for isosorbide dinitrate, 2 ng/ml for isosorbide 2-mononitrate and 10 ng/ml for isosorbide 5-mononitrate, ECD—Y. Santoni *et al.*, *J. Chromat.*, 1984, 306; *Biomed. Appl.*, 31, 165–172.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: limit of detection 200 pg—W. C. Yu and E. U. Goff, *Analyt. Chem.*, 1983, 55, 29–32.

Disposition in the Body. Readily absorbed after sublingual or oral administration; bioavailability about 60% after sublingual administration and about 20% orally, but there is considerable intersubject variation. Metabolised by enzymatic denitration followed by glucuronide conjugation. Isosorbide 2-mononitrate and isosorbide 5-mononitrate have some pharmacological activity. About 80% of a dose is excreted in the urine in 24 hours, of which about 50% is isosorbide glucuronide, up to 15% is free and conjugated isosorbide 5-mononitrate, about 1% is free isosorbide 2-mononitrate, and less than 1% is unchanged drug.

THERAPEUTIC CONCENTRATION. Isosorbide 5-mononitrate accumulates in the plasma during chronic treatment.

Following a single oral dose of 20 mg of isosorbide dinitrate to 8 subjects, peak plasma concentrations of 0.02 to 0.09 $\mu\text{g/ml}$ (mean 0.05) of isosorbide dinitrate, 0.02 to 0.06 $\mu\text{g/ml}$ (mean 0.04) of isosorbide 2-mononitrate, and 0.10 to 0.22 $\mu\text{g/ml}$ (mean 0.14) of isosorbide 5-mononitrate, were attained in 0.25, 0.7, and 1 hour respectively (H. Laufen *et al.*, *Arzneimittel-Forsch.*, 1983, 33, 980–984).

After a single sublingual dose of 5 mg to 6 subjects, peak plasma concentrations of 0.007 to 0.015 $\mu\text{g/ml}$ (mean 0.009) were attained in 10 to 15 minutes (D. F. Assinder *et al.*, *J. pharm. Sci.*, 1977, 66, 775–778).

HALF-LIFE. Plasma half-life, isosorbide dinitrate about 0.5 to 1.5 hours, isosorbide 2-mononitrate about 2 hours, isosorbide 5-mononitrate 3 to 7 hours. A longer terminal elimination half-life of about 8 hours has been reported for isosorbide dinitrate.

SALIVA. Plasma: saliva ratio, about 1.5.

PROTEIN BINDING. In plasma, about 30%.

NOTE. For a review of the pharmacokinetics of organic nitrates, see M. G. Bogaert, *Clin. Pharmacokin.*, 1983, 8, 410–421.

Dose. 10 to 240 mg daily, by mouth.

Isosorbide Mononitrate

Anti-anginal Vasodilator

Synonym. Isosorbide 5-Mononitrate

Proprietary Names. Elantan; Ismo; Monit; Mono-Cedocard.

1,4:3,6-Dianhydro-D-glucitol 5-nitrate

$\text{C}_6\text{H}_9\text{NO}_6 = 191.1$

CAS—16051-77-7

Colourless prismatic crystals. M.p. 89° to 91° .

Soluble in water, ethanol, acetone, and methanol; slightly soluble in chloroform and ether.

Caution. Isosorbide mononitrate may explode if subjected to percussion or excessive heat.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1280, 1650, 1635, 852, 1090, 968 (KBr disk).

Quantification. GAS CHROMATOGRAPHY (CAPILLARY COLUMN). In plasma: sensitivity 1 ng/ml, ECD—P. Straehl and R. L. Galeazzi, *J. pharm. Sci.*, 1984, 73, 1317–1319.

Disposition in the Body. Rapidly and almost completely absorbed after oral or sublingual administration; bioavailability almost 100%. Metabolised by enzymatic denitration and by glucuronide conjugation. About 80% of a dose is excreted in the urine in 24 hours.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 20 mg given to 19 subjects, peak plasma concentrations of 0.34 to 0.68 $\mu\text{g/ml}$ (mean 0.48) were attained in 1 hour (U. Abshagen *et al.*, *ibid.*).

HALF-LIFE. Plasma half-life, 3 to 7 hours.

VOLUME OF DISTRIBUTION. About 0.6 litre/kg.

CLEARANCE. Plasma clearance, about 1 to 2 ml/min/kg.

SALIVA. Plasma: saliva ratio, about 0.8.

PROTEIN BINDING. In plasma, less than 5%.

Dose. 20 to 120 mg daily.

Isothipendyl

Antihistamine

NN - Dimethyl - 1 - (pyrido[3,2 - *b*][1,4]benzothiazin - 10 - yl-methyl)ethylamine

$\text{C}_{16}\text{H}_{19}\text{N}_3\text{S} = 285.4$

CAS—482-15-5

Isothipendyl Hydrochloride

Proprietary Names. Andantol; Nilergex.

$\text{C}_{16}\text{H}_{19}\text{N}_3\text{S}\cdot\text{HCl} = 321.9$

CAS—1225-60-1

A fine white crystalline powder. M.p. about 212° , with decomposition.

Soluble 1 in 5 of water, 1 in 60 of ethanol, and 1 in 10 of chloroform; practically insoluble in ether.

Colour Test. Marquis Test—orange.

Thin-layer Chromatography. *System TA*—Rf 52; *system TB*—Rf 41; *system TC*—Rf 30. (*Dragendorff spray*, positive; *FPN reagent*, yellow-pink; *acidified iodoplatinate solution*, positive; *Marquis reagent*, pink; *ninhydrin spray*, positive.)

Gas Chromatography. *System GA*—RI 2267.

High Pressure Liquid Chromatography. *System HA*—k' 3.8.

Ultraviolet Spectrum. Aqueous acid—245 nm ($A_1^1 = 860$ a); aqueous alkali—250 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1017, 1030, 1070, 987, 1090, 1080 (KBr disk).

Mass Spectrum. Principal peaks at m/z 72, 73, 214, 200, 44, 285, 86, 56.

Dose. 12 to 32 mg of isothipendyl hydrochloride daily.

Isoxsuprine

Vasodilator

Proprietary Name. Defencin CP (resinate)

1 - (4 - Hydroxyphenyl) - 2 - (1 - methyl - 2 - phenoxyethyl-amino)propan-1-ol

$C_{18}H_{23}NO_3 = 301.4$

CAS—395-28-8

Crystals. M.p. 103°.

Isoxsuprine Hydrochloride

Synonym. Phenoxyisopropyl-norsuprifen

Proprietary Names. Duvadilan; Isolait; Vasodilan; Vasoplex.

$C_{18}H_{23}NO_3 \cdot HCl = 337.8$

CAS—579-56-6

A white crystalline powder. M.p. about 200°, with decomposition.

Soluble 1 in 500 of water, 1 in 100 of ethanol and dilute sodium hydroxide solution, and 1 in 2500 of dilute hydrochloric acid; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 8.0, 9.8.

Colour Tests. Mandelin's Test—green; Marquis Test—red-violet.

Thin-layer Chromatography. System TA—Rf 78; system TB—Rf 02; system TC—Rf 32. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 2300.

High Pressure Liquid Chromatography. System HA—k' 0.8.

Ultraviolet Spectrum. Aqueous acid—269 nm, 274 nm ($A_1^1 = 82$ a); aqueous alkali—243 nm ($A_1^1 = 450$ a), 270 nm, 277 nm, 292 nm ($A_1^1 = 78$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1514, 1240, 745, 1220, 1043, 1500.

Mass Spectrum. Principal peaks at m/z 178, 44, 135, 179, 77, 84, 107, 41.

Disposition in the Body. Absorbed after oral administration; peak blood concentrations are attained within 1 hour of a dose. It is excreted in the urine partly unchanged and partly as a conjugate.

Dose. Up to 80 mg of isoxsuprine hydrochloride daily.

Kanamycin

Antibiotic

Synonym. Kanamycin A

6-O-(3-Amino-3-deoxy- α -D-glucopyranosyl)-4-O-(6-amino-6-deoxy- α -D-glucopyranosyl)-2-deoxy-D-streptamine

$C_{18}H_{36}N_4O_{11} = 484.5$

CAS—59-01-8

An antimicrobial substance produced by the growth of *Streptomyces kanamyceticus*.

A whitish powder.

Kanamycin Acid Sulphate

Proprietary Name. Kannasyn (powder)

$C_{18}H_{36}N_4O_{11} \cdot 1.7H_2SO_4 = 651.2$

A white hygroscopic powder.

Soluble 1 in 1 of water; practically insoluble in ethanol, acetone, chloroform, and ether.

Kanamycin Sulphate

Synonym. Kanamycin A Sulphate

Proprietary Names. Kamycine; Kanamytrex; Kanasig; Kannasyn (solution); Kantrex; Klebcil.

$C_{18}H_{36}N_4O_{11} \cdot H_2SO_4 = 582.6$

CAS—25389-94-0

A white crystalline powder.

Soluble 1 in 8 of water; practically insoluble in ethanol, acetone, chloroform, and ether.

Dissociation Constant. pK_a 7.2.

Thin-layer Chromatography. *System TA*—Rf 01. (Acidified potassium permanganate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—249 nm (A_1^1 = about 3 b), 306 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1033, 1068, 1143, 1123, 980, 1516 (kanamycin sulphate, KBr disk).

Quantification. SPECTROFLUORIMETRY. In serum or urine: sensitivity 50 ng/ml—A. Csiba, *J. Pharm. Pharmac.*, 1979, 31, 115–116.

BIOASSAY. Aminoglycoside antibiotics in biological fluids—J. M. Broughall, Aminoglycosides, in *Laboratory Methods in Antimicrobial Chemotherapy*, D. S. Reeves *et al.* (Ed.), Edinburgh, Churchill Livingstone, 1978, pp. 194–207.

Disposition in the Body. Poorly absorbed after oral administration, but rapidly and completely absorbed after intramuscular injection. Up to 95% of a dose is excreted unchanged in the urine in 24 hours, most being excreted within the first 6 hours. A small amount is excreted in the bile.

THERAPEUTIC CONCENTRATION. During treatment, the serum concentration should be in the range 20 to 25 µg/ml and should be monitored regularly, especially in patients who have renal insufficiency. During multiple dosing, the trough concentration immediately preceding a dose should not exceed 10 µg/ml.

TOXICITY. Toxic effects may be produced at serum concentrations of 30 µg/ml or more or, during chronic treatment, if the trough serum concentration exceeds 10 µg/ml.

HALF-LIFE. Plasma half-life, about 2 to 4 hours; increased to 4 to 5 days in renal failure.

VOLUME OF DISTRIBUTION. About 0.3 litre/kg.

CLEARANCE. Plasma clearance, about 1.4 ml/min/kg.

PROTEIN BINDING. In plasma, not significantly bound.

Dose. The equivalent of up to 1.5 g of kanamycin daily, by intramuscular injection.

Ketamine

General Anaesthetic

(±)-2-(2-Chlorophenyl)-2-methylaminocyclohexanone

$C_{13}H_{16}ClNO = 237.7$

CAS—6740-88-1

Crystals. M.p. 92° to 93°.

Ketamine Hydrochloride

Proprietary Names. Ketaject; Ketalar; Ketanest.

$C_{13}H_{16}ClNO \cdot HCl = 274.2$

CAS—1867-66-9

A white crystalline powder. M.p. 258° to 261°.

Soluble 1 in 4 of water, 1 in 14 of ethanol, and 1 in 6 of methanol; sparingly soluble in chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 7.5.

Thin-layer Chromatography. *System TA*—Rf 63; *system TB*—Rf 37; *system TC*—Rf 63. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 1843.

Ultraviolet Spectrum. Aqueous acid—269 nm (A_1^1 = 25 a), 276 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1696, 747, 1142, 1120, 712, 1027 (KBr disk).

Mass Spectrum. Principal peaks at m/z 180, 209, 182, 152, 181, 30, 211, 138.

Quantification. GAS CHROMATOGRAPHY. In serum or urine: ketamine and metabolites, sensitivity 25 ng/ml for ketamine in

serum, FID—J. Wieber *et al.*, *Anaesthesist*, 1975, 24, 260–263. In plasma or urine: ketamine and norketamine, sensitivity 10 ng/ml, AFID—R. L. Stiller *et al.*, *J. Chromat.*, 1982, 232; *Biomed. Appl.*, 21, 305–314.

Disposition in the Body. Rapidly distributed in the tissues following parenteral administration. About 90% of a dose is excreted in the urine in 72 hours, with about 2% of the dose as unchanged drug, 2% as norketamine, 16% as dehydronorketamine, and 80% as conjugates of hydroxylated metabolites. Norketamine (which has about one-sixth of the potency of ketamine) and dehydronorketamine are found in the serum in concentrations similar to those of ketamine. It has been suggested that dehydronorketamine may be an analytical artefact rather than a metabolite.

THERAPEUTIC CONCENTRATION.

Following single intravenous injections of 2.5 mg/kg to 5 subjects, serum concentrations of about 1 µg/ml were reported after 15 minutes (J. Wieber *et al.*, *Anaesthesist*, 1975, 24, 260–263).

During continuous intravenous infusion at an average rate of 41 µg/kg/minute to 31 subjects, a mean steady-state plasma concentration of 2.2 µg/ml was reported; norketamine and dehydronorketamine attained mean peak plasma concentrations of 1.1 µg/ml and 0.7 µg/ml, respectively, in about 3 hours; the subjects awoke at an average plasma concentration of 0.64 µg/ml (J. Idvall *et al.*, *Br. J. Anaesth.*, 1979, 51, 1167–1173).

Following an intramuscular injection of 0.5 mg/kg to 6 subjects, peak plasma concentrations of 0.10 to 0.43 µg/ml (mean 0.24) were attained in about 0.3 hour; norketamine attained a mean peak plasma concentration of 0.09 µg/ml at about 1 hour (J. A. Clements *et al.*, *J. pharm. Sci.*, 1982, 71, 539–542).

TOXICITY. Ketamine produces hallucinogenic effects similar to those of phencyclidine and may be subject to abuse.

HALF-LIFE. Plasma half-life, about 2 to 4 hours.

VOLUME OF DISTRIBUTION. About 4 litres/kg.

CLEARANCE. Plasma clearance, about 17 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma : whole blood ratio, about 0.6.

PROTEIN BINDING. In plasma, about 20 to 50%.

Dose. The equivalent of 1 to 4.5 mg/kg of ketamine, by slow intravenous injection or 6.5 to 13 mg/kg, intramuscularly.

Ketazolam

Tranquilliser

Proprietary Names. Anxon; Contamex; Loftran; Solatran.

11 - Chloro - 8,12b - dihydro - 2,8 - dimethyl - 12b - phenyl - 4H - [1,3]oxazino[3,2-d][1,4]benzodiazepine-4,7(6H)-dione

$C_{20}H_{17}ClN_2O_3 = 368.8$

CAS—27223-35-4

A white crystalline powder. M.p. 183°.

Slightly soluble in water.

Colour Test. Formaldehyde–Sulphuric Acid—orange.

Thin-layer Chromatography. System TA—Rf 66; system TB—Rf 08; system TC—Rf 64; system TD—Rf 45; system TE—Rf 73;

system TF—Rf 45. (Dragendorff spray, positive; furfuraldehyde reagent, dark grey; acidified iodoplatinate solution, positive; mercuric chloride–diphenylcarbazone reagent, pale blue; ninhydrin spray, pale yellow; acidified potassium permanganate solution, positive.)

Gas Chromatography. Rearrangement to form diazepam occurs on-column: system GA—diazepam RI 2425, oxazepam RI 2336; system GG—diazepam RI 2940, oxazepam RI 2803.

High Pressure Liquid Chromatography. System HI—k' 12.81; system HJ—k' 2.45; system HK—k' 0.04.

Ultraviolet Spectrum. Ethanol—242 nm ($A_1^1 = 492$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1675, 820, 1105, 1195, 1308, 1242 (KBr disk).

Mass Spectrum. Principal peaks at m/z 256, 284, 283, 285, 84, 257, 258, 255; oxazepam 257, 77, 268, 239, 205, 267, 233, 259.

Disposition in the Body. Readily absorbed after oral administration. Rapidly metabolised by *N*-demethylation to desmethylketazolam and desmethyldiazepam (nordazepam). About 80% of a dose is excreted in the urine as metabolites with only traces of unchanged drug. Of the material excreted in the urine, about 56% is oxazepam and the remainder is a mixture of minor metabolites including diazepam, desmethyldiazepam, temazepam, and other unidentified metabolites. About 20% of a dose is eliminated in the faeces, mainly as metabolites.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 30 mg of ^{14}C -labelled ketazolam, peak plasma concentrations of about 0.004 $\mu\text{g}/\text{ml}$ of ketazolam, 0.017 $\mu\text{g}/\text{ml}$ of diazepam, and 0.127 $\mu\text{g}/\text{ml}$ of *N*-demethylated metabolites were attained in 2, 10, and 14 hours respectively (F. S. Eberts jun. *et al.*, *Pharmacologist*, 1977, 19, 165).

TOXICITY. Overdoses of up to 0.5 g have been ingested without serious toxic effects.

HALF-LIFE. Plasma half-life, ketazolam about 1.5 hours, oxazepam 4 to 25 hours (mean 8), diazepam 20 to 100 hours (mean 48).

Dose. 15 to 60 mg daily.

Ketobemidone

Narcotic Analgesic

Synonym. Cetobemidone

Proprietary Name. Cliradon

1-(4-*m*-Hydroxyphenyl-1-methyl-4-piperidyl)propan-1-one

$\text{C}_{15}\text{H}_{21}\text{NO}_2 = 247.3$

CAS—469-79-4

Crystals. M.p. 156° to 157° .

Dissociation Constant. pK_a 8.7 (20°).

Partition Coefficient. Log *P* (heptane/pH 7.4), -3.0 .

Colour Tests. Mandelin's Test—blue-green; Marquis Test—orange.

Thin-layer Chromatography. System *TA*—Rf 47; system *TB*—Rf 02; system *TC*—Rf 09. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System *GA*—RI 2035.

High Pressure Liquid Chromatography. System *HA*— k' 2.8 (tailing peak).

Ultraviolet Spectrum. Aqueous acid—280 nm ($A_1^1 = 81$ a); aqueous alkali—300 nm ($A_1^1 = 126$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1705, 1597, 1248, 777, 699, 1285 (KBr disk).

Mass Spectrum. Principal peaks at m/z 70, 71, 42, 44, 57, 190, 29, 247.

Quantification. GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In plasma: ketobemidone and desmethylketobemidone, sensitivity 5 ng/ml—U. Bondesson *et al.*, *Biomed. Mass Spectrom.*, 1983, 10, 283–286.

Disposition in the Body. Poorly absorbed after oral or rectal administration; bioavailability about 40%. Metabolised by *N*-demethylation.

HALF-LIFE. Plasma half-life, about 2 hours.

VOLUME OF DISTRIBUTION. About 2 to 3 litres/kg.

CLEARANCE. Plasma clearance, about 10 ml/min/kg.

REFERENCE. P. Anderson *et al.*, *Eur. J. clin. Pharmac.*, 1981, 19, 217–223.

Dose. Ketobemidone has been given in doses of 5 to 10 mg.

Ketoconazole

Antifungal

Proprietary Name. Nizoral

cis-1-Acetyl-4-{4-[2-(2,4-dichlorophenyl)-2-imidazol-1-ylmethyl-1,3-dioxolan-4-ylmethoxy]phenyl}piperazine

$\text{C}_{26}\text{H}_{28}\text{Cl}_2\text{N}_4\text{O}_4 = 531.4$

CAS—65277-42-1

Crystals. M.p. 146° .

Practically **insoluble** in water; soluble 1 in 54 of ethanol, 1 in about 2 of chloroform, and 1 in 9 of methanol; very slightly soluble in ether.

Ultraviolet Spectrum. Aqueous acid—269 nm ($A_1^1 = 26$ a); aqueous alkali—287 nm ($A_1^1 = 29$ b); methanol—244 nm ($A_1^1 = 280$ b), 296 nm ($A_1^1 = 32$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1507, 1640, 1240, 1258, 1200, 1221 (KBr disk).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity < 100 ng/ml, UV detection—K. B. Alton, *J. Chromat.*, 1980, 221; *Biomed. Appl.*, 10, 337–344. In serum, plasma, cerebrospinal fluid, or synovial fluid: sensitivity 40 ng/ml, fluorescence detection—V. L. Pascucci *et al.*, *J. pharm. Sci.*, 1983, 72, 1467–1469.

Disposition in the Body. Readily but incompletely absorbed after oral administration and extensively metabolised to inactive metabolites. About 13% of a dose is excreted in the urine in 4 days and 57% is eliminated in the faeces in the same period.

THERAPEUTIC CONCENTRATION.

Following single oral doses of 200 and 400 mg to 6 subjects, mean peak serum concentrations of 3.6 and 6.5 µg/ml were attained in 2 and 3 hours, respectively (T. K. Daneshmend *et al.*, *J. antimicrob. Chemother.*, 1981, 8, 299–304).

HALF-LIFE. Plasma half-life, about 6 to 10 hours.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 1.6.

PROTEIN BINDING. In plasma, about 99%.

NOTE. For a review of the pharmacokinetics of systemic antifungal drugs see T. K. Daneshmend and D. W. Warnock, *Clin. Pharmacokinet.*, 1983, 8, 17–42.

Dose. 200 to 400 mg daily.

Ketoprofen

Analgesic

Proprietary Names. Alrheumat; Orudis; Oruvail; Profénid.

2-(3-Benzoylphenyl)propionic acid

$C_{16}H_{14}O_3 = 254.3$

CAS—22071-15-4

A white crystalline powder. M.p. 93° to 96°.

Practically **insoluble** in water; freely soluble in ethanol, chloroform, and ether.

Partition Coefficient. Log *P* (octanol/pH 7.4), 0.

Colour Tests. Aromaticity (Method 2)—colourless/yellow; Koppanyi–Zwicker Test—violet.

Thin-layer Chromatography. System TD—Rf 27; system TE—Rf 07; system TF—Rf 40; system TG—Rf 14. (*Ludy Tenger reagent*, orange.)

Gas Chromatography. System GD—retention time of methyl derivative 1.45 relative to *n*-C₁₆H₃₄.

High Pressure Liquid Chromatography. System HD—*k'* 2.4; system HV—retention time 0.66 relative to meclofenamic acid.

Ultraviolet Spectrum. Aqueous acid—260 nm ($A_1^1 = 665$ a); aqueous alkali—262 nm ($A_1^1 = 647$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1656, 1693, 1284, 714, 690, 1226 (KBr disk). Two polymorphic forms may occur. (See below)

Mass Spectrum. Principal peaks at *m/z* 105, 177, 77, 209, 254, 210, 103, 181.

Quantification. GAS CHROMATOGRAPHY. In plasma: detection limit 130 ng/ml, ECD—P. Stenberg *et al.*, *J. Chromat.*, 1979, 177, 145–148.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: limit of detection 50 ng/ml, UV detection—C. M. Kaye *et al.*, *Br. J. clin. Pharmac.*, 1981, 11, 395–398.

Disposition in the Body. Readily absorbed after oral, rectal, or intramuscular administration. About 75% of a single oral dose is excreted in the urine in 24 hours, mostly in the first 6 hours, about 90% of which is the glucuronide conjugate; hydroxylation may also occur.

THERAPEUTIC CONCENTRATION.

After oral administration of 100 mg as capsules, to 7 subjects, peak plasma concentrations of 6.0 to 14.3 μg/ml (mean 10) were attained in 0.45 to 2.5 hours; a single rectal dose of 100 mg, produced peak plasma concentrations of 4.7 to 10.5 μg/ml (mean 7.5) in 0.75 to 1.5 hours, and an intramuscular dose of 100 mg produced peak concentrations of 8.3 to 13.2 μg/ml (mean 10.4) in 0.33 to 0.5 hour. After oral doses of 50 mg four times a day to 7 subjects, mean maximum steady-state concentrations of 5.6 μg/ml were reported (T. Ishizaki *et al.*, *Eur. J. clin. Pharmac.*, 1980, 18, 407-414).

HALF-LIFE. Plasma half-life, 1 to 4 hours.

VOLUME OF DISTRIBUTION. About 0.1 to 0.2 litre/kg.

CLEARANCE. Plasma clearance, about 1 to 2 ml/min/kg.

PROTEIN BINDING. In plasma, about 95%.

Dose. 100 to 200 mg daily.

Ketotifen

Anti-allergic

4-(1-Methyl-4-piperidylidene)-4H-benzo[4,5]cyclohepta[1,2-b]thiophen-10(9H)-one
 $C_{19}H_{19}NOS = 309.4$
 CAS—34580-13-7

Crystals. M.p. 151° to 153°.

Ketotifen Fumarate

Proprietary Name. Zaditen

$C_{19}H_{19}NOS, C_4H_4O_4 = 425.5$

CAS—34580-14-8

A white crystalline powder. M.p. 190° to 196°, with decomposition.

Slightly soluble in water; soluble in ethanol; sparingly soluble in chloroform.

Gas Chromatography. System GA—RI 2607.

Ultraviolet Spectrum. Aqueous acid—297 nm ($A_1^1 = 475$ a); aqueous alkali—237 nm, 302 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1650, 1280, 1255, 1302, 1720, 1180 (ketotifen fumarate, KBr disk).

Mass Spectrum. Principal peaks at m/z 309, 96, 42, 58, 98, 70, 57, 44.

Quantification. GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In plasma: detection limit 50 pg/ml for ketotifen and the desmethyl metabolite, 300 pg/ml for 10-hydroxyketotifen—C. Julien-Larose *et al.*, *Biomed. Mass Spectrom.*, 1983, 10, 136-142.

Disposition in the Body. Absorbed after oral administration. Metabolised by 10-hydroxylation, *N*-demethylation, and glucuronic acid conjugation. It is excreted in the urine and faeces as unchanged drug and metabolites.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 2 mg to 3 subjects, a peak plasma concentration of about 0.0006 μg/ml was attained in 2 hours; a peak plasma concentration of about 0.015 μg/ml of ketotifen glucuronide was attained in about 4 hours (C. Julien-Larose *et al.*, *ibid.*).

TOXICITY.

In 8 cases of overdose involving ingestion of up to 120 mg, drowsiness and other toxic effects were reported but in each case full recovery occurred within 12 hours. In 3 cases involving the ingestion of 10, 50, and 120 mg, plasma concentrations were 0.016, 0.054, and 0.122 μg/ml, respectively, at 5, 3, and 20 hours after ingestion (D. B. Jefferys and G. N. Volans, *Br. med. J.*, 1981, 282, 1755-1756 and 2014).

In a fatality involving ketotifen, a postmortem blood concentration of 1.2 μg/ml was reported (A. H. Stead and A. C. Moffat, personal communication).

Dose. The equivalent of 2 to 4 mg of ketotifen daily.

Labetalol

Antihypertensive

Synonym. Ibadomide

5-[1-Hydroxy-2-(1-methyl-3-phenylpropylamino)-ethyl]salicylamide

$C_{19}H_{24}N_2O_3 = 328.4$

CAS—36894-69-6

**Labetalol Hydrochloride**

Proprietary Names. Trandate; Vescal.

$\text{C}_{19}\text{H}_{24}\text{N}_2\text{O}_3 \cdot \text{HCl} = 364.9$

CAS—32780-64-6

A white crystalline solid. M.p. about 180°.

Soluble in water and ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 7.4 (phenol), 8.7 ($-\text{NH}_2$).

Colour Tests. Ferric Chloride—violet; Folin-Ciocalteu Reagent—blue; Liebermann's Test—brown-orange; Mandelin's Test—green-blue; Marquis Test—red → brown-red; Nessler's Reagent (100°)—black.

Gas Chromatography. *System GA*—RI 1280.

High Pressure Liquid Chromatography. *System HA*— k' 1.7 (tailing peak).

Ultraviolet Spectrum. Aqueous acid—302 nm ($A_1^1 = 95$ a); aqueous alkali—246 nm ($A_1^1 = 267$ a), 333 nm ($A_1^1 = 161$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1680, 1643, 1502, 1270, 820, 1250 (labetalol hydrochloride, Nujol mull).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma, serum, or whole blood: detection limit 10 ng/ml, UV detection—I. J. Hidalgo and K. T. Muir, *J. Chromat.*, 1984, 305; *Biomed. Appl.*, 30, 222–227. In postmortem tissues: UV detection—L. K. Panell *et al.*, *J. analyt. Toxicol.*, 1982, 6, 193–195.

RADIORECEPTOR ASSAY. In plasma: sensitivity 5 ng/ml—J. G. Kelly *et al.*, *Br. J. clin. Pharmacol.*, 1981, 12, 258–260.

Disposition in the Body. Well absorbed after oral administration but undergoes extensive first-pass metabolism; bioavailability 10 to 80% (mean 30). The major metabolites are glucuronides of labetalol. Up to about 60% of a dose is excreted in the urine in 24 hours as conjugates, one of which has been identified as the *O*-phenylglucuronide; about 5% of a dose is excreted as unchanged drug.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 100 mg given to 6 subjects, peak plasma concentrations of 0.09 to 0.25 $\mu\text{g/ml}$ (mean 0.16) were attained in about 0.5 hour; following a single oral dose of 200 mg to the same subjects, peak plasma concentrations of 0.09 to 0.27 $\mu\text{g/ml}$ (mean 0.19) were reported at about 1 hour (J. J. McNeil *et al.*, *Br. J. clin. Pharmacol.*, 1979, 8, *Suppl.* 2, 157S–161S).

Following oral administration of 200 mg twice daily to 9 subjects, average steady-state plasma concentrations of 0.04 to 0.18 $\mu\text{g/ml}$ (mean 0.09) were reported (J. J. McNeil *et al.*, *Br. J. clin. Pharmacol.*, 1982, 13, *Suppl.* 1, 75S–80S).

TOXICITY.

A 68-year-old subject suffering from chronic respiratory disease died about 1 hour after inadvertently being given 200 mg of labetalol. Postmortem kidney and liver concentrations of 10.6 and 20.5 $\mu\text{g/g}$ respectively, were reported and were considered to be consistent with a therapeutic dose; death was attributed to respiratory disease (L. K. Panell *et al.*, *J. analyt. Toxicol.*, 1982, 6, 193–195).

HALF-LIFE. Plasma half-life, 3 to 6 hours.

VOLUME OF DISTRIBUTION. About 3 to 10 litres/kg (mean 7).

CLEARANCE. Plasma clearance, 10 to 40 ml/min/kg (mean 25).

PROTEIN BINDING. In plasma, about 50%.

NOTE. For a review of the pharmacokinetics of labetalol see J. J. McNeil and W. J. Louis, *Clin. Pharmacokinet.*, 1984, 9, 157–167.

Dose. 200 to 800 mg of labetalol hydrochloride daily; doses of 2.4 g daily have been given.

Lachesine Chloride

Anticholinergic

(2-Benziloyloxyethyl)ethyltrimethylammonium chloride

$\text{C}_{20}\text{H}_{26}\text{ClNO}_3 = 363.9$

CAS—1164-38-1

A white amorphous powder. M.p. 212° to 214°.

Soluble 1 in 3 of water and 1 in 10 of ethanol (90%); very slightly soluble in chloroform and ether.

Colour Tests. Mandelin's Test—orange → green; Marquis Test—orange → green → blue.

Thin-layer Chromatography. *System TA*— R_f 02. (*Acidified iodoplatinate solution*, positive.)

Gas Chromatography. *System GA*—RI 1852.

Ultraviolet Spectrum. Aqueous acid—252 nm, 258 nm ($A_1^1 = 12$ b), 264 nm. No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1739, 1241, 699, 743, 1176, 1191 (KBr disk).

Use. As a 1% ophthalmic solution.

Lanatoside C

Cardiac Glycoside

Synonym. Celanide

Proprietary Names. Cedilanid(e); Celadigal; Lanimerck; Lanocide.

Note. The name Cedilanid(e) is also applied to a preparation of deslanoside.

3 β -[(*O*- β -D-Glucopyranosyl-(1 \rightarrow 4)-*O*-3-acetyl-2,6-dideoxy- β -D-ribo-hexopyranosyl-(1 \rightarrow 4)-*O*-2,6-dideoxy- β -D-ribo-hexopyranosyl-(1 \rightarrow 4)-2,6-dideoxy- β -D-ribo-hexopyranosyl)oxy]-12 β ,14-dihydroxy-5 β ,14 β -card-20(22)-enolide
 $C_{49}H_{76}O_{20}$ = 985.1
 CAS—17575-22-3

A glycoside obtained from the leaves of the woolly foxglove, *Digitalis lanata* (Scrophulariaceae).

Colourless or white hygroscopic crystals or white crystalline powder. It melts above 240°, indistinctly and with decomposition.

Practically **insoluble** in water and ether; sparingly soluble in ethanol; soluble 1 in 2000 of chloroform and 1 in 20 of methanol; soluble in dioxan and pyridine.

Colour Tests. Antimony Pentachloride—yellow \rightarrow brown \rightarrow black-violet.

Dissolve 2 to 3 mg in 5 ml of a solution containing 0.5 ml of 9% ferric chloride solution and 100 ml of *acetic acid*; underlay with 5 ml of *sulphuric acid*—an intense blue colour forms in the acetic acid layer and a brown ring free from red at the junction of the two liquids (see also Deslanoside).

Thin-layer Chromatography. System TK—Rf 36. (*Perchloric acid solution*, followed by examination under ultraviolet light, blue fluorescence; *p-anisaldehyde reagent*, blue.)

High Pressure Liquid Chromatography. System HM—lanatoside C k' 39.5, digoxin k' 11.3.

Mass Spectrum. Principal peaks at *m/z* 41, 43, 29, 55, 39, 57, 73, 81; digoxin 73, 58, 57, 43, 41, 39, 29, 45 (no peaks above 360).

Quantification. RADIOIMMUNOASSAY. In serum—A. C. Moffat, *Acta pharmac. tox.*, 1974, 35, 386–394.

Disposition in the Body. Poorly absorbed after oral administration; it is converted to digoxin in the gastro-intestinal tract and very little unchanged drug is found in the plasma or urine after oral administration. Hydrolysis to derivatives of digoxigenin and deacetylation to deslanoside also occur. After an oral dose, about 18% is excreted in the urine in 24 hours, mostly as digoxin and metabolites of digoxigenin; after intravenous administration, about 30% of a dose is excreted in the urine in 24 hours with about 70% of the urinary material consisting of unchanged drug and the remainder being digoxin and deslanoside. A total

of about 60% of an intravenous dose is excreted in the urine in 5 days.

THERAPEUTIC CONCENTRATION. In serum, usually in the range 0.0004 to 0.001 μ g/ml.

Following a single oral dose of 0.5 mg of 3 H-lanatoside C to 9 subjects, peak plasma concentrations of unchanged drug plus metabolites of about 0.002 μ g/ml were attained after about 1 hour and a second peak of approximately the same concentration was reported in each subject after 5 to 8 hours (S. Aldous *et al.*, *Aust. J. pharm. Sci.*, 1972, 1, 35–41).

TOXICITY.

A postmortem blood concentration of 0.047 μ g/ml was reported in a fatality involving an overdose of lanatoside C; death occurred 48 hours after ingestion (A. C. Moffat, *Acta pharmac. tox.*, 1974, 35, 386–394).

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 1.2.

PROTEIN BINDING. In plasma, about 25%.

Dose. For slow digitalisation, 1.5 to 2 mg daily for 3 to 5 days; maintenance, 0.25 to 1.5 mg daily.

Levallorphan

Narcotic Antagonist

(–)-9a-Allylmorphinan-3-ol

$C_{19}H_{25}NO$ = 283.4

CAS—152-02-3

White crystals. M.p. 180° to 182°.

Levallorphan Tartrate

Proprietary Names. Lofran. It is an ingredient of Pethilorfan.

$C_{19}H_{25}NO \cdot C_4H_6O_6$ = 433.5

CAS—71-82-9

A white crystalline powder. M.p. 174° to 177°.

Soluble 1 in about 20 of water, 1 in 100 of ethanol, 1 in 3300 of chloroform, 1 in 5000 of ether, and 1 in 13 of methanol.

Dissociation Constant. pK_a 4.5, 6.9.

Partition Coefficient. Log *P* (octanol/pH 7.4), 2.3.

Colour Tests. Aromaticity (Method 2)—yellow/orange; Liebermann's Test—black.

Thin-layer Chromatography. System TA—Rf 67; system TB—Rf 19; system TC—Rf 24. (*Dragendorff spray*, positive; *FPN reagent*, yellow; *acidified iodoplatinate solution*, positive; *Marquis reagent*, grey.)

Gas Chromatography. System GA—RI 2359.

High Pressure Liquid Chromatography. System HA—k' 1.9 (tailing peak); system HC—k' 1.46.

Ultraviolet Spectrum. Aqueous acid—279 nm (A_1^1 = 71 a); aqueous alkali—240 nm (A_1^1 = 312 a), 299 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 759, 1271, 747, 1575, 1242, 932 (Nujol mull).

Mass Spectrum. Principal peaks at *m/z* 283, 282, 256, 176, 157, 43, 41, 57.

Disposition in the Body. Levallorphan is effective within 1 minute of intravenous injection and the effects may last up to 4 hours. It is metabolised by *N*-dealkylation and glucuronic acid conjugation.

TOXICITY. The estimated minimum lethal dose is 0.2 g or 2 g for an addict.

Dose. 0.5 to 1 mg of levallorphan tartrate intravenously, repeated if necessary.

Levamisole

Anthelmintic

Synonym. *l*-Tetramisole

(*S*)-2,3,5,6-Tetrahydro-6-phenylimidazo[2,1-*b*]thiazole

$C_{11}H_{12}N_2S = 204.3$

CAS—14769-73-4

A white crystalline powder. M.p. 60° to 62°.

Soluble in dilute acetic acid and in chloroform.

Levamisole Hydrochloride

Proprietary Names. Cyverm (vet.); Ergamisol; Ketrax; Nemicide (vet.); Nilverm (vet.); Solaskil.

$C_{11}H_{12}N_2S \cdot HCl = 240.8$

CAS—16595-80-5

A white to pale cream-coloured crystalline powder. M.p. 227° to 229°.

Soluble 1 in 2 of water and 1 in 5 of methanol; practically insoluble in ether.

Dissociation Constant. pK_a 8.0.

Colour Tests. Liebermann's Test—red-orange; Mandelin's Test—orange → grey-green.

Thin-layer Chromatography. *System TA*—Rf 62; *system TB*—Rf 18; *system TC*—Rf 48. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 1928.

Infra-red Spectrum. Principal peaks at wavenumbers 1587, 1575, 1197, 699, 1150, 1248 (KBr disk).

Mass Spectrum. Principal peaks at m/z 204, 148, 73, 101, 203, 127, 104, 205.

Quantification. **GAS CHROMATOGRAPHY.** In plasma: sensitivity 4 ng/ml, AFID—F. Rousseau *et al.*, *Eur. J. drug Met. Pharmacokinet.*, 1981, 6, 281–288.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In sheep or cattle plasma: detection limit 20 ng/ml, UV detection—S. Marriner *et al.*, *Analyst, Lond.*, 1980, 105, 993–996.

Disposition in the Body. Readily absorbed after oral administration, but extensively metabolised. It is almost completely excreted in the urine and faeces within 48 hours.

THERAPEUTIC CONCENTRATION.

Following single oral doses of 2.5 mg/kg and 5 mg/kg to 11 subjects, mean peak plasma concentrations of 0.7 and 1.5 µg/ml, respectively, were attained within 2 hours (M. Luyckx *et al.*, *Eur. J. drug Met. Pharmacokinet.*, 1982, 7, 247–254).

HALF-LIFE. Plasma half-life, about 4 hours.

Dose. The equivalent of 2.5 to 5 mg/kg of levamisole daily, for 2 or 3 days.

Levamphetamine

Central Stimulant

Synonyms. (–)-Amphetamine; Laevo-amphetamine.

(–)- α -Methylphenethylamine

$C_9H_{13}N = 135.2$

CAS—156-34-3

For analytical data see under Amphetamine.

Levodopa*Dopaminergic Agent*

Synonyms. Dihydroxyphenylalanine; Dopa; L-Dopa; Laevodopa.

Proprietary Names. Bendopa; Berkdopa; Brocadopa; Dopar; Eldopal; Larodopa; Levopa; Syndopa. It is an ingredient of Madopar, Prolopa, and Sinemet.

(-)-3-(3,4-Dihydroxyphenyl)-L-alanine

$C_9H_{11}NO_4 = 197.2$

CAS—59-92-7

A white or slightly cream-coloured crystalline powder, which darkens on exposure to air and light. M.p. about 275°, with decomposition.

Soluble 1 in 300 of water; practically insoluble in ethanol, chloroform, and ether; soluble in aqueous solutions of mineral acids and alkali carbonates.

Dissociation Constant. pK_a 2.3, 8.7, 9.7, 13.4 (25°).

Colour Tests. Ammoniacal Silver Nitrate—yellow → brown/black; Ferric Chloride—green; Folin-Ciocalteu Reagent—blue; Methanolic Potassium Hydroxide—pink → red-brown; Millon's Reagent (cold)—brown-red; Nessler's Reagent—black; Palladium Chloride—orange (→ brown); Potassium Dichromate (Method 1)—green → brown.

Ultraviolet Spectrum. Aqueous acid—280 nm ($A_1^{1\%} = 141$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1647, 1562, 1117, 1241, 1274, 1520 (KBr disk).

Mass Spectrum. Principal peaks at m/z 123, 124, 77, 44, 51, 74, 53, 39.

Quantification. GAS CHROMATOGRAPHY. In plasma: levodopa and dopamine, ECD—Y. Mizuno, *Clinica chim. Acta*, 1977, 74, 11–19.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: levodopa and 3,4-dihydroxyphenylacetic acid, sensitivity 1 ng/ml, electrochemical detection—E. Nissinen and J. Taskinen, *J. Chromat.*, 1982, 231; *Biomed. Appl.*, 20, 459–462. In urine: levodopa and

Wavelength

metabolites, UV and fluorescence detection—J. Seki *et al.*, *Chem. pharm. Bull.*, 1981, 29, 789–795.

Disposition in the Body. Rapidly absorbed from the small bowel after oral administration and widely distributed in the tissues; less than 1% of a dose reaches the brain; bioavailability about 33%. Extensively metabolised mainly by decarboxylation to dopamine, which is further metabolised, and also by methylation to 3-*O*-methyldopa which accumulates in the central nervous system; most of a dose is decarboxylated by the gastric mucosa before entering the systemic circulation; the decarboxylase activity is inhibited by carbidopa and benserazide. Dopamine is further metabolised to noradrenaline, 3-methoxytyramine, and to the two major excretory metabolites, 3,4-dihydroxyphenylacetic acid (DOPAC) and 3-methoxy-4-hydroxyphenylacetic acid (homovanillic acid, HVA). During prolonged therapy, the rate of levodopa metabolism appears to increase, possibly due to enzyme induction. About 70 to 80% of a dose is excreted in the urine in 24 hours. Of the material excreted in the urine, about 50% is DOPAC and HVA, 10% is dopamine, up to 30% is 3-*O*-methyldopa, and less than 1% is unchanged drug. Less than 1% of a dose is eliminated in the faeces. During prolonged therapy the ratio of the amount of DOPAC produced to that of HVA may be increased.

THERAPEUTIC CONCENTRATION. There is considerable intersubject variation in plasma concentrations and there appears to be no significant correlation between plasma concentrations of levodopa or its metabolites and therapeutic effect.

Following single oral doses of 1.5 g to 42 subjects, peak plasma-levodopa concentrations averaged about 1 µg/ml at 1 to 2 hours but there was a tenfold variation in peak concentrations. Peak plasma concentrations of 3-*O*-methyldopa of about 1.5 µg/ml were attained in about 4 hours and concentrations of HVA in the cerebrospinal fluid reached a maximum of about 0.15 µg/ml in 8 hours (S. Bergmann *et al.*, *Br. J. clin. Pharmacol.*, 1974, 1, 417–424).

HALF-LIFE. Plasma half-life, about 1 hour which may be increased by concomitant administration of peripheral decarboxylase inhibitors; 3-*O*-methyldopa about 13 hours.

CLEARANCE. Plasma clearance, about 23 ml/min/kg.

Dose. Initially, 0.25 to 1 g daily; maintenance, up to 8 g daily.

Levomethadyl Acetate*Narcotic Analgesic*

Synonyms. *l*-Acetylmethadol; LAAM; LAM; Levacetylmethadol.

(-)-4-Dimethylamino-1-ethyl-2,2-diphenylpentyl acetate

$C_{23}H_{31}NO_2 = 353.5$

CAS—1477-40-3 (levomethadyl); 34433-66-4 (acetate)

M.p. about 70°.

Levomethadyl Acetate Hydrochloride

$\text{C}_{23}\text{H}_{31}\text{NO}_2 \cdot \text{HCl} = 390.0$

CAS—38821-43-1

Crystals. M.p. 215°.

Soluble in water.

Dissociation Constant. pK_a 8.3.

Colour Tests. Mandelin's Test—grey-green; Marquis Test—violet-brown → grey-green.

Thin-layer Chromatography. System TA—Rf 57; system TB—Rf 62; system TC—Rf 39. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2187.

High Pressure Liquid Chromatography. System HA— k' 1.7.

Ultraviolet Spectrum. Aqueous acid—253 nm, 258 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1240, 1735, 702, 1496, 1015, 1031.

Mass Spectrum. Principal peaks at m/z 72, 73, 43, 91, 224, 56, 71, 129.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 10 ng/ml for levomethadyl acetate using FID, 5 ng/ml and 25 ng/ml for L- α -noracetylmethadol and L- α -dinoracetylmethadol, respectively, using ECD—F. L. S. Tse and P. G. Welling, *Biopharm. Drug Disp.*, 1980, 1, 203–209.

GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In plasma, whole blood or tissues: levomethadyl acetate and demethylated metabolites, sensitivity 5 ng/ml—T. A. Jennison *et al.*, *J. chromatogr. Sci.*, 1979, 17, 64–74.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: levomethadyl acetate and metabolites, sensitivity 6 ng/ml for levomethadyl acetate, L- α -noracetylmethadol and methadol, 10 ng/ml for L- α -dinoracetylmethadol, normethadol, and dinor-methadol—C.-H. Kiang *et al.*, *J. Chromat.*, 1981, 222; *Biomed. Appl.*, 11, 81–93.

RADIOIMMUNOASSAY. In biological fluids: sensitivity 50 pg—K. L. McGilliard and G. D. Olsen, *J. Pharmac. exp. Ther.*, 1980, 215, 205–212.

Disposition in the Body. Absorbed after oral administration. It is metabolised principally by *N*-demethylation to L- α -noracetylmethadol and L- α -dinoracetylmethadol which are active narcotics, and also by deacetylation to methadol which is also active; further demethylation to normethadol and dinormethadol also occurs. L- α -Noracetylmethadol, L- α -dinoracetylmethadol and, in some subjects, unchanged drug accumulate during chronic oral administration, but there is considerable intersubject variation. About 20 to 25% of a dose is excreted in the urine as unchanged drug and demethylated metabolites, and about 2% as methadol and normethadol.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 60 mg given to 5 subjects, peak plasma concentrations of 0.09 to 0.16 $\mu\text{g/ml}$ (mean 0.13) of levomethadyl acetate and 0.04 to 0.05 $\mu\text{g/ml}$ of L- α -noracetylmethadol were attained in about 2 to 4 hours and 2 to 6 hours, respectively; following chronic oral treatment with 85 mg three times a week for three months to 3 subjects, peak plasma concentrations were: levomethadyl acetate 0.16 to 0.23 $\mu\text{g/ml}$ (mean 0.20), L- α -noracetylmethadol 0.15 to 0.30 $\mu\text{g/ml}$ (mean 0.24), and L- α -dinoracetylmethadol, mean 0.27 $\mu\text{g/ml}$ (G. L. Henderson *et al.*, *Clin. Pharmac. Ther.*, 1977, 21, 16–25).

TOXICITY.

The following postmortem tissue concentrations, $\mu\text{g/ml}$ (mean, *n*), were reported in 9 heroin addicts who died unexpectedly during treatment with levomethadyl acetate:

	Levomethadyl Acetate	L- α -Noracetylmethadol	L- α -Dinoracetylmethadol
Blood	0.01–0.12 (0.05, 7)	0.01–0.22 (0.08, 7)	0.01–0.17 (0.05, 7)
Brain	0.04, 0.24 (2)	0.07, 0.42 (2)	0.14, 0.34 (2)

Other drugs (mainly diazepam, methadone or morphine) were detected in all subjects except one in which the cause of death was multiple stab wounds (D. M. Chinn *et al.*, *J. analyt. Toxicol.*, 1979, 3, 143–149).

HALF-LIFE. Plasma half-life, levomethadyl acetate about 50 hours, L- α -noracetylmethadol 30 to 65 hours, L- α -dinoracetylmethadol about 170 hours.

Dose. Usually up to 80 mg three times a week.

Levopropoxyphene*Cough Suppressant*

(–)-1-Benzyl-3-dimethylamino-2-methyl-1-phenylpropyl propionate

 $C_{22}H_{29}NO_2 = 339.5$

CAS—2338-37-6

Crystals. M.p. 75° to 76°.

Levopropoxyphene Napsylate*Synonym.* Levopropoxyphene Naphthalene-2-sulphonate*Proprietary Name.* Novrad $C_{22}H_{29}NO_2 \cdot C_{10}H_8O_3S \cdot H_2O = 565.7$

CAS—5714-90-9 (anhydrous); 55557-30-7 (monohydrate)

A white powder. M.p. 158° to 165°.

Very slightly **soluble** in water; soluble 1 in 17 of ethanol and 1 in 2 of chloroform; soluble in acetone and methanol.For analytical data see under *Dextropropoxyphene*.**Dose.** The equivalent of 50 to 100 mg of levopropoxyphene every 4 hours.**Levorphanol***Narcotic Analgesic**Synonyms.* Levorphan; Methorphan.

(–)-9a-Methylmorphinan-3-ol

 $C_{17}H_{23}NO = 257.4$

CAS—77-07-6

Crystals. M.p. 198° to 199°.

Levorphanol Tartrate*Synonym.* Levorphanol Bitartrate*Proprietary Names.* Dalmadorm; Dalmate; Dormador; Dromoran; Levo-Dromoran. $C_{17}H_{23}NO \cdot C_4H_6O_6 \cdot 2H_2O = 443.5$

CAS—125-72-4 (anhydrous); 5985-38-6 (dihydrate)

A white crystalline powder. M.p. 114° to 117°.

Soluble 1 in about 45 of water and 1 in about 110 of ethanol; practically insoluble in chloroform.**Dissociation Constant.** pK_a 8.2 (20°).**Partition Coefficient.** Log *P* (octanol/pH 7.4), 1.1.**Thin-layer Chromatography.** *System TA*—Rf 35; *system TB*—Rf 13; *system TC*—Rf 07. (*Dragendorff spray*, positive; *acidified iodoplatinate solution*, positive.)**Gas Chromatography.** *System GA*—RI 2230; *system GC*—RI 2230.**High Pressure Liquid Chromatography.** *System HA*— k' 4.4 (tailing peak); *system HC*— k' 3.20.**Ultraviolet Spectrum.** Aqueous acid—279 nm ($A_1^1 = 79$ a); aqueous alkali—240 nm ($A_1^1 = 339$ a), 299 nm ($A_1^1 = 119$ a).**Infra-red Spectrum.** Principal peaks at wavenumbers 1238, 1495, 753, 1278, 1578, 1608 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 59, 257, 150, 256, 44, 31, 200, 157.**Quantification.** GAS CHROMATOGRAPHY—MASS SPECTROMETRY. Path. Pharmac.*, 1981, 32, 545–548.**Disposition in the Body.** Absorbed after oral administration. Metabolised by 3-glucuronidation.**TOXICITY.**Postmortem concentrations in a 41-year-old female found dead after having ingested an unknown quantity of levorphanol were: blood 2.7 µg/ml, bile 24 µg/ml, brain 1.8 µg/g, kidney 3.4 µg/g, liver 5.4 µg/g, lung 17 µg/g, urine 2.3 µg/ml (J. E. Turner *et al.*, *J. analyt. Toxicol.*, 1977, 1, 103–104).A 61-year-old man ingested 30 mg of levorphanol and died about 18 hours later. The antemortem blood concentration was 0.8 µg/ml. Concentrations in other fluids and tissues (samples taken after the body had been embalmed) were: bile 15 µg/ml, kidney 1 µg/g, liver 11 µg/g (L. R. Bednarczyk, *J. analyt. Toxicol.*, 1979, 3, 217–219).**HALF-LIFE.** Plasma half-life, about 13 hours.**Dose.** 1.5 to 9 mg of levorphanol tartrate daily.

Lidoflazine*Anti-anginal*

Synonym. Ordiflazine

Proprietary Names. Clinium; Corflazine.

4-[3-(4,4'-Difluorobenzhydryl)propyl]piperazin-1-ylaceto-2',6'-xylidide

 $C_{30}H_{35}F_2N_3O = 491.6$

CAS—3416-26-0

A white or slightly yellow amorphous powder. M.p. 158° to 161°. Practically **insoluble** in water; soluble 1 in 90 of ethanol and 1 in 220 of ether; very soluble in chloroform.

Colour Tests. Mandelin's Test—yellow; Marquis Test—yellow.

Thin-layer Chromatography. System TA—Rf 70; system TB—Rf 11; system TC—Rf 63. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—not eluted.

High Pressure Liquid Chromatography. System HA—k' 0.6.

Ultraviolet Spectrum. Acid isopropyl alcohol—266 nm ($A_1^1 = 47$ b), 272 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1505, 1645, 1220, 1155, 835, 775 (KBr disk).

Mass Spectrum. Principal peaks at m/z 343, 70, 344, 109, 42, 113, 491, 56.

Disposition in the Body. Well absorbed after oral administration. It is excreted mainly as metabolites, the major metabolites being bis(4-fluorophenyl)butyric acid and the glucuronide conjugate of bis(4-fluorophenyl)butan-1-ol. In 7 days, about 40% of an oral dose is excreted in the urine and about 40% is eliminated in the faeces.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 120 mg given with food, peak plasma concentrations of about 0.06 µg/ml were attained in about 1 hour. Following repeated oral administration of 120 mg three times a day, a mean steady-state plasma concentration of 0.12 µg/ml was reported (P. M. Vanhoutte and J. M. Van Nueten, Lidoflazine, in *New Drugs Annual: Cardiovascular Drugs*, A. Scribner (Ed.), New York, Raven Press, 1973, pp. 203–226).

HALF-LIFE. Plasma half-life, about 1 day.

REFERENCE. P. M. Vanhoutte and J. M. Van Nueten, *ibid.*

Dose. 120 to 360 mg daily.

Lignocaine*Local Anaesthetic/Anti-arrhythmic*

Synonym. Lidocaine

2-Diethylaminoaceto-2',6'-xylidide

 $C_{14}H_{22}N_2O = 234.3$

CAS—137-58-6

A white to slightly yellow crystalline powder. M.p. 66° to 69°. Practically **insoluble** in water; very soluble in ethanol and chloroform; freely soluble in ether.

Lignocaine Hydrochloride

Synonym. Lidocaine Hydrochloride

Proprietary Names. Anestacon; Laryng-O-Jet; Lidocaton; Lignostab; Ultracaine; Uro-Jet; Xylacaine; Xylocard.

 $C_{14}H_{22}N_2O \cdot HCl \cdot H_2O = 288.8$

CAS—73-78-9 (anhydrous); 6108-05-0 (monohydrate)

A white crystalline powder. M.p. 74° to 79°.

Soluble 1 in 0.7 of water, 1 in 1.5 of ethanol, and 1 in 40 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 7.9 (25°).

Colour Test. To a 2% solution in water, add 1 ml of dilute nitric acid and 3 ml of mercuric nitrate solution and heat to boiling—yellow or yellow-green.

Thin-layer Chromatography. System TA—Rf 70; system TB—Rf 35; system TC—Rf 73; system TL—Rf 63. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, pink.)

Gas Chromatography. System GA—RI 1870; system GF—RI 2240.

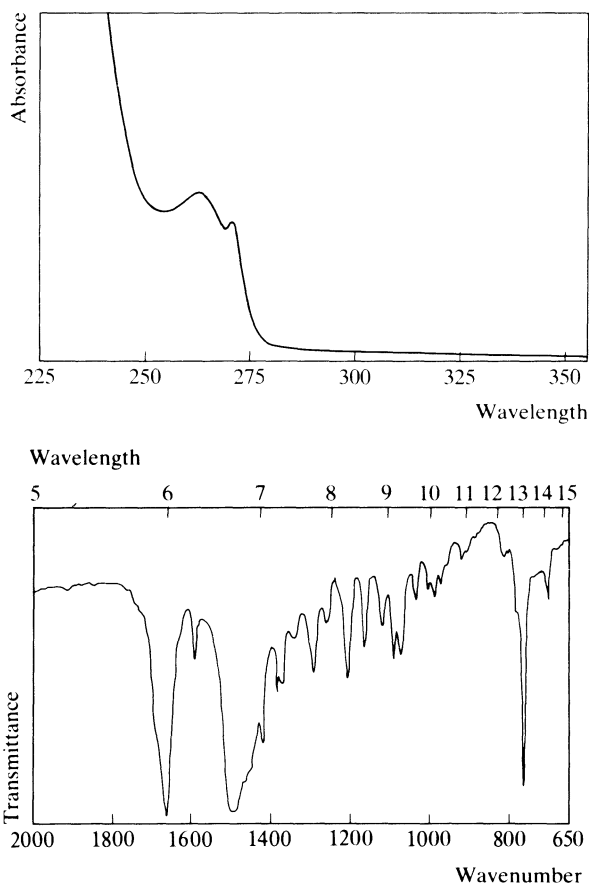

High Pressure Liquid Chromatography. System HA—lignocaine k' 0.6, monoethylglycinexylidide k' 1.2; system HQ—k' 0.79.

Ultraviolet Spectrum. Aqueous acid—263 nm ($A_1^1 = 19$ a), 272 nm. (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 1662, 1495, 762, 1204, 1290, 1086 (KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 86, 87, 58, 44, 72, 42, 120, 85.

Quantification. GAS CHROMATOGRAPHY. In blood, serum or tissues: sensitivity 100 ng/ml, AFID—B. Levine *et al.*, *J. analyt. Toxicol.*, 1983, 7, 123–124. In plasma: lignocaine and monoethylglycinexylidide, sensitivity 300 ng/ml, AFID—J. D. Hawkins *et al.*, *Ther. Drug Monit.*, 1982, 4, 103–106.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: sensitivity 100 ng/ml for lignocaine, 50 ng/ml for monoethylglycinexylidide and glycinexylidide, UV detection—R. Lindberg *et al.*, *Clin. Chem.*, 1983, 29, 1572–1573.

Disposition in the Body. Readily absorbed from the gastrointestinal tract, mucous membranes, and after intramuscular injection; oral bioavailability is low due to first-pass metabolism. Metabolic reactions include *N*-de-ethylation, hydrolysis, and ring hydroxylation. About 3% of a dose is excreted in the urine as unchanged drug in 24 hours, 40 to 70% as 4-hydroxy-2,6-xylidine, and about 4% as the active monoethylglycinexylidide; excretion of unchanged drug is increased if the urine is acid. Other metabolites include glycinexylidide (active), 2,6-xylidine, 3'-hydroxylignocaine, and 3'-hydroxymonoethylglycinexylidide. Glycinexylidide and the hydroxy metabolites are excreted as acid-hydrolysable conjugates. Glycinexylidide has also been detected in plasma after prolonged intravenous infusion.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 2 to 5 µg/ml.

Intravenous infusions at rates varying between 16 and 143 µg/min/kg were given to 31 patients; after about 10 hours, blood concentrations, normalised to an infusion rate of 10 µg/min/kg, were 0.1 to 3.2 µg/ml (mean 1.1) for lignocaine and 0.02 to 2.27 µg/ml (mean 0.25) for monoethylglycinexylidide (H. Halkin *et al.*, *Clin. Pharmac. Ther.*, 1975, 17, 669–675).

Following intravenous infusions at rates varying between 20 and 50 µg/min/kg to 24 subjects, the following steady-state serum concentrations

were reported: lignocaine 1.7 to 11.4 µg/ml (mean 5.7), monoethylglycinexylidide 0.2 to 5.2 µg/ml (mean 2.0), glycinexylidide 0 to 1.4 µg/ml (mean 0.5) (D. E. Drayer *et al.*, *Clin. Pharmac. Ther.*, 1983, 34, 14–22).

TOXICITY. Toxic effects are associated with plasma concentrations greater than 6 µg/ml, and fatalities with blood concentrations greater than 14 µg/ml.

In a fatality due to accidental intravenous injection of 2 g of lignocaine, the following postmortem tissue concentrations were reported: blood 30 µg/ml, brain 135 µg/g, heart 106 µg/g, kidney 204 µg/g, lung 87 µg/g, skeletal muscle 20 µg/g (A. Poklis *et al.*, *J. forens. Sci.*, 1984, 29, 1229–1236).

In 3 fatalities involving accidental ingestion of 25 g, the following postmortem tissue concentrations were reported: blood 44, 92, 11 µg/ml, brain 17, 32, 7 µg/g, kidney 66, —, 68 µg/g, liver 70, 96, 20 µg/g, lung 94, 130, 49 µg/g, urine 59, —, — µg/ml; in the first 2 cases death occurred within a few minutes of ingestion whereas the third subject survived for 24 hours (T. Borkowski and A. Dłuzniwska, *ibid.*, 1976, 12(3), 17–18).

HALF-LIFE. Plasma half-life, lignocaine 1 to 2 hours, increased in subjects with liver disease or after acute myocardial infarction; monoethylglycinexylidide about 1 to 2 hours, glycinexylidide about 10 hours.

VOLUME OF DISTRIBUTION. About 1 to 2 litres/kg.

CLEARANCE. Plasma clearance, about 5 to 20 ml/min/kg.

PROTEIN BINDING. In plasma, about 70% at therapeutic concentrations but there is considerable intersubject variation and binding appears to be concentration-dependent.

NOTE. For a review of the pharmacokinetics of lignocaine see N. L. Benowitz and W. Meister, *Clin. Pharmacokinet.*, 1978, 3, 177–201.

Dose. For local anaesthesia, the total dose of lignocaine hydrochloride by injection should not exceed 300 mg (4.5 mg/kg), unless administered with adrenaline. For ventricular arrhythmias, initially 50 to 100 mg intravenously, followed by an infusion.

Lincomycin

Antibiotic

Methyl 6-amino-6,8-dideoxy-*N*-[(2*S*,4*R*)-1-methyl-4-propyl-propyl]-1-thio- α -D-erythro-D-galacto-octopyranoside

$C_{18}H_{34}N_2O_6S = 406.5$

CAS—154-21-2

Soluble in water, and most organic solvents.

Lincomycin Hydrochloride

Proprietary Names. Albiotic; Cillimycin; Lincocin(e); Mycivin.

$C_{18}H_{34}N_2O_6S \cdot HCl \cdot H_2O = 461.0$

CAS—859-18-7 (anhydrous); 7179-49-9 (monohydrate)

A white crystalline powder.

Soluble 1 in 1 of water, 1 in 40 of ethanol, and 1 in 20 of dimethylformamide; soluble in methanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 7.5.

Colour Test. Sodium Nitroprusside (Method 3)—violet.

Thin-layer Chromatography. System TA—Rf 67. (Acidified potassium permanganate solution, positive.)

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1655, 1104, 1075, 1564, 1040, 1262 (lincomycin hydrochloride, KBr disk).

Dose. The equivalent of 1.5 to 2 g of lincomycin daily.

Lindane

Pesticide

Synonyms. 666; Benhexachlor; Gamma Benzene Hexachloride; Gamma-BHC; Gamma-HCH; HCH; Hexicide.

Proprietary Names. Aphtiria; Élentol; Esoderm; Gamene; GBH; Hexicid; Jacutin; Kwell; Kwellada; Lorexane; Quellada; Scabene.

1 α ,2 α ,3 β ,4 α ,5 α ,6 β -Hexachlorocyclohexane

C₆H₆Cl₆ = 290.8

CAS—58-89-9

A white crystalline powder. M.p. about 112°.

Practically **insoluble** in water; soluble 1 in 19 of dehydrated alcohol, 1 in 2 of acetone, 1 in 3.5 of chloroform, and 1 in 5.5 of ether.

Partition Coefficient. Log *P* (octanol), 3.7.

Gas Chromatography. System GA—RI 1745; system GK—retention time 0.76 relative to caffeine.

Infra-red Spectrum. Principal peaks at wavenumbers 680, 665, 695, 778, 840, 950 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 181, 183, 109, 219, 111, 217, 51, 221.

Quantification. GAS CHROMATOGRAPHY. In blood: ECD—N. Jain *et al.*, *J. Pharm. Pharmac.*, 1965, 17, 362–367. In blood or tissues: sensitivity 1 ng/ml, ECD—J. L. Radomski and A. Ray, *J. chromatogr. Sci.*, 1970, 8, 108–114.

Disposition in the Body. Readily absorbed after ingestion, inhalation, or through the skin. It is stored in the body fat and adrenal glands. Metabolised by oxidation and dehydrohalogenation to a series of chlorinated phenols which are excreted mainly in the urine in free and conjugated form.

After intravenous administration, about 25% of the dose is excreted in the urine; after topical administration about 10% of the dose is recovered in the urine (R. J. Feldmann and H. J. Maibach, *Toxic. appl. Pharmac.*, 1974, 28, 126–132).

BLOOD CONCENTRATION.

Blood-lindane concentrations in subjects with low occupational exposure ranged from 0.001 to 0.009 µg/ml (mean 0.004), and concentrations in subjects with high dermal occupational exposure ranged from 0.006 to 0.093 µg/ml (mean 0.031) (T. H. Milby *et al.*, *J. occup. Med.*, 1968, 10, 584–587).

Average serum concentrations of 0.07, 0.19 and 0.04 µg/ml of α -benzene hexachloride (α -BHC), β -BHC and γ -BHC, respectively, were reported in 57 subjects who worked in a factory manufacturing lindane; β -BHC was the only isomer observed to accumulate on chronic exposure. A mean fat concentration of 45.6 µg/g of β -BHC was reported in 8 subjects (K. Baumann *et al.*, *Int. Archs occup. envir. Hlth*, 1980, 47, 119–127).

TOXICITY. Lindane is not highly toxic when applied externally in the concentrations usually employed (0.1 to 1%), but when ingested it may cause convulsions; dusts may irritate the nose and throat when used in a confined space. Blood concentrations greater than 0.02 µg/ml have been associated with toxic effects. The estimated minimum oral lethal dose is 200 mg/kg and the maximum permissible atmospheric concentration is 0.5 mg/m³. Toxic doses or long term exposure may cause liver necrosis. The maximum acceptable daily intake is 10 µg/kg.

A young girl who ingested about 1.6 g of lindane was found to have a serum concentration of 0.84 µg/ml after 2 hours, following convulsions; the concentration decreased to 0.49 µg/ml after 4 hours; urinary concentrations of individual free phenolic metabolites determined 5.5 hours after ingestion ranged from 0.04 to 0.74 µg/ml (H. G. Starr and N. J. Clifford, *Archs envir. Hlth*, 1972, 25, 374–375).

A fat concentration of 343 µg/g was reported in a fatality due to lindane (W. J. Hayes and W. K. Vaughn, *Toxic. appl. Pharmac.*, 1977, 42, 235–252).

HALF-LIFE. Derived from urinary excretion data, about 26 hours.

Use. Topically in concentrations of 0.1 to 1%.

Liothyronine

Thyroid Agent

Synonyms. L-Tri-iodothyronine. The abbreviation T₃ is often used for tri-iodothyronine.

4-*O*-(4-Hydroxy-3-iodophenyl)-3,5-di-iodo-L-tyrosine

C₁₅H₁₂I₃NO₄ = 651.0

CAS—6893-02-3

Crystals. M.p. 236°, with decomposition.

Liothyronine Sodium

Synonym. Sodium Liothyronine

Proprietary Names. Cynomel; Cytomel; Ro-Thyronine; Tertroxin; Ti-Tre. It is an ingredient of Euthroid and Thyrolar.

C₁₅H₁₁I₃NNaO₄ = 673.0

CAS—55-06-1

A white to buff-coloured solid or crystalline powder.

Practically **insoluble** in water, chloroform, ether, and most other organic solvents; soluble 1 in 500 of ethanol; soluble in solutions of alkali hydroxides.

Dissociation Constant. pK_a 8.5.

Ultraviolet Spectrum. Liothyronine sodium: aqueous alkali—319 nm ($A_1^1 = 65$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1608, 1180, 1493, 1250, 1535, 1320 (KBr disk).

Quantification. See under Thyroxine.

Disposition in the Body. Absorbed after oral or intramuscular administration. It is metabolised by conjugation with glucuronic acid or sulphate, de-iodination, oxidative deamination, and decarboxylation. It is excreted mainly in the bile and faeces, and is subject to enterohepatic circulation; some iodide is excreted in the urine.

Endogenous serum concentrations range from 0.0010 to 0.0016 $\mu\text{g/ml}$, in normal subjects.

HALF-LIFE. Plasma half-life, about 2 days.

PROTEIN BINDING. In plasma, more than 99%.

Dose. Up to 100 μg of liothyronine sodium daily.

Lithium Carbonate

Tranquilliser

Proprietary Names. Camcolit; Carbolith; Eskalith; Hypnorex; Liskonum; Lithane; Lithazine; Lithobid; Lithonate; Lithotabs; Manialith; Phasal; Priadel; Quilonum retard; Téralithe.

$\text{Li}_2\text{CO}_3 = 73.89$

CAS—554-13-2

A white granular powder. M.p. about 618° .

Soluble 1 in 100 of water and 1 in 140 of boiling water; very slightly soluble in ethanol; soluble, with effervescence, in dilute mineral acids.

Lithium Citrate

Proprietary Names. Arthri-Sel; Cibalith-S; Litarex; Lithonate-S.

$\text{C}_6\text{H}_5\text{Li}_3\text{O}_7 \cdot 4\text{H}_2\text{O} = 282.0$

CAS—919-16-4 (anhydrous); 6080-58-6 (tetrahydrate)

A white, somewhat deliquescent, crystalline powder.

Soluble 1 in 2 of water; practically insoluble in ethanol and ether.

Quantification. **ATOMIC ABSORPTION SPECTROPHOTOMETRY.** In postmortem blood: sensitivity 145 nmol/litre—I. M. B. Scott, *J. forens. Sci. Soc.*, 1982, 22, 41–42.

EMISSION FLAME PHOTOMETRY. In blood or urine: sensitivity 2 nmol/litre in blood, 30 nmol/litre in urine—R. Robertson *et al.*, *Clinica chim. Acta.*, 1973, 45, 25–31. In serum: sensitivity 50 nmol/litre (comparison with atomic absorption spectrophotometry)—A. L. Levi and E. M. Katz, *Clin. Chem.*, 1970, 16, 840–842.

Disposition in the Body. Readily absorbed after oral administration. About 97% of a dose is excreted unchanged in the urine in 10 days with 50 to 60% in the first 24 hours. The urinary excretion of lithium appears to be slower in the elderly than the young and also appears to occur more slowly at night, resulting in a diurnal rhythm in excretion rate; its excretion is also markedly influenced by sodium and, possibly, potassium status; in subjects where the sodium intake is reduced, lithium is reabsorbed by the renal tubules and in subjects who have a high sodium intake the excretion of lithium is increased. Lithium is widely distributed throughout the body and concentrations in the cerebrospinal fluid may reach 50% of those in plasma.

THERAPEUTIC CONCENTRATION. Lithium plasma concentrations should be monitored 12 hours after a dose to ensure that they are within the range 0.5 to 1.2 mmol/litre.

Following a single oral dose of 600 mg to 10 subjects, peak plasma concentrations of 0.45 to 0.80 mmol/litre (mean 0.64) were attained in about 2 hours (J. M. Meinhold *et al.*, *J. clin. Pharmac.*, 1979, 19, 701–703). After daily oral doses of 1.5 to 1.7 g to 16 subjects, steady-state serum concentrations were in the range 0.7 to 0.9 mmol/litre (J. L. Marini and M. H. Sheard, *J. clin. Pharmac.*, 1976, 16, 276–283).

TOXICITY. Toxic effects may be produced by serum concentrations greater than 2 mmol/litre. Blood concentrations of about 5 mmol/litre or more are usually fatal, although in one instance of survival which occurred after the ingestion of 22.5 g of lithium carbonate, the maximum serum concentration was 8.2 mmol/litre; a fatality due to the acute ingestion of lithium carbonate in which the serum concentration was 2.43 mmol/litre on admission to hospital and 1.93 mmol/litre at the time of death has also been reported.

In 3 fatalities due to lithium intoxication, the following postmortem tissue concentrations were reported: blood 1.9, 3.0, and 4.6 mmol/litre, brain 1.4, 5.2, and 4.2 mmol/kg, kidney 1.9, 5.9, and 9.6 mmol/kg, liver 1.9, 2.9, and 6.7 mmol/kg, urine 4.9, —, and 6.7 mmol/litre (Z. Kosa and A. Benko, *Bull. int. Ass. forens. Toxicol.*, 1981, 16(2), 19–20 and A. Alha *et al.*, *ibid.*, 20–21).

In one subject who ingested an unknown amount, the serum concentration at 48 hours was 6.8 mmol/litre; death occurred after 21 days and the following postmortem tissue distribution was reported: serum 0.4 mmol/litre, brain 0.35 to 0.85 mmol/kg, kidney 0.60 mmol/kg, liver 0.22 mmol/kg, lung 0.51 mmol/kg (A. Amidsen *et al.*, *Acta psychiat. scand.*, 1974, 255, Suppl. 4, 25–33).

HALF-LIFE. Plasma half-life, about 20 hours after a single dose but appears to be dependent on the duration of treatment. In patients on their first course of treatment a plasma half-life averaging 31 hours has been reported; this increased to 40 hours in subjects receiving lithium for less than one year and 58 hours in those taking the drug for longer than one year.

VOLUME OF DISTRIBUTION. About 0.8 litre/kg.

CLEARANCE. Apparent plasma clearance after a single dose, about 0.4 ml/min/kg, decreased in uraemia and in the elderly.

DISTRIBUTION IN BLOOD. Lithium is taken up by erythrocytes to a variable extent which appears to be partly genetically determined.

The erythrocyte:plasma ratio was reported to range from 0.19 to 1.0 (mean 0.5), in 42 subjects (J. A. Smith *et al.*, *Med. J. Aust.*, 1979, 1, 631–632).

SALIVA. Plasma : saliva ratio, about 0.4 but there is considerable intersubject variation.

Dose. Usually 0.6 to 1.2 g daily; up to 2 g daily may be given for the first 5 to 7 days.

Lobeline

Respiratory Stimulant

Synonym. Alpha-lobeline

2-[6-(β -Hydroxyphenethyl)-1-methyl-2-piperidyl]acetophenone

$\text{C}_{22}\text{H}_{27}\text{NO}_2 = 337.5$

CAS—90-69-7

An alkaloid obtained from *Lobelia inflata* (Lobeliaceae).

Crystals. M.p. 130° to 131° .

Sparingly **soluble** in water; soluble in hot ethanol, chloroform, and ether.

Lobeline HydrochlorideC₂₂H₂₇NO₂·HCl = 373.9

CAS—134-63-4

A white crystalline or granular powder. M.p. not lower than 180°.

Soluble 1 in 40 of water and 1 in 12 of ethanol; very soluble in chloroform; very slightly soluble in ether.**Lobeline Sulphate***Proprietary Names.* Lobatox; Nikoban; Unilobin.(C₂₂H₂₇NO₂)₂·H₂SO₄ = 773.0

CAS—134-64-5

Colour Tests. Mandelin's Test—grey; Marquis Test—red-violet.**Thin-layer Chromatography.** *System TA*—Rf 61; *system TB*—Rf 17; *system TC*—Rf 35. (Acidified iodoplatinate solution, positive.)**Gas Chromatography.** *System GA*—RI 1780.**Ultraviolet Spectrum.** Aqueous acid—248 nm (A₁ = 416 a).**Infra-red Spectrum.** Principal peaks at wavenumbers 1687, 700, 1211, 1115, 1052, 769 (KBr disk).**Mass Spectrum.** Principal peaks at *m/z* 96, 105, 77, 97, 216, 42, 218, 51.**Dose.** Lobeline hydrochloride was formerly given intramuscularly in doses of 3 to 10 mg.**Lofepamine***Antidepressant**Synonym.* Lopramine4'-Chloro-2-[3-(10,11-dihydro-5*H*-dibenz[*b,f*]azepin-5-yl)-*N*-methylpropylamino]acetophenoneC₂₆H₂₇ClN₂O = 419.0

CAS—23047-25-8

Colourless crystals, which become discoloured in air. M.p. 106°. Practically **insoluble** in water; slightly soluble in ethanol; soluble in chloroform.**Lofepamine Hydrochloride***Proprietary Names.* Gamanil; Gamonil; Tymelyt.C₂₆H₂₇ClN₂O·HCl = 455.4

CAS—26786-32-3

Colourless crystals or yellowish-white microcrystalline powder. M.p. 152° to 154°.

Slightly **soluble** in water; freely soluble in ethanol and chloroform.**High Pressure Liquid Chromatography.** *System HA*—lofepramine k' 0.6, desipramine k' 2.1, 2-hydroxydesipramine k' 1.2.**Ultraviolet Spectrum.** Methanol—255 nm (A₁ = 596 a).**Infra-red Spectrum.** Principal peaks at wavenumbers 1700, 1235, 1495, 1590, 1100, 763 (lofepramine hydrochloride, KBr disk).**Mass Spectrum.** Principal peaks at *m/z* 58, 234, 193, 192, 42, 235, 194, 59; desipramine 235, 195, 208, 44, 234, 193, 194, 71; 2-hydroxydesipramine 44, 209, 211, 250, 210, 224, 42, 251.**Quantification.** GAS CHROMATOGRAPHY. In plasma: limit of detection, lofepramine 1 ng/ml, desipramine 2 ng/ml, FID—R. Lundgren *et al.*, *Acta pharm. suec.*, 1977, 14, 81–94.GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In plasma or urine: sensitivity 2 ng/ml for lofepramine and desipramine, and 20 ng/ml for 2-hydroxydesipramine—K. Matsubayashi *et al.*, *J. Chromat.*, 1977, 143; *Biomed. Appl.*, 1, 571–580.**Disposition in the Body.** Readily absorbed after oral administration but undergoes extensive first-pass demethylation to desipramine which is the principal active metabolite. It is also metabolised by *N*-oxidation, hydroxylation, and conjugation and is excreted in the urine mainly as metabolites; a second active metabolite, 2-hydroxydesipramine, has been reported to be the major unconjugated urinary metabolite.**THERAPEUTIC CONCENTRATION.**After a single oral dose of 2 mg/kg given to 6 subjects, peak plasma-lofepramine concentrations of 0.04 to 0.14 µg/ml (mean 0.09) were attained in about 1 hour; peak plasma-desipramine concentrations of 0.01 to 0.02 µg/ml were attained in 3 to 8 hours in 4 subjects. When a similar dose was given to the same subjects on a second occasion some weeks later, peak plasma-lofepramine concentrations of 0.05 to 0.27 µg/ml (mean 0.13) were reported. Following oral doses of 70 mg three times a day for 10 days to 3 subjects, plasma concentrations of about 0.003 µg/ml of lofepramine and 0.01 to 0.05 µg/ml (mean 0.025) of desipramine were reported, determined immediately prior to a dose (G. P. Forshell *et al.*, *Eur. J. clin. Pharmac.*, 1976, 9, 291–298).**PROTEIN BINDING.** In plasma, about 99%.**Dose.** 70 to 210 mg daily.**Loperamide***Antidiarrhoeal*4-(4-*p*-Chlorophenyl-4-hydroxypiperidino)-*NN*-dimethyl-2,2-diphenylbutyramideC₂₉H₃₃ClN₂O₂ = 477.0

CAS—53179-11-6

**Loperamide Hydrochloride***Proprietary Names.* Arret; Blox; Imodium; Lopemid.C₂₉H₃₃ClN₂O₂·HCl = 513.5

CAS—34552-83-5

A white or yellowish-white, amorphous or microcrystalline powder. M.p. about 225°, with some decomposition.

Slightly **soluble** in water; freely soluble in chloroform and methanol.

Thin-layer Chromatography. System *TA*—Rf 70; system *TB*—Rf 09; system *TC*—Rf 32. (*Dragendorff* spray.)

Ultraviolet Spectrum. Acid isopropyl alcohol—254 nm, 260 nm ($A_1^1 = 14$ b), 266 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1600, 700, 830, 765, 964, 986 (loperamide hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 238, 42, 239, 224, 240, 56, 72, 226.

Quantification. RADIOIMMUNOASSAY. In serum or urine—H. S. Weintraub *et al.*, *Curr. ther. Res.*, 1977, 21, 867–876.

Disposition in the Body. Poorly absorbed after oral administration. About 1 to 2% of a dose is excreted in the urine as free or conjugated loperamide in 48 hours. Up to 10% of a dose may be excreted in the urine in 8 days and about 40% is eliminated in the faeces over the same period.

THERAPEUTIC CONCENTRATION.

Following oral administration of capsules containing 8 mg of loperamide hydrochloride to 6 subjects, peak serum concentrations of about 0.002 µg/ml were attained in about 4 to 5 hours (J. M. Killinger *et al.*, *J. clin. Pharmac.*, 1979, 19, 211–218).

HALF-LIFE. Plasma half-life, 7 to 15 hours (mean 11).

PROTEIN BINDING. In plasma, about 97%.

NOTE. For a review of the pharmacokinetics of loperamide see R. C. Heel *et al.*, *Drugs*, 1978, 15, 33–52.

Dose. Up to 16 mg of loperamide hydrochloride daily.

Loprazolam

Hypnotic

6-(2-Chlorophenyl)-2,4-dihydro-2-(4-methylpiperazin-1-yl-methylene)-8-nitro-1*H*-imidazo[1,2-*a*][1,4]benzodiazepin-1-one

$C_{23}H_{21}ClN_6O_3 = 464.9$

CAS—61197-73-7

Crystals. M.p. 214° to 215°.

Loprazolam Mesylate

Proprietary Name. Dormonox

$C_{23}H_{21}ClN_6O_3 \cdot CH_4SO_3 \cdot H_2O = 579.0$

A yellow powder. M.p. 242° to 245°, with decomposition.

Soluble 1 in about 100 of water, 1 in about 200 of ethanol, and 1 in about 500 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 6.0 (24°).

Ultraviolet Spectrum. Ethanol—330 nm ($A_1^1 = 884$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1628, 1610, 1045, 1182, 1192, 1518 (loprazolam mesylate, KBr disk).

Disposition in the Body. Readily absorbed after oral administration.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 2 mg to 8 subjects, a mean peak serum concentration of 0.0097 µg/ml was attained in 2.4 hours. Following repeated oral doses of 2 mg daily for 8 days, a mean peak serum concentration of 0.012 µg/ml was reported 2.2 hours after the last dose (L. A. Stevens *et al.*, *Eur. J. clin. Pharmac.*, 1983, 25, 651–655).

HALF-LIFE. Plasma half-life, 4 to 11 hours (mean 7).

Dose. The equivalent of 1 to 2 mg of loprazolam, as a hypnotic.

Lorazepam

Tranquilliser

Proprietary Names. Almazine; Ativan; Tavor; Temesta.

7-Chloro-5-(2-chlorophenyl)-1,3-dihydro-3-hydroxy-2H-1,4-benzodiazepin-2-one

 $C_{15}H_{10}Cl_2N_2O_2 = 321.2$

CAS—846-49-1

A white powder. M.p. 166° to 168°.

Practically insoluble in water; soluble in ethanol, acetone, and glacial acetic acid; slightly soluble in chloroform and ether.

Dissociation Constant. pK_a 1.3, 11.5 (20°).Partition Coefficient. Log P (octanol/pH 7.4), 2.4.

Colour Tests. Formaldehyde-Sulphuric Acid—orange; Marquis Test—yellow; Sulphuric Acid—yellow.

Thin-layer Chromatography. System TA—Rf 52; system TB—Rf 01; system TC—Rf 36; system TD—Rf 23; system TE—Rf 45; system TF—Rf 39. (Acidified iodoplatinate solution, positive; acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 2402; system GG—RI 2910.

High Pressure Liquid Chromatography. System HA— k' 0.1; system HI— k' 4.60; system HK— k' 0.14.Ultraviolet Spectrum. Ethanol—230 nm ($A_1^1 = 1100$ b), 316 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1685, 1149, 1317, 1120, 1605, 826 (KBr disk).

Mass Spectrum. Principal peaks at m/z 291, 239, 274, 293, 75, 302, 276, 138.Quantification. GAS CHROMATOGRAPHY. In plasma or urine: lorazepam and lorazepam glucuronide, limit of detection 1 ng/ml, ECD—D. J. Greenblatt *et al.*, *J. Chromat.*, 1978, 146; *Biomed. Appl.*, 3, 311–320.GAS CHROMATOGRAPHY-MASS SPECTROMETRY. In plasma or urine: lorazepam and lorazepam glucuronide, limit of detection 2 ng/ml—S. Higuchi *et al.*, *J. Chromat.*, 1979, 164; *Biomed. Appl.*, 6, 55–61.

Disposition in the Body. Readily absorbed after oral administration; bioavailability about 95%. About 75% of a dose is excreted in the urine as the inactive glucuronide conjugate within 5 days (up to about 50% in the first 24 hours) and 14% is excreted as conjugates of minor metabolites which include ring-hydroxylation products and quinazoline derivatives; only negligible amounts are excreted as free lorazepam; about 7% of a dose is eliminated in the faeces.

Lorazepam is a metabolite of lormetazepam.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.05 to 0.24 µg/ml. Lorazepam glucuronide accumulates in plasma achieving concentrations greater than those of unchanged drug.

After a single oral dose of 0.05 mg/kg given to 9 subjects, peak plasma concentrations of 0.04 to 0.06 µg/ml (mean 0.05) were attained in about 0.5 to 1.5 hours; the maximum therapeutic effect was associated with plasma concentrations of 0.03 to 0.05 µg/ml and concentrations below 0.01 µg/ml were ineffective (E. G. Bradshaw *et al.*, *Br. J. Anaesth.*, 1981, 53, 517–522).Following daily oral doses of 6 mg to 8 subjects, mean steady-state plasma concentrations of 0.09 µg/ml of lorazepam and 0.17 µg/ml of lorazepam glucuronide were reported; in 7 subjects receiving 10 mg daily, the mean steady-state plasma concentrations were 0.16 and 0.27 µg/ml respectively (D. J. Greenblatt *et al.*, *J. clin. Pharmacol.*, 1977, 17, 495–500).

TOXICITY.

Plasma concentrations of 0.3 to 0.6 µg/ml were reported in 3 subjects suffering toxic effects after the ingestion of overdoses of lorazepam; the estimated amounts ingested were 100 and 120 mg in 2 of the cases. The subjects recovered within 24 to 30 hours (M. D. Allen *et al.*, *Am. J. Psychiat.*, 1980, 137, 1414–1415).

HALF-LIFE. Plasma half-life, lorazepam 9 to 24 hours (mean 14), lorazepam glucuronide about 16 hours.

VOLUME OF DISTRIBUTION. About 1 to 2 litres/kg.

CLEARANCE. Plasma clearance, about 1 ml/min/kg.

PROTEIN BINDING. In plasma, about 90%; decreased in patients with cirrhosis.

NOTE. For reviews of the clinical pharmacokinetics of lorazepam see A. A. Kyriakopoulos *et al.*, *J. clin. Psychiat.*, 1978, 39, 16–23, and D. J. Greenblatt, *Clin. Pharmacokinet.*, 1981, 6, 89–105.

Dose. 1 to 10 mg daily.

Lorcainide

Anti-arrhythmic

Synonyms. Isocainide; Socainide.

4'-Chloro-N-(1-isopropyl-4-piperidyl)-2-phenylacetanilide

 $C_{22}H_{27}ClN_2O = 370.9$

CAS—59729-31-6

Lorcainide Hydrochloride*Proprietary Name.* Remivox $C_{22}H_{27}ClN_2O \cdot HCl = 407.4$ *CAS*—58934-46-6

Crystals, M.p. 263°.

Freely **soluble** in water, ethanol, chloroform, and methanol.**High Pressure Liquid Chromatography.** *System HA*— k' 1.8.**Ultraviolet Spectrum.** Water—257 nm ($A_1^1 = 14.3$ b), 263 nm ($A_1^1 = 12.1$ b).**Infra-red Spectrum.** Principal peaks at wavenumbers 1649, 716, 1094, 1298, 1153, 1016 (lorcainide hydrochloride, KBr disk).**Quantification.** GAS CHROMATOGRAPHY. In plasma or urine: sensitivity 10 ng/ml for lorcainide and norlorcainide, ECD—U. Klotz *et al.*, *Clin. Pharmacokinet.*, 1978, 3, 407–418. In plasma, urine or tissues: sensitivity 5 ng/ml for lorcainide, 10 ng/ml for norlorcainide, 10 to 15 ng/ml for hydroxylated metabolites, ECD—R. Woestenborghs *et al.*, *J. Chromat.*, 1979, 164; *Biomed. Appl.*, 6, 169–176.**HIGH PRESSURE LIQUID CHROMATOGRAPHY.** In plasma: sensitivity 5 ng/ml for lorcainide and norlorcainide, UV detection—Y. G. Yee and R. E. Kates, *J. Chromat.*, 1981, 223; *Biomed. Appl.*, 12, 453–459.**Disposition in the Body.** Well absorbed after oral administration but undergoes extensive, saturable, first-pass metabolism; bioavailability about 30% after a single dose of 150 mg but almost 100% during chronic oral dosing. The principal active metabolite, norlorcainide, is found in high concentrations in plasma during chronic oral dosing. Other major metabolites include a 4-hydroxyphenyl derivative and a 4-hydroxy-3-methoxyphenyl compound. After intravenous administration, less than 2% of a dose is excreted in the urine as unchanged drug in 48 hours; a total of about 60% of a dose is excreted in the urine as metabolites in 4 days and 35% is eliminated in the faeces.**THERAPEUTIC CONCENTRATION.**Following oral doses of 100 mg twice a day to 8 subjects for 2 weeks, mean steady-state plasma concentrations of 0.05 to 0.50 µg/ml (mean 0.19) of lorcainide and 0.16 to 0.68 µg/ml (mean 0.32) of norlorcainide, were reported (R. E. Kates *et al.*, *Clin. Pharmac. Ther.*, 1983, 33, 28–34).**HALF-LIFE.** Plasma half-life, lorcainide 3 to 15 hours (mean 8), increased in subjects with cirrhosis of the liver and during chronic oral dosing; norlorcainide 20 to 40 hours (mean 27).**VOLUME OF DISTRIBUTION.** About 8 litres/kg but there is considerable intersubject variation.**CLEARANCE.** Plasma clearance, 10 to 25 ml/min/kg.**DISTRIBUTION IN BLOOD.** Plasma: whole blood ratio, about 1.3.**PROTEIN BINDING.** In plasma, 80 to 85%.**NOTE.** For a review of lorcainide see C. E. Eiriksson and R. N. Brogden, *Drugs*, 1984, 27, 279–300.**Dose.** The equivalent of 200 to 300 mg of lorcainide daily.

A white crystalline powder. M.p. 209° to 211°, with decomposition.

Practically **insoluble** in water; slightly soluble in ethanol and methanol; freely soluble in chloroform.**Colour Test.** Formaldehyde–Sulphuric Acid—orange.**Thin-layer Chromatography.** *System TA*—Rf 52; *system TB*—Rf 07; *system TC*—Rf 62; *system TD*—Rf 43; *system TE*—Rf 61; *system TF*—Rf 47. (Dragendorff spray, positive; FPN reagent, pale yellow; Marquis reagent, very weak pale yellow; mercuric chloride–diphenylcarbazone reagent, blue, on heating turns pale pink; acidified potassium permanganate solution, positive.)**Gas Chromatography.** *System GA*—lormetazepam RI 2674, lorazepam RI 2402, decomposition product RI 2727.**High Pressure Liquid Chromatography.** *System HI*— k' 6.32; *system HK*— k' 0.08.**Ultraviolet Spectrum.** Aqueous acid—231 nm ($A_1^1 = 1030$ b), 311 nm ($A_1^1 = 59$ b).**Infra-red Spectrum.** Principal peaks at wavenumbers 1682, 1153, 1121, 1315, 1610, 843 (KBr disk).**Lormetazepam***Hypnotic**Proprietary Names.* Loramet; Noctamid.

7-Chloro-5-(2-chlorophenyl)-1,3-dihydro-3-hydroxy-1-methyl-2H-1,4-benzodiazepin-2-one

 $C_{16}H_{12}Cl_2N_2O_2 = 335.2$ *CAS*—848-75-9**Mass Spectrum.** Principal peaks at m/z 305, 307, 306, 309, 308, 334, 102, 75; lorazepam 291, 239, 274, 293, 75, 302, 276, 138.**Quantification.** GAS CHROMATOGRAPHY. In plasma: sensitivity 200 pg/ml, ECD—D. M. Pierce *et al.*, *Br. J. clin. Pharmac.*, 1984, 18, 31–35.

RADIOIMMUNOASSAY. In plasma: detection limit 30 pg/ml—M. Hümpel *et al.*, *Clin. Pharmac. Ther.*, 1980, 28, 673–679.

Disposition in the Body. Well absorbed after oral administration; bioavailability about 80%. Metabolised to some extent by *N*-demethylation to lorazepam. About 80% of a dose is excreted in the urine as lormetazepam glucuronide in 72 hours, and about 6% as lorazepam glucuronide.

THERAPEUTIC CONCENTRATION.

Single oral doses of 1 mg and 3 mg given to 6 subjects, produced mean peak plasma concentrations of 0.006 and 0.016 µg/ml, respectively, in 2 to 3 hours (M. Hümpel *et al.*, *ibid.*).

HALF-LIFE. Plasma half-life, lormetazepam about 10 hours, appears to be increased in elderly subjects; lormetazepam glucuronide about 13 hours.

VOLUME OF DISTRIBUTION. About 5 litres/kg.

CLEARANCE. Plasma clearance, about 4 ml/min/kg.

PROTEIN BINDING. In plasma, about 90%.

Dose. 0.5 to 2 mg, as a hypnotic.

Loxapine

Tranquilliser

Synonym. Oxilapine

Proprietary Name. Loxapac (solution)

2 - Chloro - 11 - (4 - methylpiperazin - 1 - yl)dibenz[*b,f*][1,4]-oxazepine

$C_{18}H_{18}ClN_3O = 327.8$

CAS—1977-10-2

Pale yellowish crystals. M.p. 109° to 110°.

Loxapine Succinate

Proprietary Names. Loxapac (tablets); Loxitane (capsules).

$C_{18}H_{18}ClN_3O \cdot C_4H_6O_4 = 445.9$

CAS—27833-64-3

A white crystalline solid.

Dissociation Constant. pK_a 6.6.

Colour Tests. Liebermann's Test (50–60°)—orange.

Heat with *nitric acid* for 3 minutes at 100° and then dilute tenfold with water—yellow precipitate.

Gas Chromatography. *System GA*—loxapine RI 2530, amoxapine RI 2659.

High Pressure Liquid Chromatography. *System HA*— k' 1.1.

Ultraviolet Spectrum. Aqueous acid—251 nm ($A_1^1 = 346$ b), 292 nm; aqueous alkali—248 nm ($A_1^1 = 374$ b), 298 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1590, 1603, 1564, 1109, 1188, 1248.

Mass Spectrum. Principal peaks at m/z 70, 83, 42, 257, 193, 56, 228, 164; amoxapine 245, 257, 247, 193, 56, 246, 228, 259.

Quantification. GAS CHROMATOGRAPHY. In serum: sensitivity 2 ng/ml, AFID—J. Vasiliades *et al.*, *J. Chromat.*, 1979, 164; *Biomed. Appl.*, 6, 457–470. In plasma or urine: detection limit

140 pg/ml, ECD—S. F. Cooper *et al.*, *Xenobiotica*, 1979, 9, 405–414. In serum or urine: loxapine and metabolites, ECD (serum) or FID (urine)—T. B. Cooper and R. G. Kelly, *J. pharm. Sci.*, 1979, 68, 216–219.

Disposition in the Body. Readily absorbed after oral administration. The major urinary metabolite appears to be 8-hydroxyloxapine; other metabolites which have been identified include 7-hydroxyloxapine, desmethyl-loxapine (amoxapine) and its 7-hydroxy and 8-hydroxy derivatives, loxapine *N*-oxide, and 8-methoxyloxapine. Some unchanged drug is also excreted in the urine.

THERAPEUTIC CONCENTRATION. There is considerable intersubject variation in plasma concentrations.

After a single oral dose of 25 mg to 25 subjects, mean peak serum concentrations of 0.02 µg/ml of loxapine, 0.05 µg/ml of 8-hydroxyloxapine and 0.006 µg/ml of 8-hydroxyamoxapine were attained in 1 to 2 hours (M. A. Khan *et al.*, *Curr. ther. Res.*, 1980, 28, 277–283).

Two subjects receiving 100 mg daily were found to have serum concentrations, respectively, of 0.031 µg/ml and 0.006 µg/ml of loxapine, 0.072 µg/ml and 0.041 µg/ml of 8-hydroxyloxapine and 0.064 µg/ml and 0.031 µg/ml of 8-hydroxyamoxapine immediately prior to a morning dose (T. B. Cooper and R. G. Kelly, *J. pharm. Sci.*, 1979, 68, 216–219).

TOXICITY.

In a fatality attributed to loxapine overdose, the following postmortem tissue concentrations, µg/ml or µg/g, were reported:

	Blood	Brain	Liver	Lung	Spleen
Loxapine	1.22	4.46	11.88	4.98	3.96
8-Hydroxyloxapine (conjugated)	1.51	—	7.98	1.59	0.93
8-Hydroxyloxapine (unconjugated)	0.76	3.80	4.38	3.28	3.26
Amoxapine	1.01	4.84	10.00	3.80	6.30
8-Hydroxyamoxapine (conjugated)	1.92	—	1.89	1.32	—
8-Hydroxyamoxapine (unconjugated)	1.98	3.71	25.47	9.44	14.17

(T. B. Cooper *et al.*, *J. analyt. Toxicol.*, 1981, 5, 99–100).

A 22-year-old female ingested about 2.5 g of loxapine and died after 12 days in coma. Concentrations on admission to hospital were: blood 1.9 µg/ml, urine 0.4 µg/ml; 24 hours later the urine concentration was 8 µg/ml; in a second fatality, postmortem blood and liver concentrations of 7.7 µg/ml and 150 µg/g were reported (P. Reynolds *et al.*, *Clin. Toxicol.*, 1979, 14, 181–185).

HALF-LIFE. Plasma half-life, loxapine 1 to 4 hours, 8-hydroxyloxapine about 8 hours, 8-hydroxyamoxapine about 36 to 48 hours.

Dose. Usually the equivalent of 20 to 100 mg of loxapine daily; maximum of 250 mg daily.

Lymecycline

Antibiotic

Synonyms. Limeciclina; Tetracycline-L-methylenelysine.

Proprietary Name. Tetralysal

A water-soluble combination of tetracycline, lysine, and formaldehyde with a molecular weight of approximately 603.

CAS—992-21-2

A yellow, very hygroscopic powder which darkens on exposure to light and air. M.p. above 200°, with slow decomposition.

Soluble 1 in less than 1 of water; slightly soluble in ethanol and methanol; practically insoluble in chloroform and ether.

Colour Tests. Benedict's Reagent—red; Formaldehyde-Sulphuric Acid—brown-red; Mandelin's Test—violet-brown → yellow; Marquis Test—orange; Sulphuric Acid—red-brown.

Thin-layer Chromatography. System TA—Rf 05, streaking. (Location under ultraviolet light, orange fluorescence; acidified potassium permanganate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—269 nm ($A_1^1 = 292$ a), 356 nm; aqueous alkali—239 nm, 267 nm.

Dose. Usually 816 mg (the equivalent of 600 mg of tetracycline) daily.

Lynoestrenol

Progestational Steroid

Synonyms. Lynenol; Lynestrenol.

Proprietary Names. Exluton(a); Orgametril.

It is an ingredient of many oral contraceptives, see *Martindale, The Extra Pharmacopoeia*, 28th Edn.

19-Nor-17 α -pregn-4-en-20-yn-17 β -ol

$C_{20}H_{28}O = 284.4$

CAS—52-76-6

A white crystalline powder. M.p. 160° to 164°.

Practically **insoluble** in water; soluble 1 in 15 of ethanol, 1 in 8 of chloroform, and 1 in 12 of ether.

Thin-layer Chromatography. System TP—Rf 77; system TQ—Rf 55; system TR—Rf 99; system TS—Rf 97.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 683, 1040, 1014, 1053, 813, 1266 (KBr disk).

Mass Spectrum. Principal peaks at m/z 91, 79, 67, 201, 77, 105, 93, 120.

Dose. 2.5 mg daily, for courses of 22 days.

Lysergamide

Hallucinogen

Synonyms. Ergine; Lysergic Acid Amide.

9,10-Didehydro-6-methylergoline-8 β -carboxamide

$C_{16}H_{17}N_3O = 267.3$

CAS—478-94-4

Lysergamide is found in *Rivea corymbosa*, *Ipomoea* spp. (Convolvulaceae), and ergot.

Crystals. It decomposes at 242°.

Colour Test. Marquis Test—brown.

Thin-layer Chromatography. System TA—Rf 60; system TL—Rf 06; system TM—Rf 27. (*Van Urk reagent*, blue.)

High Pressure Liquid Chromatography. System HA— k' 0.5; system HP— k' 0.33.

Ultraviolet Spectrum. Aqueous acid—313 nm; aqueous alkali—309 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1670, 760, 783, 1618, 1158, 1270 (KBr disk).

Mass Spectrum. Principal peaks at m/z 267, 221, 207, 180, 223, 154, 196, 268.

Lysergic Acid

Hallucinogen

9,10-Didehydro-6-methylergoline-8 β -carboxylic acid
 $C_{16}H_{16}N_2O_2 = 268.3$
 CAS—82-58-6

A white crystalline powder. M.p. 240°, with decomposition. Slightly **soluble** in water; soluble in dilute acids and alkalis.

Dissociation Constant. pK_a 3.4, 6.3.

Colour Tests. Mandelin's Test—green-brown; Marquis Test—brown.

Thin-layer Chromatography. System TA—Rf 58; system TD—Rf 00; system TE—Rf 00; system TF—Rf 00; system TL—Rf 00; system TM—Rf 00. (Location under ultraviolet light, violet fluorescence; *mercuric chloride-diphenylcarbazone reagent*, blue; *acidified potassium permanganate solution*, positive; *Van Urk reagent*, blue.)

High Pressure Liquid Chromatography. System HA— k' 0.8 (tailing peak); system HP— k' 0.00.

Ultraviolet Spectrum. Aqueous acid—305 nm; aqueous alkali—308 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1592, 787, 758, 1308, 691, 1015.

Mass Spectrum. Principal peaks at m/z 268, 224, 154, 180, 207, 223, 192, 179.

Lysergide

Hallucinogen

Synonyms. LSD; LSD 25; Lysergic Acid Diethylamide.

(+)-*NN*-Diethyl-D-lysergamide

$C_{20}H_{25}N_3O = 323.4$

CAS—50-37-3

A colourless crystalline substance. M.p. 80° to 85°.

Dissociation Constant. pK_a 7.5.

Partition Coefficient. Log P (octanol), 3.0.

Colour Tests. *p*-Dimethylaminobenzaldehyde—violet; Mandelin's Test—grey; Marquis Test—grey.

Thin-layer Chromatography. System *TA*—Rf 60; system *TB*—Rf 03; system *TC*—Rf 39; system *TL*—Rf 24; system *TM*—Rf 70. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, grey; Van Urk reagent, blue.)

Gas Chromatography. System *GA*—RI 3445.

High Pressure Liquid Chromatography. System *HA*—lysergide k' 0.7; system *HP*—lysergide k' 1.83, 2-oxylysergide k' 0.92.

Ultraviolet Spectrum. Aqueous acid—315 nm (A_1^1 = 225 a); aqueous alkali—310 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1626, 1307, 1136, 1066, 1212, 749 (KBr disk).

Mass Spectrum. Principal peaks at m/z 323, 221, 181, 222, 207, 72, 223, 324.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY—RADIOIMMUNOASSAY. In biological fluids: sensitivity 1 ng/ml, fluorescence detection—P. W. Twitchett *et al.*, *J. Chromat.*, 1978, 150, 73–84.

THIN-LAYER CHROMATOGRAPHY (HIGH PERFORMANCE). In illicit dosage forms: limit of detection 2 ng—L. Kraus *et al.*, *Bull. Narcot.*, 1980, 32, 67–71.

FLUOROIMMUNOASSAY. In biological fluids: sensitivity 4 ng/ml—A. R. Hubbard *et al.*, *Analyt. Proc.*, 1983, 20, 606–608.

Disposition in the Body. Readily absorbed after oral administration; it is believed to undergo extensive biotransformation in the liver to inactive metabolites. About 1% of a dose is excreted unchanged in the urine in 24 hours. 2-Oxylysergide is a major metabolite although 13-hydroxy- and 14-hydroxylysergide also appear.

Single doses of 200 to 400 μ g were administered to 8 subjects; the urinary concentration of lysergide or a closely related metabolite ranged from 0.001 to 0.055 μ g/ml in the 24 hours after ingestion (A. Taunton-Rigby *et al.*, *Science*, 1973, 181, 165–166).

BLOOD CONCENTRATION.

A single oral dose of 160 μ g was administered to 13 subjects; plasma concentrations measured at intervals over a period of 2½ hours varied considerably but were in the range 0 to 0.009 μ g/ml (D. G. Upshall and D. G. Wailling, *Clinica chim. Acta*, 1972, 36, 67–73).

TOXICITY. Hallucinatory effects are produced with doses of 200 to 400 μ g but recovery has occurred after much larger doses (up to 10 mg). Plasma concentrations greater than 0.001 μ g/ml have been associated with toxic effects.

HALF-LIFE. Plasma half-life, about 3 hours.

VOLUME OF DISTRIBUTION. About 0.3 litre/kg.

PROTEIN BINDING. In plasma, about 90%, decreasing to about 65% in overdose subjects.

Dose. In psychotherapy, doses of 100 to 750 μ g have been given.

Mafenide

Sulphonamide

Synonyms. Bensulfamide; Benzamsulfonamide; 4-Homosulphanilamide; Sulfabenzamine.

α -Aminotoluene-*p*-sulphonamide

$C_7H_{10}N_2O_2S$ = 186.2

CAS—138-39-6

A white powder. M.p. 151° to 154°.

Sparingly **soluble** in water; soluble in methanol and in dilute acids and alkalis.

Mafenide Acetate

Proprietary Names. Napaltan; Sulfamylon.

$C_7H_{10}N_2O_2S, C_2H_4O_2 = 246.3$

CAS—13009-99-9

A white crystalline powder. M.p. 162° to 171°.

Freely **soluble** in water; sparingly soluble in ethanol.

Mafenide Hydrochloride

Synonyms. Homosulfaminum; Maphenide.

$C_7H_{10}N_2O_2S, HCl = 222.7$

CAS—138-37-4

A colourless or white crystalline powder. M.p. about 260°.

Soluble 1 in 1.7 of water and 1 in 100 of ethanol; practically insoluble in chloroform and ether.

Mafenide Propionate

Proprietary Name. Sulfomyl

$C_7H_{10}N_2O_2S, C_3H_6O_2 = 260.3$

Colourless crystals. M.p. 158°.

Soluble in water.

Colour Test. Koppányi–Zwicker Test—violet.

Thin-layer Chromatography. *System TA*—Rf 49; *system TD*—Rf 01; *system TE*—Rf 27; *system TF*—Rf 01. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—not eluted.

Ultraviolet Spectrum. Aqueous acid—267 nm ($A_1^1 = 41$ a), 274 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1151, 1316, 1299, 897, 1089, 1592 (KBr disk).

Mass Spectrum. Principal peaks at m/z 106, 30, 77, 185, 105, 104, 89, 141.

Quantification. **THIN-LAYER CHROMATOGRAPHY.** In serum: detection limit 1 µg/ml—J. M. Steyn, *J. Chromat.*, 1977, 143; *Biomed. Appl.*, 1, 210–213.

Disposition in the Body. Absorbed from wounds into the circulation and metabolised to *p*-carboxybenzenesulphonamide which is excreted in the urine.

Use. Typically as a cream containing 8.5% mafenide (as the acetate).

Malathion

Pesticide

Synonyms. Carbofos; Compound 4047; OMS-1.

Proprietary Names. Derbac (liquid); Prioderm; Suleo-M.

Diethyl 2-(dimethoxyphosphinothioylthio)succinate

$C_{10}H_{19}O_6PS_2 = 330.4$

CAS—121-75-5

A colourless to light amber liquid which decomposes in strong acid or high humidity. Although stable in light, it decomposes at high temperatures. F.p. 2.85°. Refractive index 1.4985.

Very slightly **soluble** in water; miscible with many organic solvents.

Colour Tests. Palladium Chloride—brown; Phosphorus Test—yellow; Sodium Nitroprusside (Method 2)—violet.

Thin-layer Chromatography. *System TW*—Rf 74.

Gas Chromatography. *System GA*—RI 1917; *system GK*—retention time 1.03 relative to caffeine.

Infra-red Spectrum. Principal peaks at wavenumbers 1018, 1748, 1174, 1209, 824, 1250 (thin film).

Mass Spectrum. Principal peaks at m/z 125, 93, 127, 173, 158, 99, 55, 79.

Quantification. **COLORIMETRY.** In blood or tissues—A. Faragó, *Arch. Tox.*, 1967, 23, 11–16.

GAS CHROMATOGRAPHY. In urine: dialkyl phosphate residues, detection limits 40 ng/ml to 130 ng/ml, FID—S. J. Reid and R. R. Watts, *J. analyt. Toxicol.*, 1981, 5, 126–132. In urine: malathion α -mono- and dicarboxylic acid and alkyl phosphate metabolites, detection limit 2 ng/ml for the dicarboxylic acid and 5 ng/ml for the α -monocarboxylic acid, FID—D. E. Bradway and T. M. Shafik, *J. agric. Fd Chem.*, 1977, 25, 1342–1344.

Disposition in the Body. Absorbed after oral ingestion but absorbed only slowly and to a small extent through intact skin. It is metabolised by conversion to malaoxon, the toxic keto analogue, and by hydrolysis to malathion α -mono- and dicarboxylic acids which are the major metabolites. Other hydrolysis products include dimethylthiophosphoric acid (DMTP) and dimethyldithiophosphoric acid (DMDTP) which have been detected in the urine of subjects exposed to malathion. After ingestion, up to 25% is excreted in the 24-hour urine as ether-extractable phosphates, mostly in the first 8 hours.

TOXICITY. Malathion is less toxic than most other organophosphorus pesticides; the estimated minimum lethal dose is 25 g; the maximum permissible atmospheric concentration is 10 mg/m³ and the maximum acceptable daily intake is 20 µg/kg.

In 4 fatalities due to the ingestion of 25 to 70 g of malathion, the following postmortem concentrations were reported: blood 100 to 1880 µg/ml (mean 815), kidney 190 to 1880 µg/g (mean 1308), liver 200 to 1700 µg/g (mean 1215) (A. Faragó, *Arch. Tox.*, 1967, 23, 11–16).

In a poisoning case due to the ingestion of 200 ml of a 50% malathion preparation, the following concentrations were reported in the urine collected over the period 24 to 48 hours after ingestion: malathion α -monocarboxylic acid 223 µg/ml, dicarboxylic acid metabolite 12 µg/ml, dimethylthiophosphoric acid 96 µg/ml, dimethyldithiophosphoric acid 20 µg/ml, dimethylphosphoric acid 50 µg/ml, monomethyl phosphate 8 µg/ml (D. E. Bradway and T. M. Shafik, *J. agric. Fd Chem.*, 1977, 25, 1342–1344).

HALF-LIFE. Derived from urinary excretion data, about 3 hours.

Use. Typically in concentrations of 0.5 or 1% in the treatment of pediculosis.

Mandelic Acid

Antibacterial (Urinary)

Synonyms. Amygdalic Acid; Phenylglycolic Acid; Racemic Mandelic Acid.

2-Hydroxy-2-phenylacetic acid

$C_8H_8O_3 = 152.1$

CAS—90-64-2; 611-72-3 (±)

White crystals, which turn yellow on exposure to light. M.p. 119° to 121°.

Soluble 1 in 6 of water, 1 in 1 of ethanol, 1 in 45 of chloroform, and 1 in 6 of ether.

Ammonium Mandelate

$C_8H_7O_3NH_4 = 169.2$

CAS—530-31-4

A white, very hygroscopic, crystalline powder, which discolours on exposure to light.

Very **soluble** in water; sparingly soluble in ethanol.

Calcium Mandelate

Synonym. Calcium Amygdalate

$(C_8H_7O_3)_2Ca = 342.4$

CAS—134-95-2

A white crystalline powder.

Soluble 1 in 100 of water and 1 in 4500 of ethanol (90%).

Dissociation Constant. pK_a 3.4 (25°).

Gas Chromatography. *System GA*—RI 1487.

Ultraviolet Spectrum. Aqueous acid—251 nm ($A_1^1 = 10.9$ b), 257 nm ($A_1^1 = 13.7$ b), 262 nm ($A_1^1 = 11.2$ b). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1710, 1060, 1245, 1185, 690, 720 (KBr disk).

Mass Spectrum. Principal peaks at m/z 107, 79, 77, 51, 152, 105, 50, 78.

Disposition in the Body. Mandelic acid is a urinary metabolite of several drugs and toxic chemicals and is also found endogenously in normal urine at concentrations of up to 5 µg/ml.

Dose. Mandelic acid has been given in doses of 12 g daily, usually as the calcium or ammonium salt.

Mannomustine

Antineoplastic

Synonyms. BCM; Mannitol Mustard.

1,6-Bis(2-chloroethylamino)-1,6-dideoxy-D-mannitol

$C_{10}H_{22}Cl_2N_2O_4 = 305.2$

CAS—576-68-1

M.p. 278°, with decomposition.

Soluble in water.

Mannomustine Hydrochloride

$C_{10}H_{22}Cl_2N_2O_4 \cdot 2HCl = 378.1$

CAS—551-74-6

A white crystalline powder. M.p. 241°, with decomposition.

Soluble 1 in 2 of water; slightly soluble in ethanol; practically insoluble in chloroform and ether.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1065, 1013, 1298, 1284, 1102, 1581 (mannomustine hydrochloride, KBr disk).

Dose. Mannomustine hydrochloride has been given in doses of 50 to 100 mg daily, by intravenous injection.

Maprotiline

Antidepressant

3-(9,10-Dihydro-9,10-ethanoanthracen-9-yl)-N-methylpropylamine

$C_{20}H_{23}N = 277.4$

CAS—10262-69-8

M.p. 92° to 94°.

Maprotiline Hydrochloride

Proprietary Name. Ludiomil

$C_{20}H_{23}N \cdot HCl = 313.9$

CAS—10347-81-6

A white crystalline powder. M.p. 230° to 232°.

Soluble in water and some organic solvents.

Colour Tests. Liebermann's Test—orange-brown; Mandelin's Test—blue; Marquis Test—red.

Thin-layer Chromatography. *System TA*—Rf 15; *system TB*—Rf 17; *system TC*—Rf 05.

Gas Chromatography. *System GA*—RI 2356.

High Pressure Liquid Chromatography. *System HA*—maprotiline k' 2.2, desmethylmaprotiline k' 1.1; *system HF*—maprotiline k' 4.92.

Ultraviolet Spectrum. Aqueous acid—265 nm, 272 nm ($A_1^1 = 52$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 759, 1140, 1592, 1032, 1308, 935 (maprotiline hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 44, 70, 59, 277, 71, 191, 278, 203.

Quantification. GAS CHROMATOGRAPHY. In blood: sensitivity 20 ng/ml for maprotiline and 50 ng/ml for desmethylmaprotiline, AFID—A. Sioufi and A. Richard, *J. Chromat.*, 1980, 221; *Biomed. Appl.*, 10, 393–398. In blood: sensitivity 10 ng/ml, ECD—D. Alkalay *et al.*, *Analyt. Lett. (Part B)*, 1982, 15, 1493–1503.

GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In plasma: maprotiline and desmethylmaprotiline, sensitivity 2 ng/ml—S. P. Jindal *et al.*, *J. pharm. Sci.*, 1980, 69, 684–687.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: maprotiline and desmethylmaprotiline, detection limit 2 ng/ml, UV detection—H. J. Kuss and E. Festenauer, *J. Chromat.*, 1981, 204, 349–353.

Disposition in the Body. Slowly but completely absorbed following oral administration. It appears to undergo significant first-pass metabolism; bioavailability about 70%. After intravenous administration, about 57% of a dose is excreted in the urine and 30% in the faeces over a period of 21 days; less than 10% of the dose is excreted as unchanged drug. The principal metabolite is the desmethyl derivative, which has been shown to be active in animals, but hydroxylation also occurs to form phenolic derivatives which may be further converted to aromatic methoxy ethers or excreted as glucuronide conjugates; *N*-oxidation also occurs and maprotiline *N*-oxide has been reported to be active; numerous minor metabolites have been identified in urine.

THERAPEUTIC CONCENTRATION. Blood concentrations vary considerably between subjects and there appears to be no clear correlation between clinical response, dose, side-effects, and blood or plasma concentrations. Peak blood concentrations are usually attained 3 to 8 hours after a single dose.

After a single oral dose of 75 mg to 6 subjects, peak blood concentrations of 0.012 to 0.037 $\mu\text{g/ml}$ (mean 0.023) and peak plasma concentrations of 0.016 to 0.031 $\mu\text{g/ml}$ (mean 0.024) were attained in 4 to 8 hours (K. P. Maguire *et al.*, *Eur. J. clin. Pharmac.*, 1980, 18, 249–254).

After daily oral doses of 50, 100, and 150 mg to 7 subjects, steady-state blood concentrations were: 0.02 to 0.15 $\mu\text{g/ml}$ (mean 0.07), 0.07 to 0.25 $\mu\text{g/ml}$ (mean 0.14), and 0.14 to 0.32 $\mu\text{g/ml}$ (mean 0.22) (W. Riess *et al.*, *J. int. med. Res.*, 1975, 3, Suppl. 2, 16–41).

Following daily oral doses of 150 mg to 4 subjects for 22 days, steady-state serum concentrations of 0.05 to 0.24 $\mu\text{g/ml}$ of maprotiline and 0.02 to 0.13 $\mu\text{g/ml}$ of desmethylmaprotiline were reported (R. N. Gupta *et al.*, *Clin. Chem.*, 1977, 23, 1849–1852).

TOXICITY.

The following postmortem tissue distribution was reported in a suicide case: axillary blood 6.2 $\mu\text{g/ml}$, cardiac blood 2.0 $\mu\text{g/ml}$, bile 161 $\mu\text{g/ml}$, kidney 34.0 $\mu\text{g/g}$, liver 82.0 $\mu\text{g/g}$ (A. E. Robinson *et al.*, *J. analyt. Toxicol.*, 1979, 3, 3–13).

In a fatality due to the ingestion of 4.5 to 6 g of maprotiline, the following postmortem tissue concentrations were reported: blood 44.5 $\mu\text{g/ml}$, brain 158 $\mu\text{g/g}$, liver 605 $\mu\text{g/g}$, urine 12.6 $\mu\text{g/ml}$ (T. A. Rejent and R. E. Doyle, *ibid.*, 1982, 6, 199–201).

HALF-LIFE. Plasma half-life, 20 to 70 hours (mean 45).

VOLUME OF DISTRIBUTION. 23 to 70 litres/kg (mean 52).

CLEARANCE. Plasma clearance, 6 to 20 ml/min/kg (mean 15).

DISTRIBUTION IN BLOOD. The plasma:whole blood ratio has been reported to vary between individuals and may also vary between single and multiple dosing (see K. P. Maguire *et al.*, *Eur. J. clin. Pharmac.*, 1980, 18, 249–254).

PROTEIN BINDING. In plasma, about 90%.

NOTE. For a review of the pharmacokinetics of maprotiline see R. M. Pinder *et al.*, *Drugs*, 1977, 13, 321–352.

Dose. 30 to 150 mg of maprotiline hydrochloride daily.

Mazindol

Anorectic

Proprietary Names. Mazanor; Mazildene; Sanorex; Teronac.

5-(4-Chlorophenyl)-2,5-dihydro-3*H*-imidazo[2,1-*a*]isoindol-5-ol

$\text{C}_{16}\text{H}_{13}\text{ClN}_2\text{O}$ = 284.7

CAS—22232-71-9

Crystals. M.p. 198° to 199°.

Dissociation Constant. pK_a 8.6.

Colour Test. Sulphuric Acid—orange.

Thin-layer Chromatography. System TA—Rf 63; system TB—Rf 06; system TC—Rf 13.

Gas Chromatography. System GA—RI 2355.

High Pressure Liquid Chromatography. System HA— k' 1.8; system HC— k' 0.20.

Ultraviolet Spectrum. Aqueous acid—271 nm (A_1^1 = 509 a); aqueous alkali—269 nm (A_1^1 = 170 b), 275 nm (A_1^1 = 173 b). (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 763, 1656, 1063, 1175, 674, 1093 (KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 266, 268, 267, 255, 231, 102, 88, 176.

Disposition in the Body. Absorbed after oral administration and slowly excreted in the urine, partly unchanged and partly as metabolites.

HALF-LIFE. About 12 to 24 hours.

Dose. 2 to 3 mg daily.

Mebanazine Antidepressant (Monoamine Oxidase Inhibitor)
 α -Methylbenzylhydrazine
 $C_8H_{12}N_2 = 136.2$
 CAS—65-64-5

Practically **insoluble** in water, ethanol, and ether; soluble in chloroform.

Colour Tests. Nessler's Reagent—black; Palladium Chloride—black; Sulphuric Acid—orange.

Thin-layer Chromatography. System TA—Rf 70; system TB—Rf 48; system TC—Rf 69.

Gas Chromatography. System GA—RI 1240.

High Pressure Liquid Chromatography. System HA—k' 0.2.

Ultraviolet Spectrum. Aqueous acid—251 nm, 257 nm, 261 nm, 267 nm.

• **Infra-red Spectrum.** Principal peaks at wavenumbers 699, 1175, 760, 1199, 1292, 1070 (Nujol mull).

Dose. Mebanazine has been given in doses of 5 to 30 mg daily.

Mebendazole

Anthelmintic

Proprietary Names. Telmin (vet.); Vermox.

Methyl 5-benzoyl-1H-benzimidazol-2-ylcarbamate

$C_{16}H_{13}N_3O_3 = 295.3$

CAS—31431-39-7

A white to slightly yellow amorphous powder. M.p. about 290°. Practically **insoluble** in water, ethanol, chloroform, ether, and dilute mineral acids; freely soluble in formic acid.

Thin-layer Chromatography. System TA—Rf 65; system TB—Rf 00; system TC—Rf 59. (Dragendorff spray.)

Ultraviolet Spectrum. Acid isopropyl alcohol—234 nm ($A_1^1 = 1000$ b), 288 nm ($A_1^1 = 524$ b); alkaline isopropyl alcohol—270 nm ($A_1^1 = 802$ b), 355 nm ($A_1^1 = 653$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1635, 1260, 1590, 1730, 1230, 705 (KBr disk).

Mass Spectrum. Principal peaks at m/z 186, 218, 77, 295, 263, 105, 51, 158.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: detection limit 10 ng/ml for mebendazole, 60 ng/ml for the 5-(α -hydroxy) metabolite and 30 ng/ml for the 2-amino metabolite, UV detection—R. J. Allan *et al.*, *J. Chromat.*, 1980, 183; *Biomed. Appl.*, 9, 311–319.

Disposition in the Body. Poorly absorbed after oral administration. Metabolised to the 5-(α -hydroxy) derivative and by decarboxylation to the 2-amino metabolite, both of which are detectable in plasma at concentrations higher than those of unchanged mebendazole. Less than 10% of a dose is excreted in the urine; the major urinary metabolite is the 2-amino-5-(α -hydroxy) derivative. Biliary excretion and enterohepatic circulation have been reported.

THERAPEUTIC CONCENTRATION.

Following single oral doses of 10 mg/kg to 5 subjects, peak plasma concentrations of 0.018 to 0.116 $\mu\text{g/ml}$ (mean 0.07) were attained in 2.5 to 7 hours (mean 5) (P. A. Braithwaite *et al.*, *Eur. J. clin. Pharmac.*, 1982, 22, 161–169).

HALF-LIFE. Plasma half-life, 1.5 to 9 hours.

VOLUME OF DISTRIBUTION. About 2 litres/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 1.2.

PROTEIN BINDING. In plasma, about 95%.

REFERENCE. P. A. Braithwaite *et al.*, *ibid.*

Dose. Usually 200 mg daily for 3 days.

Mebeverine

Antispasmodic

4-[Ethyl(4-methoxy- α -methylphenethyl)amino]butyl veratrate

$C_{25}H_{35}NO_5 = 429.6$

CAS—3625-06-7

Soluble in chloroform.

Mebeverine Hydrochloride

Synonym. CSAG 144

Proprietary Names. Colofac; Duspatalin; Duspatalin.

$C_{25}H_{35}NO_5 \cdot HCl = 466.0$

CAS—2753-45-9

A white crystalline powder. M.p. 131° to 136°.

Soluble in water and ethanol; sparingly soluble in ether.

Colour Test. Liebermann's Test—black.

Thin-layer Chromatography. *System TA*—Rf 63; *system TB*—Rf 40; *system TC*—Rf 53. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—not eluted.

High Pressure Liquid Chromatography. *System HA*— k' 1.9.

Ultraviolet Spectrum. Aqueous acid—262 nm ($A_1^1 = 307$ b); aqueous alkali—269 nm, 290 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1216, 1266, 1132, 1510, 1715, 1174 (mebeverine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 308, 165, 309, 121, 55, 154, 98, 56.

Disposition in the Body.

TOXICITY.

In a fatality attributed to the ingestion of mebeverine and thioridazine, the following postmortem concentrations were reported: mebeverine, blood 36 µg/ml, liver 15 µg/g, urine 24 µg/ml; thioridazine, not detected in blood and urine, liver 2 µg/g (G. del Villar, *Bull. int. Ass. forens. Toxicol.*, 1977, 13(1&2), 23–24).

Dose. 405 mg of mebeverine hydrochloride daily.

Mebezonium Iodide

Muscle Relaxant

Proprietary Name. It is an ingredient of Tanax (vet.).

4,4'-Methylenebis(cyclohexyltrimethylammonium) di-iodide

$C_{19}H_{40}I_2N_2 = 550.3$

CAS—7681-78-9

A white crystalline powder. M.p. 260°, with decomposition.

Soluble in water.

Thin-layer Chromatography. *System TA*—Rf 00. (Acidified iodoplatinate solution, positive.)

Infra-red Spectrum. Principal peaks at wavenumbers 961, 888, 831, 1621, 985, 1020 (KBr disk).

Quantification. THIN-LAYER CHROMATOGRAPHY—ULTRAVIOLET SPECTROPHOTOMETRY. In blood or urine—E. Bertol *et al.*, *J. pharm. biomed. Analysis*, 1983, 1, 373–377.

Disposition in the Body.

TOXICITY.

In 3 fatalities due to the injection of a preparation containing mebezonium iodide and embutramide, the following postmortem concentrations (µg/ml) were reported:

	Mebezonium iodide	Embutramide
Blood	4.5, 6.0, 7.5	3.0, 15.5, 12.1
Urine	0.8, 2.0, 1.8	2.0, 6.3, 4.5

(E. Bertol *et al.*, *ibid.*).

Mebhydrolin

Antihistamine

Proprietary Name. Fabahistin (tablets)

5-Benzyl-1,2,3,4-tetrahydro-2-methyl-γ-carboline

$C_{19}H_{20}N_2 = 276.4$

CAS—524-81-2

A white crystalline powder. M.p. 95°.

Practically **insoluble** in water; soluble in ethanol, chloroform, and ether.

Mebhydrolin Napadisylate

Synonyms. Diazolinum; Mebhydrolin Naphthalenedisulphonate.

Proprietary Names. Fabahistin (suspension); Incidal; Omeril.

$(C_{19}H_{20}N_2)_2 \cdot C_{10}H_8O_6S_2 = 841.1$

CAS—6153-33-9

A white powder.

Very slightly **soluble** in water, ethanol, chloroform, and ether.

Dissociation Constant. pK_a 6.7.

Colour Tests. Mandelin's Test—blue; Marquis Test—grey-blue.

Thin-layer Chromatography. System TA—Rf 57; system TB—Rf 28; system TC—Rf 45. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2465; system GC—RI 2739; system GF—RI 2920.

High Pressure Liquid Chromatography. System HA— k' 3.0 (tailing peak).

Ultraviolet Spectrum. Aqueous acid—286 nm ($A_1^1 = 409$ b), 320 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 737, 1134, 1316, 695, 1122, 1212 (thin film).

Mass Spectrum. Principal peaks at m/z 91, 233, 30, 232, 31, 276, 275, 65.

Dose. 150 to 300 mg daily.

Mebutamate

Tranquilliser

Proprietary Names. Axiten; Mebutina; No-Press; Sigmafon.

2-sec-Butyl-2-methyltrimethylene dicarbamate

$C_{10}H_{20}N_2O_4 = 232.3$

CAS—64-55-1

A white crystalline powder. M.p. 77° to 79°.

Slightly soluble in water.

Colour Tests. Furfuraldehyde—black; Nessler's Reagent—brown (slow).

Thin-layer Chromatography. System TD—Rf 10; system TE—Rf 59; system TF—Rf 35.

Gas Chromatography. System GA—RI 1889.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1682, 1070, 1710, 1601, 1140, 788 (KBr disk).

Mass Spectrum. Principal peaks at m/z 97, 55, 69, 72, 71, 98, 43, 62.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: sensitivity 1 µg/ml, FID—J. F. Douglas *et al.*, *J. pharm. Sci.*, 1969, 58, 145–146.

Dose. 0.9 to 1.2 g daily.

Mecamylamine

Antihypertensive

N-Methyl-2,3,3-trimethylbicyclo[2.2.1]hept-2-ylamine

$C_{11}H_{21}N = 167.3$

CAS—60-40-2

An oily liquid.

Slightly soluble in water.

Mecamylamine Hydrochloride

Proprietary Names. Inversine; Mevasine.

$C_{11}H_{21}N, HCl = 203.8$

CAS—826-39-1

A white crystalline powder. M.p. about 245°, with decomposition.

Soluble 1 in 5 of water and 1 in 12 of ethanol; freely soluble in chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 11.3.

Thin-layer Chromatography. System TA—Rf 16; system TB—Rf 51; system TC—Rf 02.

High Pressure Liquid Chromatography. System HA— k' 1.7.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1111, 1068, 1078, 1592, 1098, 890 (mecamylamine hydrochloride, Nujol mull).

Mass Spectrum. Principal peaks at m/z 98, 84, 71, 56, 41, 42, 99, 124.

Disposition in the Body. Almost completely absorbed after oral administration; high concentrations are found in the liver and kidney. More than 50% of a dose is excreted in 24 hours as unchanged drug in acid urine; the excretion is reduced if the urine is alkaline.

Dose. 5 to 30 mg of mecamylamine hydrochloride daily.

Meclofenamic Acid

Proprietary Name. Arquel (vet.)
N-(2,6-Dichloro-*m*-tolyl)anthranilic acid
 $C_{14}H_{11}Cl_2NO_2 = 296.2$
CAS—644-62-2

White crystals.
 Practically **insoluble** in water.

Meclofenamate Sodium

Proprietary Name. Meclomen
 $C_{14}H_{10}Cl_2NNaO_2 = 318.1$
CAS—6385-02-0
 M.p. 289° to 291°.
 Sparingly **soluble** in water.

Thin-layer Chromatography. *System TG*—Rf 38. (*Chromic acid solution*, violet.)

Gas Chromatography. *System GA*—RI 2420; *system GD*—retention time of methyl derivative 1.62 relative to *n*-C₁₆H₃₄.

High Pressure Liquid Chromatography. Meclofenamic acid is used as a reference substance in *System HV*.

Ultraviolet Spectrum. Aqueous alkali—275 nm ($A_1^1 = 240$ b), 319 nm ($A_1^1 = 180$ b); methanol—242 nm ($A_1^1 = 342$ b), 282 nm ($A_1^1 = 235$ b), 331 nm ($A_1^1 = 235$ b).

Dose. The equivalent of 200 to 400 mg of meclofenamic acid daily.

Meclofenoxate

Central Stimulant

Synonyms. Centrophenoxine; Clofenoxine; Clophenoxate; Deanol 4-Chlorophenoxyacetate; Meclofenoxane.
 2-Dimethylaminoethyl 4-chlorophenoxyacetate
 $C_{12}H_{16}ClNO_3 = 257.7$
CAS—51-68-3

Meclofenoxate Hydrochloride

Proprietary Names. Helfergin; Lucidril.

$C_{12}H_{16}ClNO_3 \cdot HCl = 294.2$

CAS—3685-84-5

A white powder. M.p. 136°.

Soluble in water. It rapidly hydrolyses in aqueous solution.

Thin-layer Chromatography. *System TA*—Rf 77; *system TB*—Rf 26; *system TC*—Rf 42. (*Acidified potassium permanganate solution*, positive.)

Gas Chromatography. *System GA*—RI 1770; *system GB*—RI 1804; *system GC*—RI 2200.

High Pressure Liquid Chromatography. *System HA*— k' 1.7.

Ultraviolet Spectrum. Aqueous acid—277 nm ($A_1^1 = 44$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1167, 1183, 1742, 1080, 833, 1768 (KBr disk).

Mass Spectrum. Principal peaks at m/z 58, 111, 71, 42, 75, 59, 141, 113.

Dose. 0.9 to 1.5 g of meclofenoxate hydrochloride daily.

Mecloqualone

Hypnotic

Proprietary Name. Nubarène

3-(2-Chlorophenyl)-2-methylquinazolin-4(3*H*)-one

$C_{15}H_{11}ClN_2O = 270.7$

CAS—340-57-8

Crystals. M.p. 125° to 128°.

Gas Chromatography. *System GA*—RI 2255.

Infra-red Spectrum. Principal peaks at wavenumbers 1682, 1605, 768, 782, 1282, 1583.

Dose. 150 to 300 mg, as a hypnotic.

Meclozine

Antihistamine

Synonyms. Histamethizine; Meclizine.

1-(4-Chlorobenzhydryl)-4-(3-methylbenzyl)piperazine

$C_{25}H_{27}ClN_2 = 391.0$

CAS—569-65-3

Meclozine Hydrochloride

Synonym. Meclizinium Chloride

Proprietary Names. Ancolan; Antivert; Bonamine; Bonine; Calmonal; Peremesin; Postafen(e); Sea-legs. It is an ingredient of Ancoloxin.

$C_{25}H_{27}ClN_2 \cdot 2HCl = 463.9$

CAS—1104-22-9 (anhydrous); 31884-77-2 (monohydrate)

A white or slightly yellowish crystalline powder. M.p. 217° to 224°, with decomposition.

Soluble 1 in 1000 of water, 1 in 25 of ethanol, and 1 in 5 of chloroform; practically insoluble in ether; freely soluble in pyridine.

Dissociation Constant. pK_a 3.1, 6.2 (25°).

Colour Test. Liebermann's Test—red-orange.

Thin-layer Chromatography. System TA—Rf 76; system TB—Rf 58; system TC—Rf 79; system TL—Rf 70. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, brown-yellow; ninhydrin spray, positive.)

Gas Chromatography. System GA—RI 3033.

High Pressure Liquid Chromatography. System HA— k' 0.7.

Ultraviolet Spectrum. Ethanol—230 nm ($A_1^1 = 391$ a), 266 nm ($A_1^1 = 27$ b), 273 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 700, 720, 760, 940, 805, 1491 (meclozine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 189, 105, 201, 285, 165, 166, 190, 134.

Quantification. GAS CHROMATOGRAPHY-MASS SPECTROMETRY. In plasma: detection limit 5 ng/ml—H. G. Fouda *et al.*, *Biomed. Mass Spectrom.*, 1978, 5, 491-494.

Dose. Usually 50 to 150 mg of meclozine hydrochloride daily.

Medazepam

Tranquilliser

Proprietary Names. Nobrium; Raporan.

7-Chloro-2,3-dihydro-1-methyl-5-phenyl-1H-1,4-benzodiazepine

$C_{16}H_{15}ClN_2 = 270.8$

CAS—2898-12-6

A white to greenish-yellow crystalline powder. M.p. 100° to 103°.

Practically **insoluble** in water; soluble 1 in 8 of ethanol, 1 in 1 of chloroform, and 1 in 5 of ether.

Dissociation Constant. pK_a 6.2 (37°).

Partition Coefficient. Log P (octanol/pH 7.4), 4.0.

Colour Tests. Formaldehyde-Sulphuric Acid—orange (add water).

Cold *nitric acid* gives a red colour.

Thin-layer Chromatography. System *TA*—Rf 67; system *TB*—Rf 40; system *TC*—Rf 74; system *TD*—Rf 56; system *TE*—Rf 79; system *TF*—Rf 40. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System *GA*—medazepam RI 2226, desmethyldiazepam RI 2496, diazepam RI 2425; system *GF*—medazepam RI 2640, diazepam RI 3045; system *GG*—medazepam RI 2620, desmethyldiazepam RI 3041, diazepam RI 2940.

High Pressure Liquid Chromatography. System *HA*—medazepam k' 0.2, desmethyldiazepam k' 0.2, diazepam k' 0.1; system *HJ*— k' 7.05; system *HK*— k' 4.44.

Ultraviolet Spectrum. Aqueous acid—253 nm ($A_1^1 = 860$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1610, 1178, 1298, 700, 1255, 815 (KBr disk).

Mass Spectrum. Principal peaks at m/z 242, 207, 244, 270, 243, 271, 269, 165; desmethyldiazepam 242, 269, 270, 241, 243, 271, 244, 272; desmethylmedazepam 193, 255, 228, 256, 257, 165, 230, 258; diazepam 256, 283, 284, 285, 257, 255, 258, 286.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: sensitivity 40 ng/ml, ECD—J. A. F. de Silva and C. V. Puglisi, *Analyt. Chem.*, 1970, 42, 1725–1736. In whole blood: detection limit 80 ng/ml, FID—M. S. Greaves, *Clin. Chem.*, 1974, 20, 141–147.

Disposition in the Body. Readily absorbed after oral administration. The active metabolites desmethyldiazepam (nordazepam)

and diazepam may be detected in the blood shortly after dosing; desmethyldiazepam accumulates during chronic treatment. Desmethylmedazepam has also been detected in plasma. A total of up to about 75% of a dose is excreted in the urine and about 20% is eliminated in the faeces. The major urinary metabolite is oxazepam glucuronide, 2 to 3% of a dose being excreted in this form in 72 hours; other urinary metabolites include desmethyldiazepam and temazepam.

THERAPEUTIC CONCENTRATION.

Following single oral doses of 10 mg given to 4 subjects, peak plasma concentrations of 0.14 to 0.26 $\mu\text{g/ml}$ (mean 0.21) of medazepam were attained in about 1 hour (D. M. Hailey and E. S. Baird, *Br. J. Anaesth.*, 1979, 51, 493–496).

Doses of 10 to 50 mg given daily to 20 subjects, resulted in the following steady-state plasma concentrations: medazepam 0.01 to 0.16 $\mu\text{g/ml}$ (mean 0.06), diazepam 0 to 0.12 $\mu\text{g/ml}$ (mean 0.03), desmethyldiazepam 0.2 to 1.7 $\mu\text{g/ml}$ (mean 0.7) (A. J. Bond *et al.*, *Br. J. clin. Pharmacol.*, 1977, 4, 51–56).

HALF-LIFE. Plasma half-life, medazepam 1 to 2 hours, desmethyldiazepam about 40 to 100 hours, but there is considerable intersubject variation—see under Nordazepam.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 1.9.

PROTEIN BINDING. In plasma, almost completely bound.

Dose. 10 to 40 mg daily.

Medigoxin

Cardiac Glycoside

Synonyms. β -Methyl Digoxin; β -Methyldigoxin; Metildigoxin.

Proprietary Names. Lanitop; Metidi.

3β -[(*O*-2,6-Dideoxy-4-*O*-methyl- β -D-ribo-hexopyranosyl-(1 \rightarrow 4)-*O*-2,6-dideoxy- β -D-ribo-hexopyranosyl-(1 \rightarrow 4)-2,6-dideoxy- β -D-ribo-hexopyranosyl)oxy]-12 β ,14-dihydroxy-5 β ,14 β -card-20(22)-enolide

$C_{42}H_{66}O_{14} = 795.0$

CAS—30685-43-9

A white crystalline powder. M.p. 162° to 168°. Very slightly **soluble** in water; soluble in ethanol and chloroform. **Infra-red Spectrum.** Principal peaks at wavenumbers 1085, 1014, 1730, 1163, 1130, 864 (KBr disk).

Quantification. RADIOIMMUNOASSAY. In plasma: sensitivity 200 pg/ml (comparison with methods using radiolabelled drug)—E. R. Garrett and P. H. Hinderling, *J. pharm. Sci.*, 1977, 66, 806–810.

Disposition in the Body. Rapidly and almost completely absorbed after oral administration. Metabolised by demethylation to digoxin and by hydrolysis to the bis- and mono-glycosides. About 75% of a dose is excreted in the urine over a period of several days with about 25 to 30% being excreted in the first 24 hours. Of the material excreted in the urine, about 30 to 50% is unchanged drug, 15% consists of conjugated bis- and mono-glycosides, and the remainder is digoxin. About 15 to 30% of a dose is eliminated in the faeces over a period of 7 days.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 0.4 mg to 17 subjects, a mean peak plasma concentration of 0.003 µg/ml was attained in about 1 hour. Following daily oral doses of 0.15 to 0.2 mg to 18 subjects, steady-state plasma concentrations of 0.0006 to 0.002 µg/ml (mean 0.001) were reported (D. Boerner *et al.*, *Eur. J. clin. Pharmac.*, 1976, 9, 307–314).

TOXICITY.

In a fatality in which death occurred about 1 hour after ingestion of a medigoxin overdose, the following postmortem tissue concentrations of glycosides were reported: blood 0.075 µg/ml, bile 2.4 µg/ml, kidney 0.237 µg/g, liver 0.047 µg/g, left ventricular myocardium 0.14 µg/g, right ventricular myocardium 0.16 µg/g, urine 0.91 µg/ml (N. Rietbrock *et al.*, *Dtsch. med. Wschr.*, 1978, 103, 1841–1844).

HALF-LIFE. Plasma half-life, 40 to 70 hours.

VOLUME OF DISTRIBUTION. About 6 to 10 litres/kg.

CLEARANCE. Plasma clearance, about 2 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 1.1.

PROTEIN BINDING. In plasma, about 10 to 30%.

Dose. For rapid digitalisation, 600 µg daily for 2 to 4 days; maintenance, 200 to 300 µg daily.

Medroxyprogesterone Acetate *Progestational Steroid*

Synonyms. Methylacetoxypregesterone; Metipregnone.

Proprietary Names. Amen; Clinovir; Curretat; Depo-Provera; Farlutal; Luteodione; Lutoral; Metilgestene; Prodasone; Provera.

6α-Methyl-3,20-dioxopregn-4-en-17α-yl acetate

$C_{24}H_{34}O_4 = 386.5$

CAS—520-85-4 (medroxyprogesterone); 71-58-9 (acetate)

A white crystalline powder. M.p. about 204°. A solution in dioxan is dextrorotatory.

Practically **insoluble** in water; soluble 1 in 800 of ethanol, 1 in 50 of acetone, and 1 in 10 of chloroform; slightly soluble in ether.

Thin-layer Chromatography. System TP—Rf 80; system TQ—Rf 50; system TR—Rf 98; system TS—Rf 85, streaking may occur.

Ultraviolet Spectrum. Ethanol—241 nm ($A_1^1 = 426$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1727, 1669, 1258, 1608, 967, 1188 (medroxyprogesterone, KBr disk).

Quantification. GAS CHROMATOGRAPHY. In plasma: detection limit 5 ng/ml, ECD—E. Rossi *et al.*, *J. Chromat.*, 1979, 169, 416–421.

GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In plasma: detection limit 1 ng—G. Phillipou and R. G. Frith, *Clinica chim. Acta*, 1980, 103, 129–133.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 4 ng/ml, UV detection—G. Milano *et al.*, *J. Chromat.*, 1982, 232; *Biomed. Appl.*, 21, 413–417.

Dose. 2.5 to 10 mg daily, by mouth; up to 1 g daily may be given.

Mefenamic Acid

Analgesic

Proprietary Names. Parkemed; Ponstan; Ponstel; Ponstyl.*N*-(2,3-Xylyl)anthranilic acid $C_{15}H_{15}NO_2 = 241.3$

CAS—61-68-7

A white to greyish-white microcrystalline powder. M.p. about 230°, with effervescence.

Practically **insoluble** in water; soluble 1 in 185 of ethanol, 1 in 150 of chloroform, and 1 in 80 of ether; soluble in solutions of alkali hydroxides.

Dissociation Constant. pK_a 4.2.**Colour Test.** Liebermann's Test—blue.

Thin-layer Chromatography. System TD—Rf 41; system TE—Rf 14; system TF—Rf 54; system TG—Rf 32. (Chromic acid solution, green.)

Gas Chromatography. System GA—RI 2201; system GD—retention time of methyl derivative 1.45 relative to *n*-C₁₆H₃₄.

High Pressure Liquid Chromatography. System HD— k' 21.1; system HV—retention time 0.95 relative to meclofenamic acid.

Ultraviolet Spectrum. Acid methanol—279 nm ($A_1^1 = 357$ a), 350 nm; aqueous alkali—285 nm ($A_1^1 = 420$ a, 322 nm).

Infra-red Spectrum. Principal peaks at wavenumbers 1255, 1647, 1572, 1504, 757, 1163 (KBr disk).

Mass Spectrum. Principal peaks at m/z 223, 241, 208, 222, 194, 180, 77, 224; 3'-carboxymefenamic acid 44, 180, 209, 227, 223, 77, 208, 179; 3'-hydroxymethylmefenamic acid 209, 257, 180, 208, 210, 77, 44, 194.

Quantification. GAS CHROMATOGRAPHY. In serum: sensitivity 1 μ g/ml, FID—L. J. Dusci and L. P. Hackett, *J. Chromat.*, 1978, 161, 340–342.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: mefenamic acid and flufenamic acid, UV detection—C. K. Lin *et al.*, *J. pharm. Sci.*, 1980, 69, 95–97.

Disposition in the Body. Readily absorbed after oral administration. Metabolised by hydroxylation of the 3'-methyl group followed by oxidation to produce the 3'-carboxy metabolite; glucuronide conjugation also occurs. About 50% of a dose is excreted in the urine in 48 hours, mainly as conjugated metabolites; about 20% of a dose is eliminated in the faeces, mostly as unconjugated 3'-carboxymefenamic acid.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 1 g to 6 subjects, a mean peak plasma concentration of 10 μ g/ml was attained in about 2 hours; the free and conjugated 3'-hydroxymethyl and 3'-carboxy metabolites attained similar concentrations after about 3 hours, and 6 to 8 hours respectively (A. J. Glazko, *Ann. phys. Med.*, 1966, 9, Suppl., 23–26).

After oral administration of 250 mg 3 times a day for four days to 10 subjects, peak plasma concentrations of 0.3 to 2.4 μ g/ml (mean 0.9) were reported 2 hours after the morning dose (R. A. Buchanan *et al.*, *Curr. ther. Res.*, 1968, 10, 592–596).

TOXICITY. Toxic effects are usually associated with plasma concentrations greater than 10 μ g/ml.

In a survey of 29 cases of mefenamic acid overdose, plasma concentrations were in the range 11 to 148 μ g/ml; in 11 of the cases convulsions occurred (mean plasma concentration 73 μ g/ml). All the patients recovered (M. Balali-Mood *et al.*, *Lancet*, 1981, *i*, 1354–1356).

HALF-LIFE. Plasma half-life, about 3 to 4 hours.

PROTEIN BINDING. In plasma, about 99%.

Dose. Up to 1.5 g daily.

Mefruside

Diuretic

Proprietary Names. Baycaron; Mefrusal.4-Chloro-*N*¹-methyl-*N*¹-(tetrahydro-2-methylfurfuryl)benzene-1,3-disulphonamide $C_{13}H_{19}ClN_2O_5S_2 = 382.9$

CAS—7195-27-9

A white powder. M.p. 148° to 149°.

Practically **insoluble** in water; soluble in dilute solutions of sodium hydroxide.

Colour Tests. Koppanyi-Zwicker Test—violet; Liebermann's Test—blue; Mercurous Nitrate—black.

Thin-layer Chromatography. System TD—Rf 45; system TE—Rf 65; system TF—Rf 58.

Gas Chromatography. System GA—RI 2950.

High Pressure Liquid Chromatography. System HN—k' 8.67.

Ultraviolet Spectrum. Methanol—276 nm ($A_1^1 = 44$ a), 284 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1162, 1176, 819, 1041, 746, 909.

Mass Spectrum. Principal peaks at m/z 85, 43, 42, 86, 44, 41, 75, 110.

Quantification. GAS CHROMATOGRAPHY. In blood, plasma, erythrocytes or urine: sensitivity 5 ng/ml in plasma, AFID—H. L. J. Fleuren *et al.*, *Arzneimittel-Forsch.*, 1979, 29, 1041–1047. In plasma, erythrocytes or urine: 5-oxomefruside and its hydroxycarboxylic acid analogue, sensitivity 25 ng, AFID—H. L. J. Fleuren *et al.*, *J. Chromat.*, 1980, 182; *Biomed. Appl.*, 8, 179–190.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In urine: mefruside and its metabolites, UV detection—C. J. Little *et al.*, *Analyt. Chem.*, 1977, 49, 1311–1313.

Disposition in the Body. Readily absorbed after oral administration. About 13% of a dose is excreted in the urine as 5-oxomefruside, about 35 to 55% as the hydroxycarboxylic acid analogue of 5-oxomefruside, and up to about 15% as a conjugate of this acid analogue. Both of these metabolites appear to be active. Less than 1% of the dose is excreted as unchanged drug.

THERAPEUTIC CONCENTRATION. There is considerable intersubject variation in plasma concentrations after therapeutic doses. Peak plasma concentrations of 0.07 to 0.13 $\mu\text{g/ml}$ were attained 2 to 5 hours after a single oral dose of 50 mg to 6 subjects (H. L. J. Fleuren *et al.*, *Eur. J. clin. Pharmac.*, 1980, 17, 59–69).

HALF-LIFE. Plasma half-life, mefruside 3 to 12 hours (mean 7), 5-oxomefruside 10 to 14 hours, hydroxycarboxylic acid analogue 8 to 12 hours.

VOLUME OF DISTRIBUTION. About 6 litres/kg.

CLEARANCE. Plasma clearance, 5 to 30 ml/min/kg (mean 13).

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 0.03.

REFERENCE. H. L. J. Fleuren *et al.*, *Eur. J. clin. Pharmac.*, 1980, 17, 59–69.

Dose. 25 to 100 mg daily.

Megestrol Acetate

Progestational Steroid

Proprietary Names. Megace; Niagestin; Pallace.

6-Methyl-3,20-dioxopregna-4,6-dien-17 α -yl acetate

$\text{C}_{24}\text{H}_{32}\text{O}_4 = 384.5$

CAS—3562-63-8 (megestrol); 595-33-5 (acetate)

A white to creamy-white crystalline powder. M.p. about 217°. A solution in chloroform is dextrorotatory.

Practically **insoluble** in water; soluble 1 in 55 of ethanol, 1 in 0.8 of chloroform, and 1 in 130 of ether; soluble in acetone.

Thin-layer Chromatography. System TP—Rf 80; system TQ—Rf 50; system TR—Rf 98; system TS—Rf 85, streaking may occur.

Ultraviolet Spectrum. Dehydrated alcohol—287 nm ($A_1^1 = 630$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1263, 1249, 1733, 1662, 1712, 1630 (KBr disk).

Mass Spectrum. Principal peaks at m/z 281, 43, 282, 187, 107, 91, 55, 105.

Dose. 40 to 320 mg daily.

Melphalan

Antineoplastic

Synonyms. PAM; Phenylalanine Nitrogen Mustard.

Note. Merphalan is the racemic form of melphalan; medphalan is the D-isomer of melphalan.

Proprietary Name. Alkeran

4-Bis(2-chloroethyl)amino-L-phenylalanine

$\text{C}_{13}\text{H}_{18}\text{Cl}_2\text{N}_2\text{O}_2 = 305.2$

CAS—148-82-3

A white to buff-coloured powder. M.p. about 177° to 180°, with decomposition.

Practically **insoluble** in water, chloroform, and ether; slightly soluble in ethanol; soluble in dilute mineral acids.

Ultraviolet Spectrum. Methanol—260 nm ($A_1^1 = 707$ a), 301 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1621, 1513, 1186, 1160, 1250, 1205 (KBr disk).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 10 ng/ml, fluorescence detection—K. W. Woodhouse and D. B. Henderson, *Br. J. clin. Pharmac.*, 1982,

13, 605P. In plasma: sensitivity 50 ng/ml, UV detection—S. Y. Chang *et al.*, *J. pharm. Sci.*, 1978, 67, 679–682.

Dose. 200 to 300 µg/kg daily, by mouth, for 4 to 6 days.

Menadione

Vitamin K Analogue

Synonyms. Menaphthene; Menaphthone; Methyl-naphthochinonum; Vitamin K₃.

Proprietary Name. Bilkaby

2-Methyl-1,4-naphthoquinone

C₁₁H₈O₂ = 172.2

CAS—58-27-5

A bright yellow crystalline powder. On exposure to light it decomposes and darkens to light brown. M.p. 105° to 107°.

Practically **insoluble** in water; soluble 1 in 60 of ethanol; freely soluble in chloroform; soluble in ether.

Caution. The powder is irritating to the respiratory tract and to the skin. The ethanolic solution has vesicant properties.

Menadione Sodium Bisulphite

Synonyms. Kavitanum; Vikasolum.

Proprietary Name. K Thrombin

C₁₁H₈O₂NaHSO₃·3H₂O = 330.3

CAS—130-37-0 (anhydrous); 6147-37-1 (trihydrate)

A white, hygroscopic, crystalline powder.

Soluble 1 in 3 of water; very slightly soluble in ethanol, chloroform, and ether.

Colour Test. Dissolve about 0.5 mg in 5 ml of ethanol and add 2 ml of *strong ammonia solution* and a few drops of ethyl cyanoacetate—violet; add 5 ml of *sodium hydroxide solution*—brown-yellow. The violet colour is destroyed on the addition of acid or on exposure to sunlight.

Ultraviolet Spectrum. Aqueous acid—244 nm (A₁¹ = 1052 b), 249 nm (A₁¹ = 1133 b), 261 nm (A₁¹ = 990 b), 340 nm (A₁¹ = 159 b).

Dose. Menadione is usually administered by intramuscular injection as a 0.5% solution in oil.

Menthol

Decongestant/Antipruritic

Synonym. Mentol

p-Menthan-3-ol

C₁₀H₂₀O = 156.3

CAS—89-78-1; 1490-04-6; 2216-51-5 (–); 15356-70-4 (±)

Menthol is natural laevo-menthol, obtained from the volatile oils of various species of *Mentha* (Labiatae), or synthetic laevo-menthol, or racemic menthol.

Colourless crystals or crystalline powder. M.p. of natural or synthetic (–)-menthol, 41° to 44° and of (±)-menthol, 27° to 28° (rising on prolonged stirring to 30° to 32°).

Very slightly **soluble** in water; soluble 1 in 0.2 of ethanol, 1 in 0.25 of chloroform, and 1 in 0.4 of ether.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1046, 1026, 995, 1102, 1078, 979 (Nujol mull).

Mass Spectrum. Principal peaks at *m/z* 81, 95, 71, 41, 67, 55, 138, 123.

Disposition in the Body. Menthol is excreted in the bile and urine as a glucuronide conjugate; the various stereoisomers differ quantitatively in the extent to which they conjugate with glucuronic acid. Menthol may occur in the conjugated form as a metabolite of pulegone which is a constituent of pulegium oil.

Toxicity. The minimum lethal dose has been estimated to be about 2 g. The application of drops or ointments containing menthol to the nostrils of infants is dangerous and may cause instant collapse. Ingestion of excess menthol may cause severe abdominal pain and coma.

Mepacrine

Antimalarial/Antiprotozoal

Synonyms. Acrichinum; Acrinamine; Atebrine; Chinacrina; Quinacrine.

6-Chloro-9-(4-diethylamino-1-methylbutylamino)-2-methoxy-acridine

C₂₃H₃₀ClN₃O = 400.0

CAS—83-89-6

Mepacrine Hydrochloride

Synonyms. Antimalarinae Chlorhydras; Erion; Quinacrine Hydrochloride.

Proprietary Name. Atabrine $C_{23}H_{30}ClN_3O \cdot 2H_2O = 508.9$

CAS—69-05-6 (anhydrous); 6151-30-0 (dihydrate)

A bright yellow crystalline powder. M.p. about 250°, with decomposition.

Soluble 1 in about 35 of water; soluble in ethanol; very slightly soluble in chloroform; practically insoluble in ether.**Mepacrine Mesylate***Synonym.* Mepacrine Methanesulphonate $C_{23}H_{30}ClN_3O \cdot 2CH_3SO_3H \cdot H_2O = 610.2$

CAS—316-05-2 (anhydrous)

Bright yellow crystals.

Soluble 1 in 3 of water and 1 in 36 of ethanol.**Dissociation Constant.** pK_a 7.7, 10.3 (20°).**Colour Tests.** Mandelin's Test—violet → yellow; Marquis Test—yellow.**Thin-layer Chromatography.** System TA—Rf 43; system TB—Rf 15; system TC—Rf 05. (Acidified iodoplatinate solution, positive.)**Ultraviolet Spectrum.** Aqueous acid—279 nm ($A_1^1 = 1706$ a), 343 nm; aqueous alkali—270 nm, 345 nm.**Infra-red Spectrum.** Principal peaks at wavenumbers 1245, 1627, 1587, 1500, 1560, 1522 (mepacrine hydrochloride, KBr disk).**Mass Spectrum.** Principal peaks at m/z 86, 36, 126, 30, 58, 38, 112, 99.**Disposition in the Body.** Readily absorbed after oral administration; it appears in the blood within 2 hours, peak concentrations being attained in 8 hours. Mepacrine accumulates in the body during chronic administration and is widely distributed, high concentrations being found in the liver, lungs, and spleen; it also persists in the skin and finger-nails. The urine and skin may become yellow. It is excreted very slowly in the urine and bile with significant amounts detectable in the urine for at least 2 months after the discontinuation of therapy. Several metabolites are excreted but these account for not more than 5% of the dose.**TOXICITY.** Large doses may give rise to nausea and vomiting and occasionally to transient mental disturbances. Attempts at suicide with massive doses have not been successful.**HALF-LIFE.** About 5 days.**DISTRIBUTION IN BLOOD.** Concentrated in the erythrocytes.**PROTEIN BINDING.** In plasma, about 90%.**Dose.** 300 to 900 mg daily.**Mepenzolate Bromide***Anticholinergic**Proprietary Names.* Cantil; Colibantil; Gastropidil.

3-Benziloyloxy-1,1-dimethylpiperidinium bromide

 $C_{21}H_{26}BrNO_3 = 420.3$

CAS—25990-43-6 (mepenzolate); 76-90-4 (bromide)

A white or light cream-coloured powder. M.p. about 230°, with decomposition.

Soluble 1 in 110 of water, 1 in 120 of dehydrated alcohol, 1 in about 630 of chloroform, and 1 in about 8 of methanol; practically insoluble in ether.**Colour Tests.** The following tests are performed on mepenzolate nitrate (see page 128): Liebermann's Test—brown; Marquis Test—orange (transient).**Thin-layer Chromatography.** System TA—Rf 01. (Acidified iodoplatinate solution, positive.)**Gas Chromatography.** System GA—RI 2327.**High Pressure Liquid Chromatography.** System HA— k' 4.1 (tailing peak).**Ultraviolet Spectrum.** Aqueous acid—252 nm, 258 nm ($A_1^1 = 11$ b), 261 nm, 263 nm.**Infra-red Spectrum.** Principal peaks at wavenumbers 1220, 1727, 1163, 763, 1062, 1093 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 97, 105, 77, 96, 42, 183, 98, 82.**Dose.** 75 to 200 mg daily.

Mephenesin

Muscle Relaxant

Synonyms. Cresoxydiol; Glykresin.

Proprietary Names. Decontractyl; Rhex.

3-(*o*-Tolyloxy)propane-1,2-diol

$C_{10}H_{14}O_3 = 182.2$

CAS—59-47-2

White crystals or crystalline aggregates. M.p. 70° to 73°.

Soluble 1 in 100 of water, 1 in 8 of ethanol, and 1 in 12 of chloroform; soluble in ether.

Mephenesin Carbamate

$C_{11}H_{15}NO_4 = 225.2$

CAS—533-06-2

White crystals. M.p. 93°.

Slightly **soluble** in water; very soluble in ethanol; soluble 1 in 50 of chloroform.

Colour Tests. Mephenesin carbamate: Mandelin's Test—grey-brown; Marquis Test—red.

Thin-layer Chromatography. System TA—Rf 64; system TB—Rf 02; system TC—Rf 43. (Marquis reagent, positive.)

Mephenesin carbamate: system TD—Rf 14; system TE—Rf 55; system TF—Rf 36. (Furfuraldehyde reagent, positive.)

Gas Chromatography. System GA—RI 1568.

High Pressure Liquid Chromatography. System HA— k' 0.2.

Ultraviolet Spectrum. Aqueous acid—270 nm ($A'_1 = 87$ a), 276 nm. No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1047, 1248, 1124, 1493, 756, 748 (Nujol mull).

Mass Spectrum. Principal peaks at m/z 108, 107, 91, 182, 109, 77, 79, 31; mephenesin carbamate 118, 108, 182, 91, 225, 107, 57, 75.

Disposition in the Body. Readily absorbed after oral administration and widely distributed throughout the tissues. It is rapidly metabolised to the inactive metabolites, β -(*o*-tolyloxy)lactic acid and β -(2-methyl-4-hydroxyphenoxy)lactic acid. Less than 2% of a dose is excreted in the urine as unchanged drug.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 3 g to 4 subjects, a mean peak plasma concentration of about 10 $\mu\text{g/ml}$ was attained in 0.5 hour (I. London and R. B. Poet, *Proc. Soc. exp. Biol. Med.*, 1957, 94, 191).

TOXICITY.

A 43-year-old woman, who ingested between 5.5 and 11 g of mephenesin recovered within about 10 hours following treatment (D. W. Barron and T. G. Milliken, *Lancet*, 1960, *i*, 262).

Dose. 0.5 to 6 g of mephenesin daily.

Mephentermine

Sympathomimetic

Synonyms. Mephenterdrine; Mephedrine.

N, α , α -Trimethylphenethylamine

$C_{11}H_{17}N = 163.3$

CAS—100-92-5

A clear, colourless to pale yellow liquid.

Practically **insoluble** in water; very soluble in ethanol.

Mephentermine Sulphate

Proprietary Name. Wyamine Sulfate

$(C_{11}H_{17}N)_2 \cdot H_2SO_4 \cdot 2H_2O = 460.6$

CAS—1212-72-2 (anhydrous); 6190-60-9 (dihydrate)

Colourless crystals or white crystalline powder.

Soluble 1 in about 18 of water and 1 in 150 of ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 10.4.

Colour Tests. Liebermann's Test—red-orange; Marquis Test—orange → brown.

Thin-layer Chromatography. System *TA*—Rf 25; system *TB*—Rf 34; system *TC*—Rf 08. (*Dragendorff* spray, positive; acidified iodoplatinate solution, positive; *Marquis* reagent, brown.)

Gas Chromatography. System *GA*—mephentermine RI 1239, phentermine RI 1147; system *GB*—mephentermine RI 1278, phentermine RI 1182; system *GC*—mephentermine RI 1668, phentermine RI 1450.

High Pressure Liquid Chromatography. System *HA*—mephentermine *k'* 1.5, phentermine *k'* 0.6; system *HC*—*k'* 2.48.

Ultraviolet Spectrum. Aqueous acid—251 nm, 257 nm ($A_1^1 = 10$ c), 263 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1111, 711, 1162, 696, 763, 1587.

Mass Spectrum. Principal peaks at *m/z* 72, 91, 73, 56, 148, 65, 57, 42; phentermine 58, 91, 42, 41, 134, 65, 59, 40.

Quantification. GAS CHROMATOGRAPHY. In urine: mephentermine, chlorphentermine and phentermine, FID—A. H. Beckett and L. G. Brookes, *J. Pharm. Pharmac.*, 1971, 23, 288–294.

Disposition in the Body. Readily absorbed after oral or parenteral administration and rapidly metabolised by demethylation and hydroxylation. About 50 to 85% of a dose is excreted in the urine unchanged, together with 15 to 20% as phentermine. Conjugated *N*-hydroxymephentermine has also been detected in the urine in small quantities.

TOXICITY. The estimated minimum lethal dose in children up to 2 years of age is 200 mg, and in adults is 2 g.

HALF-LIFE. Derived from urinary excretion data, about 6 to 20 hours.

Dose. The equivalent of 15 to 80 mg of mephentermine has been given parenterally.

Mepivacaine

(1-Methyl-2-piperidyl)formo-2',6'-xylylides

$C_{15}H_{22}N_2O = 246.4$

CAS—96-88-8

Local Anaesthetic

Yellow-white crystals. M.p. 149° to 153°.

Mepivacaine Hydrochloride

Proprietary Names. Carbocain(e); Chlorocain; Meaverin; Scandicain(e).

$C_{15}H_{22}N_2O \cdot HCl = 282.8$

CAS—1722-62-9

A white crystalline powder. M.p. 255° to 262°, with decomposition.

Freely soluble in water and methanol; soluble 1 in 10 of ethanol; very slightly soluble in chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 7.7 (20°).

Colour Test. Liebermann's Test—brown-orange.

Thin-layer Chromatography. System *TA*—Rf 65; system *TB*—Rf 27; system *TC*—Rf 62; system *TL*—Rf 48. (*Dragendorff* spray, positive; acidified iodoplatinate solution, positive; *Marquis* reagent, brown; *ninhydrin* spray, positive.)

Gas Chromatography. System *GA*—RI 2071; system *GF*—RI 2345.

High Pressure Liquid Chromatography. System *HA*—*k'* 0.9; system *HQ*—*k'* 1.09.

Ultraviolet Spectrum. Aqueous acid—263 nm ($A_1^1 = 18$ a), 271 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1650, 1523, 760, 1220, 1123, 1265 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 98, 99, 70, 42, 96, 55, 41, 40 (no peaks above 100).

Quantification. GAS CHROMATOGRAPHY. In blood: sensitivity 40 ng, FID—J. H. Asling *et al.*, *Anesthesiology*, 1969, 31, 458–461. In urine: mepivacaine and 3 metabolites, FID—J. Thomas and P. Meffin, *J. med. Chem.*, 1972, 15, 1046–1049.

Disposition in the Body. Rapidly absorbed into the circulation following epidural and paracervical injection. Rapidly metabolised by hydroxylation to the 3'- and 4'-hydroxy metabolites and

by *N*-demethylation to 2',6'-pipecoloxylidide (PPX). Less than 10% of a dose is excreted in the urine as unchanged drug in 24 hours; about 16% of a dose is excreted in the 24-hour urine as 3'-hydroxymepivacaine, 12% as 4'-hydroxymepivacaine, and 2% as 2',6'-pipecoloxylidide; the excretion of unchanged drug is increased in acid urine and in neonates.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 2 to 5 µg/ml.

Following epidural administration of 250 to 580 mg to 8 subjects, plasma concentrations at delivery were 3.7 to 5.5 µg/ml (mean 4.7) for mepivacaine and <0.1 to 0.38 µg/ml for 2',6'-pipecoloxylidide (P. Meffin *et al.*, *Clin. Pharmac. Ther.*, 1973, 14, 218–225).

Following paracervical injection of 200 mg to 5 subjects, peak plasma concentrations of 1.4 to 4.0 µg/ml (mean 2.3) were attained in about 30 minutes (K. Teramo and A. Rajamaki, *Br. J. Anaesth.*, 1971, 43, 300–312).

TOXICITY.

Mepivacaine had been given as a local anaesthetic (between 75 and 150 ml of a 2% solution) to a young woman who died while undergoing cosmetic surgery. Postmortem concentrations were: blood 50 µg/ml, bile 50 µg/ml, brain 51 µg/g, kidney 51 µg/g, liver 75 µg/g, spleen 72 µg/g. Salicylate and glutethimide were also found in the blood and urine (I. Sunshine and W. W. Fike, *New Engl. J. Med.*, 1964, 271, 487–490).

HALF-LIFE. Plasma half-life, about 2 to 3 hours.

VOLUME OF DISTRIBUTION. About 1 litre/kg.

CLEARANCE. Plasma clearance, about 5 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 1.1.

PROTEIN BINDING. In plasma, about 77%.

NOTE. For a review of the pharmacokinetics of local anaesthetics see G. T. Tucker and L. E. Mather, *Clin. Pharmacokinet.*, 1979, 4, 241–278.

Dose. Mepivacaine hydrochloride is given by injection in doses of up to 400 mg; maximum of 1 g in 24 hours.

Meprobamate

Tranquilliser

Synonym. Mepropanum

Proprietary Names. Equanil; Lan-Dol; Meditran; Mep-E; Meprate; Mepram; Mepron; Meprospan; Milonorm; Miltown; Neo-Tran; Novomepro; Oasil; Procalmadiol; Quietal; Restenil; SK-Bamate. It is an ingredient of Deprol, Ecuagesico, Equagesic, Milpath, Miltrate, and Tenavoid.

2-Methyl-2-propyltrimethylene dicarbamate

C₉H₁₈N₂O₄ = 218.3

CAS—57-53-4

Colourless crystals or white crystalline powder. M.p. 103° to 107°.

Soluble 1 in 240 of water, 1 in 7 of ethanol, 1 in 80 of chloroform, and 1 in 70 of ether; freely soluble in acetone.

Partition Coefficient. Log *P* (octanol), 0.7.

Colour Tests. Furfuraldehyde—black; Nessler's Reagent (100°)—grey-black.

Thin-layer Chromatography. System TD—Rf 0.9; system TE—Rf 0.60; system TF—Rf 0.34. (Furfuraldehyde reagent, positive; Van Urk reagent, yellow.)

Gas Chromatography. System GA—RI 1796; system GF—RI 2460.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1688, 1069, 1090, 1590, 1310, 1140 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 83, 84, 55, 56, 43, 71, 41, 62 (no peaks above 160).

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: FID—L. Martis and R. H. Levy, *J. pharm. Sci.*, 1974, 63, 834–837.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: UV detection, comparison with a GC method—R. N. Gupta and F. Eng, *J. High Resolut. Chromat. Chromat. Commun.*, 1980, 3, 419–420.

Disposition in the Body. Readily absorbed after oral administration. About 90% of a dose is excreted in the urine in 24 hours, with about 10 to 20% of the dose as unchanged drug and the remainder as metabolites, mainly 2-hydroxypropylmeprobamate and meprobamate *N*-glucuronide. About 10% of the dose is eliminated in the faeces.

Meprobamate is a minor metabolite of tybamate and is a metabolite of carisoprodol.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 5 to 20 µg/ml.

Following two oral doses of 800 mg, given to 5 subjects over a period of 1.5 hours, peak blood concentrations of 18.6 to 26.6 µg/ml (mean 23.8) were attained in about 3.5 hours (K. D. Parker *et al.*, *Clin. Toxicol.*, 1970, 3, 131–145).

TOXICITY. The estimated minimum lethal dose is 12 g, although recovery has occurred after much larger doses. Blood concentrations greater than about 50 µg/ml may cause coma and fatalities have usually been associated with blood concentrations greater than about 70 µg/ml.

In a review of 12 deaths attributed to meprobamate overdose, the blood concentrations were in the range 142 to 346 µg/ml (mean 226); in 9 of these cases, concentrations in the liver were 147 to 412 µg/g (mean 238) (S. Felby, *Acta pharmac. tox.*, 1970, 28, 334–337).

The following postmortem tissue concentrations were reported in 16 fatalities due solely to meprobamate ingestion: blood 35 to 240 µg/ml (mean 95), liver 58 to 360 µg/g (mean 148) (R. C. Baselt and R. H. Cravey, *J. analyt. Toxicol.*, 1977, 1, 81–103).

A man ingested about 200 g of meprobamate and, when admitted to hospital, was comatose and had a serum concentration of 111 µg/ml. After treatment by haemoperfusion he recovered consciousness, but 19 hours later relapsed into profound coma; the serum concentration was 260 µg/ml. Recovery occurred after further treatment (W. E. Hoy *et al.*, *Ann. intern. Med.*, 1980, 93, 455–459).

HALF-LIFE. Plasma half-life, 6 to 17 hours (mean 11); it may be much longer after chronic administration and may be dose-dependent.

VOLUME OF DISTRIBUTION. About 0.7 litre/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 0.2 to 0.3.

PROTEIN BINDING. In plasma, about 20%.

Dose. 1.2 to 2.4 g daily.

Meprylcaine

Local Anaesthetic

2-Methyl-2-propylaminopropyl benzoate

$C_{14}H_{21}NO_2 = 235.3$

CAS—495-70-5

An oil.

Practically **insoluble** in water; soluble in ethanol and ether.

Meprylcaine Hydrochloride

$C_{14}H_{21}NO_2 \cdot HCl = 271.8$

CAS—956-03-6

A white crystalline powder. M.p. 150° to 153°.

Soluble 1 in 6 of water, 1 in 5 of ethanol, 1 in 3 of chloroform, and 1 in 12 of ether.

Ultraviolet Spectrum. Aqueous acid—232 nm ($A_1^1 = 422$ b).

Mass Spectrum. Principal peaks at m/z 100, 58, 105, 77, 56, 101, 41, 70.

Meptazinol

Narcotic Analgesic

Proprietary Name. Meptid (tablets)

3-(3-Ethyl-1-methylperhydroazepin-3-yl)phenol

$C_{15}H_{23}NO = 233.4$

CAS—54340-58-8

Crystals. M.p. 127° to 133°.

Very slightly **soluble** in water; soluble in ethanol; sparingly soluble in chloroform and ether.

Meptazinol Hydrochloride

Proprietary Name. Meptid (injection)

$C_{15}H_{23}NO \cdot HCl = 269.8$

CAS—59263-76-2; 34154-59-1 (±)

A white crystalline powder. M.p. 183° to 187°.

Soluble 1 in about 4 of water and 1 in 12 of ethanol; very slightly soluble in chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 8.7 (—NH₂), 11.9 (phenol).

High Pressure Liquid Chromatography. System HA—k' 3.1.

Ultraviolet Spectrum. Ethanol—277 nm ($A_1^1 = 91$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1580, 708, 795, 1225, 1205, 1300 (meptazinol hydrochloride, KBr disk).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: detection limit 3 ng/ml, fluorescence detection—T. Frost, *Analyst, Lond.*, 1981, 106, 999–1001.

Disposition in the Body. Readily and almost completely absorbed after oral administration; bioavailability 2 to 19% (mean 9) due to extensive first-pass metabolism. Rapidly absorbed after intramuscular or rectal administration. It is excreted rapidly in the urine, mainly as the glucuronide conjugate, with less than 5% of a dose as unchanged drug, and about 5 to 10% as 7-oxomeptazinol. Both metabolites are inactive. Over 50% of a dose is excreted in the urine in 9 hours and over 60% in 24 hours. Less than 10% of an oral dose is eliminated in the faeces.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 200 mg to 9 subjects, peak plasma concentrations of 0.01 to 0.11 µg/ml (mean 0.06) were attained in 0.25 to 2 hours; accumulation in plasma did not occur after repeated oral administration (H. M. Norbury *et al.*, *Eur. J. clin. Pharmac.*, 1983, 25, 77–80).

After a single intramuscular dose of 50 mg to 4 subjects, peak plasma concentrations of 0.19 to 0.26 µg/ml (mean 0.22) were attained in 10 minutes (G. Davies *et al.*, *Eur. J. clin. Pharmac.*, 1982, 23, 535–538).

HALF-LIFE. Plasma half-life, about 2 hours.

VOLUME OF DISTRIBUTION. About 5 litres/kg.

CLEARANCE. Plasma clearance, about 30 ml/min/kg.

PROTEIN BINDING. In plasma, about 27%.

Dose. 200 mg, by mouth, every 4 hours; the equivalent of 50 to 100 mg of meptazinol parenterally.

Mepyramine

Antihistamine

Synonyms. Pyranisamine; Pyrilamine.

N-p-Anisyl-*N'*-dimethyl-*N*-(2-pyridyl)ethylenediamine

$C_{17}H_{23}N_3O = 285.4$

CAS—91-84-9

An oily liquid.

Mepyramine Maleate

Proprietary Names. Anthisan. It is an ingredient of Flavelix and Triotussic.

$C_{17}H_{23}N_3O_4$, $C_4H_4O_4 = 401.5$

CAS—59-33-6

A white or creamy-white crystalline powder. M.p. 99° to 103°.

Soluble 1 in 0.5 of water, 1 in 2.5 of ethanol, and 1 in 1.5 of chloroform; slightly soluble in ether.

Dissociation Constant. pK_a 4.0, 8.9 (25°).

Partition Coefficient. Log *P* (octanol), 2.8.

Colour Tests. Cyanogen Bromide—yellow; Mandelin's Test—violet; Marquis Test—violet.

Thin-layer Chromatography. System *TA*—Rf 51; system *TB*—Rf 39; system *TC*—Rf 25. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, red.)

Gas Chromatography. System *GA*—RI 2220; system *GF*—RI 2560.

High Pressure Liquid Chromatography. System *HA*—*k'* 3.9.

Ultraviolet Spectrum. Aqueous acid—239 nm ($A_1^1 = 633$ a), 316 nm; aqueous alkali—248 nm, 312 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1492, 1512, 1598, 1247, 1175, 1035 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 121, 58, 72, 71, 214, 122, 215, 78.

Quantification. GAS CHROMATOGRAPHY. In postmortem tissues: FID—G. R. Johnson, *Clin. Toxicol.*, 1981, 18, 907–909.

Disposition in the Body. Absorbed after oral administration.

TOXICITY.

In a fatality due to mepyramine ingestion, the following postmortem tissue concentrations were reported: blood 11 µg/ml, brain 71 µg/g, liver 18 µg/g (G. R. Johnson, *ibid.*).

Dose. 0.3 to 1 g of mepyramine maleate daily.

Mequitazine

Antihistamine

Proprietary Names. Metaplexan; Mircol; Primalan.

10-(Quinuclidin-3-ylmethyl)phenothiazine

$C_{20}H_{22}N_2S = 322.5$

CAS—29216-28-2

M.p. about 143°.

Practically **insoluble** in water; soluble in ethanol and chloroform.

Colour Tests. Formaldehyde-Sulphuric Acid—red-violet; Forrest Reagent—red; FPN Reagent—orange-red; Liebermann's Test—green; Mandelin's Test—red; Marquis Test—red (slow); Sulphuric Acid (100°)—red (slow).

Thin-layer Chromatography. System *TA*—Rf 10; system *TB*—Rf 06; system *TC*—Rf 06.

Gas Chromatography. System *GA*—RI 2760.

High Pressure Liquid Chromatography. System *HA*—*k'* 8.3 (tailing peak).

Ultraviolet Spectrum. Aqueous acid—256 nm ($A_1^1 = 1060$ a), 307 nm. No alkaline shift. (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 751, 1250, 742, 1220, 729, 1042 (KBr disk). (See below)

Dose. 10 mg daily.

Mercaptopurine

Antineoplastic

Synonym. 6MP

Proprietary Name. Puri-Nethol

Purine-6-thiol monohydrate

$C_5H_4N_4S \cdot H_2O = 170.2$

CAS—50-44-2 (anhydrous); 6112-76-1 (monohydrate)

A yellow crystalline powder which darkens on exposure to air and light. M.p. above 308°, with decomposition.

Practically **insoluble** in water, chloroform, and ether; soluble 1 in 950 of ethanol; soluble in solutions of alkali hydroxides.

Dissociation Constant. pK_a 7.7, 11.0 (20°).

Gas Chromatography. System GA—RI 1517.

Ultraviolet Spectrum. Mercaptopurine monohydrate: aqueous acid—325 nm ($A_1^1 = 1165$ a); aqueous alkali—231 nm ($A_1^1 = 831$ a), 310 nm ($A_1^1 = 1160$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1610, 1220, 1570, 1010, 865, 780 (KBr disk).

Quantification. GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In plasma: detection limit 2 ng/ml—S. Floberg *et al.*, *J. Chromat.*, 1981, 225; *Biomed. Appl.*, 14, 73–81.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: detection limit < 2 ng/ml, fluorescence detection—R. E. Jonkers *et al.*, *J. Chromat.*, 1982, 233; *Biomed. Appl.*, 22, 249–255.

Disposition in the Body. Readily absorbed after oral administration; bioavailability about 16% and very variable. It is distributed throughout the body water and diffuses into the cerebrospinal fluid. Mercaptopurine is activated in the body by intracellular conversion to nucleotide forms including the ribonucleotide thioinosinic acid. It is metabolised by xanthine oxidase to inactive 6-thiouric acid which is excreted in the urine; inorganic sulphate may also be present. About 50% of an oral dose is excreted in the urine in 24 hours, up to 8% as unchanged drug. Small amounts are excreted for up to 17 days.

Mercaptopurine is a metabolite of azathioprine.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 75 mg/m² to 14 children (mean age 13 years) with acute lymphoblastic leukaemia, peak plasma concentrations of 0.04 to 0.28 µg/ml (mean 0.14) were attained in 0.5 to 4 hours (mean 2) (S. Zimm *et al.*, *New Engl. J. Med.*, 1983, 308, 1005–1009).

TOXICITY.

A 64-year-old woman took 200 mg of mercaptopurine every 8 hours for about 2 weeks, because of an error in dispensing. She died 3 days later and the following postmortem concentrations were reported: blood 110 µg/ml, bile 16 µg/ml, brain 10 µg/g, kidney 33 µg/g (R.-L. Lin *et al.*, *J. forens. Sci.*, 1982, 27, 454–460).

HALF-LIFE. Plasma half-life, about 0.5 to 1.5 hours.

PROTEIN BINDING. In plasma, about 20%.

Dose. Initially 2.5 mg/kg daily, by mouth.

Mersalyl Acid*Diuretic*

A mixture of {3-[2-(carboxymethoxy)benzamido]-2-methoxypropyl}hydroxymercury ($C_{13}H_{17}HgNO_6 = 483.9$) and its anhydrides.

CAS—486-67-9 ($C_{13}H_{17}HgNO_6$)

A white, slightly hygroscopic powder.

Sparingly **soluble** in water and dilute mineral acids; readily soluble in solutions of alkali hydroxides.

Mersalyl Sodium

Synonym. Mersalyl

$C_{13}H_{16}HgNNaO_6 = 505.9$

CAS—492-18-2

A white deliquescent powder.

Soluble 1 in 1 of water, 1 in 3 of ethanol, and 1 in 2 of methanol; practically insoluble in chloroform and ether.

Thin-layer Chromatography. *System TA*—Rf 24.

Ultraviolet Spectrum. Aqueous acid—286 nm; aqueous alkali—290 nm ($A_1^1 = 63$ b).

Dose. 50 to 200 mg of mersalyl sodium, intramuscularly.

Mescaline*Hallucinogen*

3,4,5-Trimethoxyphenethylamine

$C_{11}H_{17}NO_3 = 211.3$

CAS—54-04-6

An alkaloid obtained from the cactus *Lophophora williamsii* (= *Anhalonium williamsii* = *A. lewinii*) (Cactaceae), which grows in the northern regions of Mexico. The cactus is also known by the names 'peyote' or 'peyotl' and dried slices of the cactus are called 'mescal buttons'.

Crystals which take up carbon dioxide from the air. M.p. 35° to 36° .

Soluble in water, ethanol, and chloroform; practically insoluble in ether.

Colour Tests. Liebermann's Test—black; Marquis Test—orange.

Thin-layer Chromatography. *System TA*—Rf 20; *system TB*—Rf 04; *system TC*—Rf 10. (*Dragendorff's spray*, positive; *FPN reagent*, positive; *acidified iodoplatinate solution*, positive; *Marquis reagent*, yellow; *ninhydrin spray*, positive.)

Gas Chromatography. *System GA*—RI 1688.

High Pressure Liquid Chromatography. *System HA*— k' 1.3; *system HB*— k' 16.82; *system HC*— k' 2.17.

Ultraviolet Spectrum. Aqueous acid—268 nm ($A_1^1 = 34$ c). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1127, 1242, 1592, 996, 1513, 834 (mescaline hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 182, 30, 181, 167, 211, 183, 151, 148.

Quantification. GAS CHROMATOGRAPHY-MASS SPECTROMETRY. In plasma—C. Van Peteghem *et al.*, *J. pharm. Sci.*, 1980, 69, 118–120.

Disposition in the Body. Readily absorbed after oral administration. It is concentrated in the kidneys, liver, and spleen. About 90% of a dose is excreted in the urine in 24 hours with about 30% as 3,4,5-trimethoxyphenylacetic acid, which is inactive; the remainder is mostly unchanged drug, together with 3,4-dihydroxy-5-methoxyphenylacetic acid which is excreted as a glutamine conjugate. Other metabolites include *N*-acetylmescaline and *N*-acetyl-3,4-dimethoxy-5-hydroxyphenethylamine.

TOXICITY. Mescaline induces psychotic changes similar to those produced by lysergide, but it is less potent. The effects of a single dose may persist for about 12 hours.

PROTEIN BINDING. In plasma, partly bound.

Mesoridazine

Tranquilliser

Synonym. Mesuridazine

10 - [2 - (1 - Methyl - 2 - piperidyl)ethyl] - 2 - (methylsulphonyl)-phenothiazine

$C_{21}H_{26}N_2OS_2 = 386.6$

CAS—5588-33-0

Soluble in chloroform.

Mesoridazine Benzenesulphonate

Synonym. Mesoridazine Besylate

Proprietary Name. Serentil

$C_{21}H_{26}N_2OS_2 \cdot C_6H_5O_3S = 544.7$

CAS—32672-69-8

A white to pale yellow, crystalline powder. M.p. about 178°, with decomposition.

Soluble 1 in 1 of water, 1 in 11 of ethanol, 1 in 3 of chloroform, and 1 in 6300 of ether; freely soluble in methanol.

Colour Tests. Formaldehyde-Sulphuric Acid—violet; Forrest Reagent—red; FPN Reagent—red; Mandelin's Test—green-brown; Marquis Test—red → violet; Sulphuric Acid—violet → blue.

Thin-layer Chromatography. System TA—Rf 38; system TB—Rf 03; system TC—Rf 06. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—not eluted.

High Pressure Liquid Chromatography. System HA— k' 5.0.

Ultraviolet Spectrum. Aqueous acid—238 nm, 262 nm ($A_1^1 = 773$ b), 310 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1050, 752, 1239, 1282, 1562, 1091 (KBr disk).

Mass Spectrum. Principal peaks at m/z 98, 70, 99, 42, 386, 126, 55, 41.

Quantification. GAS CHROMATOGRAPHY. In plasma: limit of detection 50 ng/ml, FID—E. C. Dinovo *et al.*, *J. pharm. Sci.*, 1976, 65, 667–669.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In whole blood: UV detection—J. R. McCutcheon, *J. analyt. Toxicol.*, 1979, 3, 105–107.

Disposition in the Body. Readily absorbed after oral administration. The major metabolite is sulforidazine which is pharmacologically active.

Mesoridazine is a major metabolite of thioridazine.

THERAPEUTIC CONCENTRATION.

Following a single intramuscular injection of 2 mg/kg to 6 subjects, peak plasma concentrations of 0.1 to 1.1 µg/ml (mean 0.5) for mesoridazine, and 0.1 to 0.6 µg/ml (mean 0.3) for sulforidazine, were attained in about 4 hours (L. A. Gottschalk *et al.*, Plasma Levels of Mesoridazine and its Metabolites, in *Pharmacokinetics of Psychoactive Drugs*, L. A. Gottschalk and S. Merlis (Ed.), New York, Spectrum Publications, 1976, pp. 171–189).

TOXICITY.

In a fatality attributed to the ingestion of 2.5 g, the following postmortem tissue concentrations were reported: blood 3 µg/ml, kidney 17 µg/g, liver 114 µg/g; in a second case in which 8 g had been ingested, the postmortem blood concentration was 4 µg/ml (P. T. Donlon and J. P. Tupin, *Archs gen. Psychiat.*, 1977, 34, 955–957).

HALF-LIFE. Plasma half-life, mesoridazine 2 to 9 hours (mean 5), sulforidazine 6 to 25 hours (mean 13).

Dose. The equivalent of 150 mg of mesoridazine daily; up to 400 mg daily has been given.

Mesterolone

Androgen

Proprietary Names. Mestoranum; Pro-viron.
 17 β -Hydroxy-1 α -methyl-5 α -androstan-3-one
 $C_{20}H_{32}O_2 = 304.5$
 CAS—1424-00-6

A white crystalline powder. M.p. about 210°. Practically **insoluble** in water; soluble 1 in 50 of ethanol, 1 in 6 of chloroform, and 1 in 150 of ether.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1706, 1068, 1055, 1252, 1238, 1032 (KBr disk).

Dose. 50 to 100 mg daily.

Mestranol

Oestrogen

Synonyms. EE3ME; Ethinyloestradiol-3-methyl Ether.
Proprietary Names. It is an ingredient of Metrulen, Norinyl, Ortho-Novin, and Syntex Menophase.
 3-Methoxy-19-nor-17 α -pregna-1,3,5(10)-trien-20-yn-17 β -ol
 $C_{21}H_{26}O_2 = 310.4$
 CAS—72-33-3

A white to creamy-white, crystalline powder. M.p. 146° to 154°. Practically **insoluble** in water; soluble 1 in 44 of ethanol, 1 in 4.5 of chloroform, and 1 in 23 of ether.

Caution. Mestranol is a powerful oestrogen. Contact with the skin or inhalation should be avoided.

Colour Tests. Antimony Pentachloride—green; Liebermann's Test—red; Naphthol-Sulphuric Acid—red/red; Sulphuric Acid—orange-red (yellow fluorescence under ultraviolet light).

Thin-layer Chromatography. System TP—Rf 86; system TQ—Rf 52; system TR—Rf 90; system TS—Rf 90.

Gas Chromatography. System GA—RI 2612.

Ultraviolet Spectrum. Methanol—278 nm ($A_1^1 = 61$ a), 287 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1255, 1060, 1035, 1612, 1291, 1241 (KBr disk).

Mass Spectrum. Principal peaks at m/z 227, 310, 174, 284, 147, 160, 173, 199.

Dose. Up to 100 μ g daily.

**Metalddehyde**

Molluscicide

Proprietary Names. It is an ingredient of many proprietary preparations used for the destruction of slugs. As a compressed fuel, it is known as 'Meta'.

A polymer of acetaldehyde.

$(C_2H_4O)_x$

CAS—9002-91-9

A white crystalline solid which burns readily with a non-luminous carbon-free flame and sublimates at 100°. In the presence of acids it decomposes slowly to acetaldehyde.

Practically **insoluble** in water.

Colour Test. Add 1 drop of sulphuric acid to a small amount of solid, then add a trace of pyrocatechol—violet-red.

Infra-red Spectrum. Principal peaks at wavenumbers 1094, 1113, 1163, 1074, 975, 1205 (KBr disk).

Disposition in the Body.

TOXICITY. Metalddehyde probably decomposes slowly in the body to acetaldehyde which is further oxidised. Fatalities have occurred after the ingestion of about 3 g.

Metanephrine

Synonym. Metadrenaline

(R)-1-(4-Hydroxy-3-methoxyphenyl)-2-methylaminoethanol

$C_{10}H_{15}NO_3 = 197.2$

CAS—5001-33-2

Colour Tests. Mandelin's Test—green; Marquis Test—orange → violet-brown.

Thin-layer Chromatography. System *TA*—Rf 21. (Acidified potassium permanganate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—277 nm; aqueous alkali—245 nm, 291 nm.

Disposition in the Body. Metanephrine is a metabolite of adrenaline.

Metaraminol

Sympathomimetic

Synonym. Hydroxynorephedrine
(-)-2-Amino-1-(3-hydroxyphenyl)propan-1-ol
 $C_9H_{13}NO_2 = 167.2$
CAS—54-49-9

Metaraminol Tartrate

Synonyms. Metadrin Bitartrate; Metaraminol Acid Tartrate; Metaraminol Bitartrate.

Proprietary Name. Aramine
 $C_9H_{13}NO_2 \cdot C_4H_6O_6 = 317.3$
CAS—33402-03-8

A white crystalline powder. M.p. 171° to 178°.

Soluble 1 in 3 of water and 1 in 100 of ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 8.6.

Colour Tests. Folin-Ciocalteu Reagent—blue; Mandelin's Test—blue.

Thin-layer Chromatography. System *TA*—Rf 42; system *TB*—Rf 01; system *TC*—Rf 01. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. System *GA*—not eluted.

High Pressure Liquid Chromatography. System *HA*— k' 0.9.

Ultraviolet Spectrum. Aqueous acid—272 nm ($A_1^1 = 110$ a); aqueous alkali—238 nm ($A_1^1 = 533$ b), 292 nm ($A_1^1 = 180$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1263, 1304, 1216, 1591, 1136, 1063 (KBr disk).

Mass Spectrum. Principal peaks at m/z 44, 77, 76, 29, 95, 39, 58, 42.

Dose. The equivalent of 2 to 10 mg of metaraminol, subcutaneously or intramuscularly.

Metformin

Antidiabetic

1,1-Dimethylbiguanide
 $C_4H_{11}N_5 = 129.2$
CAS—657-24-9

Metformin Hydrochloride

Proprietary Names. Diabex SR; Glucophage; Metiguanide.

$C_4H_{11}N_5 \cdot HCl = 165.6$
CAS—1115-70-4

A white, hygroscopic, crystalline powder. M.p. about 225°.

Soluble 1 in 2 of water and 1 in 100 of ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 2.8, 11.5 (32°).

Thin-layer Chromatography. System *TA*—Rf 01; system *TB*—Rf 00; system *TC*—Rf 00. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System *GA*—not eluted.

Ultraviolet Spectrum. Methanol—236 nm ($A_1^1 = 1163$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1580, 1620, 1063, 1075, 935, 740 (KBr disk).

Mass Spectrum. Principal peaks at m/z 43, 44, 85, 86, 42, 129, 68, 30.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: sensitivity 25 ng/ml, AFID—J. Brohon and M. Noel, *J. Chromat.*, 1978, 146; *Biomed. Appl.*, 3, 148–151.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: limit of detection 100 ng/ml, UV detection—B. G. Charles *et al.*, *Clin. Chem.*, 1981, 27, 434–436.

Disposition in the Body. Slowly absorbed after oral administration; bioavailability about 50 to 60%. About 30 to 50% of an oral dose is excreted in the urine as unchanged drug in 24 hours, and about 30% of the dose is eliminated unchanged in the faeces.

THERAPEUTIC CONCENTRATION.

Following single oral doses of 0.5 g and 1.5 g to 4 subjects, peak plasma concentrations of 0.59 to 1.3 $\mu\text{g/ml}$ (mean 1.0) and 1.8 to 4.0 $\mu\text{g/ml}$ (mean 3.1), respectively, were attained in about 2 hours (G. T. Tucker *et al.*, *Br. J. clin. Pharmac.*, 1981, 12, 235–246).

Following daily oral doses of 0.5 g, 1.7 g, and 2.5 g to 6, 13, and 12 subjects, mean steady-state plasma concentrations of 0.16, 0.38, and 1.0 $\mu\text{g/ml}$, respectively, were reported (C. R. Sirtori *et al.*, *Clin. Pharmac. Ther.*, 1978, 24, 683–693).

TOXICITY.

Plasma and urine concentrations of 85 and 389 $\mu\text{g/ml}$, respectively, were reported in 1 subject, 12 hours after the ingestion of 25.5 g; death occurred after 2 weeks (A. Larcen *et al.*, *Vet. Human Toxicol.*, 1979, 21, Suppl., 19–22).

HALF-LIFE. Plasma half-life, after intravenous administration, about 1.5 to 4 hours; half-life derived from urinary excretion data, about 16 hours.

VOLUME OF DISTRIBUTION. Various reported as about 1 to 4 litres/kg.

CLEARANCE. Plasma clearance, about 7 to 10 ml/min/kg.

PROTEIN BINDING. In plasma, not significantly bound.

Dose. 1.5 to 3 g of metformin hydrochloride daily.

Methacholine Chloride

Parasympathomimetic

Synonym. Acetyl- β -methylcholine Chloride

(2-Acetoxypentyl)trimethylammonium chloride

$\text{C}_8\text{H}_{18}\text{ClNO}_2 = 195.7$

CAS—55-92-5 (methacholine); 62-51-1 (chloride)

Colourless, very hygroscopic crystals, or a white crystalline powder. M.p. 170° to 173°.

Soluble 1 in 0.4 of water, 1 in 1.2 of ethanol, and 1 in 2.1 of chloroform.

Methacholine Bromide

$\text{C}_8\text{H}_{18}\text{BrNO}_2 = 240.1$

CAS—333-31-3

A white, very hygroscopic, crystalline powder. M.p. about 148°.

Soluble 1 in 0.3 of water, 1 in 0.8 of ethanol (90%), and 1 in 1.3 of chloroform; practically insoluble in ether.

Thin-layer Chromatography. System TA—Rf 02. (Acidified iodoplatinate solution, positive.)

Infra-red Spectrum. Principal peaks at wavenumbers 1739, 1248, 1066, 1632, 972, 1128 (KBr disk).

Dose. Methacholine has been given subcutaneously in doses of 10 to 25 mg (chloride), or orally in doses of 200 to 600 mg daily (bromide).

Methacycline

Antibiotic

Synonyms. Méthylénecycline; 6-Methyleneoxytetracycline.

6-Demethyl-6-deoxy-5 β -hydroxy-6-methylenetetracycline

$\text{C}_{22}\text{H}_{22}\text{N}_2\text{O}_8 = 442.4$

CAS—914-00-1

Methacycline Hydrochloride

Proprietary Names. Physiomycline; Rondomycin(e).

$\text{C}_{22}\text{H}_{22}\text{N}_2\text{O}_8 \cdot \text{HCl} = 478.9$

CAS—3963-95-9

A yellow crystalline powder. M.p. about 240°.

Soluble 1 in 65 to 1 in 100 of water, 1 in 80 to 1 in 300 of ethanol, and 1 in 30 of methanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 3.1, 7.6, 9.5 (20°).

Partition Coefficient. Log P (octanol/pH 7.5), -0.4 .

Colour Tests. Benedict's Reagent—red; Formaldehyde-Sulphuric Acid—red-orange; Mandelin's Test—yellow \rightarrow orange \rightarrow violet; Marquis Test—orange; Sulphuric Acid—red.

Thin-layer Chromatography. System TA—Rf 05, streaking. (Location under ultraviolet light, orange fluorescence; acidified potassium permanganate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—243 nm ($A_1^1 = 524$ a), 340 nm. (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 1615, 1575, 1658, 1224, 1258, 1206 (KBr disk).

Dose. Usually 600 mg of methacycline hydrochloride daily.

Methadone

Narcotic Analgesic

Synonyms. Amidone; Phenadone.

(±)-6-Dimethylamino-4,4-diphenylheptan-3-one

$C_{21}H_{27}NO = 309.5$

CAS—76-99-3; 297-88-1 (±)

Methadone Hydrochloride

Proprietary Names. Dolophine Hydrochloride; Eptadone; Mephenon; Physeptone.

$C_{21}H_{27}NO \cdot HCl = 345.9$

CAS—1095-90-5; 125-56-4 (±)

Colourless crystals or white crystalline powder. M.p. 233° to 236°.

Soluble 1 in 12 of water, 1 in 7 of ethanol, and 1 in 3 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 8.3 (20°).

Partition Coefficient. Log P (octanol/pH 7.4), 2.1.

Colour Tests. Liebermann's Test—brown-orange; Mandelin's Test—green → blue.

Thin-layer Chromatography. System TA—Rf 48; system TB—Rf 61; system TC—Rf 20. (Dragendorff spray, positive; acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—methadone RI 2148, 2-ethylidene-1,5-dimethyl-3,3-diphenylpyrrolidine (EDDP) RI 2030, 2-ethyl-5-methyl-3,3-diphenyl-1-pyrroline (EMDP) RI 1950; system GB—RI 2124; system GC—RI 2470; system GF—methadone RI 2370, EDDP RI 2280, EMDP RI 2190.

High Pressure Liquid Chromatography. System HA—methadone k' 2.2, 2-ethylidene-1,5-dimethyl-3,3-diphenylpyrrolidine k' 2.8, 2-ethyl-5-methyl-3,3-diphenyl-1-pyrroline k' 0.2; system HC— k' 1.03.

Ultraviolet Spectrum. Aqueous acid—253 nm, 259 nm, 264 nm, 292 nm ($A_1' = 18$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 710, 1709, 769, 1107, 943, 1133 (methadone hydrochloride, Nujol mull).

Mass Spectrum. Principal peaks at m/z 72, 73, 91, 293, 223, 165, 85, 71; EMDP 208, 193, 130, 115, 91, 165, 179, 207.

Quantification. SPECTROFLUORIMETRY. In plasma or tissues—C. H. Chi and B. N. Dixit, *J. pharm. Sci.*, 1979, 68, 1097–1099.

GAS CHROMATOGRAPHY. In blood, plasma or urine: methadone and EDDP, sensitivity <5 ng/ml, AFID—P. Jacob *et al.*, *J. analyt. Toxicol.*, 1981, 5, 292–295. In blood, urine or tissues: methadone and metabolites, detection limit 20 ng/ml for methadone, FID—B. C. Thompson and Y. H. Caplan, *J. analyt. Toxicol.*, 1977, 1, 66–69.

GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In plasma, saliva or urine: methadone and metabolites, sensitivity 20 ng/ml for methadone in plasma or saliva—G. I. Kang and F. S. Abbott, *J. Chromat.*, 1982, 231; *Biomed. Appl.*, 20, 311–319.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 200 ng/ml, UV detection—R. G. Buice *et al.*, *Res. Commun. Subst. Abuse*, 1982, 3, 97–107.

REVIEW. N. Jain *et al.*, *J. analyt. Toxicol.*, 1977, 1, 6–9.

Disposition in the Body. Rapidly absorbed after oral administration, and widely distributed in the tissues, with higher concentrations in the liver, lungs, and kidneys than in the blood. The main metabolic reaction is *N*-demethylation resulting in a substance which spontaneously cyclises to form the major metabolites, 2-ethylidene-1,5-dimethyl-3,3-diphenylpyrrolidine (EDDP) and 2-ethyl-5-methyl-3,3-diphenyl-1-pyrroline (EMDP), neither of which are active. Hydroxylation to methadol followed by *N*-demethylation to normethadol also occurs to some extent. Other metabolic reactions occur and there are at least eight known metabolites. In subjects on methadone maintenance, about 20 to 60% of a dose is excreted in the urine in 24 hours, with up to about 33% of the dose as unchanged drug and up to about 43% as EDDP; EMDP accounts for about 5 to 10% of the dose. The ratio of EDDP to unchanged methadone is usually very much higher in the urine of patients on methadone maintenance treatment than in simple overdose cases. Urinary excretion of unchanged drug is pH-dependent, being increased in acid urine. Up to 30% of a dose may be eliminated in the faeces, but this appears to decrease with increasing dosage. About 75% of the total excreted material is unconjugated.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.05 to 1.0 µg/ml. During methadone maintenance treatment there are often considerable fluctuations in plasma concentrations from day to day, and there appears to be a decrease in concentration as dispositional tolerance develops.

A single oral dose of 15 mg given to 5 subjects, resulted in a mean peak plasma concentration of 0.07 µg/ml at about 4 hours (C. E. Inturrisi and K. Verebely, *Clin. Pharmac. Ther.*, 1972, 13, 923-930).

Steady-state plasma concentrations of 0.14 to 0.22 µg/ml (mean 0.18) were attained with daily oral doses of 0.46 to 0.58 mg/kg given to 6 subjects; with oral doses of 0.85 to 1.33 mg/kg, the steady-state plasma concentrations were 0.34 to 0.58 µg/ml (mean 0.42) (K. Verebely *et al.*, *Clin. Pharmac. Ther.*, 1975, 18, 180-190).

TOXICITY. The estimated minimum lethal dose is 50 mg but addicts on maintenance treatment may tolerate doses of 200 mg or more. In non-addicted subjects, toxic reactions are associated with plasma concentrations in the region of 1 to 2 µg/ml and concentrations above 2 µg/ml may be lethal.

In 3 cases in which death was attributed to methadone overdose, liver concentrations of 1.9, 1.3, and 0.7 µg/g and urine concentrations of 13, 25, and 4 µg/ml, respectively, were reported (P. E. Nelson and R. C. Selkirk, *Forens. Sci.*, 1975, 6, 175-186).

In 23 fatalities in which methadone was involved, the following postmortem tissue concentrations, µg/ml or µg/g (mean, *n*), were reported:

	Methadone	EDDP
Blood	0-3 (1.2, 21)	0-0.4 (0.1, 10)
Bile	1.1-75 (13, 18)	0.2-315 (41, 18)
Brain	0.23-2.2 (0.9, 7)	—
Kidney	0.51-18.3 (3.5, 19)	0.5-3.1 (1.2, 14)
Liver	0.05-49.5 (6, 23)	0.02-2.7 (0.6, 16)
Lung	1.6-110 (16, 17)	0.01-0.98 (0.2, 10)
Spleen	1.6-20.9 (5.3, 7)	0-0.98 (0.7, 4)
Urine	0.52-76.2 (21, 22)	0.4-46.2 (11, 17)

(J. C. Garriott *et al.*, *Clin. Toxicol.*, 1973, 6, 163-173; A. E. Robinson and F. M. Williams, *J. Pharm. Pharmac.*, 1971, 23, 353-358; A. E. Robinson and A. T. Holder, *J. chromatogr. Sci.*, 1974, 12, 281-284; A. E. Robinson and A. T. Holder, *Z. Rechtsmed.*, 1973, 72, 306-311; G. Norheim, *Z. Rechtsmed.*, 1973, 73, 219-224).

HALF-LIFE. Plasma half-life, after a single dose, 10 to 25 hours (mean 15); increased during long-term maintenance therapy to 13 to 55 hours (mean 30).

VOLUME OF DISTRIBUTION. About 5 litres/kg.

CLEARANCE. Plasma clearance, about 2 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 1.3.

PROTEIN BINDING. In plasma, up to 90%, but there is considerable intersubject variation.

Dose. Initially 5 to 10 mg of methadone hydrochloride every 6 hours; doses of 30 mg have been given.

Methallenoestril

Oestrogen

Synonym. Methallenoestrol

Proprietary Name. Vallestrol

3-(6-Methoxy-2-naphthyl)-2,2-dimethylvaleric acid

C₁₈H₂₂O₃ = 286.4

CAS—517-18-0

A white crystalline powder. M.p. about 138°.

Very slightly **soluble** in water; soluble 1 in 10 of ethanol, 1 in 2 of chloroform, and 1 in 8 of ether.

Thin-layer Chromatography. System TP—Rf 79; system TQ—Rf 18; system TR—Rf 70; system TS—Rf 54, streaking may occur.

Ultraviolet Spectrum. Methanol—253 nm, 264 nm (A₁¹ = 180 a), 273 nm (A₁¹ = 180 a), 317 nm, 332 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1689, 1232, 1270, 857, 1606, 1149 (KBr disk).

Dose. 3 to 9 mg daily.

Methallibure

Hypothalamus and Pituitary Suppressant

1-Methyl-6-(1-methylallyl)-2,5-dithiobiurea

C₇H₁₄N₄S₂ = 218.3

CAS—926-93-2

A white powder. M.p. about 187°.

Practically **insoluble** in water and chloroform; soluble 1 in 100 of acetone and 1 in 200 of methanol; soluble in pyridine.

Caution. Protective gloves should be worn when handling methallibure.

Colour Tests. Nessler's Reagent (100°)—black; Palladium Chloride—orange.

Thin-layer Chromatography. System TA—Rf 79. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—not eluted.

Ultraviolet Spectrum. Aqueous acid—243 nm ($A_1^1 = 1340$ b); aqueous alkali—293 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1524, 1577, 1209, 1025, 1147, 1258 (KBr disk).

Methandienone

Anabolic Steroid

Synonym. Methandrostenolone

Proprietary Names. Danabol; Dianabol; Metastenol; Vetanabol (vet.).

17 β -Hydroxy-17 α -methylandrosta-1,4-dien-3-one

$C_{20}H_{28}O_2 = 300.4$

CAS—72-63-9

A white or faintly yellowish-white, crystalline powder. M.p. 163° to 167°.

Practically **insoluble** in water; soluble 1 in 2 of ethanol, 1 in less than 1 of chloroform, and 1 in 70 of ether.

Thin-layer Chromatography. System TP—Rf 65; system TQ—Rf 10; system TR—Rf 87; system TS—Rf 61.

Gas Chromatography. System GA—RI 2672.

Ultraviolet Spectrum. Dehydrated alcohol—245 nm ($A_1^1 = 516$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1660, 1620, 886, 1601, 1160, 1240 (KBr disk).

Quantification. GAS CHROMATOGRAPHY. In urine: sensitivity 30 ng for methandienone, 10 ng for 17-epimethandienone and 6 β -hydroxy-17-epimethandienone—H. H. Dürbeck *et al.*, *J. Chromat.*, 1978, 167, 117–124.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In urine: sensitivity 5 ng, UV detection—C. G. B. Frischkorn and H. E. Frischkorn, *J. Chromat.*, 1978, 151, 331–338.

Dose. Initially 2.5 to 5 mg daily.

Methanol

Solvent

Synonym. Methyl Alcohol

$CH_3OH = 32.04$

CAS—67-56-1

A clear, colourless, highly inflammable liquid. B.p. 63.5° to 65.7°. Refractive index 1.328 to 1.329.

Miscible with water, ethanol, chloroform, and ether.

Note. The commercial substance known as 'wood naphtha', 'pyroxylic spirit' or 'wood spirit' contains 60 to 90% of methanol, together with acetone and other empyreumatic impurities. The variety used for denaturing ethanol (see under Ethanol) contains not less than 72% v/v of methanol.

Colour Test. Potassium Dichromate (Method 2)—green.

Gas Chromatography. System GA—RI 491; system GI—retention time 0.7 min.

Mass Spectrum. Principal peaks at m/z 31, 32, 29, 30, 28, 33, 34, 27; formic acid 29, 46, 45, 28, 44, 30, 47, —.

Quantification. GAS CHROMATOGRAPHY. In blood or urine: direct injection, FID—B. R. Manno and J. E. Manno, *J. analyt. Toxicol.*, 1978, 2, 257–261.

Disposition in the Body. Readily absorbed after oral administration and distributed in the body according to the water content of the tissues; it may also be absorbed by inhalation or through intact skin. It is metabolised, much more slowly than ethanol, by oxidation to formaldehyde, formic acid, and possibly other products. Oxidation to formaldehyde is probably accomplished by alcohol dehydrogenase since the metabolism is inhibited by ethanol. Maximum concentrations of formic acid in the blood

and urine occur 2 to 3 days after ingestion. Small amounts of methanol are excreted unchanged in the urine and expired air and about 10% of a dose is excreted in the urine as formic acid. Endogenous blood-methanol concentrations are approximately 1.5 µg/ml, and urinary formic acid concentrations are usually about 12 to 17 µg/ml.

TOXICITY. The initial effects of methanol are much milder than those of ethanol and toxic effects are not usually seen until after a latent period of 8 to 36 hours; the symptoms may include severe upper abdominal pain, visual disturbance often proceeding to incurable blindness, severe metabolic acidosis, and prolonged coma which may terminate in death from respiratory failure. The fatal dose varies greatly but is usually between 100 and 200 ml in adults, although ingestion of 30 ml is potentially lethal; permanent blindness has been caused by as little as 10 ml. Toxic effects are usually associated with blood concentrations greater than 100 µg/ml and blood concentrations greater than 200 µg/ml are indicative of severe poisoning and may be lethal. The maximum permissible atmospheric concentration is 200 ppm.

In an incident involving the consumption of contraband 'vodka' subsequently found to be a mixture of methanol and water, 57 people were poisoned; 17 of the 57 died and 2 became blind. Postmortem heart-blood concentrations of 230 to 2680 µg/ml (mean 1205) were reported in 15 subjects (S. E. H. Tonkabony, *Forens. Sci.*, 1975, 6, 1-3).

The following postmortem tissue concentrations were reported in 3 fatalities due to methanol ingestion: blood 2100, 2600, and 3200 µg/ml; brain 2700, 2500, and 3100 (brain blood) µg/g; kidney -, 2600, and 3300 (kidney blood) µg/g; liver 2200, 2200, and 2400 (liver blood) µg/g; urine 3000, 1200, - µg/ml (H. Bremer and D. Tiess, *Bull. int. Ass. forens. Toxicol.*, 1976, 12(1), 21; L. R. Bednarczyk and M. Commiskey, *ibid.*, 1978, 14(2), 14; H. Bremer and D. Tiess, *ibid.*, 1978, 13(3), 21-22).

A 44-year-old man suffering from methanol intoxication was found comatose and had a serum concentration of 5830 µg/ml on admission. The subject died 40 hours later and the following postmortem concentrations were found (µg/ml or µg/g): blood 1420, bile 1750, brain 1590, heart 930, kidney 1300, liver 1070, lung 1270, vitreous humour 1730 (N. B. Wu Chen *et al.*, *J. forens. Sci.*, 1985, 30, 213-216).

VOLUME OF DISTRIBUTION. About 0.6 litre/kg.

PROTEIN BINDING. In plasma, not significantly bound.

Methanthelinium Bromide

Anticholinergic

Synonyms. Bromuro de Metantelina; Dixamonum Bromidum; Methantheline Bromide; Methanthine Bromide.

Proprietary Names. Banthine; Bronerg; Evogal; Vagantin; Xantenol.

Diethylmethyl[2-(xanthen-9-ylcarbonyloxy)ethyl]ammonium bromide

$C_{21}H_{26}BrNO_3 = 420.3$

CAS—5818-17-7 (methanthelinium); 53-46-3 (bromide)

A white crystalline powder. M.p. 171° to 177°.

Soluble 1 in less than 5 of water, ethanol, and chloroform; practically insoluble in ether. Aqueous solutions decompose on standing.

Colour Tests. Mandelin's Test—orange; Marquis Test—orange.

Thin-layer Chromatography. System TA—Rf 02. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—282 nm ($A_1^1 = 65$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1155, 1248, 1724, 761, 1200, 755 (KBr disk).

Mass Spectrum. Principal peaks at m/z 72, 181, 85, 152, 42, 44, 58, 43.

Dose. Methanthelinium bromide has been given in doses of 200 to 400 mg daily.

Methapyrilene

Antihistamine

Synonym. Thenylpyramine

NN-Dimethyl-*N'*-(2-pyridyl)-*N'*-(2-thenyl)ethylenediamine

$C_{14}H_{19}N_3S = 261.4$

CAS—91-80-5

A liquid.

Methapyrilene Fumarate

$(C_{14}H_{19}N_3S)_2 \cdot 3C_4H_4O_4 = 871.0$

CAS—33032-12-1

A white crystalline powder. M.p. 133° to 137°.

Soluble 1 in 20 of water and 1 in 30 of ethanol.

Methapyrilene Hydrochloride

Synonym. Methapyrilenum Chloride

$C_{14}H_{19}N_3S \cdot HCl = 297.8$

CAS—135-23-9

A white crystalline powder. M.p. 161° to 165°.

Soluble 1 in 0.5 of water, 1 in 5 of ethanol, and 1 in 3 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 3.7, 8.9 (25°).

Colour Tests. Liebermann's Test—red-brown; Mandelin's Test—black-violet; Marquis Test—black-violet; Sulphuric Acid—orange.

Thin-layer Chromatography. System *TA*—Rf 52; system *TB*—Rf 43; system *TC*—Rf 26. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, violet.)

Gas Chromatography. System *GA*—RI 1981; system *GF*—RI 2305.

High Pressure Liquid Chromatography. System *HA*—*k'* 4.1.

Ultraviolet Spectrum. Aqueous acid—237 nm ($A_1^1 = 720$ a), 314 nm; aqueous alkali—241 nm, 312 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1592, 765, 1558, 1250, 1158, 1316 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 58, 97, 72, 71, 42, 191, 79, 78.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: sensitivity 10 ng/ml in plasma, 50 ng/ml in urine, AFID—R. C. Baselt and S. Franch, *J. Chromat.*, 1980, 183; *Biomed. Appl.*, 9, 234–238. In blood, urine or tissues: FID—C. L. Winek *et al.*, *Clin. Toxicol.*, 1977, 11, 287–294.

Disposition in the Body. Variably and incompletely absorbed after oral administration. Less than 2% of a dose is excreted in the urine as unchanged drug in 24 hours.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 50 mg to 8 subjects, peak plasma concentrations of 0.006 to 0.05 µg/ml (mean 0.024) were attained in about 1.5 hours (E. P. Calandre *et al.*, *Clin. Pharmac. Ther.*, 1981, 29, 527–532).

TOXICITY. Methapyrilene has been shown to be carcinogenic in rats and is little used. Fatalities have occurred after ingestion of 7 g or more and toxic effects have been associated with plasma concentrations greater than 30 µg/ml. In 13 fatalities attributed to methapyrilene overdose, reported blood concentrations ranged from 2 to 380 µg/ml (mean 50) (salicylamide and ethanol were also detected in several cases).

The following postmortem tissue concentrations were reported in one fatality: blood 9 µg/ml, kidney 52 µg/g, liver 82 µg/g, lung 119 µg/g, urine 200 µg/ml (C. A. Ainsworth and J. D. Biggs, *Clin. Toxicol.*, 1977, 11, 281–286).

HALF-LIFE. Plasma half-life, about 1 to 2 hours.

VOLUME OF DISTRIBUTION. About 4 litres/kg.

CLEARANCE. Plasma clearance, about 30 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 1.0.

Dose. Methapyrilene hydrochloride has been given in doses of up to 200 mg daily.

Methaqualone

Hypnotic/Sedative

Synonym. Methachalonum

Proprietary Names. Mequin; Normi-Nox; Quaalude.

A preparation containing methaqualone and diphenhydramine hydrochloride was formerly marketed under the proprietary name Mandrax.

2-Methyl-3-*o*-tolylquinazolin-4(3*H*)-one

$C_{16}H_{14}N_2O = 250.3$

CAS—72-44-6

A white crystalline powder. M.p. 114° to 117°.

Practically **insoluble** in water; soluble 1 in 12 of ethanol, 1 in 1 of chloroform, and 1 in 50 of ether.

Methaqualone Hydrochloride

Proprietary Names. Parest; Rouqualone; Sleepinal; Tualone.

$C_{16}H_{14}N_2O \cdot HCl = 286.8$

CAS—340-56-7

A white crystalline powder. M.p. about 250°, with decomposition.

Soluble 1 in 65 of water, 1 in 31 of ethanol, and 1 in 13 of chloroform; soluble in acetone; practically insoluble in ether.

Dissociation Constant. pK_a 2.5.

Thin-layer Chromatography. System *TA*—Rf 70; system *TB*—Rf 37; system *TC*—Rf 80; system *TD*—Rf 63. (Dragendorff spray, positive; acidified iodoplatinate solution, positive.)

Gas Chromatography. System *GA*—methaqualone RI 2125, 2-hydroxymethylmethaqualone RI 2360, 2'-hydroxymethylmethaqualone RI 2410, 3'-hydroxymethaqualone RI 2490, 4'-hydroxymethaqualone RI 2520, 6-hydroxymethaqualone RI 2525; system *GF*—methaqualone RI 2580.

High Pressure Liquid Chromatography. System *HA*—*k'* 0.2.

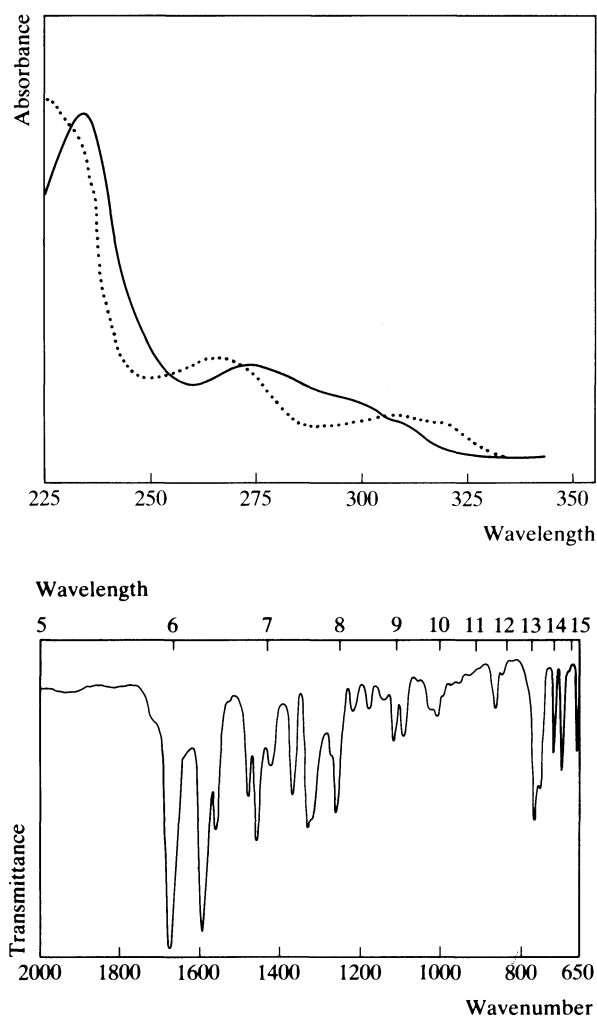

Ultraviolet Spectrum. Aqueous acid—234 nm ($A_1^1 = 1320$ a), 269 nm; aqueous alkali—265 nm ($A_1^1 = 347$ b), 306 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1682, 1599, 1565, 770, 1265, 697 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 235, 250, 91, 233, 236, 65, 76, 132; 4'-hydroxymethaqualone 251, 266, 249, 77, 143, 76, 252, 39.

Quantification. GAS CHROMATOGRAPHY. In plasma or saliva: methaqualone and the 2'-hydroxymethyl metabolite, sensitivity 20 ng/ml, AFID—M. A. Peat and B. S. Finkle, *J. analyt. Toxicol.*, 1980, 4, 114–118.

GAS CHROMATOGRAPHY (CAPILLARY COLUMN)—MASS SPECTROMETRY. In urine: methaqualone and metabolites—L. Kazyak *et al.*, *Clin. Chem.*, 1977, 23, 2001–2006.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: detection limit 1 ng/ml, UV detection—R. A. Hux *et al.*, *Analyt. Chem.*, 1982, 54, 113–117.

RADIOIMMUNOASSAY–THIN-LAYER CHROMATOGRAPHY. In urine: methaqualone and metabolites, sensitivity 1 µg/ml—R. D. Budd *et al.*, *J. Chromat.*, 1980, 190, 129–132.

REVIEW. S. S. Brown, *Methodol. Dev. Biochem.*, 1976, 5, 179–184.

Disposition in the Body. Readily absorbed after oral administration and widely distributed throughout the body. The major metabolites are 4'-hydroxymethaqualone, 2'-hydroxymethylmethaqualone and their *O*-glucuronides or *O*-methyl ethers, and methaqualone *N*-oxide. A large number of metabolites are known and there is considerable intersubject variation in the relative amounts produced. About 40 to 50% of a dose is excreted in the urine in 72 hours, mostly as conjugated metabolites, with less than 2% of a dose as unchanged drug. In 24 hours, about 10% of a dose is excreted in the urine as the conjugated 4'-hydroxy metabolite, 7% as the *N*-oxide, 5% as the conjugated 2'-hydroxymethyl derivative, and about 3% each as the conjugated

2-hydroxymethyl, 3'-hydroxy, and 6-hydroxy metabolites. Up to 4% of a dose may be eliminated unchanged in the faeces.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.4 to 5 µg/ml.

After a single oral dose of 250 mg of the base to 7 subjects, peak plasma concentrations of 1.0 to 4.0 µg/ml (mean 2.2) were attained in 2 hours; following an equivalent dose of the hydrochloride, peak plasma concentrations of 2.0 to 4.9 µg/ml (mean 3.7) were attained in 1 hour (S. Goenechea *et al.*, *Arch. Tox.*, 1973, 31, 25–30).

After daily oral doses of 300 mg to 8 subjects, a mean maximum steady-state plasma concentration of 3.7 µg/ml was reported (R. K. Nayak *et al.*, *J. Pharmacokinet. Biopharm.*, 1974, 2, 107–121).

TOXICITY. The estimated minimum lethal dose is 5 g in non-tolerant subjects. Drug accumulation is likely in chronic dosing because of the long half-life. Toxic effects may be associated with plasma concentrations greater than 2 µg/ml, and plasma concentrations greater than about 8 µg/ml are likely to produce coma and may be lethal. The 2'-hydroxymethyl metabolite, which has been found unconjugated in both blood and urine in overdose cases, may contribute to the degree of intoxication.

Abuse of methaqualone, particularly when taken in conjunction with diphenhydramine, has been reported.

In 6 fatal cases, postmortem blood concentrations of 5 to 42 µg/ml (mean 22) and liver concentrations of 26 to 89 µg/g (mean 55) were reported (R. C. Baselt and R. H. Cravey, *J. analyt. Toxicol.*, 1977, 1, 81–102).

In 19 mildly poisoned patients the plasma concentration on admission to hospital ranged from 2 to 20 µg/ml (mean 9). In 9 more severe cases, a mean peak concentration of 27 µg/ml was reached within 12 hours of admission to hospital (A. A. H. Lawson and S. S. Brown, *Br. med. J.*, 1966, 2, 1455–1456).

HALF-LIFE. Plasma half-life, about 20 to 60 hours (mean 35); a slower terminal elimination half-life of up to about 72 hours has also been reported.

VOLUME OF DISTRIBUTION. About 6 litres/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio about 1.1 at therapeutic concentrations decreasing to about 0.5 at concentrations of 20 µg/ml.

SALIVA. Plasma: saliva ratio, about 9.

PROTEIN BINDING. In plasma, about 75 to 95% (concentration-dependent).

NOTE. For a review of the pharmacokinetics of hypnotic drugs see D. D. Breimer, *Clin. Pharmacokinet.*, 1977, 2, 93–109.

Dose. Usually up to 300 mg daily.

Metharbital

Barbiturate

Synonyms. Endiemal; Metharbital.

Proprietary Name. Gemonil

5,5-Diethyl-1-methylbarbituric acid

$C_9H_{14}N_2O_3$ = 198.2

CAS—50-11-3

A white crystalline powder. M.p. 151° to 155°.

Soluble 1 in 830 of water, 1 in 23 of ethanol, and 1 in 40 of ether.

Dissociation Constant. pK_a 8.3 (20°).

Colour Tests. Koppanyi-Zwicker Test—violet; Mercurous Nitrate—black.

Thin-layer Chromatography. System TD—Rf 66; system TE—Rf 53; system TF—Rf 67; system TH—Rf 86. (Mercurous nitrate spray, black; Zwicker's reagent, faint pink.)

Gas Chromatography. System GA—metharbitone RI 1472, barbitone RI 1497.

High Pressure Liquid Chromatography. System HG—metharbitone k' 2.69, barbitone k' 1.11; system HH—metharbitone k' 1.99, barbitone k' 0.63.

Ultraviolet Spectrum. Borax buffer 0.05M (pH 9.2)—244 nm ($A_1^1 = 433$ a); M sodium hydroxide (pH 13)—244 nm ($A_1^1 = 458$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1655, 1699, 1755, 1275, 1205, 815 (KBr disk).

Mass Spectrum. Principal peaks at m/z 155, 170, 112, 169, 55, 82, 41, 39; barbitone 156, 141, 55, 155, 98, 39, 82, 43.

Quantification. See under Amylobarbitone.

Disposition in the Body. About 1% of a dose is excreted in the urine in 48 hours as unchanged drug and about 10% as the active metabolite, barbitone; the remainder is thought to be slowly excreted in the urine as barbitone over a period of 2 to 3 weeks.

THERAPEUTIC CONCENTRATION.

Following daily oral doses of 300 mg for 14 days to 1 subject, metharbitone reached a peak plasma concentration of 5 $\mu\text{g/ml}$ shortly after a dose, but was undetectable 8 hours later when the plasma concentration of barbitone was 26 $\mu\text{g/ml}$ (T. C. Butler and W. J. Waddell, *Neurology*, *Minneapolis*, 1958, 8, 106-112).

TOXICITY. The estimated minimum lethal dose is 2 g.

Dose. 100 to 300 mg daily.

Methazolamide

Carbonic Anhydrase Inhibitor

Proprietary Name. Neptazane

N-(4-Methyl-2-sulphamoyl- Δ^2 -1,3,4-thiadiazolin-5-ylidene)acetamide

$\text{C}_5\text{H}_8\text{N}_4\text{O}_3\text{S}_2 = 236.3$

CAS—554-57-4

A white or faintly yellow, crystalline powder. M.p. about 213°. Very slightly **soluble** in water and ethanol; slightly soluble in acetone; soluble in dimethylformamide.

Dissociation Constant. pK_a 7.3.

Partition Coefficient. Log P (ether/pH 7.4), -0.2 .

Colour Test. Koppanyi-Zwicker Test—violet.

Thin-layer Chromatography. System TA—Rf 72. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2187.

Ultraviolet Spectrum. Aqueous acid—255 nm, 290 nm ($A_1^1 = 396$ a); aqueous alkali—288 nm ($A_1^1 = 568$ a).

Mass Spectrum. Principal peaks at m/z 43, 221, 83, 236, 56, 223, 222, 55.

Quantification. GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In blood, plasma or urine: sensitivity <1 ng/ml in plasma—W. F. Bayne *et al.*, *J. pharm. Sci.*, 1981, 70, 75–81.

Disposition in the Body. Well absorbed after oral administration. About 15 to 20% of a dose may be excreted in the urine in 24 hours, of which about half is unchanged drug.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 50 mg to 1 subject, peak concentrations of 19.1 and 0.08 µg/ml in blood and plasma respectively were reported at 3 hours; the corresponding concentrations, 3 hours after a dose of 150 mg to a different subject were 36.1 and 1.4 µg/ml. Following oral doses of 100 mg three times a day to 1 subject, steady-state concentrations of about 40 µg/ml and about 9.5 µg/ml were reported for blood and plasma respectively (W. F. Bayne *et al.*, *ibid.*).

DISTRIBUTION IN BLOOD. Plasma:erythrocyte ratio appears to be concentration-dependent, saturation of the carbonic anhydrase in the erythrocytes occurring at about 40 µg/ml.

PROTEIN BINDING. In plasma, about 55%.

Dose. In the treatment of glaucoma, 100 to 300 mg daily.

Methdilazine

Antihistamine

Proprietary Name. Tacaryl (chewable tablets)

10-(1-Methylpyrrolidin-3-ylmethyl)phenothiazine

C₁₈H₂₀N₂S = 296.4

CAS—1982-37-2

A light tan, crystalline powder. M.p. 83° to 88°.

Practically **insoluble** in water; soluble 1 in 2 of ethanol, 1 in 1 of chloroform, and 1 in 8 of ether.

Methdilazine Hydrochloride

Proprietary Names. Dilosyn; Tacaryl (syrup and tablets).

C₁₈H₂₀N₂S.HCl = 332.9

CAS—1229-35-2

A light tan, crystalline powder, which darkens on exposure to light. M.p. 184° to 190°.

Soluble 1 in 2 of water, 1 in 2 of ethanol, and 1 in 6 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 7.5.

Colour Tests. Formaldehyde–Sulphuric Acid—red-violet; Forest Reagent—red-orange; FPN Reagent—red; Liebermann's Test—green-brown; Mandelin's Test—green → violet; Marquis Test—red-violet.

Thin-layer Chromatography. System TA—Rf 29; system TB—Rf 32; system TC—Rf 15. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2467; system GF—RI 2920.

High Pressure Liquid Chromatography. System HA—k' 6.0.

Ultraviolet Spectrum. Aqueous acid—253 nm (A₁¹ = 982 a), 302 nm; aqueous alkali—255 nm, 308 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 753, 1242, 1319, 1222, 1277, 1031 (methdilazine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at *m/z* 97, 98, 296, 199, 55, 212, 96, 198.

Dose. Usually 14.4 to 28.8 mg daily.

Methicillin

Antibiotic

Synonyms. Dimethoxyphenecillin; Dimethoxyphenyl Penicillin.

(6*R*)-6-(2,6-Dimethoxybenzamido)penicillanic acid

C₁₇H₂₀N₂O₆S = 380.4

CAS—61-32-5

Methicillin Sodium

Synonym. Meticillinum Natricum

Proprietary Names. Azapen; Celbenin; Flabelline; Metin; Pénistaph; Staphcillin.

C₁₇H₁₉N₂NaO₆S.H₂O = 420.4

CAS—132-92-3 (anhydrous); 7246-14-2 (monohydrate)

A fine white crystalline powder. M.p. 196° to 197°, with decomposition.

Soluble 1 in 0.6 of water and 1 in 35 of ethanol; slightly soluble in chloroform; practically insoluble in ether; freely soluble in methanol.

Dissociation Constant. pK_a 2.8 (25°).

Ultraviolet Spectrum. Water—280 nm (A₁¹ = 61 a). (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 1607, 1766, 1673, 1500, 1093, 1260 (methicillin sodium, KBr disk). (See below)

Dose. Up to 12 g of methicillin sodium daily, by slow intravenous injection.

Gas Chromatography. System GA—RI 1550.

Ultraviolet Spectrum. Aqueous acid—252 nm ($A_1^1 = 1505$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1570, 1271, 740, 1250, 765, 675 (KBr disk).

Methimazole

Antithyroid Agent

Synonyms. Mercazolylum; Thiamazole; Tiamazol.

Proprietary Names. Antitiroide GW; Favistan; Strumazol; Tapazole.

1-Methylimidazole-2-thiol

$C_4H_6N_2S = 114.2$

CAS—60-56-0

A white to pale buff, crystalline powder. M.p. 144° to 147°.

Soluble 1 in 5 of water, 1 in 5 of ethanol, and 1 in about 5 of chloroform; freely soluble in acetone; slightly soluble in ether.

Colour Test. Palladium Chloride—orange.

Thin-layer Chromatography. System TA—Rf 62; system TB—Rf 01; system TC—Rf 52. (Acidified iodoplatinate solution, positive.)

Mass Spectrum. Principal peaks at m/z 114, 42, 72, 113, 69, 81, 54, 115.

Quantification. See under Carbimazole.

Disposition in the Body. Absorbed after oral administration and widely distributed throughout the body. About 10% of a dose is excreted in the urine as unchanged drug. 3-Methyl-2-thiohydantoin has been identified in plasma and urine as a minor metabolite.

Methimazole is the active metabolite of carbimazole.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 60 mg given to 11 subjects, peak serum concentrations of 0.5 to 2.5 µg/ml (mean 1.3) were attained in about 1 to 3 hours (A. Melander *et al.*, *Eur. J. clin. Pharmac.*, 1980, 17, 295–299).

HALF-LIFE. Plasma half-life, about 3 to 5 hours.

VOLUME OF DISTRIBUTION. About 0.5 litre/kg.

PROTEIN BINDING. In plasma, not significantly bound.

NOTE. For a review of the pharmacokinetics of antithyroid agents see J. P. Kampmann and J. M. Hansen, *Clin. Pharmacokin.*, 1981, 6, 401–428.

Dose. Initially, 15 to 60 mg daily; maintenance, 5 to 15 mg daily.

Methindizate

Antispasmodic (Veterinary)

2-(1-Methylperhydroindol-3-yl)ethyl benzilate

$C_{25}H_{31}NO_3 = 393.5$

CAS—15687-33-9

**Methindizate Hydrochloride**

Proprietary Name. It is an ingredient of Isaverin.

$C_{25}H_{31}NO_3 \cdot HCl = 430.0$

A fine, white, crystalline powder. M.p. 159° to 160°.

Freely **soluble** in water and ethanol; practically insoluble in chloroform and ether.

Colour Tests. Liebermann's Test—orange → brown; Mandelin's Test—brown; Marquis Test—orange → green; Sulphuric Acid—orange.

Thin-layer Chromatography. System TA—Rf 36. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—251 nm, 257 nm ($A_1^1 = 10.3$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1739, 1238, 1227, 702, 1058, 1093 (KBr disk).

Methisazone

Antiviral

Synonyms. N-Methylisatin β-Thiosemicarbazone; Metisazone.

Proprietary Name. Marboran

1-Methylindoline-2,3-dione 3-thiosemicarbazone

$C_{10}H_{10}N_4OS = 234.3$

CAS—1910-68-5

A very fine, orange-yellow powder. M.p. about 248°, with decomposition.

Practically **insoluble** in water; soluble 1 in 25 of acetone and 1 in 800 of chloroform; soluble in warm dilute solutions of alkali hydroxides.

Colour Tests. Mandelin's Test—violet → yellow; Palladium Chloride—yellow → orange → brown.

Thin-layer Chromatography. System TA—Rf 65; system TB—Rf 03; system TC—Rf 68. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Ethanol—241 nm, 274 nm ($A_1^1 = 588$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1605, 1493, 1097, 1673, 1040, 826 (KBr disk).

Mass Spectrum. Principal peaks at m/z 234, 146, 179, 206, 131, 91, 117, 118.

Dose. Usually 6 g daily (prophylactic dose).

Methixene

Anticholinergic

9-(1-Methyl-3-piperidylmethyl)thioxanthene

$C_{20}H_{23}NS = 309.5$

CAS—4969-02-2

A slightly yellow viscous liquid.

Methixene Hydrochloride

Proprietary Names. Tremaril; Tremonil; Trest.

$C_{20}H_{23}NS \cdot HCl = 345.9$

CAS—1553-34-0

A white crystalline powder. M.p. about 216° .

Soluble in water, ethanol, and chloroform.

Colour Tests. Formaldehyde-Sulphuric Acid—orange; Liebermann's Test—red-orange; Mandelin's Test—orange; Sulphuric Acid—orange (fluoresces under ultraviolet light).

Thin-layer Chromatography. *System TA*—Rf 50; *system TB*—Rf 48; *system TC*—Rf 25. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 2461; *system GF*—RI 2895.

High Pressure Liquid Chromatography. *System HA*— k' 3.6.

Ultraviolet Spectrum. Aqueous acid—268 nm ($A_1^1 = 324$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 750, 729, 1052, 1162, 1086, 1280 (KBr disk).

Mass Spectrum. Principal peaks at m/z 99, 197, 44, 58, 112, 309, 41, 42.

Disposition in the Body. Absorbed after oral administration. It is excreted in the urine, partly unchanged, partly as its two isomeric sulfoxides, and partly as the stereoisomeric sulfoxides of *N*-demethylated methixene.

Dose. 7.5 to 60 mg of methixene hydrochloride daily.

Methocarbamol

Muscle Relaxant

Synonym. Guaiphenesin Carbamate

Proprietary Names. Delaxin; Lumirelax; Miowas; Robamol; Robaxin; Traumacut. It is an ingredient of Robaxisal Forte.

2-Hydroxy-3-(2-methoxyphenoxy)propyl carbamate

$C_{11}H_{15}NO_5 = 241.2$

CAS—532-03-6

A white powder. M.p. about 94° or, if previously ground to a fine powder, about 90° .

Soluble 1 in 40 of water; soluble in ethanol only with heating; sparingly soluble in chloroform; soluble in propylene glycol.

Colour Tests. Liebermann's Test—violet; Mandelin's Test—green; Marquis Test—blue-violet.

Thin-layer Chromatography. *System TA*—Rf 70; *system TD*—Rf 07; *system TE*—Rf 49; *system TF*—Rf 23. (Furfuraldehyde reagent, positive; acidified potassium permanganate solution, positive.)

High Pressure Liquid Chromatography. *System HA*— k' 0.1.

Ultraviolet Spectrum. Methanol—275 nm ($A_1^1 = 101$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1667, 1248, 1119, 1215, 1010, 1080 (KBr disk).

Mass Spectrum. Principal peaks at m/z 124, 118, 198, 109, 43, 57, 125, 77.

Quantification. COLORIMETRY. In serum—A. A. Forist and R. W. Judy, *J. pharm. Sci.*, 1971, 60, 1686–1688.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In blood: UV detection—K. Sprague and A. Poklis, *J. Can. Soc. forens. Sci.*, 1980, 13, 31–36.

Disposition in the Body. Absorbed after oral administration. Metabolised by demethylation and *p*-hydroxylation followed by

conjugation with glucuronic acid or sulphate. About 98% of a dose is excreted in the urine in 72 hours, with less than 1% as unchanged drug and the remainder as free and conjugated metabolites; most of the excretion occurs in the first 8 hours.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 2 g to 1 subject, a peak serum concentration of 25.8 µg/ml was attained in 1 hour (A. A. Forist and R. W. Judy, *J. pharm. Sci.*, 1971, 60, 1686-1688).

TOXICITY.

In a fatality due to ingestion of methocarbamol and alcohol, the following postmortem tissue concentrations were reported: blood, methocarbamol 525 µg/ml, alcohol 1400 µg/ml, salicylate 20 µg/ml; urine, methocarbamol 575 µg/ml (M. Kemal *et al.*, *J. forens. Sci.*, 1982, 27, 217-222).

HALF-LIFE. Plasma half-life, about 1 to 2 hours.

Dose. 4 to 6 g daily.

Methohexitone

Barbiturate

Synonym. Methohexital

α -(+)-5-Allyl-1-methyl-5-(1-methylpent-2-ynyl)barbituric acid

$C_{14}H_{18}N_2O_3 = 262.3$

CAS—151-83-7; 18652-93-2

A white to faintly yellowish-white, crystalline powder. M.p. 92° to 96°.

Very slightly **soluble** in water; slightly soluble in ethanol and chloroform.

Methohexitone Sodium

Synonyms. Enallynymalnatium; Sodium Methohexital.

Proprietary Names. Brevital Sodium; Brietal Sodium.

$C_{14}H_{17}N_2NaO_3 = 284.3$

CAS—309-36-4

A white crystalline substance.

Soluble in water.

Dissociation Constant. pK_a 8.3.

Colour Tests. Koppanyi-Zwicker Test—violet; Mercurous Nitrate—black; Vanillin Reagent—violet-brown/colourless.

Thin-layer Chromatography. *System TD*—Rf 73; *system TE*—Rf 58; *system TF*—Rf 72; *system TH*—Rf 93. (Mercuric chloride-diphenylcarbazone reagent, positive; mercurous nitrate spray, black; acidified potassium permanganate solution, yellow-brown; Zwicker's reagent, faint pink.)

Gas Chromatography. *System GA*—RI 1766.

High Pressure Liquid Chromatography. *System HG*— k' 27.61; *system HH*— k' 20.48.

Ultraviolet Spectrum. Borax buffer 0.05M (pH 9.2)—246 nm ($A_1^1 = 276$ a); M sodium hydroxide (pH 13)—246 nm ($A_1^1 = 308$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1680, 1709, 1316, 1193, 1253, 1040 (methohexitone sodium).

Mass Spectrum. Principal peaks at m/z 41, 81, 53, 221, 79, 39, 178, 233.

Quantification. See also under Amylobarbitone.

GAS CHROMATOGRAPHY. In blood or plasma: methohexitone and 4'-hydroxymethohexitone, sensitivity 50 ng/ml in plasma and 100 ng/ml in blood, AFID—H. Heusler *et al.*, *J. Chromat.*, 1981, 226; *Biomed. Appl.*, 15, 403–412.

Disposition in the Body. Methohexitone has a very short duration of action. It rapidly enters the brain and upon redistribution is localised in body fat but to a lesser extent than thiopentone. Less than 1% of a dose is excreted unchanged in the urine in 24 hours; the major metabolite is 4'-hydroxymethohexitone.

THERAPEUTIC CONCENTRATION.

Following an intravenous dose of 2 mg/kg of methohexitone to 6 subjects, venous blood concentrations of 3.9 to 8.6 $\mu\text{g/ml}$ were reported at 1 to 3 minutes (I. Sunshine *et al.*, *Br. J. Anaesth.*, 1966, 38, 23–28).

After a slow intravenous infusion of 3 mg/kg of methohexitone sodium over a period of 60 minutes to 1 subject, a peak plasma concentration of about 3 $\mu\text{g/ml}$ was reported (D. D. Breimer, *Br. J. Anaesth.*, 1976, 48, 643–649).

TOXICITY. The estimated minimum lethal dose is 1 g.

The following postmortem tissue concentrations were reported in a fatal case involving the intravenous self-administration of methohexitone: blood 103 $\mu\text{g/ml}$, kidney 45 $\mu\text{g/g}$, liver 41 $\mu\text{g/g}$, spleen 41 $\mu\text{g/g}$; alcohol was also found in the blood (B. Finkle, 1967—personal communication). In a fatality due to the injection of about 300 mg of methohexitone, postmortem blood and liver concentrations of 2 $\mu\text{g/ml}$ and 17 $\mu\text{g/g}$, respectively, were reported (J. E. Ryall, *Bull. int. Ass. forens. Toxicol.*, 1981, 16(2), 36–37).

HALF-LIFE. Plasma half-life, about 1 to 2 hours.

VOLUME OF DISTRIBUTION. About 1 litre/kg.

CLEARANCE. Plasma clearance, about 12 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 1.5.

PROTEIN BINDING. In plasma, about 73%.

Dose. For induction of anaesthesia, 50 to 120 mg of methohexitone sodium, by slow intravenous injection.

Methoin

Anticonvulsant

Synonyms. Mephenetoin; Mephentoin; Methantoin; Phenantoin.

Proprietary Name. Mesantoin

5-Ethyl-3-methyl-5-phenylhydantoin

$\text{C}_{12}\text{H}_{14}\text{N}_2\text{O}_2 = 218.3$

CAS—50-12-4

Colourless lustrous crystals or white crystalline powder. M.p. 136° to 140°.

Soluble 1 in 1400 of water, 1 in 15 of ethanol, 1 in 3 of chloroform, and 1 in 90 of ether.

Dissociation Constant. pK_a 8.1.

Colour Tests. Koppanyi-Zwikker Test—violet; Liebermann's Test—red-orange; Mercurous Nitrate—black.

Thin-layer Chromatography. System TD—Rf 62; system TE—Rf 76; system TF—Rf 58.

Gas Chromatography. System GA—RI 1791; system GE—retention time 0.55 for methoin and 0.73 for 5-ethyl-5-phenylhydantoin, both relative to phenytoin.

Ultraviolet Spectrum. Ethanol—257 nm ($A_1^1 = 11$ a), 264 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1704, 1754, 733, 1052, 1302, 702 (KBr disk).

Mass Spectrum. Principal peaks at m/z 189, 104, 190, 77, 44, 105, 132, 103.

Quantification. GAS CHROMATOGRAPHY. In serum: sensitivity 5 µg/ml for methoin and 10 µg/ml for 5-ethyl-5-phenylhydantoin, FID—V. A. Raisys *et al.*, *Clin. Chem.*, 1979, 25, 172–175.

GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In plasma: sensitivity 10 ng/ml for methoin and 50 ng/ml for 5-ethyl-5-phenylhydantoin—W. Yonekawa and H. J. Kupferberg, *J. Chromat.*, 1979, 163; *Biomed. Appl.*, 5, 161–167.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: methoin and 5-ethyl-5-phenylhydantoin, sensitivity 1 µg/ml, UV detection—P. M. Kabra *et al.*, *J. analyt. Toxicol.*, 1978, 2, 127–133. In urine: methoin and metabolites, UV detection—A. Küpfer *et al.*, *J. Chromat.*, 1982, 232; *Biomed. Appl.*, 21, 93–100.

Disposition in the Body. Rapidly absorbed after oral administration. During chronic administration, the major metabolite is 5-ethyl-5-phenylhydantoin (nirvanol) which is a more active anticonvulsant than methoin and accounts for at least 22% of the daily dose in the 24-hour urine. After a single dose, the major metabolite is 4'-hydroxymethoin which is excreted in the urine as a glucuronide conjugate and accounts for 43% of a dose in 24 hours; only about 1% of a single dose is excreted in the urine as 5-ethyl-5-phenylhydantoin; 5-ethyl-5-(4-hydroxyphenyl)hydantoin has also been detected in the urine in both free and conjugated forms, together with minor amounts of other conjugated hydroxy metabolites; very little unchanged drug is excreted in the urine.

THERAPEUTIC CONCENTRATION. In plasma, methoin plus metabolites, usually in the range 15 to 40 µg/ml.

Following a single oral dose of 7 mg/kg to 5 subjects, peak serum concentrations of about 3 µg/ml each of methoin and 5-ethyl-5-phenylhydantoin were attained in about 1 hour and 27 hours respectively (A. S. Troupin, *Ann. Neurol.*, 1979, 6, 410–414).

A mean steady-state serum concentration of 26 µg/ml of total hydantoin was reported for 173 subjects receiving daily oral doses averaging 6.8 mg/kg; methoin concentrations averaged 8% of the total hydantoin concentration (A. S. Troupin *et al.*, *Epilepsia*, 1976, 17, 403–414).

TOXICITY. The estimated minimum lethal dose is 5 g. Methoin gives rise to toxic symptoms more frequently than phenytoin and cases of fatal aplastic anaemia have been reported; the toxicity of the drug is attributed to the proven toxicity of 5-ethyl-5-phenylhydantoin. Acute overdosage may result in coma.

HALF-LIFE. Plasma half-life, after a single dose, methoin about 7 hours, 5-ethyl-5-phenylhydantoin about 95 hours; the half-life of the metabolite decreases to about 72 hours during chronic treatment.

SALIVA. Plasma: saliva ratio, about 1.6.

PROTEIN BINDING. In plasma, about 40%.

Dose. Initially, 50 to 100 mg daily; maintenance, 200 to 600 mg daily.

Methoprotryne

Herbicide

2-Isopropylamino-4-(3-methoxypropylamino)-6-methylthio-1,3,5-triazine

$C_{11}H_{21}N_5OS = 271.4$

CAS—841-06-5

A crystalline solid. M.p. 68° to 70°.

Soluble 1 in 3000 of water; soluble in most organic solvents.

Thin-layer Chromatography. System TA—Rf 74. (Dragendorff spray, positive.)

Gas Chromatography. System GA—RI 2098.

Infra-red Spectrum. Principal peaks at wavenumbers 1538, 811, 1304, 1121, 1272, 1175 (KBr disk).

Methoserpidine

Antihypertensive

Synonym. 10-Methoxydeserpidine

Proprietary Name. Decaserpyl

Methyl 11-demethoxy-10-methoxy-18-O-(3,4,5-trimethoxybenzoyl)reserpate

$C_{33}H_{40}N_2O_9 = 608.7$

CAS—865-04-3

A cream-coloured, hygroscopic, microcrystalline powder, which darkens on exposure to light. M.p. about 171°, with decomposition.

Practically **insoluble** in water; soluble 1 in 60 of ethanol, 1 in 5 of chloroform, and 1 in 8 of dioxan.

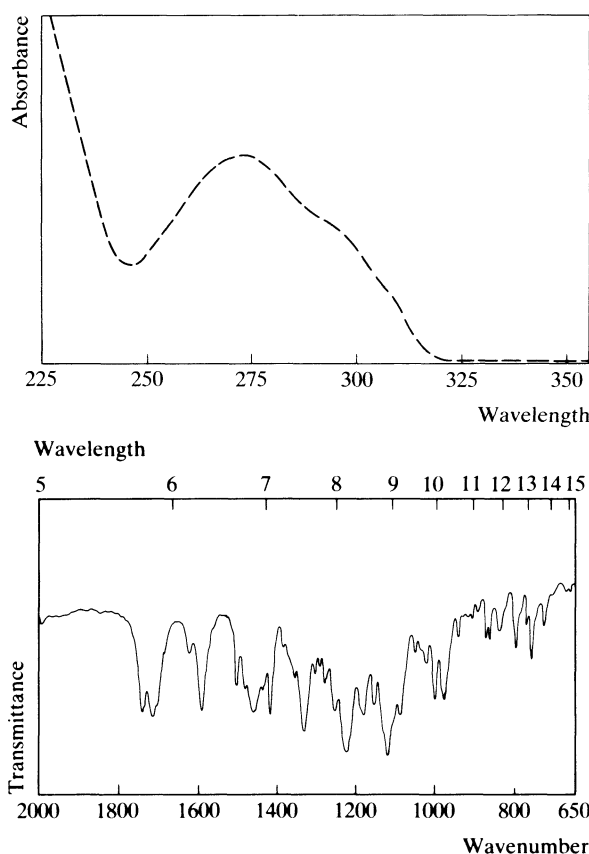

Colour Tests. Mandelin's Test—grey-violet; Marquis Test—grey.

Thin-layer Chromatography. System TA—Rf 72; system TB—Rf 04; system TC—Rf 77. (Acidified iodoplatinate solution, positive.)

High Pressure Liquid Chromatography. System HA—k' 0.5.

Ultraviolet Spectrum. Dehydrated alcohol—273 nm ($A_1^1 = 300$ a). (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 1120, 1220, 1710, 1088, 1180, 1740 (KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 608, 195, 607, 397, 609, 395, 381, 396.

Dose. 15 to 50 mg daily.

Methotrexate

Antineoplastic

Synonyms. Amethopterin; 4-Amino-10-methylfolic Acid; α -Methopterin.

Proprietary Names of Methotrexate and Methotrexate Sodium. Emtexate; Ledertrexate; Mexate.

A mixture of 4-amino-10-methylpteroyl-L-glutamic acid and related substances.

$C_{20}H_{22}N_8O_5 = 454.4$

CAS—59-05-2

A yellow to orange-brown, crystalline powder. M.p. 182° to 189° .

Practically **insoluble** in water, ethanol, chloroform, and ether; very soluble in dilute solutions of alkali hydroxides and carbonates.

Caution. Methotrexate is irritant; avoid contact with skin and mucous membranes.

Dissociation Constant. pK_a 3.8, 4.8, 5.6.

Colour Tests. Mandelin's Test—red; Mercurous Nitrate—black; Nessler's Reagent—orange.

Ultraviolet Spectrum. Aqueous acid—243 nm ($A_1^1 = 372$ a), 307 nm ($A_1^1 = 430$ a); aqueous alkali—258 nm ($A_1^1 = 500$ a), 303 nm ($A_1^1 = 500$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1600, 1511, 1634, 1305, 1200, 1538 (Nujol mull).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum or urine: methotrexate and 3 metabolites, detection limit 12.5 ng/ml for methotrexate in serum, UV detection—Y. Y. Z. Farid *et al.*, *J. pharm. biomed. Analysis*, 1983, 1, 55–63. In plasma, urine or cerebrospinal fluid: methotrexate and 2 metabolites, sensitivity 50 ng/ml, UV detection—H. Breithaupt *et al.*, *Analyt. Biochem.*, 1982, 121, 103–113. In serum: methotrexate and 7-hydroxymethotrexate, sensitivity 100 ng/ml for methotrexate, UV detection—G. J. Lawson *et al.*, *J. Chromat.*, 1981, 223; *Biomed. Appl.*, 12, 225–231.

RADIOIMMUNOASSAY. In serum, urine or cerebrospinal fluid: sensitivity 450 pg/ml—G. W. Aherne *et al.*, *Br. J. Cancer*, 1977, 36, 608–617.

Disposition in the Body. When given in low doses, it is rapidly absorbed after oral administration to give plasma concentrations equivalent to those obtained by intravenous administration; higher doses may be less well absorbed. It is distributed mainly in the extracellular spaces but a proportion penetrates cell membranes and is strongly bound to dihydrofolate reductase. Small amounts of methotrexate diffuse into the cerebrospinal fluid, higher concentrations being achieved with high doses. The major metabolite appears to be 4-amino-10-methylpteroic acid; 7-hydroxymethotrexate has been detected after high doses; 7-hydroxy-4-amino-10-methylpteroic acid has also been reported to be a metabolite. About 50 to 95% of a dose is excreted unchanged in the urine in 24 hours (dose-dependent); after oral administration, about 30% of a dose may be excreted as metabolites as a result of the action of intestinal bacteria prior to absorption; after intravenous administration, up to about 10% of a dose is excreted in the urine as metabolites and up to about 15% of a dose may be excreted in the bile.

THERAPEUTIC CONCENTRATION.

After single oral doses of 15 mg/m² to 10 fasting subjects (children), peak serum concentrations of 0.18 to 0.73 μ g/ml (mean 0.41) were attained in 1 to 2 hours (C. R. Pinkerton *et al.*, *Lancet*, 1980, 2, 944–946).

Following intravenous infusion of 50 to 250 mg/kg over 6 hours to 14 subjects, peak plasma concentrations of 45 to 450 μ g/ml were attained (R. G. Stoller *et al.*, *New Engl. J. Med.*, 1977, 297, 630–634).

TOXICITY. Toxic effects are usually associated with plasma concentrations greater than 4.5 μ g/ml, 24 hours after a dose, or 0.45 μ g/ml, 48 hours after a dose.

HALF-LIFE. Plasma half-life, about 4 to 10 hours; a longer terminal elimination phase of 10 to 70 hours (mean 27) has also been reported.

VOLUME OF DISTRIBUTION. About 0.8 litre/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 0.9.

PROTEIN BINDING. In plasma, variously reported as 50 to 95%.

NOTE. For reviews of the clinical pharmacokinetics of methotrexate see D. D. Shen and D. L. Azarnoff, *Clin. Pharmacokinet.*, 1978, 3, 1–13, F. M. Balis *et al.*, *ibid.*, 1983, 8, 202–232, and Y.-M. Wang and T. Fujimoto, *ibid.*, 1984, 9, 335–348.

Dose. 10 to 25 mg weekly, by mouth.

Methotrimprazine

Tranquilliser

Synonym. Levomepromazine*Proprietary Names of Methotrimprazine and its Salts.* Levoprome; Minozinan; Neurocil; Nozinan. Methotrimprazine is an ingredient of Immobilon (for small animals).*(-)-NN-Dimethyl-3-(2-methoxyphenothiazin-10-yl)-2-methylpropylamine* $C_{19}H_{24}N_2OS = 328.5$

CAS—60-99-1

A fine, white, crystalline powder. M.p. about 126°.

Practically **insoluble** in water; sparingly soluble in ethanol; soluble 1 in 2 of chloroform and 1 in 10 of methanol; freely soluble in ether.**Methotrimprazine Hydrochloride** $C_{19}H_{24}N_2OS \cdot HCl = 364.9$

CAS—4185-80-2

Very **soluble** in water and ethanol.**Methotrimprazine Maleate***Synonym.* Methotrimprazine Hydrogen Maleate $C_{19}H_{24}N_2OS \cdot C_4H_4O_4 = 444.5$

CAS—7104-38-3; 17086-29-2

A white crystalline powder. M.p. about 187°, with decomposition.

Very slightly **soluble** in water; slightly soluble in ethanol; soluble in chloroform; practically insoluble in ether.**Dissociation Constant.** pK_a 9.2.**Partition Coefficient.** Log *P* (octanol), 4.7.**Colour Tests.** Formaldehyde-Sulphuric Acid—blue; Forrester Reagent—violet; FPN Reagent—violet; Mandelin's Test—blue-violet; Marquis Test—blue-violet.**Thin-layer Chromatography.** *System TA*—Rf 57; *system TB*—Rf 49; *system TC*—Rf 38. (*Dragendorff spray*, positive; *FPN reagent*, violet; *acidified iodoplatinate solution*, positive; *Marquis reagent*, violet.)**Gas Chromatography.** *System GA*—RI 2514; *system GF*—RI 2965.**High Pressure Liquid Chromatography.** *System HA*— k' 3.2.**Ultraviolet Spectrum.** Aqueous acid—250 nm ($A_1^1 = 783$ a), 302 nm; aqueous alkali—259 nm, 323 nm.**Infra-red Spectrum.** Principal peaks at wavenumbers 1580, 1270, 1175, 1030, 1205, 752 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 58, 328, 100, 228, 185, 329, 242, 229.**Quantification.** GAS CHROMATOGRAPHY. In plasma or erythrocytes: methotrimprazine and metabolites, AFID—S. G. Dahl *et al.*, *Ther. Drug Monit.*, 1982, 4, 81–87.GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In plasma or urine: methotrimprazine and metabolites—S. G. Dahl and M. Garle, *J. pharm. Sci.*, 1977, 66, 190–193.HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: limit of detection 2 ng/ml, UV detection—J. E. Holt *et al.*, *Br. J. clin. Pharmacol.*, 1982, 13, 282P.**Disposition in the Body.** Readily absorbed after oral administration and widely distributed throughout the body. The major metabolites are the sulfoxide and *N*-monodesmethyl derivative (active); hydroxylation also occurs. Less than 1% of a dose is excreted in the urine as unchanged drug in 24 hours. About 10% of a dose is excreted in the urine as the sulfoxide.**THERAPEUTIC CONCENTRATION.**After a single oral dose of 50 mg to 5 subjects, peak plasma concentrations of 0.016 to 0.04 μg/ml were attained in 1 to 4 hours; concentrations of the sulfoxide metabolite exceeded those of unchanged drug in each case (S. G. Dahl, *Clin. Pharmac. Ther.*, 1976, 19, 435–442).Following daily oral doses of 300 to 400 mg to 4 subjects, steady-state plasma concentrations of 0.05 to 0.14 μg/ml (mean 0.08) were reported; steady-state plasma concentrations of the sulfoxide metabolite ranged from 0.26 to 0.39 μg/ml (mean 0.33); the *N*-monodesmethyl metabolite was also detected (S. G. Dahl and M. Garle, *J. pharm. Sci.*, 1977, 66, 190–193).

TOXICITY.

The following postmortem concentrations were reported in a fatality attributed to methotrimeprazine overdose: blood 8 µg/ml, liver 160 µg/g (R. Bonnicksen *et al.*, *Z. Rechtsmed.*, 1970, 67, 158–169).

HALF-LIFE. Plasma half-life, methotrimeprazine 15 to 77 hours (mean 27), sulfoxide metabolite 10 to 30 hours (mean 20).

VOLUME OF DISTRIBUTION. About 30 litres/kg.

DISTRIBUTION IN BLOOD. Plasma:whole blood ratio, about 1.2 but there is considerable intersubject variation.

Dose. Usually 25 to 50 mg of methotrimeprazine maleate daily; up to 1 g daily has been given.

Methoxamine*Sympathomimetic*

Synonym. Methoxamedrine

2-Amino-1-(2,5-dimethoxyphenyl)propan-1-ol

$C_{11}H_{17}NO_3 = 211.3$

CAS—390-28-3

**Methoxamine Hydrochloride**

Proprietary Names. Vasoxine; Vasoxyl.

$C_{11}H_{17}NO_3 \cdot HCl = 247.7$

CAS—61-16-5

Colourless or white plate-like crystals or white crystalline powder. M.p. 214° to 219°.

Soluble 1 in 2.5 of water and 1 in 12 of ethanol; very slightly soluble in chloroform and ether.

Dissociation Constant. pK_a 9.2 (25°).

Colour Tests. Mandelin's Test—green-yellow; Marquis Test—violet-brown → green.

Thin-layer Chromatography. System TA—Rf 55. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 1726; system GB—RI 1735.

High Pressure Liquid Chromatography. System HA— k' 0.9.

Ultraviolet Spectrum. Aqueous acid—290 nm; water—290 nm ($A_1 = 161$ a). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1496, 1219, 1022, 1276, 1179, 1050 (methoxamine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 168, 137, 44, 139, 43, 152, 124, 167.

Dose. 5 to 20 mg of methoxamine hydrochloride intramuscularly.

Methoxsalen*Pigmenting Agent*

Synonyms. Ammoidin; 8-Methoxypsoralen; Metoxaleno; Xanthotoxin.

Proprietary Names. Deltasoralen; Meladinine; Oxsoralen.

9-Methoxy-7H-furo[3,2-g]chromen-7-one

$C_{12}H_8O_4 = 216.2$

CAS—298-81-7

A constituent of the fruits of *Ammi majus*.

White to cream-coloured fluffy crystals. M.p. 143° to 148°.

Practically **insoluble** in water; soluble in boiling ethanol and in acetone; freely soluble in chloroform; sparingly soluble in ether.

Gas Chromatography. System GA—RI 1980.

Ultraviolet Spectrum. Aqueous acid—247 nm, 304 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1705, 1150, 1100, 1580, 1020, 1000 (Nujol mull).

Dose. 20 mg daily; doses of up to 50 mg have been given.

Methoxyamphetamine

Hallucinogen

Synonym. *p*-Methoxyamphetamine
 α -Methyl-4-methoxyphenethylamine
 $C_{10}H_{15}NO = 165.2$
 CAS—23239-32-9

A colourless oil.

Practically **insoluble** in water; soluble in chloroform and dilute acids.

Methoxyamphetamine Hydrochloride

$C_{10}H_{15}NO \cdot HCl = 201.7$
 CAS—3706-26-1
 White crystals.
Soluble in water.

Colour Test. Mandelin's Test—green.

Thin-layer Chromatography. *System TA*—Rf 73; *system TB*—Rf 36; *system TC*—Rf 77. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 1385.

High Pressure Liquid Chromatography. *System HB*—k' 14.95.

Ultraviolet Spectrum. Aqueous acid—274 nm ($A_1^1 = 80$ b). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1512, 1259, 1033, 808, 1190, 1623 (methoxyamphetamine hydrochloride).

Mass Spectrum. Principal peaks at m/z 44, 122, 121, 78, 77, 42, 51, 52.

Quantification. GAS CHROMATOGRAPHY. In urine: sensitivity 70 ng/ml—B. M. Angrist *et al.*, *Nature*, 1970, 225, 651–652.

Disposition in the Body. Absorbed after oral administration. About 80% of a dose is excreted in the urine in 24 hours with up to 15% of the dose as unchanged drug, about 25% as free 4-hydroxyamphetamine, 50% as conjugated 4-hydroxyamphetamine, and 5% each as 4-hydroxynorephedrine and a conjugated

N-oxidation product. The extent of *O*-demethylation appears to be genetically determined being decreased in poor metabolisers.

TOXICITY. Methoxyamphetamine is about 3 times as potent as methylenedioxyamphetamine and appears to be more toxic.

In 9 fatalities due to the ingestion or intravenous administration of methoxyamphetamine, the following postmortem tissue concentrations were reported: blood 0.3 to 1.9 $\mu\text{g/ml}$, bile 0.4 to 3 $\mu\text{g/ml}$, liver 0.5 to 10.3 $\mu\text{g/g}$, urine 6 to 175 $\mu\text{g/ml}$; alcohol was also detected in 4 cases (G. Cimbura, *Can. med. Ass. J.*, 1974, 110, 1263–1264).

Methoxychlor

Pesticide

Synonyms. Dimethoxy-DT; DMDT; Methoxy-DDT.

1,1,1-Trichloro-2,2-bis(4-methoxyphenyl)ethane

$C_{16}H_{15}Cl_3O_2 = 345.7$

CAS—72-43-5

The technical product contains about 88% of methoxychlor and about 12% of related isomers.

The pure *pp'*-isomer occurs as colourless crystals; the technical product is a grey powder. M.p. pure isomer, about 89°; technical product, 77°.

Practically **insoluble** in water; soluble in ethanol and aromatic solvents; very soluble in ether.

Colour Test. Liebermann's Test—black-violet.

Gas Chromatography. *System GA*—*op'*-methoxychlor RI 2417; *system GK*—*pp'*-methoxychlor retention time 1.46, *op'*-methoxychlor retention time 1.40, both relative to caffeine.

Ultraviolet Spectrum. Hexane—276 nm ($A_1^1 = 100$ b), shoulder at 283 nm.

Mass Spectrum. Principal peaks at m/z 121, 227, 228, 114, 152, 122, 63, 165 (*op'*-methoxychlor); 227, 228, 114, 152, 212, 63, 169, 115 (*pp'*-methoxychlor).

Disposition in the Body. Methoxychlor is less persistent than dicophane. It is stored in the fat to a limited extent and disappears in 2 to 4 weeks after cessation of exposure. It is eliminated mainly in the faeces; small amounts are excreted in the urine.

TOXICITY. Methoxychlor is the least toxic of the chlorinated hydrocarbon insecticides. The maximum permissible atmospheric concentration is 10 mg/m^3 and the maximum permissible concentration in food is 14 $\mu\text{g/g}$.

Methoxyflurane

General Anaesthetic

Proprietary Name. Penthrane

2,2-Dichloro-1,1-difluoroethyl methyl ether

$\text{CHCl}_2 \cdot \text{CF}_2 \cdot \text{O} \cdot \text{CH}_3 = 165.0$

CAS—76-38-0

A clear, almost colourless, non-inflammable mobile liquid. Wt per ml 1.423 to 1.427 g. B.p. 103° to 108°.

Methoxyflurane (*B.P.*) contains butylated hydroxytoluene 0.01% w/w.

Soluble 1 in 500 of water; miscible with ethanol, chloroform, and ether.

Gas Chromatography. *System GA*—RI 701; *system GI*—retention time 17.6 min.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1315, 1063, 1136, 833, 1204, 1234.

Quantification. GAS CHROMATOGRAPHY. In blood: FID—W. J. Cole *et al.*, *Br. J. Anaesth.*, 1975, 47, 1043–1047. In blood: sensitivity 10 µg/ml, FID—P. L. Jones *et al.*, *Br. J. Anaesth.*, 1972, 44, 124–130.

Dose. For maintenance of anaesthesia, 0.2 to 0.5% of the vapour by inhalation.

Methoxyphenamine

Sympathomimetic

Synonyms. Methoxiphenadrin; Mexyphamine.

2-Methoxy-*N*, α -dimethylphenethylamine

$C_{11}H_{17}NO = 179.3$

CAS—93-30-1

An oil.

Methoxyphenamine Hydrochloride

Proprietary Names. Orthoxine. It is an ingredient of Orthoxicol.

$C_{11}H_{17}NO \cdot HCl = 215.7$

CAS—5588-10-3

White crystals or powder. M.p. about 130°.

Freely **soluble** in water, ethanol, and chloroform; slightly soluble in ether.

Dissociation Constant. pK_a 10.1.

Partition Coefficient. Log *P* (chloroform/pH 7.4), 0.0.

Colour Tests. Mandelin's Test—blue-green; Marquis Test—red.

Thin-layer Chromatography. *System TA*—Rf 23; *system TB*—Rf 24; *system TC*—Rf 04. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 1361; *system GB*—RI 1370; *system GC*—RI 1670.

High Pressure Liquid Chromatography. *System HA*— k' 1.7; *system HB*— k' 32.17.

Ultraviolet Spectrum. Aqueous acid—271 nm ($A_1^1 = 92$ a). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1236, 749, 1047, 1125, 1026, 1175 (Nujol mull).

Mass Spectrum. Principal peaks at m/z 58, 91, 59, 56, 30, 42, 121, 78.

Disposition in the Body. Readily absorbed after oral administration. Metabolites identified in urine include the *N*-desmethyl, *O*-desmethyl, and 5-hydroxy derivatives and their glucuronide and/or sulphate conjugates. Unchanged drug is also excreted in the urine.

TOXICITY. The estimated minimum lethal dose for children up to 2 years of age is 200 mg and for adults is 2 g.

Dose. 50 to 100 mg of methoxyphenamine hydrochloride every 4 hours.

Methsuximide

Anticonvulsant

Synonym. Mesuximide

Proprietary Names. Celontin; Petinutin.

N,2-Dimethyl-2-phenylsuccinimide

$C_{12}H_{13}NO_2 = 203.2$

CAS—77-41-8

A white to greyish-white crystalline powder. M.p. 50° to 56°.

Soluble 1 in 350 of water, 1 in 3 of ethanol, 1 in less than 1 of chloroform, and 1 in 2 of ether.

Thin-layer Chromatography. *System TA*—Rf 76.

Gas Chromatography. *System GA*—RI 1622; *system GE*—retention time 0.35 for methsuximide and 0.50 for *N*-desmethylmethsuximide, relative to phenytoin.

High Pressure Liquid Chromatography. *System HE*— k' 6.02.

Ultraviolet Spectrum. Methanol—247 nm ($A_1^1 = 21$ a), 252 nm, 258 nm, 264 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1705, 1282, 1030, 699, 1775, 1086 (KBr disk).

Mass Spectrum. Principal peaks at m/z 118, 117, 203, 103, 77, 78, 119, 91.

Quantification. GAS CHROMATOGRAPHY. In serum: sensitivity 1 µg/ml, FID—J. Bonitati, *Clin. Chem.*, 1976, 22, 341–345. In plasma or serum: *N*-desmethylmethsuximide, sensitivity 500 ng/ml, ECD—J. E. Wallace *et al.*, *Clin. Chem.*, 1979, 25, 252–255.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: sensitivity 1 µg/ml, UV detection—P. M. Kabra *et al.*, *J. analyt. Toxicol.*, 1978, 2, 127–133.

Disposition in the Body. Rapidly absorbed after oral administration and metabolised to the active *N*-desmethyl derivative.

Less than 1% of a dose is excreted in the urine as unchanged drug. The major urinary metabolites are conjugated 4-hydroxyphenyl derivatives; minor metabolites include the 3-hydroxy, 2-hydroxymethyl, and 2-dihydrodihydroxyphenyl derivatives. Methsuximide increases its own rate of metabolism on chronic dosing.

THERAPEUTIC CONCENTRATION. In plasma, *N*-desmethylnmethsuximide, usually in the range 10 to 40 µg/ml.

Following daily oral doses of 600 to 1200 mg to 8 subjects experiencing good seizure control, steady-state plasma concentrations of 0.01 to 0.11 µg/ml (mean 0.04) and 16 to 37 µg/ml (mean 25) for methsuximide and the *N*-desmethyl metabolite, respectively, were reported (J. M. Strong *et al.*, *Neurology*, Minneap., 1974, 24, 250-255).

TOXICITY. The estimated minimum lethal dose is 5 g. Toxic effects are usually associated with plasma *N*-desmethylnmethsuximide concentrations of more than 40 µg/ml.

In a case of severe coma, which began several hours after the ingestion of nearly 10 g in a suicide attempt, blood concentrations of 18 µg/ml of methsuximide and 44 µg/ml of the *N*-desmethyl metabolite were reported 14 hours after ingestion; the coma persisted for about 80 hours and correlated with the presence of the *N*-desmethyl metabolite in the blood (S. B. Karch, *J. Am. med. Ass.*, 1973, 223, 1463-1465).

HALF-LIFE. Plasma half-life, methsuximide about 3 hours, but may reduce to one quarter of this value on chronic dosing; *N*-desmethylnmethsuximide about 30 to 40 hours.

PROTEIN BINDING. In plasma, not significantly bound.

Dose. 0.3 to 1.2 g daily; up to 3.6 g daily has been given.

Methyclothiazide

Diuretic

Proprietary Names. Aquatensen; Duretic; Enduron; Thiazidil. It is an ingredient of Enduronyl.

6-Chloro-3-chloromethyl-3,4-dihydro-2-methyl-2*H*-1,2,4-benzothiadiazine-7-sulphonamide 1,1-dioxide

C₉H₁₁Cl₂N₃O₄S₂ = 360.2

CAS—135-07-9

A white crystalline powder. M.p. 216°.

Very slightly **soluble** in water and chloroform; soluble 1 in about 90 of ethanol; freely soluble in acetone and pyridine; soluble in solutions of alkali hydroxides and carbonates.

Dissociation Constant. pK_a 9.4.

Colour Tests. Koppanyi-Zwicker Test—violet; Sulphuric Acid—orange.

Thin-layer Chromatography. System TD—Rf 19; system TE—Rf 53; system TF—Rf 50.

Gas Chromatography. System GA—not eluted.

High Pressure Liquid Chromatography. System HN—k' 3.82.

Ultraviolet Spectrum. Aqueous acid—270 nm (A₁¹ = 525 b), 314 nm; aqueous alkali—264 nm, 300 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1158, 1595, 715, 1063, 1515, 1300 (KBr disk). (See below)

Mass Spectrum. Principal peaks at *m/z* 310, 64, 36, 312, 42, 43, 62, 63.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: detection limit 1.5 ng/ml, UV detection—C. A. Hartman *et al.*, *J. Chromat.*, 1981, 226; *Biomed. Appl.*, 15, 510–513.

Dose. 2.5 to 10 mg daily.

Methyl Benzoate

Coccidiostat (Veterinary)

Synonym. Nequinat

Methyl 7-benzyloxy-6-butyl-1,4-dihydro-4-oxoquinoline-3-carboxylate

$C_{22}H_{23}NO_4 = 365.4$

CAS—13997-19-8

A white or creamy-white, amorphous powder. M.p. about 208°. Practically **insoluble** in water; very slightly soluble in ethanol, chloroform, and methanol.

Colour Tests. Liebermann's Test—red-orange; Mandelin's Test—brown; Marquis Test—red-brown; Sulphuric Acid—yellow.

Ultraviolet Spectrum. Methanolic acid—261 nm ($A_1^1 = 1955$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1621, 1689, 1250, 1089, 1211, 1550 (KBr disk).

Methyl Ethyl Ketone

Solvent

Synonym. Ethyl Methyl Ketone

Butan-2-one

$CH_3 \cdot CO \cdot CH_2 \cdot CH_3 = 72.11$

CAS—78-93-3

An inflammable liquid. B.p. 80°.

Soluble 1 in about 4 of water; miscible with ethanol and ether.

Gas Chromatography. *System GA*—RI 579; *system GI*—retention time 7.3 min.

Mass Spectrum. Principal peaks at m/z 43, 29, 27, 72, 57, 42, 44, 41.

Methyl Hydroxybenzoate

Preservative

Synonyms. Metagin; Methyl Parahydroxybenzoate; Methylis Oxybenzoas; Methylparaben.

Proprietary Names. Methyl Chemosept; Nipagin M.

Methyl *p*-hydroxybenzoate

$C_8H_8O_3 = 152.1$

CAS—99-76-3

Colourless crystals or a fine, white, crystalline powder. M.p. 125° to 128°.

Soluble 1 in 400 to 1 in 500 of water, 1 in 20 of boiling water, 1 in 3 to 1 in 3.5 of ethanol, 1 in 40 of chloroform, and 1 in 10 of ether.

Sodium Methyl Hydroxybenzoate

Synonyms. Sodium Methylparaben; Soluble Methyl Hydroxybenzoate.

Proprietary Name. Nipagin M Sodium

$C_8H_7NaO_3 = 174.1$

CAS—5026-62-0

A white, hygroscopic, crystalline powder.

Soluble 1 in 2 of water and 1 in 50 of ethanol.

Dissociation Constant. pK_a 8.4 (22°).

Gas Chromatography. *System GA*—RI 1419.

Ultraviolet Spectrum. Ethanol—257 nm ($A_1^1 = 1075$ a).

Mass Spectrum. Principal peaks at m/z 121, 152, 40, 93, 65, —, —.

Methyl Nicotinate

Topical Vasodilator

Proprietary Names. It is an ingredient of Algipan, Cremalgex, and Cremalgin.

$C_7H_7NO_2 = 137.1$

CAS—93-60-7

White crystals or crystalline powder; it darkens to a reddish colour on storage. M.p. 40° to 42°.

Soluble 1 in 0.7 of water and ethanol, 1 in 0.4 of chloroform, and 1 in 1 of ether.

Dissociation Constant. pK_a 3.1 (22°).

Thin-layer Chromatography. *System TA*—Rf 61; *system TB*—Rf 37; *system TC*—Rf 66.

Gas Chromatography. *System GA*—RI 1100.

Ultraviolet Spectrum. Water—264 nm ($A_1^1 = 230$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1282, 1718, 1111, 741, 1022, 703 (KBr disk).

Mass Spectrum. Principal peaks at m/z 78, 106, 51, 137, 50, 136, 107, 79.

Use. Topically in a concentration of 1%.

Methyl Salicylate

Analgesic

Synonym. Wintergreen Oil

Methyl 2-hydroxybenzoate

$C_8H_8O_3 = 152.1$

CAS—119-36-8

A colourless or pale yellow liquid. Relative density 1.182 to 1.187. B.p. about 221°, with some decomposition. Refractive index 1.535 to 1.538.

Very slightly **soluble** in water; miscible with ethanol (90%) and with most organic solvents.

Gas Chromatography. *System GA*—methyl salicylate RI 1193, salicylic acid RI 1308.

High Pressure Liquid Chromatography. *System HD*—methyl salicylate k' 3.9, salicylic acid k' 0.7.

Ultraviolet Spectrum. Ethanol—238 nm ($A_1^1 = 581$ a), 306 nm ($A_1^1 = 280$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1680, 705, 1310, 1220, 760, 1255 (thin film).

Mass Spectrum. Principal peaks at m/z 120, 92, 152, 121, 65, 64, 93, 63; salicylic acid 120, 92, 138, 64, 39, 63, 121, 65.

Disposition in the Body. Poorly absorbed through intact skin; absorbed after oral ingestion. It is incompletely hydrolysed to salicylic acid.

Toxicity. Methyl salicylate is more toxic than salicylic acid. Deaths have occurred in children after ingestion of as little as 4 ml and doses of 30 ml are usually fatal in adults.

In a fatality due to the ingestion of about 120 ml of methyl salicylate, postmortem salicylic acid concentrations were, blood 615 µg/ml and liver 455 µg/g (J. Ryall, *Bull. int. Ass. forens. Toxicol.*, 1974, 10(1), 10).

Use. Topically in liniments and ointments or in undiluted form.

Methylamphetamine

Central Stimulant

Synonyms. *d*-Deoxyephedrine; Desoxyephedrine; Methamphetamine; Phenylmethaminopropane.

(+)-*N*, α -Dimethylphenethylamine

$C_{10}H_{15}N = 149.2$

CAS—537-46-2

A clear, colourless, slowly volatile, mobile liquid. Wt per ml 0.921 to 0.922 g. B.p. about 214°.

Slightly **soluble** in water; miscible with ethanol, chloroform, and ether.

Methylamphetamine Hydrochloride

Proprietary Names. Desoxyn; Methampex; Pervitin.

$C_{10}H_{15}N \cdot HCl = 185.7$

CAS—51-57-0

White crystals or crystalline powder. M.p. 172° to 174°.

Soluble 1 in 2 of water, 1 in 4 of ethanol, and 1 in 5 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 10.1.

Colour Test. Marquis Test—orange.

Thin-layer Chromatography. *System TA*—Rf 31; *system TB*—Rf 28; *system TC*—Rf 13. (*Dragendorff spray*, positive; *acidified iodoplatinate solution*, positive; *Marquis reagent*, brown; *ninhydrin spray*, positive; *acidified potassium permanganate solution*, positive.)

Gas Chromatography. *System GA*—methylamphetamine RI 1176, amphetamine RI 1123; *system GB*—methylamphetamine RI 1200, amphetamine RI 1134; *system GC*—methylamphetamine RI 1722, amphetamine RI 1536; *system GF*—methylamphetamine RI 1335, amphetamine RI 1315.

High Pressure Liquid Chromatography. *System HA*—methylamphetamine k' 2.0, amphetamine k' 0.9; *system HB*—methylamphetamine k' 10.52, amphetamine k' 8.48; *system HC*—methylamphetamine k' 2.07, amphetamine k' 0.98.

Ultraviolet Spectrum. Aqueous acid—252 nm, 257 nm ($A_1^1 = 12.1$ a), 263 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 747, 698, 1060, 1491, 1590, 1085 (methylamphetamine hydrochloride, KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 58, 91, 59, 134, 65, 56, 42, 57; amphetamine 44, 91, 40, 42, 65, 45, 39, 43.

Quantification. GAS CHROMATOGRAPHY. In urine: methylamphetamine and amphetamine, detection limit 10 ng/ml, ECD—M. Terada *et al.*, *J. Chromat.*, 1982, 237, 285–292.

RADIOIMMUNOASSAY. In urine: sensitivity 1 ng—S. Inayama *et al.*, *Chem. pharm. Bull.*, 1980, 28, 2779–2782.

Disposition in the Body. Readily absorbed after oral administration. About 70% of a dose is excreted in the urine in 24 hours. Under normal conditions, up to 43% of a dose is excreted as

unchanged drug, up to 15% as 4-hydroxymethylamphetamine, and about 5% as amphetamine, the major active metabolite. A number of other metabolites have been identified. Excretion of unchanged drug is dependent on the urinary pH, being increased in acidic urine and greatly reduced (to about 2% of a dose) if the urine is alkaline.

Methylamphetamine is a metabolite of benzphetamine and selegiline.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.01 to 0.05 µg/ml.

Following a single oral dose of 12.5 mg of methylamphetamine hydrochloride to 10 subjects, a mean peak blood concentration of about 0.02 µg/ml was attained in about 2 hours (R. C. Driscoll *et al.*, *J. pharm. Sci.*, 1971, 60, 1492-1495).

TOXICITY. The estimated minimum lethal dose is 1 g, but fatalities attributed to methylamphetamine are rare.

The following postmortem tissue concentrations, µg/ml or µg/g, were reported in a 25-year-old female found dead after the intravenous abuse of methylamphetamine followed by ingestion of about 1.5 g:

	Methylamphetamine	Amphetamine
Blood	43	0.35
Brain	101.8	0.86
Kidney	75.5	0.72
Liver	174.6	1.30
Urine	277.5	10.0

(T. Kojima *et al.*, *Forens. Sci. Int.*, 1984, 24, 87-93).

In 3 fatalities caused by the intravenous self-administration of methylamphetamine, the following postmortem tissue concentrations, µg/ml or µg/g, were reported:

	Methylamphetamine	Amphetamine
Blood	0, 0.1, 0.6	0.1, 0, 0.5
Brain	0.2, 0.3, 0.8	0.2, 0, 0.8
Kidney	1.0, -, 0.2	0.8, -, 0.2
Liver	0.6, 0.7, 0.4	0.2, 0, 0.3
Urine	1.0, -, -	4.0, -, -

(R. H. Cravey and D. Reed, *J. forens. Sci. Soc.*, 1970, 10, 109-112).

HALF-LIFE. Plasma half-life, about 9 hours.

Dose. 2.5 to 25 mg of methylamphetamine hydrochloride daily, by mouth; 15 to 20 mg intramuscularly, or 10 to 15 mg intravenously.

Methylchlorophenoxyacetic Acid

Herbicide

Synonym. MCPA

4-Chloro-2-methylphenoxyacetic acid

$C_9H_9ClO_3$ = 200.6

CAS—4841-22-9

A white crystalline solid. M.p. pure compound, 118° to 119°; technical product, 100° to 115°.

Very slightly **soluble** in water; soluble 1 in 160 of ethanol and 1 in 80 of ether.

Colour Test. Liebermann's Test—black.

Thin-layer Chromatography. System TD—Rf 09; system TE—Rf 05; system TF—Rf 11.

Gas Chromatography. Methylchlorophenoxyacetic acid methyl ester: system GK—retention time 0.54 relative to caffeine.

Ultraviolet Spectrum. Methanol—280 nm (A_1^1 = 80 a), 287 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1247, 1198, 1748, 1499, 1143, 806 (Nujol mull).

Mass Spectrum. Principal peaks at m/z 141, 214, 125, 155, 46, 77, 89, 143 (methylchlorophenoxyacetic acid methyl ester).

Methyldopa

Antihypertensive

Synonyms. Alpha-methyldopa; Methyldopum Hydratum; Metildopa.

Proprietary Names. Aldomet (tablets); Dopamet; Medimet-250; Medomet; Novomedopa; Presinol; Sembrina. It is an ingredient of Aldoclor, Aldoril, and Hydromet.

(-)-3-(3,4-Dihydroxyphenyl)-2-methyl-L-alanine sesquihydrate $C_{10}H_{13}NO_4 \cdot 1\frac{1}{2}H_2O$ = 238.2

CAS—555-30-6 (anhydrous); 41372-08-1 (sesquihydrate)

Colourless crystals or a white to yellowish-white, fine powder. M.p. about 310°.

Soluble 1 in 100 of water, 1 in 400 of ethanol, and 1 in 0.5 of dilute hydrochloric acid; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 2.2 (—COOH), 9.2 (—OH), 10.6 (—NH₂), 12.0 (—OH), (25°).

Colour Tests. Ammoniacal Silver Nitrate—red-brown/black; Ferric Chloride—green; Folin-Ciocalteu Reagent—blue; Mandelin's Test—orange; Marquis Test—yellow→violet; Methanolic Potassium Hydroxide—yellow→orange; Nessler's Reagent—black; Potassium Dichromate (Method 1)—green→brown (30s).

Thin-layer Chromatography. System TA—Rf 49; system TB—Rf 01; system TC—Rf 01. (Mercuric chloride-diphenylcarbazone reagent, white-blue; acidified potassium permanganate solution, positive; Van Urk reagent, violet.)

Ultraviolet Spectrum. Aqueous acid—279 nm ($A_1^1 = 130$ a); aqueous alkali—302 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1600, 1288, 1261, 1530, 1123, 1219 (KBr disk).

Mass Spectrum. Principal peaks at m/z 88, 42, 123, 124, 89, 77, 51, 44.

Quantification. SPECTROFLUORIMETRY. In plasma or urine: sensitivity 100 ng/ml—B. K. Kim and R. T. Koda, *J. pharm. Sci.*, 1977, 66, 1632–1634.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or breast milk: electrochemical detection—J. A. Hoskins and S. B. Holliday, *J. Chromat.*, 1982, 230; *Biomed. Appl.*, 19, 162–167. In urine: sensitivity 5 μg/ml, electrochemical detection—G. M. Kochak and W. D. Mason, *Analyt. Lett. (Part B)*, 1981, 14, 439–449.

Disposition in the Body. Poorly absorbed after oral administration. It is mainly excreted as unchanged drug and as the mono-*O*-sulphate conjugate. After oral dosage, about 40% of the dose is excreted in the urine in 48 hours, of which about 40% is the conjugate. A considerable amount of unchanged drug is eliminated in the faeces. After intravenous administration, the amount of conjugate excreted is much less than after oral dosage; a total of 52 to 82% of an intravenous dose is excreted in the urine in 36 hours, only about 2% of which is the conjugate. Other metabolites and their conjugates which have been identified in the urine in small amounts (each less than 5% of the dose) include 3-*O*-methyl- α -methyldopa, α -methyldopamine, 3-*O*-methyl- α -methyldopamine, and 3,4-dihydroxyphenylacetone. Methyldopa is a metabolite of methyldopate.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 1 to 5 μg/ml.

After a single oral dose of 750 mg administered to 12 subjects, mean peak plasma concentrations of 2.6 μg/ml of unchanged drug and 1.3 μg/ml of the conjugate were attained in 3 hours. An intravenous infusion of 250 mg given over 90 minutes to 12 subjects produced, at the end of the infusion period, a mean peak plasma concentration of 7.5 μg/ml; no conjugate was found in the plasma (K. C. Kwan *et al.*, *J. Pharmac. exp. Ther.*, 1976, 198, 264–277).

TOXICITY.

In a fatality involving the ingestion of methyldopa, postmortem blood and urine concentrations of 9 and 1400 μg/ml, respectively, were reported (V. Tamminen and A. Alha, *Bull. int. Ass. forens. Toxicol.*, 1970, 7(2), 2–3).

HALF-LIFE. Plasma half-life, about 2 hours; a longer terminal elimination half-life has also been reported.

VOLUME OF DISTRIBUTION. About 0.6 litre/kg.

CLEARANCE. Plasma clearance, about 3 ml/min/kg.

PROTEIN BINDING. In plasma, less than 20%.

NOTE. For a review of the pharmacokinetics of methyldopa see E. Myhre *et al.*, *Clin. Pharmacokinet.*, 1982, 7, 221–233.

Dose. The equivalent of 0.5 to 3 g of anhydrous methyldopa daily.

Methyldopate*Antihypertensive*

Ethyl 3-(3,4-dihydroxyphenyl)-2-methyl-L-alaninate

 $C_{12}H_{17}NO_4 = 239.3$

CAS—2544-09-4

**Methyldopate Hydrochloride***Proprietary Name.* Aldomet (injection) $C_{12}H_{17}NO_4 \cdot HCl = 275.7$

CAS—2508-79-4

A white crystalline powder.

Soluble 1 in 1 of water, 1 in 3 of ethanol, and 1 in 2 of methanol; slightly soluble in chloroform; practically insoluble in ether.

Colour Tests. Ammoniacal Silver Nitrate—orange-brown/orange-brown; Ferric Chloride—green; Folin-Ciocalteu Reagent—blue; Mandelin's Test—orange; Marquis Test—yellow → violet; Methanolic Potassium Hydroxide—blue → orange; Nessler's Reagent—black; Potassium Dichromate (Method 1)—green → brown (30s).

Thin-layer Chromatography. *System TA*—Rf 65. (*Acidified potassium permanganate solution*, positive.)

Ultraviolet Spectrum. Aqueous acid—280 nm ($A_1^1 = 115$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1527, 1726, 1516, 1290, 1240, 1215 (KBr disk).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or breast milk: electrochemical detection—J. A. Hoskins and S. B. Holliday, *J. Chromat.*, 1982, 230; *Biomed. Appl.*, 19, 162–167.

Disposition in the Body. Metabolised by de-esterification to methyldopa; a small amount of sulphate conjugation also occurs.

THERAPEUTIC CONCENTRATION.

After an intravenous dose of 250 mg to 5 subjects, peak plasma concentrations of 0.8 to 2.2 µg/ml (mean 1.6) of free and esterified methyldopa, and 1.0 to 2.2 µg/ml (mean 1.5) of conjugated methyldopa

were attained in about 1 hour (J. A. Saavedra *et al.*, *Eur. J. clin. Pharmac.*, 1975, 8, 381–386).

HALF-LIFE. Plasma half-life, about 4 hours.

VOLUME OF DISTRIBUTION. About 2 litres/kg.

Dose. Usually 250 to 500 mg of methyldopate hydrochloride, by intravenous infusion, every 6 hours.

Methylene Chloride*Solvent*

Dichloromethane

 $CH_2Cl_2 = 84.93$

CAS—75-09-2

A clear, colourless, volatile liquid. Wt per ml about 1.32 g. B.p. 39° to 41°.

Soluble 1 in 50 of water; miscible with ethanol and ether.

Gas Chromatography. *System GA*—RI 515; *system GI*—retention time 1.9 min.

Mass Spectrum. Principal peaks at m/z 49, 84, 86, 51, 47, 35, 88, 41.

Disposition in the Body.

TOXICITY. Methylene chloride is widely used in paint strippers and several non-fatal and fatal cases of accidental inhalation have been reported. The maximum permissible atmospheric concentration is 200 ppm and the temporary estimated acceptable daily intake is up to 500 µg/kg.

In a fatality involving the accidental inhalation of a paint stripper containing methylene chloride, the following postmortem tissue concentrations were reported: blood 510 µg/ml, brain 248 µg/g, liver 144 µg/g (J. Bonventre *et al.*, *J. analyt. Toxicol.*, 1977, 1, 158–160).

In a fatality following the intentional inhalation of a paint stripper containing methylene chloride, the following postmortem tissue concentrations were reported: blood 252 µg/ml, brain 125 µg/g, liver 130 µg/g, lungs 67 µg/g, urine 10 µg/ml (A. Franc, *Bull. Int. Ass. forens. Toxicol.*, 1983, 17(2), 22–25).

Methylenedioxyamphetamine*Hallucinogen**Synonym.* MDA α -Methyl-3,4-methylenedioxyphenethylamine $C_{10}H_{13}NO_2 = 179.2$

CAS—4764-17-4

A white powder.

Soluble in chloroform and dilute acetic acid.

Colour Tests. Liebermann's Test—black; Mandelin's Test—green→blue; Marquis Test—blue-black; Sulphuric Acid—violet.

Thin-layer Chromatography. System *TA*—Rf 39; system *TB*—Rf 17; system *TC*—Rf 12. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. System *GA*—RI 1472.

High Pressure Liquid Chromatography. System *HC*—*k'* 0.98.

Ultraviolet Spectrum. Aqueous acid—233 nm ($A_1^1 = 216$ b), 285 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1490, 1257, 1038, 1504, 799, 1188 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 44, 136, 51, 135, 77, 42, 78, 45.

Quantification. COLORIMETRY. In plasma or urine—M. M. DeMayo *et al.*, *J. forens. Sci.*, 1972, 17, 444–446.

GAS CHROMATOGRAPHY. In biological tissues: FID—G. Cimbura, *J. forens. Sci.*, 1972, 17, 329–333. In plasma or urine: sensitivity 125 ng/ml, FID—K. K. Midha *et al.*, *J. pharm. Sci.*, 1976, 65, 188–197.

Disposition in the Body.

TOXICITY. The estimated lethal dose is 0.5 g.

In 5 fatalities due to the ingestion of methylenedioxymphetamine, the following postmortem tissue concentrations were reported: blood 6 to 26 µg/ml (mean 14, 5 cases), bile 5 to 9 µg/ml (mean 6, 3 cases), liver 8 to 17 µg/g (mean 11, 3 cases), urine 46 to 160 µg/ml (mean 102, 3 cases) (G. Cimbura, *J. forens. Sci.*, 1972, 17, 329–333).

In a fatality in which death occurred shortly after the ingestion of methylenedioxymphetamine, the following postmortem concentrations were reported: blood 2.3 µg/ml, bile 7 µg/ml, liver 11 µg/g, urine 175 µg/ml (T. Lukabzewski, *Clin. Toxicol.*, 1979, 15, 405–409).

Methylephedrine

Sympathomimetic

Synonyms. *l*-Methylephedrine; *l*-*N*-Methylephedrine.

(–)-2-Dimethylamino-1-phenylpropan-1-ol

$C_{11}H_{17}NO = 179.3$

CAS—552-79-4

Soluble in chloroform and ether.

Methylephedrine Hydrochloride

Proprietary Name. It is an ingredient of Pholcomed (expectorant).

$C_{11}H_{17}NO \cdot HCl = 215.7$

CAS—38455-90-2

A white crystalline powder. M.p. 190° to 195°.

Freely **soluble** in water; soluble in ethanol; practically insoluble in ether.

Dissociation Constant. pK_a 9.3 (25°).

Thin-layer Chromatography. System *TA*—Rf 32. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System *GA*—methylephedrine RI 1400, ephedrine RI 1363; system *GB*—methylephedrine RI 1440, ephedrine RI 1386; system *GC*—methylephedrine RI 1480, ephedrine RI 1467.

High Pressure Liquid Chromatography. System *HA*—methylephedrine *k'* 2.3, ephedrine *k'* 1.0; system *HC*—methylephedrine *k'* 1.83, ephedrine *k'* 1.79.

Ultraviolet Spectrum. Aqueous acid—251 nm, 257 nm ($A_1^1 = 11$ a), 263 nm. (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 742, 1039, 702, 1052, 990, 1162 (KBr disk). (See below)

Mass Spectrum. Principal peaks at *m/z* 58, 72, 30, 77, 56, 44, 42, 73; ephedrine 58, 146, 56, 105, 77, 42, 106, 40.

Disposition in the Body. Absorbed after oral administration. About 32% of a dose is excreted in the urine unchanged and 8% is excreted as the demethylated metabolite, ephedrine; the rate of excretion is dependent on the urinary pH.

Dose. Methylephedrine hydrochloride has been given in doses of 160 to 200 mg daily.

Methylergometrine

Uterine Stimulant

Synonyms. Methylergobasine; Methylergonovine.
N-[(*S*)-1-(Hydroxymethyl)propyl]-*D*-lysergamide
 $C_{20}H_{25}N_3O_2 = 339.4$
CAS—113-42-8

Crystals. M.p. 172°, with decomposition.
 Slightly **soluble** in water; very soluble in ethanol.

Methylergometrine Maleate

Proprietary Name. Methergin(e)

$C_{20}H_{25}N_3O_2 \cdot C_4H_4O_4 = 455.5$

CAS—57432-61-8

A white or pinkish-tan, crystalline powder, which darkens on exposure to light. M.p. 185° to 195°, with decomposition.

Soluble 1 in 200 of water and 1 in 140 of ethanol giving a blue fluorescence; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 6.7 (24°).

Colour Tests. Mandelin's Test—violet-brown; Marquis Test—grey-brown.

Thin-layer Chromatography. *System TA*—Rf 62; *system TB*—Rf 00; *system TC*—Rf 14; *system TL*—Rf 12; *system TM*—Rf 31. (*Van Urk reagent*, blue.)

Gas Chromatography. *System GA*—not eluted.

High Pressure Liquid Chromatography. *System HA*— k' 0.4; *system HP*— k' 0.83.

Ultraviolet Spectrum. Aqueous acid—313 nm ($A_1^{1\%} = 255$ a); aqueous alkali—310 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1580, 1490, 1650, 1620, 1065, 1103 (KBr disk).

Mass Spectrum. Principal peaks at m/z 339, 221, 196, 181, 207, 223, 222, 72.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or serum: methylergometrine and ergotamine, detection limit 100 pg/ml, fluorescence detection—P. O. Edlund, *J. Chromat.*, 1981, 226; *Biomed. Appl.*, 15, 107–115.

Disposition in the Body. Rapidly absorbed after oral administration. About 2 to 3% of a dose is excreted in the urine as unchanged drug in 24 hours.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 0.25 mg to 6 subjects, peak plasma concentrations of about 0.003 $\mu\text{g/ml}$ were attained in 0.5 hour (R. Mantyla *et al.*, *Int. J. clin. Pharmac. Biopharm.*, 1978, 16, 254–257).

HALF-LIFE. Plasma half-life, about 2 hours.

VOLUME OF DISTRIBUTION. About 0.5 litre/kg.

Infra-red Spectrum. Principal peaks at wavenumbers 917, 1126, 1156, 995, 1030, 1050 (thin film).

PROTEIN BINDING. In plasma, about 35%.

Dose. 0.375 to 1 mg of methylergometrine maleate daily, for up to 7 days.

Methylpentynol

Hypnotic/Sedative

Synonyms. Meparfynol; Methylparafynol.

Proprietary Name. Allotropal

3-Methylpent-1-yn-3-ol

$C_6H_{10}O = 98.14$

CAS—77-75-8

A colourless or pale yellow liquid. Wt per ml 0.865 to 0.873 g.

B.p. about 120°. Refractive index, at 20°, 1.430 to 1.432.

Soluble 1 in 10 of water; miscible with organic solvents.

Methylpentynol Carbamate

Synonym. Mepentamate

Proprietary Name. N-Oblivon

$C_7H_{11}NO_2 = 141.2$

CAS—302-66-9

A white powder. M.p. 53° to 56°.

Soluble 1 in less than 200 of water, 1 in 1 of ethanol, and 1 in 2 of chloroform.

Thin-layer Chromatography. Methylpentynol carbamate: *system TD*—Rf 49; *system TE*—Rf 74; *system TF*—Rf 62. (Furfuraldehyde reagent, positive; acidified potassium permanganate solution, positive.)

Gas Chromatography. *System GA*—RI 715; *system GI*—retention time 20.1 min.

Mass Spectrum. Principal peaks at m/z 69, 83, 43, 79, 41, 81, 53, 80 (methylpentynol carbamate).

Quantification. GAS CHROMATOGRAPHY. In serum (methylpentynol) or urine (4-hydroxymethylpentynol): FID—J. Grove and B. K. Martin, *J. Chromat.*, 1977, 133, 267–272.

Disposition in the Body. Absorbed after oral administration. It is almost completely metabolised with less than 1% being excreted in the urine as unchanged drug in 7 days; higher amounts of unchanged drug may be excreted after large doses. The major metabolite is the *N*-glucuronide which accounts for about 80% of the dose; the 4-hydroxy metabolite accounts for about 13% of a dose.

TOXICITY. A fatality has been reported after a dose of 5 g although recoveries have occurred after ingestion of up to 10 g. Repeated medication may cause toxic reactions in the liver and skin.

A liver concentration of 1100 µg/g and a urine concentration of 410 µg/ml were reported in one fatal poisoning case (J. V. Jackson, 1967—personal communication).

Dose. 0.5 to 1 g daily.

Methylphenidate

Central Stimulant

Synonyms. Methyl Phenidate; Methyl Phenidylacetate.

Methyl α -phenyl- α -(2-piperidyl)acetate

$C_{14}H_{19}NO_2 = 233.3$

CAS—113-45-1

Crystals. M.p. 74° to 75°.

Practically **insoluble** in water; soluble in ethanol and ether.

Methylphenidate Hydrochloride

Proprietary Names. Methidate; Ritalin.

$C_{14}H_{19}NO_2 \cdot HCl = 269.8$

CAS—298-59-9

Fine, white, crystalline powder or acicular crystals.

Freely **soluble** in water and methanol; soluble in ethanol; slightly soluble in acetone and chloroform.

Dissociation Constant. pK_a 8.8.

Colour Test. Liebermann's Test—orange.

Thin-layer Chromatography. *System TA*—Rf 57; *system TB*—Rf 34; *system TC*—Rf 34. (*Dragendorff spray*, positive; *acidified iodoplatinate solution*, positive; *ninhydrin spray*, positive; *acidified potassium permanganate solution*, positive.)

Gas Chromatography. *System GA*—RI 1737; *system GC*—RI 2200; *system GF*—RI 1935.

High Pressure Liquid Chromatography. *System HA*— k' 1.7; *system HC*— k' 0.36.

Ultraviolet Spectrum. Aqueous acid—251 nm, 257 nm ($A_1^1 = 9.0$ a), 264 nm. No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1735, 1175, 1210, 1150, 705, 740 (methylphenidate hydrochloride, KCl disk).

Mass Spectrum. Principal peaks at m/z 84, 91, 85, 56, 55, 150, 41, 118 (no peaks above 150).

Quantification. **GAS CHROMATOGRAPHY.** In urine: sensitivity 30 ng/ml, AFID—R. Dugal *et al.*, *J. analyt. Toxicol.*, 1978, 2, 101–106. In urine: ritalinic acid, sensitivity about 1 µg/ml, FID—H. W. Allen and B. Sedgwick, *J. analyt. Toxicol.*, 1984, 8, 61–62.

GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In blood or urine: methylphenidate and ritalinic acid, sensitivity about 2 ng/ml and 60 ng/ml respectively—R. M. Milberg *et al.*, *Biomed. Mass Spectrom.*, 1975, 2, 2–8.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: methylphenidate and ritalinic acid, sensitivity 20 ng/ml, UV detection—S. J. Soldin *et al.*, *Clin. Chem.*, 1979, 25, 401–404.

Disposition in the Body. Readily absorbed after oral administration. About 80% of a dose is excreted in the urine in 24 hours, of which 60 to 80% is ritalinic acid and 5 to 12% is 6-oxo- α -phenylpiperidine-2-acetic acid; only a small amount is excreted as unchanged drug.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 20 mg to 2 subjects, peak plasma concentrations of 0.013 and 0.058 µg/ml were attained in 3 hours; ritalinic acid concentrations averaged 0.22 µg/ml at the same time (R. M. Milberg *et al.*, *Biomed. Mass Spectrom.*, 1975, 2, 2–8).

Following oral doses of 10 to 30 mg daily, administered to 4 hyperkinetic children, peak plasma concentrations of 0.008 to 0.023 µg/ml (mean 0.018) were reported (B. L. Hungund *et al.*, *Br. J. clin. Pharmacol.*, 1979, 8, 571–576).

TOXICITY. The estimated minimum lethal dose for adults is 2 g but few instances of serious toxicity due to overdosage have been reported. Abuse and dependence of the amphetamine type is not uncommon.

Urine concentrations of 0.8 to 40 µg/ml (mean 16) were reported in six arrested drivers who showed signs of drowsiness or hyperactivity (B. Schubert, *Acta chem. scand.*, 1970, 24, 433–438).

HALF-LIFE. Plasma half-life, about 2 hours, ritalinic acid about 8 hours.

PROTEIN BINDING. In plasma, about 15%.

Dose. Usually up to 60 mg of methylphenidate hydrochloride daily.

Methylphenobarbitone

Barbiturate

Synonyms. Enphenemalum; Mephobarbital; Phemitone.

Proprietary Names. Mebaral; Prominal.

5-Ethyl-1-methyl-5-phenylbarbituric acid

$C_{13}H_{14}N_2O_3 = 246.3$

CAS—115-38-8

Colourless crystals or white crystalline powder. M.p. 176° to 181°.

Practically **insoluble** in water; soluble 1 in 240 of ethanol, 1 in 40 of chloroform, and 1 in 200 of ether; soluble in solutions of ammonia, alkali hydroxides, and carbonates.

Dissociation Constant. pK_a 7.8 (20°).

Colour Tests. Koppanyi-Zwicker Test—violet; Liebermann's Test—red-orange; Mercurous Nitrate—black.

Thin-layer Chromatography. System TD—Rf 70; system TE—Rf 43; system TF—Rf 69; system TH—Rf 72. (Mercurous nitrate spray, black; Zwicker's reagent, faint pink.)

Gas Chromatography. System GA—methylphenobarbitone RI 1891, phenobarbitone RI 1957.

High Pressure Liquid Chromatography. System HG— k' 7.27; system HH— k' 3.84.

Ultraviolet Spectrum. Borax buffer 0.05M (pH 9.2)—244 nm ($A_1^1 = 355$ c); M sodium hydroxide (pH 13)—243 nm ($A_1^1 = 329$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1707, 1684, 1754, 720, 1298, 1050 (KBr disk).

Mass Spectrum. Principal peaks at m/z 218, 117, 118, 146, 103, 77, 91, 115; phenobarbitone 204, 117, 146, 161, 77, 103, 115, 118.

Quantification. See also under Amylobarbitone.

GAS CHROMATOGRAPHY. In plasma or serum: methylphenobarbitone and phenobarbitone, FID—W. D. Hooper *et al.*, *J. Chromat.*, 1975, 110, 206–209.

GAS CHROMATOGRAPHY-MASS SPECTROMETRY. In plasma: methylphenobarbitone and phenobarbitone, detection limit 20 ng/ml for both compounds—W. D. Hooper *et al.*, *J. Chromat.*, 1981, 223; *Biomed. Appl.*, 12, 426–431.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: methylphenobarbitone, phenobarbitone and other anticonvulsants, sensitivity 500 ng/ml, UV detection—P. M. Kabra *et al.*, *J. analyt. Toxicol.*, 1978, 2, 127–133. In urine: the metabolites phenobarbitone, *p*-hydroxyphenobarbitone and *p*-hydroxymethylphenobarbitone, detection limit 500 ng/ml for each compound, UV detection—H. E. Kunze *et al.*, *Ther. Drug Monit.*, 1981, 3, 45–49.

Disposition in the Body. Incompletely absorbed after oral administration; bioavailability about 70%. Metabolised by *N*-demethylation to the active metabolite, phenobarbitone, and by *p*-hydroxylation. Over a period of 10 days, less than 2% of a dose is excreted in the urine as unchanged drug, about 30 to 35% is excreted as *p*-hydroxymethylphenobarbitone both free and conjugated, and up to 10% may be excreted as phenobarbitone. Small amounts of *p*-hydroxyphenobarbitone, 5-ethyl-5-(4-hydroxy-3-methoxyphenyl)barbituric acid, and 5-ethyl-5-(4-hydroxy-3-methoxyphenyl)-1-methylbarbituric acid have also been detected in the urine.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 800 mg to 2 subjects, peak plasma concentrations of about 3 μ g/ml were attained in 3 to 6 hours; peak phenobarbitone plasma concentrations of 2 to 3 μ g/ml were attained in 4 to 6 days (W. D. Hooper *et al.*, *Ther. Drug Monit.*, 1981, 3, 39–44).

Following daily oral doses of 60 to 600 mg to 11 subjects, steady-state plasma concentrations of 0.2 to 1.7 µg/ml (mean 0.9) of methylphenobarbitone and 4 to 32 µg/ml (mean 15) of phenobarbitone were reported (H. J. Kupferberg and J. Longacre-Shaw, *Ther. Drug Monit.*, 1979, 1, 117-122).

TOXICITY. The estimated minimum lethal dose is 2 g.

HALF-LIFE. Plasma half-life, methylphenobarbitone about 50 to 60 hours, phenobarbitone about 100 hours.

VOLUME OF DISTRIBUTION. About 2 to 3 litres/kg.

CLEARANCE. Plasma clearance, about 0.5 ml/min/kg.

PROTEIN BINDING. In plasma, about 40 to 60%.

Dose. 90 to 600 mg daily.

Methylpiperidyl Benzilate

Hallucinogen

1-Methyl-3-piperidyl benzilate

$C_{20}H_{23}NO_3 = 325.4$

CAS—3321-80-0

A clear liquid.

Practically **insoluble** in water; soluble in chloroform and most organic solvents.

Methylpiperidyl Benzilate Hydrochloride

A white powder. M.p. 212° to 218°, with decomposition.

Soluble in water; practically insoluble in chloroform.

Colour Tests. Liebermann's Test—brown; Mandelin's Test—orange → brown → green; Marquis Test—orange → green → blue; Sulphuric Acid—orange.

Thin-layer Chromatography. *System TA*—Rf 60. (*Acidified iodoplatinate solution*, positive.)

Ultraviolet Spectrum. Aqueous acid—251 nm ($A_1^1 = 18$ b), 257 nm ($A_1^1 = 20$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1734, 1195, 965, 685, 1160, 720 (methylpiperidyl benzilate hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 97, 105, 77, 183, 84, 36, 42, 51.

Methylprednisolone

Corticosteroid

Synonym. 6 α -Methylprednisolone

Proprietary Names. Medrol; Medrone; Urbason.

11 β ,17 α ,21-Trihydroxy-6 α -methylpregna-1,4-diene-3,20-dione

$C_{22}H_{30}O_5 = 374.5$

CAS—83-43-2

A white crystalline powder. M.p. about 240° to 243°, with decomposition. A solution in dioxan is dextrorotatory. Practically **insoluble** in water; soluble 1 in 100 of dehydrated alcohol; slightly soluble in chloroform and ether; sparingly soluble in dioxan and methanol.

Methylprednisolone Acetate

Synonym. 6 α -Methylprednisolone 21-Acetate

Proprietary Names. Depo-Medrone; Medrone (cream).

$C_{24}H_{32}O_6 = 416.5$

CAS—53-36-1

A white crystalline powder. M.p. about 225°, with decomposition.

Practically **insoluble** in water; slightly soluble in ethanol; soluble 1 in 250 of chloroform and 1 in 1500 of ether; soluble in dioxan.

Methylprednisolone Hemisuccinate

Synonym. Methylprednisolone Hydrogen Succinate

$C_{26}H_{34}O_8 = 474.5$

CAS—2921-57-5

A white hygroscopic solid.

Very slightly **soluble** in water; freely soluble in ethanol; soluble in acetone.

Methylprednisolone Sodium Succinate

Synonym. Sodium 6 α -Methylprednisolone 21-Succinate

Proprietary Name. Solu-Medrone

$C_{26}H_{33}NaO_8 = 496.5$

CAS—2375-03-3

A white, hygroscopic, amorphous powder.

Soluble 1 in 1.5 of water and 1 in 12 of ethanol; practically insoluble in chloroform and ether.

Thin-layer Chromatography. *System TP*—Rf 23; *system TQ*—Rf 80; *system TR*—Rf 03; *system TS*—Rf 00.

High Pressure Liquid Chromatography. *System HT*— k' 7.5.

Ultraviolet Spectrum. Dehydrated alcohol—240 nm ($A_1^1 = 400$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1595, 1650, 1114, 914, 1313, 1248 (KBr disk).

Dose. Usually 4 to 48 mg daily.

Methyltestosterone

Androgen

Proprietary Names. Android; Glosso-Stérandryl; Metandren; Neohombreol M; Oreton Methyl; Testoviron (tablets); Testred; Virilon; Virormone-Oral. It is an ingredient of Menolet, Mixogen (tablets), Plex-Hormone (tablets), and Trimone Sublets.

17 β -Hydroxy-17 α -methylandroster-4-en-3-one

$C_{20}H_{30}O_2 = 302.5$

CAS—58-18-4

A white or slightly yellowish-white, slightly hygroscopic, crystalline powder. M.p. 162° to 168°. A solution in ethanol is dextrorotatory.

Practically **insoluble** in water; soluble 1 in 5 of ethanol; freely soluble in chloroform; slightly soluble in ether.

Thin-layer Chromatography. System TP—Rf 70; system TQ—Rf 16; system TR—Rf 91; system TS—Rf 71.

Gas Chromatography. System GA—RI 2643.

Ultraviolet Spectrum. Ethanol—241 nm ($A_1^1 = 540$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1660, 1160, 1239, 950, 1612, 1090 (KBr disk).

Mass Spectrum. Principal peaks at m/z 302, 124, 43, 91, 79, 121, 105, 122.

Quantification. SPECTROFLUORIMETRY. In plasma or serum: sensitivity 1 ng/ml—D. Alkalay *et al.*, *J. pharm. Sci.*, 1972, 61, 1746–1749.

Dose. 5 to 80 mg daily, by mouth; up to 200 mg daily has been given.

Methylthiouracil

Antithyroid Agent

Proprietary Name. Thyreostat

2,3-Dihydro-2-thioxo-6-methylpyrimidin-4(1H)-one

$C_5H_6N_2OS = 142.2$

CAS—56-04-2

A white crystalline powder. M.p. about 330°, with decomposition.

Soluble 1 in 2000 of water, 1 in 150 of boiling water, and 1 in 800 of ethanol; slightly soluble in chloroform and ether; freely soluble in solutions of ammonium hydroxide and sodium hydroxide.

Dissociation Constant. pK_a 8.2 (20°).

Ultraviolet Spectrum. Aqueous acid—276 nm ($A_1^1 = 1190$ b); aqueous alkali—256 nm ($A_1^1 = 850$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1645, 1170, 1564, 1198, 850, 1240.

Dose. Initially, 200 to 400 mg daily; maintenance, 50 to 150 mg daily.

5-Methyltryptamine

Hallucinogen

3-(2-Aminoethyl)-5-methylindole

$C_{11}H_{14}N_2 = 174.2$

CAS—1821-47-2

**5-Methyltryptamine Hydrochloride**

$C_{11}H_{14}N_2 \cdot HCl = 210.7$

CAS—1010-95-3

M.p. 289° to 292°.

Colour Tests. Mandelin's Test—green-orange; Marquis Test—orange → brown; Sulphuric Acid—yellow.

Thin-layer Chromatography. System TA—Rf 56. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 1795.

Infra-red Spectrum. Principal peaks at wavenumbers 800, 1515, 1612, 1587, 1234, 1315 (5-methyltryptamine hydrochloride).

 α -Methyltryptamine

Hallucinogen

3-(2-Aminopropyl)indole

$C_{11}H_{14}N_2 = 174.2$

CAS—299-26-3

A white crystalline powder. M.p. 98° to 108°.

Soluble in chloroform and dilute acetic acid.

Colour Tests. Mandelin's Test—green → orange; Marquis Test—orange → brown; Sulphuric Acid—yellow.

Thin-layer Chromatography. System TA—Rf 58. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 1740.

Ultraviolet Spectrum. Aqueous acid—279 nm, 288 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1215, 1170, 1050, 750, 1520, 790 (α -methyltryptamine esylate, KBr disk).

N-Methyltryptamine

Hallucinogen

3-(2-Methylaminoethyl)indole

$C_{11}H_{14}N_2 = 174.2$

CAS—61-49-4

Colour Tests. Marquis Test—orange; Sulphuric Acid—yellow.

Thin-layer Chromatography. System TA—Rf 18. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 1770.

Infra-red Spectrum. Principal peaks at wavenumbers 700, 1040, 762, 1025, 1605, 1200 (KBr disk).

Methypylone

Hypnotic

Synonym. Methypylon

Proprietary Name. Noludar

3,3-Diethyl-5-methylpiperidine-2,4-dione

$C_{10}H_{17}NO_2 = 183.2$

CAS—125-64-4

A white crystalline powder. M.p. 74° to 78°.

Soluble 1 in 14 of water, 1 in 0.7 of ethanol, 1 in 0.6 of chloroform, and 1 in 3.5 of ether.

Dissociation Constant. pK_a 12.0.

Thin-layer Chromatography. System TA—Rf 58; system TD—Rf 31; system TE—Rf 61; system TF—Rf 25. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 1529; system GF—RI 2090.

Infra-red Spectrum. Principal peaks at wavenumbers 1660, 1693, 1085, 1310, 750, 869 (KBr disk).

Mass Spectrum. Principal peaks at m/z 155, 140, 83, 98, 55, 41, 84, 69.

Quantification. GAS CHROMATOGRAPHY. In blood, plasma or urine: methyprylone and methylpersedon, sensitivity 1 µg/ml, FID—R. R. Bridges and M. A. Peat, *J. analyt. Toxicol.*, 1979, 3, 21–25.

GAS CHROMATOGRAPHY (CAPILLARY COLUMN). In blood, urine or tissues: methyprylone and metabolites, FID—M. Van Boven and I. Sunshine, *J. analyt. Toxicol.*, 1979, 3, 174–176.

Disposition in the Body. Absorbed after oral administration. The principal metabolites are 2,4-dioxo-3,3-diethyl-5-methyltetrahydropyridine (methylpersedon) which is active, 6-oxomethyprylone, 5-hydroxymethyprylone, and 5-carboxymethyprylone. About 60% of a dose is excreted in the urine in 24 hours as free and conjugated metabolites together with 3% of the dose as unchanged drug.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 10 to 20 µg/ml.

Following a single oral dose of 650 mg to 6 subjects, peak plasma concentrations averaging 10.2 µg/ml were attained in 2 hours (L. O. Randell *et al.*, *Archs int. Pharmacodyn. Thér.*, 1956, 106, 388–394).

TOXICITY. Prolonged use of methyprylone may lead to dependence of the barbiturate-alcohol type. Numerous cases of overdose have been reported but there have been few fatalities; death has occurred after the ingestion of 6 g but at least two recoveries following doses of 30 g have been reported. Plasma concentrations of 12 to 75 to 128 µg/ml have been associated with toxic effects and concentrations greater than 50 µg/ml may be lethal.

In one fatality attributed to methyprylone overdose, the following postmortem tissue concentrations, µg/ml or µg/g, were reported:

	Blood	Brain	Kidney	Liver	Spleen	Urine
Methyprylone	158	176	87	90	121	61
Methylpersedon	36	73	21	40	29	123
5-Hydroxymethyprylone	—	—	—	—	—	16
5-Carboxymethyprylone	2	—	10	7	16	80
6-Oxomethyprylone	16	18	9	8	3	68

(M. Van Boven and I. Sunshine, *J. analyt. Toxicol.*, 1979, 3, 174–176).

In 4 cases of fatal overdose, the following tissue disposition was reported: blood 53 to 66 µg/ml (mean 59), kidney 10 to 108 µg/g (mean 62), liver 62 to 260 µg/g (mean 118), urine 17 to 166 µg/ml (mean 86) (R. C. Baselt, *Disposition of Toxic Drugs and Chemicals in Man*, 2nd Edn, Davis, California, Biomedical Publications, 1982, pp. 527–529).

HALF-LIFE. Plasma half-life following a single oral dose, about 4 hours, increased to about 50 hours in acute intoxication.

Dose. 200 to 400 mg, as a hypnotic.

Methysergide

Migraine Prophylactic

N-[1-(Hydroxymethyl)propyl]-1-methyl-D-lysergamide

$C_{21}H_{27}N_3O_2 = 353.5$

CAS—361-37-5

Crystals. M.p. 194° to 196°.

Methysergide Maleate

Synonym. 1-Methyl-D-lysergic Acid Butanolamide Maleate

Proprietary Names. Deseril; Désernil; Sansert.

$C_{21}H_{27}N_3O_2 \cdot C_4H_4O_4 = 469.5$

CAS—129-49-7

A white to yellowish-white or reddish-white, crystalline powder.

Soluble 1 in 500 of water, 1 in 165 of ethanol, and 1 in 125 of methanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 6.6 (24°).

Colour Tests. *p*-Dimethylaminobenzaldehyde—violet; Mandelin's Test—brown; Marquis Test—grey.

Thin-layer Chromatography. System TA—Rf 65; system TB—Rf 01; system TC—Rf 21; system TL—Rf 12; system TM—Rf 33. (*Van Urk reagent*, blue.)

Gas Chromatography. System GA—RI 3089.

High Pressure Liquid Chromatography. System HA— k' 0.4; system HP— k' 2.33.

Ultraviolet Spectrum. Aqueous acid—230 nm, 322 nm ($A_1^1 = 223$ a); aqueous alkali—243 nm, 320 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1566, 1650, 863, 1615, 1190, 740 (methysergide maleate, KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 353, 210, 235, 336, 72, 54, 236, 195.

Dose. The equivalent of 2 to 6 mg of methysergide daily.

Metipranolol

Beta-adrenoceptor Blocking Agent

Synonyms. Methipranolol; Trimepranol.

Proprietary Name. Disorat

4-(2-Hydroxy-3-isopropylaminopropoxy)-2,3,6-trimethylphenyl acetate

$C_{17}H_{27}NO_4 = 309.4$

CAS—22664-55-7

A white crystalline powder. M.p. 105° to 109°. Practically **insoluble** in water; soluble in ethanol; sparingly soluble in ether.

Ultraviolet Spectrum. Aqueous acid—278 nm ($A_1^1 = 44$ b).

Disposition in the Body. Readily absorbed after oral administration and rapidly metabolised to the active metabolite, desacetyl-metipranolol. About 20% of a dose is excreted in the urine as unchanged drug.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 40 mg to 13 subjects, peak plasma concentrations of the desacetyl metabolite of 0.034 to 0.214 $\mu\text{g/ml}$ (mean 0.14) were attained in about 1 hour. Oral administration of 20 mg twice daily to 6 subjects, produced mean steady-state plasma concentrations (desacetyl derivative) of 0.06 to 0.08 $\mu\text{g/ml}$ determined on the 6th to 8th day; considerable intersubject variation was reported (O. Mayer, *Int. J. clin. Pharmac. Ther. Toxicol.*, 1980, 18, 113–120).

HALF-LIFE. Plasma half-life, desacetylmepipranolol about 2 to 4 hours but there is considerable intersubject variation.

Dose. Metipranolol has been given in doses of 10 to 120 mg daily.

Metoclopramide

Anti-emetic

4-Amino-5-chloro-*N*-(2-diethylaminoethyl)-2-methoxybenzamide

$C_{14}H_{22}ClN_3O_2 = 299.8$

CAS—364-62-5

A white crystalline powder. M.p. about 148°.

Practically **insoluble** in water; soluble 1 in 45 of ethanol and 1 in 15 of chloroform.

Metoclopramide Hydrochloride

Proprietary Names. Maxeran; Maxolon; Metamide; Metox; Mygdalon; Parmid; Paspertin; Primperan; Reglan. It is an ingredient of Migravess and Paramax.

$C_{14}H_{22}ClN_3O_2 \cdot HCl \cdot H_2O = 354.3$

CAS—7232-21-5 (anhydrous); 54143-57-6 (monohydrate)

A white crystalline powder. M.p. about 185°.

Soluble 1 in 0.7 of water, 1 in 3 of ethanol, and 1 in 55 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 9.0.

Colour Tests. Coniferyl Alcohol—orange; Liebermann's Test—yellow; Mandelin's Test—brown.

Thin-layer Chromatography. *System TA*—Rf 47; *system TB*—Rf 01; *system TC*—Rf 07. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 2630.

High Pressure Liquid Chromatography. *System HA*— k' 5.0.

Ultraviolet Spectrum. Aqueous acid—273 nm ($A_1^1 = 467$ b), 309 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1590, 1614, 1530, 1496, 1254, 1311 (metoclopramide hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 86, 99, 184, 58, 30, 87, 201, 186.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 5 ng/ml, ECD—L. M. Ross-Lee *et al.*, *J. Chromat.*, 1980, 183; *Biomed. Appl.*, 9, 175–184.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 10 ng/ml, UV detection—G. Bishop-Freudling and H. Vergin, *J. Chromat.*, 1983, 273; *Biomed. Appl.*, 24, 453–457. In serum, saliva or urine: sensitivity 4.5 ng/ml for serum and saliva, 900 ng/ml for urine, UV detection—J. Popović, *Ther. Drug Monit.*, 1984, 6, 77–82.

Disposition in the Body. Rapidly absorbed after oral administration. Up to about 60% of an oral dose undergoes first-pass metabolism but there is considerable intersubject variation. Up to about 80% of a dose is excreted in the urine in 24 hours with about 10 to 20% as unchanged drug, up to 50% as conjugated metoclopramide (mainly the *N*-4-sulphate), and a small amount as 2-(4-amino-5-chloro-2-methoxybenzamido)acetic acid.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 10 mg given to 6 subjects, peak plasma concentrations of 0.04 to 0.06 $\mu\text{g/ml}$ (mean 0.05) were attained in 0.5 to 2 hours; following intravenous administration of 10 mg to 6 subjects, plasma concentrations of 0.07 to 0.13 $\mu\text{g/ml}$ were reported after 5 minutes (L. M. Ross-Lee *et al.*, *Eur. J. clin. Pharmac.*, 1981, 20, 465–471).

TOXICITY. Ingestion by adults of up to 0.8 g without serious adverse effects has been reported.

HALF-LIFE. Plasma half-life, 3 to 6 hours, increased in renal impairment.

VOLUME OF DISTRIBUTION. About 3 litres/kg but there is considerable intersubject variation.

CLEARANCE. Plasma clearance, 7 to 17 ml/min/kg (mean 11).

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 0.93.

PROTEIN BINDING. In plasma, about 60 to 70%.

NOTE. For reviews of metoclopramide, see R. A. Harrington *et al.*, *Drugs*, 1983, 25, 451–494, and D. N. Bateman, *Clin. Pharmacokinet.*, 1983, 8, 523–529.

Dose. The equivalent of 30 mg of anhydrous metoclopramide hydrochloride daily.

Metocurine Iodide

Muscle Relaxant

Synonyms. Dimethyl Tubocurarine Iodide; Dimethyltubocurarine Iodide.

Note. The name dimethyltubocurarine iodide was based on the old empirical formula for Tubocurarine.

Proprietary Name. Metubine Iodide

(+)-6,6',7',12'-Tetramethoxy-2,2,2',2'-tetramethyltubocurarine di-iodide

$\text{C}_{40}\text{H}_{48}\text{I}_2\text{N}_2\text{O}_6 = 906.6$

CAS—5152-30-7 (metocurine); 7601-55-0 (iodide)

A white to pale yellow, crystalline powder. When heated to 257°, it decomposes with the evolution of gas.

Soluble 1 in 400 of water; very slightly soluble in ethanol; practically insoluble in chloroform and ether; slightly soluble in dilute acids and alkalis.

Colour Tests. Aromaticity (Method 2)—yellow/orange. Cold *nitric acid* gives a brown colour.

Ultraviolet Spectrum. Aqueous acid—280 nm ($A_1^1 = 74$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1510, 1220, 1265, 1280, 1125, 1240 (KBr disk).

Disposition in the Body. About 50% of a dose is excreted in the urine unchanged in 48 hours, and about 2% of the dose is excreted in the bile in the same period.

HALF-LIFE. Plasma half-life, about 3 to 4 hours.

VOLUME OF DISTRIBUTION. About 0.4 litre/kg.

CLEARANCE. Plasma clearance, about 1.3 ml/min/kg.

PROTEIN BINDING. In plasma, about 35%.

REFERENCE. D. K. F. Meijer *et al.*, *Anesthesiology*, 1979, 51, 402–407.

Dose. Initially, 1.5 to 8 mg intravenously.

Metolazone

Diuretic

Proprietary Names. Diulo; Metenix; Zaroxolyn.

7-Chloro-1,2,3,4-tetrahydro-2-methyl-4-oxo-3-*o*-tolylquinazoline-6-sulphonamide

$\text{C}_{16}\text{H}_{16}\text{ClN}_3\text{O}_3\text{S} = 365.8$

CAS—17560-51-9

Colourless crystals. It may occur in two polymorphic forms which melt at 227° and 270°.

Sparingly **soluble** in water; more soluble in alkalis and organic solvents.

Dissociation Constant. pK_a 9.7.

Colour Tests. Koppányi-Zwicker Test—violet; Liebermann's Test—orange → green-brown; Methanolic Potassium Hydroxide—yellow; Sulphuric Acid—yellow.

Thin-layer Chromatography. System TD—Rf 23; system TE—Rf 57; system TF—Rf 51.

High Pressure Liquid Chromatography. System HN— k' 4.89.

Ultraviolet Spectrum. Aqueous acid—237 nm ($A_1^1 = 1470$ b), 271 nm, 344 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1610, 1660, 1165, 1145, 962, 1012.

Mass Spectrum. Principal peaks at m/z 350, 91, 259, 352, 348, 65, 351, 107.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: detection limit 2 ng/ml, UV detection—R. R. Brodie *et al.*, *J. Chromat.*, 1981, 226; *Biomed. Appl.*, 15, 526–532. In plasma or urine: detection limit 1 ng/ml in plasma and 5 ng/ml in urine, fluorescence detection—C. W. Vose *et al.*, *J. Chromat.*, 1981, 222; *Biomed. Appl.*, 11, 311–315.

Disposition in the Body. Incompletely but fairly readily absorbed after oral administration. About 80% of a dose is excreted in the urine as unchanged drug in 48 hours; about 10% is excreted in the bile.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 2.5 mg given to 3 subjects, a mean peak plasma concentration of about 0.01 μg/ml was attained in 5 hours (W. J. Tilstone *et al.*, *Clin. Pharmac. Ther.*, 1974, 16, 322–329).

HALF-LIFE. Plasma half-life, about 18 hours.

VOLUME OF DISTRIBUTION. About 1.6 litres/kg.

CLEARANCE. Plasma clearance, about 1.4 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 0.84.

PROTEIN BINDING. In plasma, 95%.

REFERENCE. W. J. Tilstone *et al.*, *ibid.*

Dose. Usually 2.5 to 10 mg daily; maximum of 80 mg daily.

Metomidate

Sedative (Veterinary)

Methyl 1-(α -methylbenzyl)imidazole-5-carboxylate

$C_{13}H_{14}N_2O_2 = 230.3$

CAS—5377-20-8

Metomidate Hydrochloride

Proprietary Name. Hypnodil

$C_{13}H_{14}N_2O_2 \cdot HCl = 266.7$

CAS—35944-74-2

An off-white crystalline powder. M.p. about 172°.

Very **soluble** in water.

Colour Test. Liebermann's Test—red-orange.

Thin-layer Chromatography. System TA—Rf 73. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Water—240 nm ($A_1^1 = 408$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1730, 1230, 725, 770, 1288, 1200 (metomidate hydrochloride, KBr disk).

Metopimazine

Anti-emetic

Proprietary Name. Vogalene

1-[3-(2-Methylsulphonylphenothiazin-10-yl)propyl]piperidine-4-carboxamide

$C_{22}H_{27}N_3O_3S_2 = 445.6$

CAS—14008-44-7

A white crystalline powder. M.p. 170° to 171°.

Soluble in chloroform and dilute acetic acid.

Colour Tests. Formaldehyde-Sulphuric Acid—red; Forrest Reagent—brown; FPN Reagent—orange; Mandelin's Test—green; Marquis Test—red; Sulphuric Acid—red.

Thin-layer Chromatography. System TA—Rf 56; system TB—Rf 00; system TC—Rf 11. (Acidified iodoplatinate solution, positive.)

High Pressure Liquid Chromatography. System HA— k' 1.4.

Ultraviolet Spectrum. Aqueous acid—264 nm ($A_1^1 = 922$ b), 310 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1150, 1310, 750, 1665, 1102, 1248 (KBr disk).

Mass Spectrum. Principal peaks at m/z 141, 445, 169, 123, 155, 96, 42, 317.

Dose. 5 to 15 mg daily.

Metoprolol

Beta-adrenoceptor Blocking Agent

(±)-1-Isopropylamino-3-[4-(2-methoxyethyl)phenoxy]propan-2-ol

$C_{15}H_{25}NO_3 = 267.4$

CAS—37350-58-6

Metoprolol Tartrate

Proprietary Names. Beloc; Betaloc; Lopresor; Lopresor; Seloken. It is an ingredient of Co-Betaloc and Lopresoretic.

$(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_6 = 684.8$

CAS—56392-17-7

A white crystalline powder. M.p. about 120°.

Very **soluble** in water; soluble in ethanol and chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 9.7.

Colour Tests. Liebermann's Test—pink-brown; Mandelin's Test—pink-brown; Marquis Test—pink.

Thin-layer Chromatography. System TA—Rf 49; system TB—Rf 08; system TC—Rf 08.

Gas Chromatography. System GA—RI 2010.

High Pressure Liquid Chromatography. System HA— k' 1.3.

Ultraviolet Spectrum. Aqueous acid—274 nm ($A_1^1 = 52$ a), 280 nm (inflexion).

Infra-red Spectrum. Principal peaks at wavenumbers 1510, 1245, 1108, 1028, 1175, 810 (KBr disk).

Mass Spectrum. Principal peaks at m/z 72, 30, 107, 56, 45, 41, 44, 43.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: sensitivity 3 ng/ml, ECD—C. D. Kinney, *J. Chromat.*, 1981, 225; *Biomed. Appl.*, 14, 213–218. In plasma or urine: metoprolol metabolites, sensitivity 6 ng/ml, ECD—C. P. Quartermann *et al.*, *J. Chromat.*, 1980, 183; *Biomed. Appl.*, 9, 92–98.

GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In plasma or urine: metoprolol and metabolites, sensitivity 300 pg/ml—M. Ervik *et al.*, *Biomed. Mass Spectrom.*, 1981, 8, 322–326.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 3 ng/ml for metoprolol and 12.5 ng/ml for α -hydroxymetoprolol, fluorescence detection—D. B. Pautler and W. J. Jusko, *J. Chromat.*, 1982, 228; *Biomed. Appl.*, 17, 215–222.

Disposition in the Body. Well absorbed after oral administration; bioavailability about 50% due to extensive first-pass metabolism. About 95% of a dose is excreted in the urine within 48 hours, with about 65% of the dose as the inactive metabolite, 4-(2-hydroxy-3-isopropylaminopropoxy)phenylacetic acid, and about 10% as a further inactive metabolite, 2-hydroxy-3-[4-(2-methoxyethyl)phenoxy]propionic acid. Two active metabolites, α -hydroxymetoprolol and *O*-desmethylmetoprolol are also excreted in the urine in amounts equivalent to about 10% and less than 1% of the dose, respectively. Up to about 10% of a dose is excreted as unchanged drug.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 100 mg, given to 6 subjects, peak plasma concentrations of 0.03 to 0.28 $\mu\text{g/ml}$ (mean 0.13) were attained in about 2.5 hours (W. Kirch *et al.*, *Biopharm. Drug Disp.*, 1983, 4, 73–81).

Following a single oral dose of 100 mg to 8 subjects, a mean peak plasma concentration of metoprolol of 0.12 $\mu\text{g/ml}$ was attained in 2 to 3 hours; the α -hydroxy metabolite reached a mean peak of 0.07 $\mu\text{g/ml}$ in about 3 hours. After repeated administration of 100 mg every 12 hours, the mean peak plasma concentrations on the 8th day were 0.19 $\mu\text{g/ml}$ for metoprolol and 0.07 $\mu\text{g/ml}$ for the α -hydroxy metabolite. The concentration of the metabolite appears to be increased in elderly subjects (C. P. Quartermann *et al.*, *Br. J. clin. Pharmacol.*, 1981, 11, 287–294).

TOXICITY.

In a fatality due to metoprolol, the following postmortem tissue concentrations were reported: blood 4.7 $\mu\text{g/ml}$, bile 254 $\mu\text{g/ml}$, kidney 7.1 $\mu\text{g/g}$, liver 6.3 $\mu\text{g/g}$, urine 194 $\mu\text{g/ml}$ (M. Stajić *et al.*, *J. analyt. Toxicol.*, 1984, 8, 228–230).

In a fatality due to metoprolol and salicylate, the following postmortem tissue concentrations were reported: blood, metoprolol 56 $\mu\text{g/ml}$, salicylate 220 $\mu\text{g/ml}$; bile, metoprolol 276 $\mu\text{g/ml}$; liver, metoprolol 230 $\mu\text{g/g}$ (M. Holzbecher *et al.*, *J. forens. Sci. Soc.*, 1982, 27, 715–717).

HALF-LIFE. Plasma half-life, metoprolol 2 to 7 hours (mean 3), α -hydroxymetoprolol 4 to 12 hours (mean 6).

VOLUME OF DISTRIBUTION. About 4 litres/kg.

CLEARANCE. Plasma clearance, about 13 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 0.77.

PROTEIN BINDING. In plasma, about 12%.

NOTE. For a review of the clinical pharmacokinetics of metoprolol see C.-G. Regardh and G. Johnsson, *Clin. Pharmacokinet.*, 1980, 5, 557–569.

Dose. 100 to 400 mg of metoprolol tartrate daily.

Metronidazole

Antiprotozoal/Antibacterial

Proprietary Names. Elyzol; Flagyl; Metrolyl; Metryl; Neo-Tric; Nidazol; Novonidazol; Sātric; Trichozole; Triakide; Vaginyll; Zadstat. It is an ingredient of Entamizole.

2-(2-Methyl-5-nitroimidazol-1-yl)ethanol

$\text{C}_6\text{H}_9\text{N}_3\text{O}_3 = 171.2$

CAS—443-48-1

A white to pale yellow crystalline powder or crystals. It darkens on exposure to light. M.p. 159° to 163°.

Soluble 1 in 100 of water, 1 in 200 of ethanol, and 1 in 250 of chloroform; slightly soluble in ether.

Dissociation Constant. pK_a 2.5.

Partition Coefficient. Log P (octanol/pH 7.4), -0.1 .

Colour Test. Methanolic Potassium Hydroxide—red.

Thin-layer Chromatography. System TA—Rf 58; system TB—Rf 02; system TC—Rf 36. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 1592.

Ultraviolet Spectrum. Aqueous acid—277 nm ($A_1^1 = 377$ a); aqueous alkali—319 nm ($A_1^1 = 520$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1187, 1535, 1070, 1265, 745, 1160 (KBr disk).

Mass Spectrum. Principal peaks at m/z 81, 124, 54, 53, 125, 171, 45, 42.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma, serum, saliva, whole blood or urine: metronidazole and metabolites, UV detection—C. M. Kaye *et al.*, *Br. J. clin. Pharmacol.*, 1980, 9, 528–529. In plasma: sensitivity 25 ng/ml, UV detection—R. A. Gibson *et al.*, *Clin. Chem.*, 1984, 30, 784–787.

Disposition in the Body. Readily and almost completely absorbed after oral administration and widely distributed in the body. Metabolised by oxidation to 2-hydroxymethylmetronidazole and 2-methyl-5-nitroimidazol-1-acetic acid, and by conjugation with

glucuronic acid. About 70 to 80% of a dose is excreted in the urine in 48 hours with less than 10% of the dose as unchanged drug, up to 10% as conjugated metronidazole, about 27% as 2-hydroxymethylmetronidazole, 10% as the conjugated 2-hydroxy methyl metabolite, and 20% as the acid metabolite.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 400 mg to 7 subjects, peak plasma concentrations of 4.5 to 11.6 μg/ml (mean 6.9) were attained in about 2 hours; a mean peak plasma concentration of 1.6 μg/ml of 2-hydroxymethylmetronidazole was attained in about 8 hours (J. C. Jensen and R. Gugler, *Clin. Pharmac. Ther.*, 1983, 34, 481-487).

HALF-LIFE. Plasma half-life, about 8 hours.

VOLUME OF DISTRIBUTION. About 0.5 to 1 litre/kg.

CLEARANCE. Plasma clearance, about 1 ml/min/kg.

PROTEIN BINDING. In plasma, less than 20%.

NOTE. For a review of the pharmacokinetics of metronidazole see E. D. Ralph, *Clin. Pharmacokinet.*, 1983, 8, 43-62.

Dose. Up to 2.4 g daily for 10 days.

Metyrapone

Diagnostic Agent (Pituitary Function)

Synonym. Methopyrapone

Proprietary Name. Metopiron(e)

2-Methyl-1,2-di(3-pyridyl)propan-1-one

C₁₄H₁₄N₂O = 226.3

CAS—54-36-4

A white to light amber, fine, crystalline powder which darkens on exposure to light. M.p. 50° to 53°.

Soluble 1 in 100 of water, 1 in 3 of ethanol and chloroform; soluble in methanol.

Colour Test. Cyanogen Bromide—orange.

Thin-layer Chromatography. System *TA*—Rf 58; system *TB*—Rf 16; system *TC*—Rf 58. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System *GA*—RI 1860.

Ultraviolet Spectrum. Aqueous acid—260 nm ($A_1^1 = 500$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1672, 1578, 1255, 714, 699, 970 (KBr disk).

Mass Spectrum. Principal peaks at m/z 120, 106, 78, 92, 51, 226, 41, 39.

Quantification. COLORIMETRY. In plasma or tissues: sensitivity 5 μg/ml for metyrapone, 2 μg/ml for 1-hydroxymetyrapone—S. Szeberenyi *et al.*, *J. Chromat.*, 1969, 40, 417-421.

SPECTROFLUORIMETRY. In plasma—A. W. Meikle *et al.*, *J. Lab. clin. Med.*, 1969, 74, 515–520.

GAS CHROMATOGRAPHY. In urine: metyrapone and 1-hydroxymetyrapone, FID—D. M. Hannah and J. G. Sprunt, *J. Pharm. Pharmac.*, 1969, 21, 877–878.

Disposition in the Body. Metabolised by reduction to the 1-hydroxy derivative which is active. Excreted in the urine mainly as the glucuronide conjugates of 1-hydroxymetyrapone and metyrapone. About 50% of a dose is excreted in the urine in 3 days.

Dose. Up to 4.5 g daily.

Mevinphos

Pesticide

Proprietary Name. Phosdrin

2-Methoxycarbonyl-1-methylvinyl dimethyl phosphate

$C_7H_{13}O_6P = 224.1$

CAS—7786-34-7

The technical product is a pale yellow to orange liquid.

Miscible with water, ethanol, acetone, carbon tetrachloride, and chloroform.

Colour Test. Phosphorus Test—yellow.

Thin-layer Chromatography. System TW—Rf 23.

Gas Chromatography. System GA—RI 1450; system GK—retention time 0.50 relative to caffeine.

Mass Spectrum. Principal peaks at m/z 127, 192, 109, 67, 43, 193, 39, 79.

Quantification. GAS CHROMATOGRAPHY. In postmortem tissues and fluids: AFID—J. F. Lewin and J. L. Love, *Forens. Sci.*, 1974, 4, 253–255.

Disposition in the Body.

TOXICITY. Mevinphos is extremely toxic by inhalation, ingestion, or percutaneous absorption and the estimated lethal dose is less than 500 mg. The maximum permissible atmospheric concentration is 0.1 mg/m^3 .

The following postmortem tissue concentrations were reported in a fatality due to the ingestion of mevinphos: blood 360 $\mu\text{g/ml}$, brain 3 $\mu\text{g/g}$, kidney 20 $\mu\text{g/g}$, liver 240 $\mu\text{g/g}$, skeletal muscle 86 $\mu\text{g/g}$, urine 8 $\mu\text{g/ml}$; alcohol was detected in blood and urine at concentrations of 1250 $\mu\text{g/ml}$ and 1550 $\mu\text{g/ml}$, respectively; death occurred within 45 minutes of ingestion (J. F. Lewin and J. L. Love, *ibid.*).

A 66-year-old man died about 1 minute after ingesting 28 g of mevinphos (R. Lokan and R. James, *Forens. Sci. Int.*, 1983, 22, 179–182).

Mexenone

Sunscreen Agent

Synonym. Benzophenone-10

Proprietary Names. Uvicone; Uvistat.

2-Hydroxy-4-methoxy-4'-methylbenzophenone

$C_{15}H_{14}O_3 = 242.3$

CAS—1641-17-4

A pale yellow crystalline powder. M.p. 99° to 102° .

Practically **insoluble** in water; soluble 1 in 70 of ethanol and 1 in 7 of acetone.

Ultraviolet Spectrum. Methanol—243 nm ($A_1^1 = 353 \text{ b}$), 287 nm ($A_1^1 = 640 \text{ a}$), 325 nm ($A_1^1 = 440 \text{ b}$).

Infra-red Spectrum. Principal peaks at wavenumbers 1260, 1598, 1637, 1211, 1613, 920 (KBr disk).

Use. Topically in a concentration of 4% in a cream or a solid basis.

Mexiletine

Anti-arrhythmic

1-Methyl-2-(2,6-xylyloxy)ethylamine

$C_{11}H_{17}NO = 179.3$

CAS—31828-71-4

Mexiletine Hydrochloride

Proprietary Name. Mexitil

$C_{11}H_{17}NO \cdot HCl = 215.7$

CAS—5370-01-4

A white crystalline powder. M.p. 198° to 204° .

Soluble 1 in 2 of water, 1 in 3 of ethanol, and 1 in 30 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 9.0.

Colour Tests. Liebermann's Test—brown; Mandelin's Test—brown-orange; Marquis Test—red.

Thin-layer Chromatography. System TA—Rf 40; system TB—Rf 04; system TC—Rf 04.

Gas Chromatography. System GA—RI 1340.

High Pressure Liquid Chromatography. System HA— k' 1.2.

Ultraviolet Spectrum. Aqueous acid—260 nm ($A_1^1 = 14 \text{ a}$).

Infra-red Spectrum. Principal peaks at wavenumbers 1200, 1040, 770, 760, 1595, 1090 (mexiletine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 58, 44, 41, 83, 77, 69, 85, 43.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: sensitivity 50 ng/ml, FID—K. Chan *et al.*, *J. Pharm. Pharmac.*, 1980, 32, *Suppl.*, 98P. In plasma: detection limits 20 ng/ml for mexiletine and 7 ng/ml for the 2'-hydroxymethyl metabolite; ECD—A. Pachecus *et al.*, *Arzneimittel-Forsch.*, 1982, 32, 688–693. In blood or plasma: sensitivity 5 ng/ml, AFID—K. J. Smith and P. J. Meffin, *J. Chromat.*, 1980, 181; *Biomed. Appl.*, 7, 469–472.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma, urine or cerebrospinal fluid: detection limit 10 ng/ml, UV detection—H. Breithaupt and M. Wilfling, *J. Chromat.*, 1982, 230; *Biomed. Appl.*, 19, 97–105.

Disposition in the Body. Readily absorbed after oral administration; bioavailability 80 to 90%. It is extensively metabolised; the major metabolites are the 4'-hydroxy and 2'-hydroxymethyl derivatives, which may be further metabolised by deamination to the corresponding alcohols. The rate and extent of renal excretion is dependent on the urinary pH. Under normal conditions, up to about 20% of a dose may be excreted in the urine as unchanged drug in 24 hours, but this may be increased to about 50% if the urinary pH is maintained at about 5.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.5 to 2 µg/ml.

Following a single oral dose of 400 mg to 6 subjects, peak plasma concentrations of 0.65 to 0.94 µg/ml (mean 0.77) were attained in about 2 hours (V. Häselbarth *et al.*, *Clin. Pharmac. Ther.*, 1981, 29, 729–736).

Following daily oral doses of 450 mg to 10 subjects, steady-state plasma concentrations of 0.75 to 2.18 µg/ml (mean 1.6) were reported (K. Ohashi *et al.*, *Arzneimittel-Forsch.*, 1984, 34, 503–507).

TOXICITY. Serious toxic effects are usually associated with plasma concentrations of about 2 µg/ml or more, although toxicity may occur throughout the therapeutic range.

In a fatality due to the ingestion of 4.4 g, a postmortem blood concentration of about 35 µg/ml was reported (P. Jequier *et al.*, *Lancet*, 1976, 1, 429).

In a fatality due to a mexiletine overdose, postmortem blood and liver concentrations of 44.3 µg/ml and 636 µg/g, respectively, were reported (R. C. Blackmore and M. D. Ossleton, *Bull. int. Ass. forens. Toxicol.*, 1983, 16(3), 7–8).

HALF-LIFE. There is considerable intersubject variation and the plasma half-life appears to vary with the urinary pH; it is usually in the range 7 to 25 hours (mean 11 hours in normal subjects, increased in subjects with arrhythmias).

VOLUME OF DISTRIBUTION. About 8 litres/kg but there is considerable intersubject variation.

CLEARANCE. Plasma clearance, about 7 ml/min/kg with considerable intersubject variation.

PROTEIN BINDING. In plasma, about 70%.

NOTE. For a review of mexiletine see C. Y. C. Chew *et al.*, *Drugs*, 1979, 17, 161–181, and B. G. Wulf, *Clin. Pharm.*, 1983, 2, 340–346.

Dose. 0.6 to 1 g of mexiletine hydrochloride daily.

Mianserin

Antidepressant

1,2,3,4,10,14b-Hexahydro-2-methyldibenzo[*c,f*]-pyrazino[1,2-*a*]azepine

$C_{18}H_{20}N_2 = 264.4$

CAS—24219-97-4

Mianserin Hydrochloride

Proprietary Names. Bolvidon; Norval; Tolvon.

Note. The name Norval was formerly applied to a preparation containing docusate sodium.

$C_{18}H_{20}N_2 \cdot HCl = 300.8$

CAS—21535-47-7

White crystals or crystalline powder. M.p. 282° to 284°.

Soluble 1 in 50 of water, 1 in 100 of ethanol, and 1 in 20 of chloroform.

Colour Tests. Liebermann's Test—violet; Mandelin's Test—violet.

Thin-layer Chromatography. System TA—Rf 58; system TB—Rf 39; system TC—Rf 58. (Acidified iodoplatinate solution, blue; Mandelin's reagent, violet.)

Gas Chromatography. System GA—RI 2211; system GF—RI 2595.

High Pressure Liquid Chromatography. System HA—mianserin k' 1.8, N-desmethylnianserin k' 2.4.

Ultraviolet Spectrum. Aqueous acid—279 nm ($A_1^1 = 75$ a). (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 787, 772, 1138, 1254, 1314, 742 (mianserin hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 193, 264, 43, 72, 71, 220, 192, 194; *N*-desmethybmianserin 193, 208, 194, 250, 178, 192, 29, 179.

Quantification. GAS CHROMATOGRAPHY. In plasma: detection limit 1 ng/ml, AFID—G. F. Lachâtre *et al.*, *Ther. Drug Monit.*, 1982, 4, 359–364.

GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In plasma: sensitivity 5 ng/ml—S. P. Jindal *et al.*, *J. analyt. Toxicol.*, 1982, 6, 34–37.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 5 ng/ml, electrochemical detection—R. F. Suckow *et al.*, *J. pharm. Sci.*, 1982, 71, 889–893.

Disposition in the Body. Readily absorbed after oral administration. The major metabolites are *N*-desmethybmianserin and 8-hydroxymianserin, which are both active, and mianserin *N*-oxide. About 30 to 40% of a dose is excreted in the urine in 24

hours, and a total of about 70% is excreted over a period of several days, mainly as conjugated metabolites. About 5% of a dose is excreted in the urine unchanged.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.015 to 0.07 µg/ml. *N*-Desmethybmianserin is detectable in plasma at concentrations about one-third of those of mianserin. Following a single oral dose of 60 mg given to 8 subjects, peak plasma concentrations of 0.05 to 0.14 µg/ml (mean 0.10) and peak blood concentrations of 0.04 to 0.09 µg/ml (mean 0.06) were attained in about 3 hours (K. P. Maguire *et al.*, *Eur. J. clin. Pharmacol.*, 1982, 21, 517–520). Following oral doses of 20 mg three times a day to 10 subjects, minimum steady-state plasma concentrations of 0.03 to 0.09 µg/ml (mean 0.06) were reported (G. F. Lachâtre *et al.*, *Ther. Drug Monit.*, 1982, 4, 359–364).

TOXICITY. Overdosage does not appear to cause the complications associated with overdose of tricyclic antidepressants. Toxic effects have been associated with plasma concentrations greater than 0.5 µg/ml.

Plasma concentrations of 0.11 µg/ml of mianserin and 0.5 µg/ml of lorazepam were reported on admission to hospital in a comatose subject who had ingested 600 mg of mianserin plus an unknown amount of lorazepam; the patient died the following day (P. Crome and B. Newman, *Br. med. J.*, 1977, 2, 260).

HALF-LIFE. Plasma half-life, 6 to 39 hours (mean 16), increased in elderly subjects.

VOLUME OF DISTRIBUTION. About 13 litres/kg.

PROTEIN BINDING. In plasma, about 90%.

NOTE. For a review of mianserin see R. Brogden *et al.*, *Drugs*, 1978, 16, 273–301.

Dose. 30 to 90 mg of mianserin hydrochloride daily; maximum of 200 mg daily.

Miconazole

Antifungal

Proprietary Name. Daktarin

1-[2,4-Dichloro-β-(2,4-dichlorobenzyloxy)phenethyl]imidazole

$C_{18}H_{14}Cl_4N_2O = 416.1$

CAS—22916-47-8

A white crystalline powder.

Very slightly **soluble** in water; very soluble in chloroform; soluble in most other organic solvents.

Miconazole Nitrate

Proprietary Names. Albistat; Daktarin (cream); Dermonistat; Gyno-Daktarin; Micatin; Monistat.

$C_{18}H_{14}Cl_4N_2O \cdot HNO_3 = 479.1$

CAS—22832-87-7

A white crystalline powder. M.p. about 182°.

Very slightly **soluble** in water and ether; soluble 1 in 140 of ethanol; slightly soluble in chloroform.

Dissociation Constant. pK_a 6.7.

Thin-layer Chromatography. System TA—Rf 73; system TB—Rf 11; system TC—Rf 67. (Dragendorff spray.)

Gas Chromatography. System GA—RI 2980.

Ultraviolet Spectrum. Methanol—264 nm, 272 nm ($A_1^1 = 17$ a), 280 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1085, 1319, 827, 1302, 1038, 812 (miconazole nitrate, KBr disk).

Mass Spectrum. Principal peaks at m/z 159, 161, 81, 335, 333, 163, 337, 205.

Quantification. GAS CHROMATOGRAPHY (CAPILLARY COLUMN). In serum: sensitivity 1 ng/ml, ECD—P. T. Männistö *et al.*, *Antimicrob. Ag. Chemother.*, 1982, 21, 730–733.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In saliva: sensitivity 500 ng/ml, UV detection—A. Turner and D. W. Warnock, *J. Chromat.*, 1982, 227; *Biomed. Appl.*, 16, 229–232.

BIOASSAY. In serum—A. Espinel-Ingroff *et al.*, *Antimicrob. Ag. Chemother.*, 1977, 11, 365–368.

Disposition in the Body. Incompletely absorbed after oral administration and poorly absorbed after topical administration. Metabolised by oxidation to 2,4-dichloromandelic acid and 2-(2,4-dichlorobenzyloxy)-2-(2,4-dichlorophenyl)acetic acid which are both inactive. About 10 to 20% of an oral or

intravenous dose is excreted in the urine in 6 days, with only about 1% of the dose as unchanged drug. About 50% of an oral dose is eliminated in the faeces, mostly unchanged.

THERAPEUTIC CONCENTRATION.

Following an intravenous infusion of 522 mg to 4 subjects, plasma concentrations of 2.0 to 9.1 $\mu\text{g/ml}$ (mean 6.2) were reported at the end of the infusion (P. J. Lewi *et al.*, *Eur. J. clin. Pharmac.*, 1976, 10, 49–54).

HALF-LIFE. Plasma half-life, about 24 hours.

VOLUME OF DISTRIBUTION. About 20 litres/kg.

PROTEIN BINDING. In plasma, about 92%.

NOTE. For a review of the pharmacokinetics of systemic antifungal drugs see T. K. Daneshmend and D. W. Warnock, *Clin. Pharmacokinet.*, 1983, 8, 17–42.

Dose. 0.6 to 3.6 g daily by intravenous infusion; 1 g daily by mouth.

Midazolam

Hypnotic

Proprietary Name. Hypnovel (as the hydrochloride)

8 - Chloro - 6 - (2 - fluorophenyl) - 1 - methyl - 4H - imidazo[1,5 - a][1,4]benzodiazepine

$C_{18}H_{13}ClFN_3 = 325.8$

CAS—59467-70-8

Colourless crystals. M.p. 158° to 160°.

Soluble in water.

Dissociation Constant. pK_a 6.2.

High Pressure Liquid Chromatography. System HI— k' 9.75; system HJ— k' 2.10; system HK— k' 5.90.

Infra-red Spectrum. Principal peaks at wavenumbers 1608, 820, 767, 1310, 1210, 995 (KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 310, 312, 311, 163, 325, 75, 39, 297.

Quantification. GAS CHROMATOGRAPHY. In plasma: limit of detection 500 pg/ml, ECD—M. T. Smith *et al.*, *Eur. J. clin. Pharmac.*, 1981, 19, 271–278.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: midazolam and 1-hydroxymethylmidazolam, sensitivity 15 ng/ml, UV detection—J. Vasiliades and T. H. Sahawneh, *J. Chromat.*, 1981, 225; *Biomed. Appl.*, 14, 266–271.

POLAROGRAPHY. In urine: 1-hydroxymethylmidazolam, sensitivity 50 ng/ml—C. V. Puglisi *et al.*, *J. Chromat.*, 1978, 145; *Biomed. Appl.*, 2, 81–96.

NOTE. For a comparison of various chromatographic methods see J. Vasiliades and T. H. Sahawneh, *J. Chromat.*, 1982, 228; *Biomed. Appl.*, 17, 195–203.

Disposition in the Body. Rapidly absorbed after oral administration; bioavailability 30 to 70%. Metabolised by hydroxylation to 1-hydroxymethylmidazolam (which is active), 4-hydroxymida-

zolam, and 4-hydroxy-1-hydroxymethylmidazolam; the hydroxy metabolites are then conjugated with glucuronic acid. Up to 90% of a dose is excreted in the urine in 24 hours as the conjugated metabolites, mainly as conjugated 1-hydroxymethylmidazolam (60 to 80% of a dose). Less than 1% of a dose is excreted in the urine as unchanged drug.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 20 mg to 6 subjects, peak plasma concentrations of 0.13 to 0.37 μg/ml (mean 0.26) of midazolam and 0.07 to 0.25 μg/ml (mean 0.14) of 1-hydroxymethylmidazolam were attained in 0.25 to 0.5 hour (P. Heizmann *et al.*, *Br. J. clin. Pharmacol.*, 1983, 16, *Suppl.*, 43S-49S).

HALF-LIFE. Plasma half-life, about 2 hours, increased in elderly subjects.

VOLUME OF DISTRIBUTION. 0.5 to 2 litres/kg.

CLEARANCE. Plasma clearance, 3 to 8 ml/min/kg (mean 5).

PROTEIN BINDING. In plasma, about 95%.

Dose. The equivalent of 70 μg/kg of midazolam by slow intravenous injection; usual dose range 2.5 to 7.5 mg.

Minocycline

Antibiotic

6-Desmethyl-6-deoxy-7-dimethylaminotetracycline

$C_{23}H_{27}N_3O_7 = 457.5$

CAS—10118-90-8

A bright yellow-orange amorphous solid.

Minocycline Hydrochloride

Proprietary Names. Klinomycin; Minocin; Minomycin; Mynocine; Ultramycin; Vectrin.

$C_{23}H_{27}N_3O_7 \cdot HCl = 493.9$

CAS—13614-98-7

A yellow crystalline powder.

Soluble in water and in solutions of alkali hydroxides and carbonates; slightly soluble in ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 2.8, 5.0, 7.8, 9.5.

Colour Test. Sulphuric Acid—yellow.

Ultraviolet Spectrum. Aqueous acid—265 nm ($A_1^1 = 400$ b), 354 nm; aqueous alkali—243 nm ($A_1^1 = 414$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1600, 1645, 1525, 1225, 1310, 1050 (minocycline hydrochloride, KBr disk).

Dose. The equivalent of 100 to 200 mg of minocycline daily.

Minoxidil

Antihypertensive

Proprietary Name. Loniten

2,6-Diamino-4-piperidinopyrimidine 1-oxide

$C_9H_{15}N_5O = 209.3$

CAS—38304-91-5

A white crystalline solid. M.p. about 225°, with decomposition.

Soluble 1 in about 500 of water; readily soluble in ethanol and propylene glycol; practically insoluble in chloroform.

Thin-layer Chromatography. System TA—Rf 51; system TB—Rf 00; system TC—Rf 03.

Ultraviolet Spectrum. Aqueous acid—230 nm, 281 nm ($A_1^1 = 547$ b); aqueous alkali—262 nm, 288 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1640, 1610, 1550, 1231, 1210, 758 (KBr disk).

Mass Spectrum. Principal peaks at m/z 84, 209, 67, 43, 110, 41, 192, 164.

Quantification. RADIOIMMUNOASSAY. In serum: limit of detection 3 ng/ml—M. E. Royer *et al.*, *J. pharm. Sci.*, 1977, 66, 1266–1269.

Disposition in the Body. Readily absorbed after oral administration. More than 80% of a dose is excreted in the urine in 24 hours, mainly as glucuronide conjugates with less than 10% as unchanged drug; about 3% of a dose is eliminated in the faeces.

THERAPEUTIC CONCENTRATION.

Following daily oral administration of 27 to 30 mg to 6 subjects, serum concentrations of 0.04 to 0.25 $\mu\text{g/ml}$ (mean 0.10) were reported 1 to 2 hours after a dose (D. T. Lowenthal *et al.*, *J. clin. Pharmac.*, 1978, 18, 500–508).

HALF-LIFE. Plasma half-life, about 3 to 4 hours.

PROTEIN BINDING. In plasma, not significantly bound.

NOTE. For a review of minoxidil see V. M. Campese, *Drugs*, 1981, 22, 257–278.

Dose. 5 to 50 mg daily; up to 100 mg daily has been given.

Molindone

Tranquilliser

3-Ethyl-6,7-dihydro-2-methyl-5-(morpholinomethyl)indol-4(5H)-one

$\text{C}_{16}\text{H}_{24}\text{N}_2\text{O}_2 = 276.4$

CAS—7416-34-4

Crystals. M.p. 180° to 181°.

Molindone Hydrochloride

Proprietary Names. Lidone; Moban.

$\text{C}_{16}\text{H}_{24}\text{N}_2\text{O}_2 \cdot \text{HCl} = 312.8$

CAS—15622-65-8

A white crystalline powder.

Freely soluble in water and ethanol.

Dissociation Constant. pK_a 6.9 (25°).

Gas Chromatography. System GA—RI 2465.

Ultraviolet Spectrum. Aqueous acid—255 nm ($A_1^1 = 41$ b), 299 nm.

Mass Spectrum. Principal peaks at m/z 100, 56, 42, 176, 98, 120, 70, 189.

Disposition in the Body. Readily absorbed after oral administration; peak plasma concentrations of unchanged drug are attained in 1 to 2 hours. It is extensively metabolised and excreted in the urine and faeces almost entirely as metabolites.

Dose. 15 to 225 mg of molindone hydrochloride daily.

6-Monoacetylmorphine

6-O-Acetylmorphine

$\text{C}_{19}\text{H}_{21}\text{NO}_4 = 327.4$

CAS—2784-73-8

6-Monoacetylmorphine HydrochlorideC₁₉H₂₁NO₄·HCl = 363.8

CAS—36418-22-1

Crystals.

Soluble in water.

Colour Test. Marquis Test—violet.**Thin-layer Chromatography.** System TA—Rf 46; system TB—Rf 06; system TC—Rf 19. (Acidified iodoplatinate solution, positive.)**Gas Chromatography.** System GA—RI 2537.**High Pressure Liquid Chromatography.** System HA—k' 3.6 (tailing peak); system HC—k' 0.80; system HS—k' 1.00.**Ultraviolet Spectrum.** Aqueous acid—287 nm (A₁¹ = 45 b).**Infra-red Spectrum.** Principal peaks at wavenumbers 1238, 1730, 1213, 1050, 1030, 1131 (KBr disk).**Mass Spectrum.** Principal peaks at *m/z* 327, 268, 46, 43, 215, 44, 328, 269.**Disposition in the Body.** 6-Monoacetylmorphine is the first hydrolysis product of diamorphine. It is further metabolised to morphine.**Monocrotaline**

Alkaloid

Synonym. CrotalineC₁₆H₂₃NO₆ = 325.4

CAS—315-22-0

An alkaloid obtained from *Crotalaria spectabilis* and other species of *Crotalaria* (Leguminosae).

A white crystalline powder. M.p. 197° to 198°, with decomposition.

Soluble 1 in 80 of water; soluble in chloroform and dilute acetic acid.**Colour Test.** Mandelin's Test—green.**Thin-layer Chromatography.** System TA—Rf 36. (Acidified iodoplatinate solution, positive.)**Infra-red Spectrum.** Principal peaks at wavenumbers 1736, 1064, 1110, 1183, 1242, 1174 (KBr disk).**Monosulfiram**

Parasiticide

Synonym. Sulfiram*Proprietary Name.* Tetmosol

Tetraethylthiuram monosulphide

C₁₀H₂₀N₂S₃ = 264.5

CAS—95-05-6

A yellow or yellowish-brown, soft crystalline powder. M.p. 28.5° to 32°.

Practically **insoluble** in water; soluble 1 in 3 of ethanol; freely soluble in chloroform, ether, and most other organic solvents.**Colour Test.** Sodium Nitroprusside (Method 3)—violet.**Thin-layer Chromatography.** System TA—Rf 75. (Acidified iodoplatinate solution, positive.)**Ultraviolet Spectrum.** Methanol—281 nm (A₁¹ = 650 a).**Infra-red Spectrum.** Principal peaks at wavenumbers 1270, 1490, 1198, 1142, 968, 915 (KBr disk).**Use.** As a 25% alcoholic solution, diluted with 2 or 3 parts of water immediately before use.

Morantel*Anthelmintic (Veterinary)*

(*E*)-1,4,5,6-Tetrahydro-1-methyl-2-[2-(3-methyl-2-thienyl)vinyl]pyrimidine
 $C_{12}H_{16}N_2S = 220.3$
 CAS—20574-50-9

Crystals. M.p. 239° to 241°.

Morantel Tartrate

$C_{12}H_{16}N_2S \cdot C_4H_6O_6 = 370.4$
 CAS—26155-31-7

Pale yellow to greenish-yellow crystals. M.p. 167° to 170°.
 Readily soluble in water.

Colour Tests. Liebermann's Test—black; Mandelin's Test—violet; Marquis Test—blue-violet; Sulphuric Acid—violet-red.

Thin-layer Chromatography. System TA—Rf 60. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—not eluted.

Ultraviolet Spectrum. Methanol—322 nm ($A_1^1 = 864$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1626, 1577, 1319, 1305, 1148, 955 (KBr disk).

Morazone*Analgesic*

1,5-Dimethyl-4-(3-methyl-2-phenylmorpholinomethyl)-2-phenyl-4-pyrazolin-3-one
 $C_{23}H_{27}N_3O_2 = 377.5$
 CAS—6536-18-1

A white crystalline powder. M.p. 131° to 134°.

Very soluble in ethanol, acetone, chloroform, and methanol.

Morazone Hydrochloride

Proprietary Names. Rosimon-Neu. It is an ingredient of Delimon.

$C_{23}H_{27}N_3O_2 \cdot HCl = 413.9$

CAS—50321-35-2

Crystals. M.p. 171° to 172°, with decomposition.

Soluble in water.

Colour Test. Liebermann's Test—red-orange.

Thin-layer Chromatography. System TA—Rf 58; system TB—Rf 08; system TC—Rf 46. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 1718.

High Pressure Liquid Chromatography. System HA— k' 0.7; system HD— k' 0.4; system HW— k' 2.05.

Ultraviolet Spectrum. Aqueous acid—258 nm ($A_1^1 = 212$ a); aqueous alkali—244 nm, 263 nm ($A_1^1 = 201$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 754, 1656, 700, 1492, 1590, 1117 (thin film).

Mass Spectrum. Principal peaks at m/z 201, 176, 202, 56, 258, 70, 71, 42.

Dose. Morazone hydrochloride has been given in doses of 75 to 150 mg.

Morinamide*Antituberculous Agent*

Synonym. Morphazinamide

N-Morpholinomethylpyrazine-2-carboxamide

$C_{10}H_{14}N_4O_2 = 222.2$

CAS—952-54-5

Crystals. M.p. 118° to 120°.

Soluble 1 in 3 of water, 1 in 30 of ethanol, and 1 in 2.5 of chloroform.

Morinamide Hydrochloride

Proprietary Name. Piazofoina

$C_{10}H_{14}N_4O_2 \cdot HCl = 258.7$

CAS—1473-73-0

A white crystalline powder. M.p. 196°.

Soluble 1 in 2 of water, 1 in 350 of ethanol, and 1 in 2000 of chloroform.

Thin-layer Chromatography. System TA—Rf 54; system TB—Rf 08; system TC—Rf 49. (Acidified iodoplatinate solution, weak reaction; acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 1906.

Ultraviolet Spectrum. Aqueous acid—269 nm ($A_1^1 = 340$ b), 314 nm. (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 1667, 1101, 1499, 1125, 1002, 1019 (KBr disk).

Mass Spectrum. Principal peaks at m/z 115, 86, 79, 57, 56, 107, 100, 52.

Dose. Morinamide has been given in doses of 3 g daily.

Morphine

Narcotic Analgesic

Synonym. Morphia

Proprietary Names. Duromorph; Nepenthe.

(4aR,5S,7aR,8R,9cS) - 4a,5,7a,8,9,9c - Hexahydro - 12 - methyl - 8,9c - iminoethanophenanthro[4,5 - bcd]furan - 3,5 - diol monohydrate

$C_{17}H_{19}NO_3 \cdot H_2O = 303.4$

CAS—57-27-2 (anhydrous); 6009-81-0 (monohydrate)

The principal alkaloid of opium. A white crystalline powder or colourless or white acicular crystals. M.p. 254° to 256°, with decomposition.

Soluble 1 in 5000 of water, 1 in 250 of ethanol, 1 in 1500 of chloroform, and 1 in 125 of glycerol; practically insoluble in ether.

Note. The solubility can vary according to the method of preparation and the crystalline state.

Morphine Acetate

$C_{17}H_{19}NO_3 \cdot C_2H_4O_2 \cdot 3H_2O = 399.4$

CAS—596-15-6 (anhydrous); 5974-11-8 (trihydrate)

A white amorphous or crystalline powder.

Soluble 1 in 2.5 of water, 1 in 100 of ethanol, and 1 in 5 of glycerol; practically insoluble in ether.

Morphine Hydrochloride

$C_{17}H_{19}NO_3 \cdot HCl \cdot 3H_2O = 375.8$

CAS—52-26-6 (anhydrous); 6055-06-7 (trihydrate)

Colourless silky crystals or crystalline powder, or cubical white masses. A solution in water is laevorotatory.

Soluble 1 in 24 of water, 1 in 100 of ethanol, and 1 in 10 of glycerol; practically insoluble in chloroform and ether.

Morphine Sulphate

Proprietary Name. MST-Continus

$(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O = 758.8$

CAS—64-31-3 (anhydrous); 6211-15-0 (pentahydrate)

White, acicular crystals, cubical masses, or crystalline powder. When exposed to air it gradually loses water of crystallisation. It darkens on prolonged exposure to light. M.p. 250°, with decomposition. A solution in water is laevorotatory.

Soluble 1 in 21 of water and 1 in 1000 of ethanol; practically insoluble in chloroform and ether.

Morphine Tartrate

Proprietary Name. It is an ingredient of Cyclimorph.

$(C_{17}H_{19}NO_3)_2 \cdot C_4H_6O_6 \cdot 3H_2O = 774.8$

CAS—302-31-8 (anhydrous); 6032-59-3 (trihydrate)

Minute, colourless, acicular, efflorescent crystals.

Soluble 1 in 10 of water and 1 in 1000 of ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 8.0, 9.9 (20°).

Partition Coefficient. Log P (octanol/pH 7.4), -0.1 .

Colour Tests. Ferric Chloride—blue; Liebermann's Test—black; Mandelin's Test—blue-grey; Marquis Test—violet.

Thin-layer Chromatography. *System TA*—Rf 37; *system TB*—Rf 00; *system TC*—Rf 09. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, violet.)

Gas Chromatography. *System GA*—morphine RI 2454, codeine RI 2376, norcodeine RI 2388; *system GC*—morphine RI 2542, codeine RI 2681.

High Pressure Liquid Chromatography. *System HA*—morphine k' 3.8 (tailing peak), codeine k' 4.8 (tailing peak), morphine *N*-oxide k' 3.2 (tailing peak), norcodeine k' 3.1 (tailing peak), normorphine k' 2.9 (tailing peak); *system HC*—morphine k' 1.30, codeine k' 1.21, morphine-3-glucuronide k' 1.56, norcodeine k' 3.51, normorphine k' 3.92; *system HS*— k' 5.16.

Ultraviolet Spectrum. Aqueous acid—285 nm ($A_1^1 = 52$ a); aqueous alkali—298 nm ($A_1^1 = 92$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 805, 1243, 1118, 945, 1086, 833 (KBr disk).

Mass Spectrum. Principal peaks at m/z 285, 162, 42, 215, 286, 124, 44, 284; codeine 299, 42, 162, 124, 229, 59, 300, 69; norcodeine 285, 81, 215, 148, 286, 164, 110, 115; normorphine 271, 81, 150, 201, 148, 110, 272, 82.

Quantification. GAS CHROMATOGRAPHY. In postmortem tissues: sensitivity 50 ng/ml in blood, 300 ng/g in kidney and liver, 500 ng/ml in urine, FID—G. R. Nakamura and E. L. Way, *Analyt. Chem.*, 1975, 47, 775–778. In whole blood: sensitivity 1 ng/ml, ECD—S. Felby, *Forens. Sci. Int.*, 1979, 13, 145–150. In raw opium and opium preparations—D. C. Garratt *et al.*, *Analyst, Lond.*, 1978, 103, 268–283.

GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In blood, urine or tissues: sensitivity 20 ng/ml—J. J. Saady *et al.*, *J. analyt. Toxicol.*, 1982, 6, 235–237.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or cerebrospinal fluid: sensitivity 1 ng/ml, electrochemical detection—R. D. Todd *et al.*, *J. Chromat.*, 1982, 232; *Biomed. Appl.*, 21, 101–110. In plasma or urine: morphine and morphine-3-

glucuronide, sensitivities 20 ng/ml and 200 ng/ml respectively, using ion-pair chromatography and UV detection—J. O. Svensson *et al.*, *J. Chromat.*, 1982, 230; *Biomed. Appl.*, 19, 427–432.

HIGH PRESSURE LIQUID CHROMATOGRAPHY–IMMUNOASSAY. In blood or urine—P. E. Nelson *et al.*, *J. forens. Sci. Soc.*, 1980, 20, 195–202.

RADIOIMMUNOASSAY. In serum: detection limit 100 pg—S. Spector, *J. Pharmac. exp. Ther.*, 1971, 178, 253–258. Comparison with GC—D. R. Stanski *et al.*, *J. pharm. Sci.*, 1982, 71, 314–317.

Disposition in the Body. Rapidly absorbed after subcutaneous, intravenous, or intramuscular administration. Absorption after oral administration is variable and there is considerable first-

pass metabolism; bioavailability about 20 to 30%. It is widely distributed, mainly in kidneys, liver, lungs, and spleen with lower concentrations in the brain and muscles, but does not accumulate in the tissues. The major metabolic reaction is conjugation to form morphine-3- and 6-glucuronides; other reactions include *N*-demethylation, *O*-methylation, and *N*-oxide formation. After a parenteral dose, up to 90% is excreted in the urine in 24 hours, including about 10% of the dose as free morphine, 65 to 70% as conjugated morphine, up to 10% as morphine-3-etheral sulphate, 1% as normorphine, and 3% as normorphine glucuronide. After an oral dose, about 60% is excreted in the urine in 24 hours, and about 3% of the dose is excreted as free morphine in 48 hours. The urinary excretion of morphine appears to be pH-dependent to some extent; as the urine becomes more acid, excretion of free morphine rises, and as the urine becomes more alkaline, excretion of the glucuronide conjugate rises. Up to about 10% of a dose may be excreted in the bile.

Morphine is the major active metabolite of diamorphine, and is also a metabolite of codeine.

NOTE. Morphine may be slowly converted to pseudomorphine in cadavers and can be found as such on exhumation.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.01 to 0.07 µg/ml.

A single intramuscular dose of 10 mg of morphine sulphate administered to 5 subjects, produced peak average serum concentrations of 0.051 to 0.062 µg/ml (mean 0.056) within 20 minutes (D. R. Stanski *et al.*, *Clin. Pharmac. Ther.*, 1978, 24, 52–59).

Following a single intravenous dose of 10 mg of morphine sulphate administered to 12 subjects, a mean serum concentration of free morphine of about 0.05 µg/ml was reported at 15 minutes, and serum concentrations of conjugated morphine of 0.13 to 0.16 µg/ml were reported at 1 hour (S. F. Brunk *et al.*, *J. clin. Pharmac.*, 1974, 14, 581–587).

Following repeated oral administration of 5 mg every 4 hours to 8 patients, a mean minimum steady-state plasma concentration of 0.011 µg/ml was reported; in 8 patients receiving 30 mg every 4 hours, a mean minimum steady-state plasma concentration of 0.044 µg/ml was reported (T. D. Walsh and B. V. Kadam, *Br. J. clin. Pharmac.*, 1984, 17, 232P).

TOXICITY. The estimated minimum lethal dose for adults is 200 mg but addicts may be able to tolerate up to ten times as much. Morphine is initially eliminated from the blood fairly quickly and blood concentrations are difficult to interpret, especially as toxic effects depend on the degree of tolerance which has been acquired.

In a survey of 10 fatalities due to morphine overdose in addicts, the following tissue concentrations of total morphine were found: blood 0.2 to 2.3 µg/g (mean 0.7, 7 cases), liver 0.4 to 18.0 µg/g (mean 3.0, 10 cases), muscle 0.1 to 2.0 µg/g (mean 0.8, 6 cases), urine 14 to 81 µg/g (mean 52, 7 cases) (S. Felby *et al.*, *Forens. Sci.*, 1974, 3, 77–81).

HALF-LIFE. Plasma half-life, about 2 to 3 hours.

VOLUME OF DISTRIBUTION. About 3 to 5 litres/kg.

CLEARANCE. Plasma clearance, about 15 to 20 ml/min/kg.

PROTEIN BINDING. In plasma, 20 to 35%.

NOTE. For a review of the metabolism of morphine see U. Boerner *et al.*, *Drug Met. Rev.*, 1975, 4, 39–73.

Dose. 5 to 20 mg of morphine hydrochloride, sulphate, or tartrate, by mouth or parenterally, every 4 hours.

Muzolimine

Diuretic

3-Amino-1-[1-(3,4-dichlorophenyl)ethyl]-2-pyrazolin-5-one

C₁₁H₁₁Cl₂N₃O = 272.1

CAS—55294-15-0

Crystals.

M.p. 134° to 137°.

Practically **insoluble** in water; soluble 1 in 4 of ethanol, 1 in 9 of acetone, and 1 in 3 of chloroform.

Dissociation Constant. pK_a 9.3.

Ultraviolet Spectrum. Methanolic acid—240 nm ($A_1^1 = 489$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1690, 1640, 1602, 835, 665, 880 (KBr disk).

Quantification. THIN-LAYER CHROMATOGRAPHY. In plasma or urine: detection limit 2 ng/ml—W. Ritter, *J. Chromat.*, 1977, 142, 431–440.

Disposition in the Body. Readily absorbed following oral administration. About 5% of a dose is excreted unchanged in the urine in 10 hours.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 30 mg given to 6 subjects, peak plasma concentrations of 0.29 to 0.51 µg/ml (mean 0.44) were attained in 1 to 3 hours (D. Loew *et al.*, *Eur. J. clin. Pharmac.*, 1977, 12, 341–344).

HALF-LIFE. Plasma half-life, 10 to 17 hours.

Dose. 40 to 80 mg daily.

Myristicin

5-Allyl-1-methoxy-2,3-methylenedioxybenzene

$C_{11}H_{12}O_3 = 192.2$

CAS—607-91-0

The most toxic principle of nutmeg and nutmeg oil. M.p. below –20°. B.p. 276° to 277°. Refractive index 1.5403.

Slightly **soluble** in ethanol; soluble in ether.

Nutmeg

Synonyms. Muscade; Myristica; Nux Moschata.

The dried kernels of the seeds of *Myristica fragrans* (Myristicaceae), containing not less than 5% v/w of volatile oil.

Nutmeg Oil

Synonyms. Essence de Muscade; Myristica Oil; Oleum Myristicae.

CAS—8008-45-5

A volatile oil obtained by distillation from nutmeg. East Indian oil contains about 15% of myristicin and West Indian about 2%.

A colourless, pale yellow, or pale green liquid. Wt per ml, East Indian oil 0.885 to 0.915 g, West Indian oil 0.86 to 0.88 g. Refractive index 1.472 to 1.488.

Freely **soluble** in ethanol (90%); soluble in glacial acetic acid.

Disposition in the Body.

TOXICITY. Severe symptoms of poisoning have been caused by the ingestion of 1 to 1½ nutmegs, and doses of 5 g or more of nutmeg or nutmeg powder will produce a marked depressive action on the central nervous system.

A 28-year-old woman ingested 18.3 g of powdered nutmeg. Following a period of disorientation, delirium and excitement, the patient became semi-stuporous for 12 hours. For some days she complained of numbness, dizziness and nausea and there were further periods of excitement. No specific therapy was given and she was discharged after 7 days (R. C. Green, *J. Am. med. Ass.*, 1959, 171, 1342–1344).

Two young women consumed 15 and 25 g respectively of ground nutmeg in order to experience its hallucinogenic action. Both became intoxicated but recovered (H. O. Akesson and J. Walinder, *Lancet*, 1965, 1, 1271–1272).

For a review of the toxic effects and uses of nutmeg see A. T. Weil, *Bull. Narcot.*, 1966, 18 (4), 15–23.

Nabilone

Anti-emetic

Proprietary Name. Cesamet

(±)-(6aR,10aR)-3-(1,1-Dimethylheptyl)-6,6a,7,8,10,10a-hexahydro-1-hydroxy-6,6-dimethyl-9H-dibenzo[b,d]pyran-9-one

$C_{24}H_{36}O_3 = 372.5$

CAS—51022-71-0

Nabilone is a synthetic cannabinoid.

Ultraviolet Spectrum. Methanol—275 nm ($A_1^1 = 35$ b), 282 nm ($A_1^1 = 35$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1696, 1619, 1574, 1260, 1100, 1038 (KBr disk).

Mass Spectrum. Principal peaks at m/z 288, 69, 178, 41, 287, 43, 289, 55.

Disposition in the Body. Readily absorbed after oral administration; rapidly distributed into the tissues and metabolised by reduction of the 9-keto group forming a mixture of isomeric alcohols (carbinols) together with several other unidentified metabolites. About 65% of a dose is eliminated in the faeces, and about 20% is excreted in the urine as polar acidic metabolites.

HALF-LIFE. Plasma half-life, about 2 hours.

REFERENCE. A. Rubin *et al.*, *Clin. Pharmac. Ther.*, 1977, 22, 85–91.

Dose. 2 to 4 mg daily; maximum of 6 mg daily.

Nadolol*Beta-adrenoceptor Blocking Agent*

Proprietary Names. Corgard; Solgol. It is an ingredient of Corgaretic.

(2*R*,3*S*)-5-(3-*tert*-Butylamino-2-hydroxypropoxy)-1,2,3,4-tetrahydronaphthalene-2,3-diol

$C_{17}H_{27}NO_4 = 309.4$

CAS—42200-33-9

A white crystalline powder. M.p. 124° to 136°.

Soluble in water; freely soluble in ethanol; slightly soluble in chloroform; practically insoluble in ether.

Colour Tests. Liebermann's Test—brown; Mandelin's Test—brown-red; Marquis Test—red; Nessler's Reagent—brown.

Thin-layer Chromatography. System *TA*—Rf 42; system *TB*—Rf 01; system *TC*—Rf 01.

Gas Chromatography. System *GA*—RI 2550.

High Pressure Liquid Chromatography. System *HA*—k' 1.2.

Ultraviolet Spectrum. Aqueous acid—269 nm, 276 nm; methanol—270 nm, 278 nm ($A_1^1 = 38$ a). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1092, 1070, 1248, 1262, 1582, 1217 (KBr disk).

Mass Spectrum. Principal peaks at m/z 30, 86, 57, 294, 71, 310, 70, 87.

Quantification. SPECTROFLUORIMETRY. In serum or urine: sensitivity < 10 ng/ml—E. Ivashkiv, *J. pharm. Sci.*, 1977, 66, 1168–1172.

GAS CHROMATOGRAPHY-MASS SPECTROMETRY. In serum: detection limit 7 ng/ml—P. T. Funke *et al.*, *J. pharm. Sci.*, 1978, 67, 653–657.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: electrochemical detection—P. Surmann, *Arch. Pharm. Berl.*, 1980, 313, 1052–1054.

Disposition in the Body. Absorbed after oral administration; bioavailability about 30%. It is excreted almost entirely as unchanged drug; about 15 to 21% of the dose is excreted in the urine and 68 to 85% is eliminated in the faeces in 4 days, after oral administration. After intravenous administration, about 75% of a dose is excreted in the urine unchanged.

THERAPEUTIC CONCENTRATION.

Following single oral doses of 60 and 120 mg to 7 subjects, peak plasma concentrations of 0.02 to 0.14 $\mu\text{g/ml}$ (mean 0.07) and 0.05 to 0.25 $\mu\text{g/ml}$ (mean 0.13) were attained in 1 to 4 hours (M. Schäfer-Korting *et al.*, *Eur. J. clin. Pharmac.*, 1984, 26, 125–127).

Single oral doses of 80 mg to 4 subjects, resulted in peak plasma concentrations of 0.04 to 0.21 $\mu\text{g/ml}$ (mean 0.14) in 1 to 4 hours. During daily oral dosing of 4 subjects with 80 mg a day, peak plasma concentrations of 0.11 to 0.24 $\mu\text{g/ml}$ (mean 0.22) were observed 2 to 4 hours after a morning dose (J. Dreyfuss *et al.*, *J. clin. Pharmac.*, 1979, 19, 712–720).

HALF-LIFE. Plasma half-life, 6 to 24 hours.

VOLUME OF DISTRIBUTION. About 2 litres/kg.

CLEARANCE. Plasma clearance, about 3 ml/min/kg.

PROTEIN BINDING. In plasma, about 4 to 30% (mean 14).

NOTE. For a review of the pharmacokinetics of nadolol see R. C. Heel *et al.*, *Drugs*, 1980, 20, 1–23.

Dose. 40 to 240 mg daily.

Naftidrofuryl Oxalate

Vasodilator

Synonym. Nafronyl Oxalate

Proprietary Names. Dusodril; Praxilene.

2-Diethylaminoethyl 3-(1-naphthyl)-2-tetrahydrofurfurylpropionate hydrogen oxalate

 $C_{24}H_{33}NO_3 \cdot C_2H_2O_4 = 473.6$

CAS—31329-57-4 (naftidrofuryl); 3200-06-4 (oxalate)

A white powder. M.p. about 108°.

Readily soluble in water.

Dissociation Constant. pK_a 8.2 (30°).

Thin-layer Chromatography. System TA—Rf 64; system TB—Rf 52; system TC—Rf 41.

Gas Chromatography. System GA—RI 2748.

Ultraviolet Spectrum. Aqueous acid—273 nm, 283 nm ($A_1^1 = 141$ a). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1730, 1165, 722, 1280, 1620, 1070 (KBr disk).

Mass Spectrum. Principal peaks at m/z 86, 99, 100, 141, 87, 71, 44, 58 (naftidrofuryl).Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 20 ng/ml, UV detection—R. R. Brodie *et al.*, *J. Chromat.*, 1979, 164; *Biomed. Appl.*, 6, 534–540.

Disposition in the Body. Absorbed after oral administration. It is metabolised by hydrolysis to the free acid, 3-(1-naphthyl)-2-tetrahydrofurfurylpropionic acid. Less than 1% of a dose is excreted in the urine in 48 hours as free or conjugated naftidrofuryl. Most of a dose appears to be excreted in the bile.

THERAPEUTIC CONCENTRATION.

After oral administration of 100 mg to 2 subjects, peak plasma concentrations averaging 0.21 $\mu\text{g/ml}$ were attained in 0.5 to 0.75 hour (R. R. Brodie *et al.*, *ibid.*).

Dose. 300 to 600 mg daily.

Nalbuphine

Narcotic Analgesic

17-Cyclobutylmethyl-7,8-dihydro-14-hydroxy-17-normorphine

 $C_{21}H_{27}NO_4 = 357.4$

CAS—20594-83-6

Crystals. M.p. about 231°.

Nalbuphine Hydrochloride

Proprietary Name. Nubain

 $C_{21}H_{27}NO_4 \cdot HCl = 393.9$

CAS—23277-43-2

Ultraviolet Spectrum. Aqueous acid—284 nm ($A_1^1=46$ b); aqueous alkali—297 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 970, 1080, 1033, 1060, 1115, 1495.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 500 pg/ml, ECD—S. H. Weinstein *et al.*, *J. pharm. Sci.*, 1978, 67, 547–548.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 1 ng, electrochemical detection—C. L. Lake *et al.*, *J. Chromat.*, 1982, 233; *Biomed. Appl.*, 22, 410–416.

Disposition in the Body. Absorbed after oral administration, but there is thought to be considerable first-pass metabolism; rapidly absorbed after intramuscular or subcutaneous injection. The major metabolic reaction is conjugation to form nalbuphine glucuronide (inactive); oxidation to 6-oxonalbuphine occurs, and the desalkyl derivative, 7,8-dihydro-14-hydroxynormorphine, has also been identified as a metabolite. Unchanged nalbuphine, its conjugates, and the two metabolites have been detected in the urine.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 30 mg to 3 subjects, a peak plasma concentration of about 0.015 $\mu\text{g/ml}$ was attained in 1 hour. Following a single intramuscular dose of 10 mg to 6 subjects, peak plasma concentrations of 0.038 to 0.059 $\mu\text{g/ml}$ (mean 0.052) were attained in 15 to 30 minutes (R. E. S. Bullingham, *Pharmacokinetics of Nalbuphine*, in *Opioid Agonist/Antagonist Drugs in Clinical Practice*, W. S. Nimmo and G. Smith (Ed.), Oxford, Excerpta Medica, 1984, pp. 115–122).

HALF-LIFE. Plasma half-life, about 5 hours.

NOTE. For a review of nalbuphine see J. K. Errick and R. C. Heel, *Drugs*, 1983, 26, 191–211.

Dose. 10 to 20 mg of nalbuphine hydrochloride parenterally, every 3 to 6 hours.

Nalidixic Acid

Antibacterial (Urinary)

Synonym. Nalidixinic Acid

Proprietary Names. NegGram; Negram; Uriben. It is an ingredient of Mictral.

1-Ethyl-1,4-dihydro-7-methyl-4-oxo-1,8-naphthyridine-3-carboxylic acid

$\text{C}_{12}\text{H}_{12}\text{N}_2\text{O}_3=232.2$

CAS—389-08-2

An almost white or very pale yellow crystalline powder. M.p. 225° to 231°.

Practically **insoluble** in water; soluble 1 in 910 of ethanol and 1 in 35 of chloroform; very slightly soluble in ether; soluble in solutions of alkali hydroxides and carbonates.

Dissociation Constant. pK_a 6.0.

Thin-layer Chromatography. System TD—Rf 39; system TE—Rf 02; system TF—Rf 31.

Ultraviolet Spectrum. Aqueous acid—257 nm ($A_1^1=1233$ b), 315 nm; aqueous alkali—258 nm ($A_1^1=1120$ a), 334 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1613, 1704, 809, 1250, 1225, 1515 (KBr disk).

Mass Spectrum. Principal peaks at m/z 188, 189, 159, 132, 53, 173, 131, 145.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 5 $\mu\text{g/ml}$, FID—H. Roseboom *et al.*, *J. Chromat.*, 1979, 163; *Biomed. Appl.*, 5, 92–95.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: nalidixic acid, 7-hydroxynalidixic acid and 7-carboxynalidixic acid, sensitivity 500 ng/ml, UV detection—G. Cuisinaud *et al.*, *J. Chromat.*, 1980, 181; *Biomed. Appl.*, 7, 399–406.

THIN-LAYER CHROMATOGRAPHY. In plasma: sensitivity 200 ng/ml, fluorescence detection—H. K. L. Hundt and E. C. Barlow, *J. Chromat.*, 1981, 223; *Biomed. Appl.*, 12, 165–172.

Disposition in the Body. Readily absorbed after oral administration. The major metabolite, 7-hydroxynalidixic acid, is active; other metabolites include glucuronide conjugates of nalidixic acid and 7-hydroxynalidixic acid, and a 7-carboxy metabolite,

all of which are inactive. About 80% of a dose is excreted in the urine in 8 hours mainly as glucuronide conjugates with about 2 to 3% as unchanged drug.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 1 g to 11 female subjects, a mean peak plasma concentration of nalidixic acid of 27.3 µg/ml was attained in 1.5 hours; concentrations of 7-hydroxynalidixic acid reached a maximum of about 10 µg/ml within 1 hour. After repeated oral administration of 1 g twice daily to the same subjects, a peak plasma concentration of 33 µg/ml of nalidixic acid was reported on the 7th day. Urinary concentrations of nalidixic acid plus 7-hydroxynalidixic acid following single or multiple dose administration were in excess of about 200 µg/ml for 8 hours in all subjects, and in some cases greater than 50 µg/ml for 12 hours (N. Ferry *et al.*, *Clin. Pharmac. Ther.*, 1981, 29, 695-698).

TOXICITY. Toxic effects have been associated with plasma concentrations greater than 40 µg/ml.

HALF-LIFE. Plasma half-life, nalidixic acid and the 7-hydroxy metabolite about 7 hours; increased in renal failure to about 20 hours.

VOLUME OF DISTRIBUTION. About 0.4 litre/kg.

PROTEIN BINDING. In plasma, nalidixic acid about 93%, 7-hydroxynalidixic acid about 60%.

Dose. 2 to 4 g daily.

Nalorphine

Narcotic Antagonist

17-Allyl-17-normorphine

$C_{19}H_{21}NO_3 = 311.4$

CAS—62-67-9

Crystals. M.p. 208°.

Slightly **soluble** in water and ether; soluble in ethanol and chloroform.

Nalorphine Hydrobromide

Proprietary Names. Lethidrone; Norfin.

$C_{19}H_{21}NO_3 \cdot HBr = 392.3$

CAS—1041-90-3

A white to creamy-white crystalline powder. M.p. about 206°, with decomposition.

Soluble 1 in 24 of water and 1 in 35 of ethanol. Aqueous solutions may deposit crystals of the dihydrate; the dihydrate is readily soluble in dehydrated alcohol but the solution rapidly yields a deposit of the anhydrous salt.

Nalorphine Hydrochloride

$C_{19}H_{21}NO_3 \cdot HCl = 347.8$

CAS—57-29-4

A white crystalline powder which slowly darkens on exposure to air and light. M.p. 260° to 263°.

Soluble 1 in 8 of water and 1 in 35 of ethanol; practically insoluble in chloroform and ether; soluble in dilute solutions of alkali hydroxides.

Dissociation Constant. pK_a 7.8 (20°).

Partition Coefficient. Log *P* (octanol/pH 7.4), 1.5.

Colour Test. Marquis Test—violet.

Thin-layer Chromatography. System *TA*—Rf 59; system *TB*—Rf 01; system *TC*—Rf 23. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System *GA*—RI 2577.

High Pressure Liquid Chromatography. System *HA*— k' 1.0; system *HC*— k' 0.29.

Ultraviolet Spectrum. Aqueous acid—285 nm ($A_1^1 = 49$ a); aqueous alkali—251 nm ($A_1^1 = 190$ a), 298 nm ($A_1^1 = 81$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1505, 1121, 1155, 1304, 805, 945 (nalorphine hydrobromide, KBr disk).

Mass Spectrum. Principal peaks at m/z 311, 312, 41, 188, 80, 82, 81, 241.

Disposition in the Body. Absorbed after oral administration but undergoes extensive first-pass metabolism. It is excreted in the urine mainly as metabolites and glucuronide conjugates with about 2 to 6% of a dose as unchanged drug.

TOXICITY. The estimated minimum lethal dose is 200 mg. The administration of nalorphine to morphine addicts may be followed by a typical withdrawal syndrome.

Dose. 5 to 10 mg of nalorphine hydrobromide intravenously, repeated if necessary.

Naloxone

Narcotic Antagonist

Synonym. Allylnoroxymorphone

17-Allyl-6-deoxy-7,8-dihydro-14-hydroxy-6-oxo-17-normorphine

$C_{19}H_{21}NO_4 = 327.4$

CAS—465-65-6

Crystals. M.p. 177° to 180°.

Soluble in chloroform; practically insoluble in ether.

Naloxone Hydrochloride

Proprietary Names. Naloxone; Narcan.

$C_{19}H_{21}NO_4 \cdot HCl = 363.8$

CAS—357-08-4 (anhydrous); 51481-60-8 (dihydrate)

A white powder. M.p. 200° to 205°.

Soluble in water; slightly soluble in ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 7.9.

Partition Coefficient. Log P (octanol/pH 7.4), 1.5.

Colour Tests. Folin-Ciocalteu Reagent—blue; Liebermann's Test—black; Mandelin's Test—violet → brown; Marquis Test—brown → violet.

Thin-layer Chromatography. System TA—Rf 65; system TB—Rf 09; system TC—Rf 66. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2640.

High Pressure Liquid Chromatography. System HA— k' 1.4; system HC— k' 0.17.

Ultraviolet Spectrum. Aqueous acid—281 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1244, 1728, 940, 1230, 922, 1050 (KBr disk).

Mass Spectrum. Principal peaks at m/z 327, 328, 41, 242, 286, 96, 229, 70.

Quantification. GAS CHROMATOGRAPHY. In biological fluids: sensitivity 5 ng, ECD—P. J. Meffin and K. J. Smith, *J. Chromat.*, 1980, 183; *Biomed. Appl.*, 9, 352–356.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: naloxone and naltrexone, sensitivity 2 to 5 ng/ml for plasma, 10 ng/ml for urine, electrochemical detection—H. Derendorf *et al.*, *J. pharm. Sci.*, 1984, 73, 621–624.

RADIOIMMUNOASSAY. In plasma: sensitivity < 500 pg/ml—E. F. Hahn *et al.*, *J. Pharm. Pharmac.*, 1983, 35, 833–836.

Disposition in the Body. Rapidly absorbed after oral administration but undergoes extensive first-pass metabolism. It is rapidly but incompletely excreted in the urine, mainly as conjugated metabolites, with about 30% of a dose being excreted in 6 hours but only 60% being excreted in 72 hours. Metabolites which have been identified include naloxone-3-glucuronide and the *N*-desalkyl, and 6-hydroxy derivatives together with their glucuronide conjugates.

THERAPEUTIC CONCENTRATION.

Following intravenous administration of 0.4 mg to 9 subjects, mean serum concentrations of 0.01 µg/ml were reported after 2 minutes (S. H. Ngai *et al.*, *Anesthesiology*, 1976, 44, 398–401).

During constant intravenous infusion of 0.02 mg/min to 3 subjects, steady-state plasma concentrations of 0.014, 0.015 and 0.030 µg/ml were reported (E. F. Hahn *et al.*, *J. Pharm. Pharmac.*, 1983, 35, 833–836.)

HALF-LIFE. Plasma half-life, about 1 to 2 hours.

VOLUME OF DISTRIBUTION. About 3 litres/kg.

CLEARANCE. Plasma clearance, about 20 to 30 ml/min/kg.

PROTEIN BINDING. In plasma, about 40%.

Dose. 0.4 to 2 mg of naloxone hydrochloride parenterally, repeated as necessary.

Naltrexone

Narcotic Antagonist

17-Cyclopropylmethyl-6-deoxy-7,8-dihydro-14-hydroxy-6-oxo-17-normorphine

$C_{20}H_{23}NO_4 = 341.4$

CAS—16590-41-3

Crystals. M.p. 167° to 174°.

Naltrexone Hydrochloride

$C_{20}H_{23}NO_4 \cdot HCl = 377.9$

CAS—16676-29-2

A white powder. M.p. 274° to 276°.

Soluble in water, dilute acids, and alkali.

Ultraviolet Spectrum. Aqueous acid—281 nm ($A_1^1 = 34$ b); aqueous alkali—293 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1716, 1505, 1280, 1639, 1115, 909 (naltrexone hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 341, 55, 36, 300, 342, 110, 243, 256.

Quantification. GAS CHROMATOGRAPHY. In plasma, erythrocytes, saliva, or urine: naltrexone, 6 β -naltrexol and 2-hydroxy-3-methoxy-6 β -naltrexol, sensitivity 0.5 to 1 ng/ml in plasma, ECD and FID—K. Verebey *et al.*, *J. analyt. Toxicol.*, 1980, 4, 33–37.

Disposition in the Body. Rapidly and almost completely absorbed after oral administration. It is metabolised by reduction to 6 β -naltrexol which has weak activity; both naltrexone and 6 β -naltrexol are conjugated with glucuronic acid. About 40% of an oral dose is excreted in the urine in 24 hours, with about 8% of the dose as naltrexone (mainly conjugated), 26% as 6 β -naltrexol (mainly unconjugated), and about 4% as free 2-hydroxy-3-methoxy-6 β -naltrexol. About 2% of a dose is eliminated in the faeces in 24 hours, mainly as 6 β -naltrexol.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 100 mg to 4 subjects, peak plasma concentrations of 0.01 to 0.06 $\mu\text{g/ml}$ (mean 0.04) of naltrexone and 0.08 to 0.13 $\mu\text{g/ml}$ (mean 0.10) of 6 β -naltrexol were attained in 1 to 2 hours and 1 to 4 hours, respectively (K. Verebey *et al.*, *Clin. Pharmac. Ther.*, 1976, 20, 315–328).

HALF-LIFE. Plasma half-life, after oral administration, about 10 hours for naltrexone and about 12 hours for 6 β -naltrexol; after intravenous administration, naltrexone about 3 hours.

VOLUME OF DISTRIBUTION. About 20 litres/kg.

CLEARANCE. Plasma clearance, about 70 ml/min/kg.

PROTEIN BINDING. In plasma, about 20%.

NOTE. For a review of the pharmacokinetics of naltrexone see B. L. Crabtree, *Clin. Pharm.*, 1984, 3, 273–280.

Dose. Usually 50 mg of naltrexone hydrochloride daily.

Nandrolone

Anabolic Steroid

Synonym. Nortestosterone

17 β -Hydroxyestr-4-en-3-one

$\text{C}_{18}\text{H}_{26}\text{O}_2 = 274.4$

CAS—434-22-0

Crystals. Two polymorphic forms occur; m.p. 111° to 112°, and 124°.

Soluble in ethanol, chloroform, and ether.

Nandrolone Decanoate

Synonym. Nortestosterone Decylate

Proprietary Names. Anabolin LA-100; Androlone-D; Deca-Durabolin;

Hybolin Decanoate.

$\text{C}_{28}\text{H}_{44}\text{O}_3 = 428.7$

CAS—360-70-3

A white to creamy-white crystalline powder. M.p. 33° to 37°.

Practically **insoluble** in water; soluble 1 in 1 of ethanol; freely soluble in chloroform and ether.

Nandrolone Phenylpropionate

Synonyms. Nandrolone Phenpropionate; 19-Norandrostenolone Phenylpropionate; Nortestosteronum Phenylpropionicum.

Proprietary Names. Androlone; Durabolin; Hybolin Improved; Nandrolin.

$\text{C}_{27}\text{H}_{34}\text{O}_3 = 406.6$

CAS—62-90-8

A white crystalline powder. M.p. 95° to 99°.

Practically **insoluble** in water; soluble 1 in 20 of ethanol; soluble in chloroform.

Thin-layer Chromatography. Nandrolone decanoate: *system TP*—Rf 88; *system TQ*—Rf 49; *system TR*—Rf 97; *system TS*—Rf 95. Nandrolone phenylpropionate: *system TP*—Rf 87; *system TQ*—Rf 48; *system TR*—Rf 97; *system TS*—Rf 95.

Ultraviolet Spectrum. Nandrolone decanoate: dehydrated alcohol—240 nm ($A_1^1 = 407$ a). Nandrolone phenylpropionate: dehydrated alcohol—240 nm ($A_1^1 = 430$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1679, 1733, 1205, 1178, 1255, 692 (nandrolone phenylpropionate).

Disposition in the Body. In man, nandrolone is excreted in the urine mainly as the two metabolites, 19-norandrosterone and 19-noretiocholanolone. In the horse, the major metabolites are 5 α -estrane-3 β ,17 α -diol, excreted mainly as the glucuronide conjugate, and its 17 β -epimer which is excreted as the sulphate conjugate.

Dose. By intramuscular injection: 25 to 100 mg of nandrolone decanoate every 3 weeks; 25 to 50 mg of nandrolone phenylpropionate weekly.

Naphazoline

Sympathomimetic

2-(1-Naphthylmethyl)-2-imidazoline

$\text{C}_{14}\text{H}_{14}\text{N}_2 = 210.3$

CAS—835-31-4

M.p. about 120°.

Naphazoline Hydrochloride

Proprietary Names. Albalon; Clear Eyes; Clera; Naphcon Forte; Privine; Rhino-Mex-N; Vasocon.

$\text{C}_{14}\text{H}_{14}\text{N}_2\text{HCl} = 246.7$

CAS—550-99-2

A white crystalline powder. M.p. about 255°, with decomposition.

Soluble 1 in 6 of water and 1 in 15 of ethanol; very slightly soluble in chloroform; practically insoluble in ether.

Naphazoline Nitrate

Proprietary Names. Imidazyl; Privine; Rinazina. It is an ingredient of Antistin-Privine.

$\text{C}_{14}\text{H}_{14}\text{N}_2\text{HNO}_3 = 273.3$

CAS—5144-52-5

A white crystalline powder. M.p. about 168°.

Soluble 1 in 36 of water and 1 in 16 of ethanol; very slightly soluble in chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 10.9 (20°).

Partition Coefficient. Log *P* (chloroform/pH 7.4), −0.3.

Colour Tests. Mandelin's Test—brown-violet; Marquis Test—grey-green.

Thin-layer Chromatography. System *TA*—Rf 14; system *TB*—Rf 03; system *TC*—Rf 06. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, green.)

Gas Chromatography. System *GA*—RI 2057; system *GB*—RI 2122; system *GC*—RI 2457.

High Pressure Liquid Chromatography. System *HA*— k' 2.4.

Ultraviolet Spectrum. Aqueous acid—271 nm, 281 nm ($A_1^1 = 321$ a), 288 nm, 291 nm. No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1615, 780, 1499, 791, 1211, 800 (KBr disk).

Mass Spectrum. Principal peaks at m/z 209, 210, 141, 115, 153, 208, 46, 181.

Disposition in the Body. Systemic absorption has been reported following topical application of solutions of naphazoline. It is not used systemically but is readily absorbed from the gastrointestinal tract.

Toxicity. The estimated minimum lethal dose is 10 mg, intranasally.

Use. Naphazoline hydrochloride and nitrate are used as 0.05 to 0.1% aqueous solutions.

Naphthalene

Synonym. Naphthalin

$C_{10}H_8 = 128.2$

CAS—91-20-3

Colourless transparent scales. M.p. 80°. B.p. 218°.

Practically **insoluble** in water; soluble 1 in 8 of ethanol and 1 in 1.5 of chloroform; very soluble in ether.

Gas Chromatography. System *GA*—RI 1186.

Ultraviolet Spectrum. Ethanol—266 nm ($A_1^1 = 411$ b), 275 nm ($A_1^1 = 454$ b), 286 nm ($A_1^1 = 307$ b).

Naproxen

Analgesic

Proprietary Names. Equiproxen (vet.); Floginax; Laser; Naprosyn(e); Proxen; Xenar.

(+)-2-(6-Methoxy-2-naphthyl)propionic acid

$C_{14}H_{14}O_3 = 230.3$

CAS—22204-53-1

A white crystalline powder. M.p. about 156°.

Practically **insoluble** in water; soluble 1 in 25 of ethanol, 1 in 15 of chloroform, and 1 in 40 of ether.

Naproxen Sodium

Proprietary Names. Anaprox; Synflex.

$C_{14}H_{13}NaO_3 = 252.2$

CAS—26159-34-2

Dissociation Constant. pK_a 4.2 (25°).

Colour Tests. Liebermann's Test—black-green; Marquis Test—brown; Sulphuric Acid—orange.

Thin-layer Chromatography. System *TD*—Rf 33; system *TE*—Rf 07; system *TF*—Rf 45; system *TG*—Rf 14. (Ludy Tenger reagent, orange.)

Gas Chromatography. System *GA*—RI 2130; system *GD*—retention times of methyl derivative 1.37 and 1.18, relative to n - $C_{16}H_{34}$.

High Pressure Liquid Chromatography. System *HD*— k' 3.3; system *HV*—retention time 0.67 relative to meclofenamic acid.

Ultraviolet Spectrum. Aqueous acid—262 nm ($A_1^1=208$ b), 272 nm ($A_1^1=215$ b), 315 nm ($A_1^1=52$ b), 328 nm ($A_1^1=63$ b); aqueous alkali—261 nm ($A_1^1=218$ b), 271 nm ($A_1^1=218$ b), 316 nm, 330 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1724, 1174, 1155, 1223, 1190, 1681 (KBr disk).

Mass Spectrum. Principal peaks at m/z 185, 230, 141, 186, 184, 115, 170, 153.

Quantification. ULTRAVIOLET SPECTROPHOTOMETRY. In serum—M. Holzbecher *et al.*, *Clin. Biochem.*, 1979, 12, 66–67.

SPECTROFLUORIMETRY. In serum: detection limit 500 ng/ml—M. Anttila, *J. pharm. Sci.*, 1977, 66, 433–434.

GAS CHROMATOGRAPHY. In serum: sensitivity 2 µg/ml, FID—S. S. Weber *et al.*, *Ther. Drug Monit.*, 1981, 3, 75–83. In urine: naproxen and metabolites, FID—S. H. Wan and S. B. Matin, *J. Chromat.*, 1979, 170, 473–478.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: naproxen and 6-*O*-desmethylnaproxen, sensitivity 100 ng/ml, fluorescence detection—J. W. A. van Loenhout *et al.*, *J. liq. Chromat.*, 1982, 5, 549–561.

Disposition in the Body. Readily and almost completely absorbed after oral or rectal administration. About 50% of a dose is excreted in the urine in 24 hours and about 94% in 5 days together with about 1 to 2% in the faeces. Of the material excreted in the urine, approximately 60% is conjugated naproxen, 5% is 6-*O*-desmethylnaproxen, and 20% is conjugated desmethylnaproxen. Less than 10% of the excreted material is unchanged drug.

Hydrolysis of conjugated naproxen has been reported during storage of urine samples, and assays carried out immediately after collection suggested that only very small amounts of unchanged drug were excreted (R. A. Upton *et al.*, *J. pharm. Sci.*, 1980, 69, 1254–1257).

THERAPEUTIC CONCENTRATION. Plasma concentrations are dose-dependent at doses of up to 500 mg twice daily; at larger doses the increase in concentration is non-linear and renal clearance is accelerated.

Following single oral doses of 250 mg to 6 subjects, peak plasma concentrations of 26 to 51 µg/ml (mean 38) were attained in 2 to 4 hours; peak plasma concentrations of 49 to 69 µg/ml (mean 60), were attained in 3 subjects, 2 hours after a single oral dose of 500 mg; peak concentrations of the desmethyl metabolite were about 0.1 to 0.2 µg/ml (G. Tomson *et al.*, *Clin. Pharmac. Ther.*, 1981, 29, 168–173).

TOXICITY.

A serum concentration of 414 µg/ml was reported in one subject 15 hours after the ingestion of 25 g of naproxen; the only toxic effect was mild gastro-intestinal distress (E. W. Fredell and L. J. Strand, *J. Am. med. Ass.*, 1977, 238, 938).

HALF-LIFE. Plasma half-life, 10 to 20 hours (mean 14).

VOLUME OF DISTRIBUTION. About 0.1 litre/kg.

PROTEIN BINDING. In plasma, more than 99% at normal therapeutic concentrations; decreased at higher plasma concentrations and in subjects with liver disease.

NOTE. For a review of naproxen see R. N. Brogden *et al.*, *Drugs*, 1979, 18, 241–277.

Dose. Usually 0.5 to 1 g daily.

Narceine

Alkaloid

6-[[6-(2-Dimethylaminoethyl)-4-methoxy-1,3-benzodioxol-5-yl]acetyl]-2,3-dimethoxybenzoic acid

$C_{23}H_{27}NO_8 \cdot 3H_2O = 499.5$

CAS—131-28-2 (anhydrous)

An alkaloid present in opium.

White silky crystals. M.p. 170° to 171°. The anhydrous substance melts at about 138° and is very hygroscopic.

Slightly soluble in water; soluble in ethanol; practically insoluble in chloroform and ether.

Narceine HydrochlorideC₂₃H₂₇NO₈·HCl = 481.9

CAS—4901-03-5

Prismatic crystals. M.p. 192° to 193°.

Slightly **soluble** in hot water and ether; soluble in hot ethanol.**Dissociation Constant.** pK_a 3.8 (20°).**Colour Tests.** Liebermann's Test—black; Mandelin's Test—green-brown; Marquis Test—brown → green.**Thin-layer Chromatography.** System TA—Rf 52; system TB—Rf 00; system TC—Rf 03. (Acidified iodoplatinate solution, positive.)**High Pressure Liquid Chromatography.** System HA—k' 0.7.**Ultraviolet Spectrum.** Aqueous acid—277 nm (A₁¹ = 306 a). No alkaline shift.**Infra-red Spectrum.** Principal peaks at wavenumbers 1253, 1582, 1060, 1090, 1000, 1047 (KCl disk).**Mass Spectrum.** Principal peaks at *m/z* 58, 427, 234, 59, 50, 42, 428, 91.**Natamycin***Antifungal**Synonym.* Pimaricin*Proprietary Names.* Natafucin; Pimafucin(e).C₃₃H₄₇NO₁₃ = 665.7

CAS—7681-93-8

An antibiotic produced by the growth of *Streptomyces natalensis*. A white crystalline powder, which may discolour slightly on storage.Very slightly **soluble** in water and ethanol; practically insoluble in chloroform; readily soluble in dilute acids and alkalis, forming salts.**Ultraviolet Spectrum.** Acid methanol—290 nm (A₁¹ = 795 b), 303 nm (A₁¹ = 1250 b), 318 nm (A₁¹ = 1145 b).**Infra-red Spectrum.** Principal peaks at wavenumbers 1062, 1002, 1563, 1709, 1101, 1258 (KBr disk).**Uses.** Topically in concentrations of 2 to 5%; by inhalation in a dose of 7.5 mg daily.**Nealbarbitone***Barbiturate**Synonyms.* Alneobarbital; Nealbarbital; Neallymalum.

5-Allyl-5-neopentylbarbituric acid

C₁₂H₁₈N₂O₃ = 238.3

CAS—561-83-1

A white or slightly cream-coloured powder. M.p. 155° to 157°.

Soluble 1 in 5000 of water, 1 in 4 of ethanol, 1 in 80 of chloroform, and 1 in 5 of ether; soluble in aqueous solutions of alkalis.**Dissociation Constant.** pK_a 7.2 (20°).**Thin-layer Chromatography.** System TD—Rf 58; system TE—Rf 39; system TF—Rf 69; system TH—Rf 78. (Mercurous nitrate spray, black; acidified potassium permanganate solution, yellow-brown; Zwicker's reagent, pink.)**Gas Chromatography.** System GA—RI 1720; system GF—RI 2460.**High Pressure Liquid Chromatography.** System HG—k' 10.22; system HH—k' 6.19.**Ultraviolet Spectrum.** Borax buffer 0.05 M (pH 9.2)—240 nm (A₁¹ = 396 b); M sodium hydroxide (pH 13)—255 nm (A₁¹ = 303 b).**Infra-red Spectrum.** Principal peaks at wavenumbers 1695, 1752, 1265, 833, 1205, 775 (KBr disk).**Mass Spectrum.** Principal peaks at *m/z* 57, 41, 141, 167, 39, 83, 55, 182.**Dose.** Nealbarbitone has been given in doses of up to 200 mg as a hypnotic.

Nefopam

Analgesic

3,4,5,6-Tetrahydro-5-methyl-1-phenyl-1*H*-2,5-benzoxazocine
 $C_{17}H_{19}NO = 253.3$
 CAS—13669-70-0

**Nefopam Hydrochloride**

Proprietary Names. Acupan; Ajan.

$C_{17}H_{19}NO \cdot HCl = 289.8$

CAS—23327-57-3

A white crystalline powder. M.p. about 252°, with decomposition.

Soluble in water, chloroform, and methanol.

Dissociation Constant. pK_a 9.2.

Colour Tests. Liebermann's Test—brown-orange → brown; Marquis Test—orange → brown; Sulphuric Acid—orange.

Thin-layer Chromatography. System TA—Rf 50; system TB—Rf 33; system TC—Rf 32.

Gas Chromatography. System GA—RI 2000; system GF—RI 2380.

High Pressure Liquid Chromatography. System HA— k' 3.0.

Ultraviolet Spectrum. Aqueous acid—267 nm ($A_1^1 = 29$ b), 275 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 720, 760, 775, 1112, 1130, 1038 (nefopam hydrochloride).

Mass Spectrum. Principal peaks at m/z 58, 179, 180, 225, 178, 165, 42, 210.

Quantification. GAS CHROMATOGRAPHY. In plasma, saliva, or cerebrospinal fluid: sensitivity 5 ng/ml, AFID—S. F. Chang *et al.*, *J. Chromat.*, 1981, 226; *Biomed. Appl.*, 15, 79–89.

Disposition in the Body. Rapidly absorbed after oral administration. It is extensively metabolised, less than 5% of a dose being excreted unchanged in the urine; metabolites include desmethylnefopam and its *N*-glucuronide, and nefopam *N*-oxide. About 87% of a dose is excreted in the urine and about 8% in the faeces in 5 days.

Wavelength

**THERAPEUTIC CONCENTRATION.**

Following a single oral dose of 90 mg, peak blood concentrations of 0.07 to 0.15 µg/ml were reported at 1 to 3 hours (per R. C. Heel *et al.*, *Drugs*, 1980, 19, 249–267).

TOXICITY.

A postmortem blood concentration of 11.9 µg/ml was reported in a suicide due to nefopam overdose; in a second non-fatal overdose case, a plasma concentration of 3.8 µg/ml was reported 3 hours after ingestion, declining to 0.9 µg/ml at 19 hours (D. M. Piercy *et al.*, *Br. med. J.*, 1981, 283, 1508–1509).

HALF-LIFE. Plasma half-life, 3 to 8 hours (mean 4).

PROTEIN BINDING. In plasma, about 75%.

NOTE. For a review of nefopam see R. C. Heel *et al.*, *Drugs*, 1980, 19, 249–267.

Dose. 90 to 270 mg of nefopam hydrochloride daily.

Neomycin

Antibiotic

A mixture of the 2 isomers, neomycins B and C, with neomycin A (neamine), an inactive component and degradation product of neomycins B and C.

$C_{23}H_{46}N_6O_{13} = 614.6$ (neomycin B)

CAS—1404-04-2 (neomycin); 3947-65-7 (neomycin A);

119-04-0 (neomycin B); 66-86-4 (neomycin C)

Neomycin is obtained from certain selected strains of *Streptomyces fradiae*.

Neomycin Sulphate

Synonyms. Fradiomycin Sulphate; Neomycin.

Proprietary Names. It is an ingredient of many proprietary preparations—see *Martindale, The Extra Pharmacopoeia*, 28th Edn.

CAS—1405-10-3

A white to yellowish-white hygroscopic powder.

Slowly soluble 1 in 1 of water; very slightly soluble in ethanol; practically insoluble in chloroform and ether.

Neomycin Undecenoate

Synonym. Neomycin Undecylenate

Proprietary Names. It is an ingredient of Audicort.

CAS—1406-04-8

A yellowish-white to pale yellow, waxy, unctuous powder.

Practically **insoluble** in water; very soluble in ethanol; soluble in chloroform.**Thin-layer Chromatography.** *System TA*—Rf 00. (*Acidified potassium permanganate solution*, positive.)**Ultraviolet Spectrum.** No significant absorption, 230 to 360 nm.**Dose.** As an intestinal antiseptic, up to 12 g of neomycin sulphate daily, by mouth; it is also applied topically.**Neopine***Alkaloid***Synonym.** β -Codeine. It has been incorrectly called hydroxy-codeine.

4,5-Epoxy-3-methoxy-9a-methylmorphin-8-en-6-ol

 $C_{18}H_{21}NO_3 = 299.4$

CAS—467-14-1

An alkaloid obtained from opium.

Crystals. M.p. about 127°.

Slightly **soluble** in water; soluble in chloroform.**Neopine Hydrobromide** $C_{18}H_{21}NO_3 \cdot HBr = 380.3$

Crystals which darken at about 240° and decompose at about 283°.

Practically **insoluble** in water hence ease of separation from other opium alkaloids.**Colour Test.** Marquis Test—blue-violet.**Thin-layer Chromatography.** *System TA*—Rf 35; *system TB*—Rf 05; *system TC*—Rf 12. (*Acidified iodoplatinate solution*, positive.)**Gas Chromatography.** *System GA*—RI 2395.**Ultraviolet Spectrum.** Aqueous acid—285 nm ($A_1^1 = 39$ b). No alkaline shift.**Infra-red Spectrum.** Principal peaks at wavenumbers 1275, 1500, 1118, 1050, 1250, 782 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 299, 162, 229, 123, 59, 42, 44, 300.**Neostigmine Bromide***Anticholinesterase***Synonym.** Synstigmine Bromide**Proprietary Name.** Prostigmin(e) (tablets)3-(Dimethylcarbamoyloxy)-*NNN*-trimethylanilinium bromide $C_{12}H_{19}BrN_2O_2 = 303.2$

CAS—59-99-4 (neostigmine); 114-80-7 (bromide)

Colourless crystals or a white crystalline, slightly hygroscopic powder. M.p. 171° to 176°, with decomposition.

Soluble 1 in 0.5 of water, 1 in 8 of ethanol, and 1 in 5 of chloroform; practically insoluble in ether.**Neostigmine Methylsulphate****Synonym.** Proserinum**Proprietary Name.** Prostigmin(e) (injection) $C_{13}H_{22}N_2O_6S = 334.4$

CAS—51-60-5

Colourless crystals or a white crystalline powder. M.p. 144° to 149°.

Soluble 1 in 0.5 of water and 1 in 6 of ethanol.**Dissociation Constant.** pK_a 12.0.**Thin-layer Chromatography.** *System TA*—Rf 02. (*Acidified iodoplatinate solution*, positive.)**Gas Chromatography.** *System GA*—RI 1770.**High Pressure Liquid Chromatography.** *System HA*— k' 4.7 (tailing peak).**Ultraviolet Spectrum.** Aqueous acid—260 nm ($A_1^1 = 16$ a), 266 nm. No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1711, 1215, 1154, 1176, 948, 690 (KBr disk).

Mass Spectrum. Principal peaks at m/z 72, 42, 208, 108, 65, 73, 66, 39.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 50 ng/ml, AFID—K. Chan *et al.*, *J. Chromat.*, 1976, 120, 349–358.

GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In plasma: sensitivity 1 ng/ml—S.-M. Aquilonius *et al.*, *Eur. J. clin. Pharmacol.*, 1979, 15, 367–371.

Disposition in the Body. Poorly absorbed after oral administration. Metabolised by ester hydrolysis to form 3-hydroxytrimethylanilinium bromide, which is active. About 20% of an oral dose is excreted in the urine with less than 5% as unchanged drug; about 50% of an oral dose is eliminated in the faeces. After intramuscular administration, about 80% of a dose is excreted in the urine in 24 hours, with approximately 50% consisting of unchanged drug and 15% as the 3-hydroxytrimethylanilinium metabolite.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 30 mg to 3 subjects, peak plasma concentrations of 0.004 to 0.009 $\mu\text{g/ml}$ were attained in 1 to 2 hours (S.-M. Aquilonius *et al.*, *ibid.*).

Following intravenous administration of 5 mg to 5 subjects, plasma concentrations of 0.84 to 6.25 $\mu\text{g/ml}$ were reported at 2 minutes (N. E. Williams *et al.*, *Br. J. Anaesth.*, 1978, 50, 1065–1067).

HALF-LIFE. Plasma half-life, about 1 hour.

VOLUME OF DISTRIBUTION. About 1 litre/kg.

CLEARANCE. Plasma clearance, about 11 ml/min/kg.

Dose. Usually 75 to 300 mg of neostigmine bromide daily, by mouth; 1 to 2.5 mg of neostigmine methylsulphate daily, given parenterally.

Nialamide *Antidepressant (Monoamine Oxidase Inhibitor)*

Proprietary Name. Niamid(e)

2'-(2-Benzylcarbamoyl)ethyl)isonicotinohydrazide

$\text{C}_{16}\text{H}_{18}\text{N}_4\text{O}_2 = 298.3$

CAS—51-12-7

$\text{CO} \cdot \text{NH} \cdot \text{NH} \cdot \text{CH}_2 \cdot \text{CH}_2 \cdot \text{CO} \cdot \text{NH} \cdot \text{CH}_2 \cdot \text{C}_6\text{H}_5$

A white crystalline powder. M.p. 151° to 153° .

Soluble 1 in 400 of water, 1 in 40 of ethanol, 1 in 150 of chloroform, and 1 in 10 of methanol.

Partition Coefficient. Log P (octanol/pH 7.4), 0.9.

Colour Tests. Liebermann's Test—red-orange; Mandelin's Test—red; Nessler's Reagent—black.

Thin-layer Chromatography. System TA —Rf 70; system TB —Rf 02; system TC —Rf 25. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, brown.)

High Pressure Liquid Chromatography. System HA — k' 1.2 (tailing peak).

Ultraviolet Spectrum. Aqueous acid—266 nm ($A_1^1 = 193$ a); aqueous alkali—307 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1625, 1520, 1547, 698, 670, 1600 (KBr disk).

Mass Spectrum. Principal peaks at m/z 91, 177, 44, 106, 45, 78, 123, 51.

Dose. 75 to 150 mg daily.

Nicametate

Vasodilator

2-Diethylaminoethyl nicotinate

$\text{C}_{12}\text{H}_{18}\text{N}_2\text{O}_2 = 222.3$

CAS—3099-52-3

$\text{CO} \cdot \text{O} \cdot \text{CH}_2 \cdot \text{CH}_2 \cdot \text{N}(\text{C}_2\text{H}_5)_2$

A liquid.

Nicametate Citrate

Proprietary Name. Euclidan

$C_{17}H_{18}N_2O_2 \cdot C_6H_8O_7 = 414.4$

CAS—1641-74-3

A white crystalline powder.

Colour Test. Cyanogen Bromide—orange.

Thin-layer Chromatography. *System TA*—Rf 56; *system TB*—Rf 41; *system TC*—Rf 35. (*Acidified iodoplatinate solution*, positive.)

Gas Chromatography. *System GA*—nicametate RI 1608, nicotinic acid RI 1335.

Ultraviolet Spectrum. Aqueous acid—261 nm ($A_1^1 = 120$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1729, 1283, 1594, 1130, 1116, 743 (KBr disk).

Mass Spectrum. Principal peaks at m/z 86, 30, 58, 123, 78, 51, 29, 42; nicotinic acid 123, 105, 78, 51, 106, 77, 124, 50.

Disposition in the Body. Slowly hydrolysed to nicotinic acid and diethylaminoethanol.

Dose. 300 mg of nicametate citrate daily.

Nicergoline

Vasodilator

Synonyms. Nicotergoline; Nimergoline.

Proprietary Name. Sermion

10 α -Methoxy-1,6-dimethylergolin-8 β -ylmethyl 5-bromonicotinate

$C_{24}H_{26}BrN_3O_3 = 484.4$

CAS—27848-84-6

A yellowish-white crystalline powder. M.p. 136° to 138°.

Practically **insoluble** in water; soluble in ethanol and chloroform; slightly soluble in ether.

Colour Tests. Liebermann's Test—black; Mandelin's Test—violet-brown → brown; Marquis Test—blue → grey; Sulphuric Acid—violet.

Thin-layer Chromatography. *System TA*—Rf 64. (*Acidified iodoplatinate solution*, positive.)

Gas Chromatography. *System GA*—not eluted.

Ultraviolet Spectrum. Aqueous acid—286 nm; aqueous alkali—280 nm; ethanol—287 nm ($A_1^1 = 200$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1281, 751, 1718, 1306, 1075, 1103 (KBr disk).

Quantification. RADIOIMMUNOASSAY. In plasma or urine: sensitivity < 60 pg/ml—C. A. Bizollon *et al.*, *Eur. J. nucl. Med.*, 1982, 7, 318–321.

Disposition in the Body. Extensively metabolised mainly by hydrolysis and N^1 -demethylation and excreted in the urine as free and conjugated (glucuronide) metabolites.

REFERENCE. F. Arcamone *et al.*, *Biochem. Pharmac.*, 1972, 21, 2205–2213.

Dose. Usually 15 mg daily.

Niclosamide

Anthelmintic

Synonym. Phenasaie

Proprietary Names. Mansonil (vet.); Niclocide; Trédémine; Yomesan.

2',5-Dichloro-4'-nitrosalicylanilide

$C_{13}H_8Cl_2N_2O_4 = 327.1$

CAS—50-65-7

A cream-coloured powder. M.p. about 228°. Practically **insoluble** in water; soluble 1 in 150 of ethanol, 1 in 400 of chloroform, and 1 in 350 of ether; soluble in acetone.

Colour Tests. Mandelin's Test—green; Methanolic Potassium Hydroxide—yellow.

Thin-layer Chromatography. System TA—Rf 91. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous alkali—334 nm, 377 nm; methanol—333 nm ($A_1^1 = 527$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1572, 1515, 1613, 1285, 1650, 1218 (KBr disk).

Dose. Usually 2 g as a single dose.

Nicofuranose

Vasodilator

Synonyms. Tetranicotinoylfructofuranose; Tetranicotinoylfructose.

Proprietary Name. Bradilan

β -D-Fructofuranose 1,3,4,6-tetranicotinate

$C_{30}H_{24}N_4O_{10} = 600.5$

CAS—15351-13-0

A creamy-white crystalline powder. M.p. 132° to 143°. Practically **insoluble** in water; soluble 1 in 4 of chloroform and 1 in 70 of methanol; sparingly soluble in dilute solutions of hydrochloric acid and sodium hydroxide.

Colour Tests. Add 50 mg to 5 ml of *potassium cupri-tartrate solution* and heat to boiling for 1 minute—red precipitate.

Fuse 50 mg with 10 mg of 2,4-dinitrochlorobenzene, cool, add about 3 ml of ethanol and 1 ml of M sodium hydroxide—intense red-violet colour.

Thin-layer Chromatography. System TA—Rf 61; system TB—Rf 42; system TC—Rf 70. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—262 nm ($A_1^1 = 380$ b); aqueous alkali—263 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1721, 1271, 1107, 737, 1587, 1022 (KBr disk).

Mass Spectrum. Principal peaks at m/z 123, 106, 78, 51, 105, 50, 77, 52; nicotinic acid 123, 105, 78, 51, 106, 77, 124, 50.

Disposition in the Body. Slowly hydrolysed in the small intestine to nicotinic acid which is readily absorbed.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 500 mg to 27 subjects, a mean peak plasma concentration of 0.72 µg/ml was attained in 3 hours (H. A. Salmi and H. Frey, *Curr. ther. Res.*, 1974, 16, 669–674).

Dose. 1.5 to 3 g daily.

Nicotinamide

Vitamin

Synonyms. Niacinamide; Nicotinic Acid Amide; Nicotylamide; Vitamin PP.

Proprietary Names. Nicobion. It is an ingredient of Apisate and Effico.

Pyridine-3-carboxamide

$C_6H_6N_2O = 122.1$

CAS—98-92-0

A white crystalline powder or colourless crystals. M.p. 128° to 131°.

Soluble 1 in 1 of water and 1 in 1.5 of ethanol; slightly soluble in chloroform and ether.

Dissociation Constant. pK_a 3.3 (20°).

Partition Coefficient. Log P (octanol), -0.4.

Colour Tests. Cyanogen Bromide—orange; Nessler's Reagent—brown-orange.

Thin-layer Chromatography. System TA—Rf 54, streaking.

Gas Chromatography. System GA—nicotinamide RI 1436, nicotinic acid RI 1335.

Ultraviolet Spectrum. Aqueous acid—261 nm ($A_1^1 = 451$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1680, 1698, 703, 1618, 1594, 1026 (KBr disk).

Mass Spectrum. Principal peaks at m/z 122, 78, 106, 51, 50, 52, 44, 123; nicotinic acid 123, 105, 78, 51, 106, 77, 124, 50.

Disposition in the Body. It is excreted in the urine as unchanged drug, nicotinic acid, *N*-methylnicotinamide, and nicotinuric acid.

Nicotinamide is a metabolite of nikethamide.

Dose. Up to 250 mg daily.

Nicotine

Insecticide

Proprietary Name. Nicorette (anti-smoking preparation)

3-(1-Methylpyrrolidin-2-yl)pyridine

$C_{10}H_{14}N_2 = 162.2$

CAS—54-11-5

An alkaloid obtained from the dried leaves of the tobacco plant, *Nicotiana tabacum* (Solanaceae).

A colourless to pale yellow, very hygroscopic, oily liquid with an unpleasant pungent odour. It gradually becomes brown on exposure to air or light. Wt per ml about 1.01 g. B.p. 247°, with decomposition. Refractive index 1.5280.

Soluble in water, ethanol, chloroform, and ether.

Dissociation Constant. pK_a 3.2, 7.9 (25°).

Colour Test. Cyanogen Bromide—orange.

Thin-layer Chromatography. System TA—Rf 54; system TB—Rf 39; system TC—Rf 35. (*Dragendorff* spray, positive; *acidified iodoplatinate* solution, positive.)

Gas Chromatography. System GA—nicotine RI 1348, cotinine RI 1678; system GB—nicotine RI 1375, cotinine RI 1736; system GC—nicotine RI 1573, cotinine RI 2111; system GF—nicotine RI 1525, cotinine RI 2195.

High Pressure Liquid Chromatography. System HA—nicotine k' 1.1, cotinine k' 0.2.

Ultraviolet Spectrum. Aqueous acid—259 nm ($A_1^1 = 338$ a); aqueous alkali—261 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 712, 1022, 810, 1575, 1310, 1040 (thin film).

Mass Spectrum. Principal peaks at m/z 84, 133, 42, 162, 161, 105, 77, 119; cotinine 98, 176, 42, 118, 41, 119, 51, 175; nicotine-1'-N-oxide 84, 178, 161, 133, 118, —, —, —.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: detection limits in plasma, 5 ng/ml for nicotine and cotinine and 15 ng/ml for the N-oxide; detection limits in urine, 30 ng/ml for nicotine and cotinine and 100 ng/ml for the N-oxide, FID—G. Stehlich *et al.*, *J. Chromat.*, 1982, 232; *Biomed. Appl.*, 21, 295–303.

GAS CHROMATOGRAPHY (CAPILLARY COLUMN). In plasma: sensitivity 1 ng/ml for nicotine, 5 ng/ml for cotinine, AFID—K. G. Verebey *et al.*, *J. analyt. Toxicol.*, 1982, 6, 294–296.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: detection limit 2 ng/ml for nicotine or cotinine in urine, UV detection—M. P. Maskarinec *et al.*, *J. analyt. Toxicol.*, 1978, 2, 124–126.

Disposition in the Body. Readily absorbed from the gastrointestinal tract, the respiratory tract, and from intact skin, and widely distributed throughout the tissues. It is metabolised by oxidation to cotinine and nicotine-1'-N-oxide followed by further degradation to produce hydroxycotinine, norcotinine, and a ring cleavage product. About 5% is excreted unchanged in the urine in 24 hours and about 10% as cotinine; the excretion of unchanged drug is decreased if the urine is alkaline.

BLOOD CONCENTRATION.

In a group of 150 habitual smokers, nicotine concentrations in samples of plasma withdrawn 2 minutes after smoking were in the range 0.003 to 0.063 $\mu\text{g/ml}$ (mean 0.019); corresponding cotinine concentrations ranged from 0.02 to 0.26 $\mu\text{g/ml}$ (mean 0.22) (M. J. Kogan *et al.*, *J. forens. Sci.*, 1981, 26, 6–11).

TOXICITY. Nicotine is highly toxic and, in acute poisoning, death may occur within a few minutes due to respiratory failure arising from paralysis of the respiratory muscles. The lethal dose for an adult is between 40 and 60 mg. Blood concentrations greater than 5 $\mu\text{g/ml}$ may be fatal. The maximum permissible atmospheric concentration is 0.5 mg/m^3 .

In 5 adults who ingested 20 to 25 g of nicotine and died within 1 hour, postmortem blood concentrations were between 11 and 63 $\mu\text{g/ml}$ (mean 29) (R. C. Baselt and R. H. Cravey, *J. analyt. Toxicol.*, 1977, 1, 81–103).

HALF-LIFE. After inhalation or parenteral administration, plasma half-life, nicotine 0.5 to 2 hours, cotinine 6 to 16 hours (mean 11).

VOLUME OF DISTRIBUTION. About 1 to 3 litres/kg.

CLEARANCE. Plasma clearance, 10 to 30 ml/min/kg.

Nicotinic Acid

Vitamin/Vasodilator

Synonym. Niacin

Proprietary Names. Nico-400; Nicobid; Nicolar; Niconacid; Nico-Span; Nicotinex; Nicyl; Vasotherm. It is an ingredient of Equivert and Pernivit.

Pyridine-3-carboxylic acid

$\text{C}_6\text{H}_5\text{NO}_2 = 123.1$

CAS—59-67-6

White or creamy-white crystals or crystalline powder. M.p. 234° to 237°.

Soluble 1 in 55 to 1 in 60 of water and 1 in 100 of ethanol; very slightly soluble in chloroform; practically insoluble in ether; soluble in solutions of alkali hydroxides and carbonates.

Dissociation Constant. pK_a 2.0 ($-\text{N}=\text{O}$), 4.8 ($-\text{COOH}$), (25°).

Colour Test. Cyanogen Bromide—orange.

Thin-layer Chromatography. System TA—Rf 58; system TD—Rf 01; system TE—Rf 00; system TF—Rf 00.

Gas Chromatography. *System GA*—RI 1335.

Ultraviolet Spectrum. Methanol—263 nm ($A_1^1 = 229$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1300, 744, 1710, 1042, 694, 1180 (KBr disk).

Mass Spectrum. Principal peaks at m/z 123, 105, 78, 51, 106, 77, 124, 50; *N*-methylnicotinamide 78, 106, 135, 136, 51, 50, 79, 52.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: nicotinic acid and nicotinuric acid, sensitivity 500 ng/ml, UV detection—N. Hengen *et al.*, *Clin. Chem.*, 1978,

24, 1740–1743. In plasma: nicotinic acid, nicotinuric acid and nicotinamide, sensitivity 100 ng/ml, 500 ng/ml and 1 µg/ml, respectively—K. Takikawa *et al.*, *J. Chromat.*, 1982, 233; *Biomed. Appl.*, 22, 343–348.

Disposition in the Body. Readily absorbed after oral administration. Metabolised to *N*-methylnicotinamide, *N*-methyl-6-oxopyridine-3-carboxamide, *N*-methyl-4-oxopyridine-3-carboxamide, and by glycine conjugation to nicotinuric acid. It is rapidly excreted in the urine, and after administration of therapeutic doses about 34% is excreted unchanged in 6 hours. Nicotinic acid is a metabolite of nicergoline, nicotinamide, and nicotinyl tartrate.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 300 mg to 5 subjects, peak plasma concentrations of 3.5 to 18.4 µg/ml (mean 9.3) were attained in about 40 minutes (M. Lesne *et al.*, *Pharm. Acta Helv.*, 1976, 51, 367–370).

HALF-LIFE. Plasma half-life, about 0.3 to 0.8 hour.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 0.01.

NOTE. For a review of the pharmacokinetics of nicotinic acid see R. Gugler, *Clin. Pharmacokinet.*, 1978, 3, 425–439.

Dose. Up to 500 mg daily.

Nicotinyl Alcohol

Vasodilator

Synonyms. 3-Hydroxymethylpyridine; Nicotinic Alcohol; 3-Pyridinemethanol; β -Pyridylcarbinol.

3-Pyridylmethanol

$C_6H_7NO = 109.1$

CAS—100-55-0

A very hygroscopic liquid. Refractive index 1.5425.

Very **soluble** in water and ether.

Nicotinyl Tartrate

Proprietary Names. Roniacol; Ronicol; Tebarcon.

$C_6H_7NO \cdot C_4H_6O_6 = 259.2$

CAS—6164-87-0

A white crystalline powder. M.p. 146° to 149°.

Soluble in water, ethanol, and ether.

Thin-layer Chromatography. *System TA*—Rf 56; *system TB*—Rf 04; *system TC*—Rf 17. (*Dragendorff spray*, positive; *acidified iodoplatinate solution*, positive.)

Gas Chromatography. *System GA*—nicotinyl alcohol RI 1215, nicotinic acid RI 1335.

Ultraviolet Spectrum. Aqueous acid—260 nm. No alkaline shift. (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 675, 1262, 1305, 1556, 1215, 788 (KBr disk).

Mass Spectrum. Principal peaks at m/z 109, 108, 80, 53, 51, 39, 91, 27; nicotinic acid 123, 105, 78, 51, 106, 77, 124, 50.

Disposition in the Body. Nicotinyl tartrate is absorbed after oral administration and partly metabolised to nicotinic acid. It is excreted in the urine.

Dose. The equivalent of 100 to 200 mg of nicotinyl alcohol daily; up to 600 mg daily given as a sustained-release preparation.

Nicoumalone

Anticoagulant

Synonyms. Acenocoumarol; Acenocoumarin.

Proprietary Names. Sintrome; Sintrom.

4-Hydroxy-3-[1-(4-nitrophenyl)-3-oxobutyl]coumarin

$C_{19}H_{15}NO_6 = 353.3$

CAS—152-72-7

An almost white to buff-coloured powder. M.p. about 198°. Practically **insoluble** in water and ether; soluble 1 in 400 of ethanol and 1 in 200 of chloroform; soluble in solutions of alkali hydroxides.

Dissociation Constant. pK_a 4.7.

Thin-layer Chromatography. System TD—Rf 52; system TE—Rf 15; system TF—Rf 51. (Acidified iodoplatinate solution, positive; acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 1779.

Ultraviolet Spectrum. Methanol—283 nm ($A_1^1 = 640$ a), 306 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1686, 1616, 1508, 1070, 762, 1570 (KBr disk).

Mass Spectrum. Principal peaks at m/z 310, 121, 353, 311, 43, 120, 92, 296.

Quantification. GAS CHROMATOGRAPHY. In plasma: detection limit 500 pg, ECD—G. Bianchetti *et al.*, *J. Chromat.*, 1976, 124, 331–335.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: sensitivity 15 ng/ml, UV detection—F. A. de Wolff *et al.*, *J. analyt. Toxicol.*, 1980, 4, 156–159.

THIN-LAYER CHROMATOGRAPHY. In plasma: sensitivity 10 ng/ml, fluorescence detection—G. M. J. van Kempen *et al.*, *J. Chromat.*, 1978, 145; *Biomed. Appl.*, 2, 332–335.

Disposition in the Body. Readily absorbed after oral administration. It is extensively metabolised by reduction to a number of metabolites including the amino derivative, and the two diastereoisomers of 4-hydroxy-3-[1-(4-nitrophenyl)-3-hydroxybutyl]coumarin. Two further inactive metabolites, the 6-hydroxy- and 7-hydroxycoumarin derivatives have been identified in urine. About 50 to 60% of a dose is excreted in the urine in 48 hours, mostly as metabolites, with less than 1% as unchanged drug; about 30% of a dose is eliminated in the faeces.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 12 mg to 2 subjects, peak plasma-nicoumalone concentrations of 0.17 and 0.41 µg/ml were attained in 3 hours; peak concentrations of the amino metabolite of 0.28 and 0.16 µg/ml were reported after 6 to 10 hours (W. Dieterle *et al.*, *Eur. J. clin. Pharmac.*, 1977, 11, 367-375).

Following a single oral dose of 10 mg to 3 subjects, peak plasma concentrations of about 0.3 µg/ml were attained in 2 to 3 hours; the amino metabolite was not detected in plasma (H. H. W. Thijssen and L. G. Baars, *Br. J. clin. Pharmac.*, 1983, 16, 491-496).

Following oral administration of 2.5 mg twice daily to 2 subjects, steady-state plasma concentrations of 0.02 to 0.07 µg/ml were reported (G. Bianchetti *et al.*, *J. Chromat.*, 1976, 124, 331-335).

HALF-LIFE. Plasma half-life, about 8 hours.

VOLUME OF DISTRIBUTION. About 0.3 litre/kg.

CLEARANCE. Plasma clearance, about 0.5 ml/min/kg.

PROTEIN BINDING. In plasma, about 98%.

Dose. Maintenance, 1 to 8 mg daily.

Nifedipine

Anti-anginal Vasodilator

Proprietary Names. Adalat(e); Procardia.

Dimethyl 1,4-dihydro-2,6-dimethyl-4-(2-nitrophenyl)pyridine-3,5-dicarboxylate

$C_{17}H_{18}N_2O_6 = 346.3$

CAS—21829-25-4

A yellow crystalline powder. M.p. 171° to 175°.

Practically **insoluble** in water; slightly soluble in ethanol; soluble in acetone and chloroform.

Colour Tests. Methanolic Potassium Hydroxide—orange; Sulphuric Acid—orange.

Thin-layer Chromatography. *System TA*—Rf 68; *system TB*—Rf 01; *system TC*—Rf 65.

Gas Chromatography. *System GA*—RI 2170.

High Pressure Liquid Chromatography. *System HA*—k' 0.2.

Ultraviolet Spectrum. Aqueous acid—238 nm ($A_1^1 = 595$ b), 338 nm ($A_1^1 = 165$ b). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1690, 1225, 1527, 1120, 1496, 1310 (KBr disk).

Mass Spectrum. Principal peaks at m/z 329, 284, 224, 268, 330, 285, 225, 270.

Quantification. **GAS CHROMATOGRAPHY.** In plasma: nifedipine and dimethyl 2,6-dimethyl-4-(2-nitrophenyl)pyridine-3,5-dicarboxylate, detection limit 1 ng/ml, ECD—J. Dokladalova *et al.*, *J. Chromat.*, 1982, 231; *Biomed. Appl.*, 20, 451-458.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: UV detection—T. Sadanaga *et al.*, *Chem. pharm. Bull.*, 1982, 30, 3807-3809.

Disposition in the Body. Rapidly and almost completely absorbed after oral or sublingual administration. It is completely metabolised. About 70% of a dose is excreted in the urine in 24 hours as metabolites including 5-methoxycarbonyl-2,6-dimethyl-4-(2-nitrophenyl)pyridine-3-carboxylic acid, dimethyl 2,6-dimethyl-4-(2-nitrophenyl)pyridine-3,5-dicarboxylate, and 2-hydroxy-methyl-5-methoxycarbonyl-6-methyl-4-(2-nitrophenyl)pyridine-3-carboxylic acid, and its lactone derivative. Up to 15% of a dose is eliminated in the faeces as metabolites in 4 days.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 10 mg to 9 subjects, a mean peak plasma concentration of 0.07 µg/ml was attained in about 0.6 hour; in a further 3 subjects, absorption was much slower with peak plasma concentrations reported at 2 to 6 hours (T. S. Foster *et al.*, *J. clin. Pharmac.*, 1983, 23, 161-170).

Following single oral doses of 20, 40, and 60 mg to 8 hypertensive subjects, mean peak plasma concentrations of 0.06, 0.11, and 0.17 µg/ml were reported at 1.6, 2.1, and 1.8 hours, respectively (O. Banzet, *Eur. J. clin. Pharmac.*, 1983, 24, 145-150).

HALF-LIFE. Plasma half-life, about 2 to 6 hours.

VOLUME OF DISTRIBUTION. About 1 litre/kg.

CLEARANCE. Plasma clearance, about 10 ml/min/kg.

PROTEIN BINDING. In plasma, more than 90%.

Dose. 15 to 60 mg daily.

Nifenazone

Analgesic

Synonym. Nicotinylamidoantipyrine

Proprietary Names. Neopiran; Nicopyron; Nicoreumal; Reumatosil.

N-(2,3-Dimethyl-5-oxo-1-phenyl-3-pyrazolin-4-yl)nicotinamide

$C_{17}H_{16}N_4O_2 = 308.3$

CAS—2139-47-1

A pale yellow crystalline powder.
Slightly **soluble** in water and ether.

Colour Tests. Cyanogen Bromide—orange; Ferric Chloride—brown-red; Liebermann's Test (100°)—yellow.

Thin-layer Chromatography. System TA—Rf 57. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 1608.

High Pressure Liquid Chromatography. System HD— k' 0.1; system HW— k' 0.45.

Ultraviolet Spectrum. Aqueous acid—262 nm ($A_1^1 = 502$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1648, 1670, 1588, 1511, 1302, 1495 (KBr disk).

Dose. 0.5 to 1.5 g daily.

Niflumic Acid

Analgesic

Proprietary Names. Actol; Flaminon; Inflaryl; Nifluril.

2-($\alpha\alpha\alpha$ -Trifluoro-*m*-toluidino)nicotinic acid

$C_{13}H_9F_3N_2O_2 = 282.2$

CAS—4394-00-7

Crystals. M.p. 204°.

Thin-layer Chromatography. System TG—Rf 28. (Ludy Tenger reagent, orange-brown.)

Gas Chromatography. System GD—retention time of methyl derivative 1.38 relative to n -C₁₆H₃₄.

High Pressure Liquid Chromatography. System HV—retention time 0.93 relative to meclofenamic acid.

Ultraviolet Spectrum. Aqueous acid—255 nm ($A_1^1 = 471$ b), 329 nm ($A_1^1 = 202$ b); aqueous alkali—288 nm ($A_1^1 = 788$ b).

Mass Spectrum. Principal peaks at m/z 282, 236, 237, 281, 263, 145, 44, 93.

Dose. 0.5 to 1 g daily.

Nifuratel

Antimicrobial

Synonyms. Methylmercadone; Thiodinone.

Proprietary Names. Inimur; Macmiror; Omnes; Polmiror.

5-Methylthiomethyl-3-(5-nitrofurfurylideneamino)-2-oxazolidone

$C_{10}H_{11}N_3O_3S = 285.3$

CAS—4936-47-4

A yellow crystalline powder. M.p. 186° to 188°.

Practically **insoluble** in water; soluble 1 in 400 of chloroform; sparingly soluble in acetone; soluble in dimethylformamide.

Colour Tests. Methanolic Potassium Hydroxide—orange; Palladium Chloride—black.

Thin-layer Chromatography. System TA—Rf 73. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2590.

Ultraviolet Spectrum. Aqueous acid—259 nm ($A_1^1 = 452$ a), 367 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1748, 1253, 1232, 1520, 1027, 1126 (KBr disk).

Dose. 600 mg daily.

Nifursol*Antiprotozoal (Veterinary)**Proprietary Name.* Sulfuride

3,5-Dinitro-2'-(5-nitrofurfurylidene)salicylohydrazide

 $C_{12}H_7N_5O_9 = 365.2$ *CAS*—16915-70-1

A bright yellow crystalline powder. M.p. 214° to 225°, with decomposition.

Very slightly **soluble** in water, ethanol, and chloroform; soluble 1 in 350 of acetone; practically insoluble in ether; slightly soluble in methanol.

Colour Test. Methanolic Potassium Hydroxide—orange.

Thin-layer Chromatography. *System TA*—Rf 86. (Visible yellow spot; acidified potassium permanganate solution, positive.)

Gas Chromatography. *System GA*—not eluted.

Infra-red Spectrum. Principal peaks at wavenumbers 1251, 1281, 1606, 1176, 1674, 1566 (KBr disk).

Ultraviolet Spectrum. Aqueous acid—264 nm ($A_1^1 = 280$ a); aqueous alkali—256 nm, 261 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1635, 1590, 1291, 1103, 1316, 712 (KBr disk).

Nikethamide*Respiratory Stimulant*

Synonyms. Cardiamide; Diethylamide Nicotinic Acid; Nicethamidum; Nicorine; Nicotinoyldiethylamidum; Nikethylamide.

Proprietary Names. Coramin(e); Cormed; Juvacor; Kardonyl.

NN-Diethylnicotinamide

 $C_{10}H_{14}N_2O = 178.2$ *CAS*—59-26-7

A colourless or slightly yellow, oily liquid or crystalline solid. Relative density 1.060 to 1.066. F.p. 23° to 25°. B.p. 280°. Refractive index 1.524 to 1.526.

Miscible with water, ethanol, chloroform, and ether.

Dissociation Constant. pK_a 3.5 (20°).

Partition Coefficient. Log *P* (octanol), 0.3.

Colour Test. Cyanogen Bromide—orange.

Thin-layer Chromatography. *System TA*—Rf 59; *system TB*—Rf 15; *system TC*—Rf 56. (Dragendorff spray, positive; acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—nikethamide RI 1525, nicotinamide RI 1436; *system GB*—RI 1513; *system GC*—RI 1852; *system GF*—RI 1895.

Mass Spectrum. Principal peaks at m/z 106, 78, 177, 51, 178, 107, 149, 40; nicotinamide 122, 78, 106, 51, 50, 52, 44, 123.

Quantification. GAS CHROMATOGRAPHY. In canine blood or urine: FID—J. H. Lewis, *J. Chromat.*, 1979, 172, 295–302.

Disposition in the Body. Rapidly absorbed after oral or parenteral administration and metabolised by *N*-dealkylation to *N*-ethyl-nicotinamide and nicotinamide; rapidly excreted in the urine; the major urinary metabolite is *N*-ethylnicotinamide.

Dose. 0.5 to 2 g intravenously, repeated if necessary.

Nimorazole*Antiprotozoal**Synonym.* Nitrimidazine*Proprietary Names.* Acterol Forte; Esclama; Naxogin.

4-[2-(5-Nitroimidazol-1-yl)ethyl]morpholine

 $C_9H_{14}N_4O_3 = 226.2$ *CAS*—6506-37-2

A whitish crystalline powder. M.p. about 110°.

Soluble 1 in 33 of water; soluble in acetone, alcohols, chloroform, and dilute acetic acid.**Colour Test.** Dissolve 10 mg in 1 ml of methanol, add 10 ml of water, 10 ml of 6M sodium hydroxide containing 20 mg of alpha-naphthol, and 10 ml of 12M sodium hydroxide, and heat for 30 minutes on a boiling water-bath—an intense brown colour develops.**Thin-layer Chromatography.** *System TA*—Rf 57; *system TB*—Rf 03; *system TC*—Rf 44. (Acidified iodoplatinate solution, positive.)**Gas Chromatography.** *System GA*—RI 1803.**Ultraviolet Spectrum.** Aqueous acid—297 nm; aqueous alkali—305 nm.**Mass Spectrum.** Principal peaks at m/z 100, 56, 42, 101, 55, 54, 41, 30.**Dose.** Usually 2 g as a single dose.**Niridazole***Schistosomicide**Proprietary Name.* Ambilhar

1-(5-Nitrothiazol-2-yl)imidazolidin-2-one

 $C_6H_6N_4O_3S = 214.2$ *CAS*—61-57-4

A yellow crystalline powder. M.p. 260° to 264°.

Practically **insoluble** in water, ethanol, acetone, chloroform, and ether; soluble in dimethyl sulphoxide, dimethylformamide, and pyridine.**Colour Test.** Methanolic Potassium Hydroxide—yellow.**Thin-layer Chromatography.** *System TA*—Rf 54; *system TB*—Rf 01; *system TC*—Rf 44. (Visible yellow spot.)**Ultraviolet Spectrum.** Aqueous acid—239 nm; aqueous alkali—233 nm, 282 nm.**Mass Spectrum.** Principal peaks at m/z 158, 214, 57, 145, 124, 45, 70, 96.**Quantification.** GAS CHROMATOGRAPHY. In serum or urine: sensitivity 250 ng/ml, FID—J. J. Miller and R. J. Oake, *J. Chromat.*, 1977, 131, 442–443.HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: sensitivity 50 ng/ml, UV detection—J. J. Miller *et al.*, *J. Chromat.*, 1978, 147, 507–508.**Disposition in the Body.** Slowly absorbed after oral administration. It undergoes extensive first-pass metabolism in the liver to inactive metabolites. About 50% of a dose is excreted in the urine as metabolites in 48 hours; niridazole is also excreted as metabolites in bile.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 25 mg/kg, peak blood concentrations of unchanged drug of about 0.2 µg/ml were attained in about 3 hours, and peak blood concentrations of metabolites of about 5 to 10 µg/ml were reported after 6 to 9 hours (J. W. Faigle, *Acta pharmac. tox.*, 1971, 29, Suppl. 3, 233-239).

HALF-LIFE. Plasma half-life, 12 to 15 hours.

PROTEIN BINDING. In plasma, niridazole metabolites extensively bound.

Dose. 25 mg/kg daily, by mouth, up to a maximum of 1.5 g daily.

Nitrazepam*Hypnotic*

Proprietary Names. Apodorm; Dormicum; Dumolid; Mogadon; Nitrados; Noctesed; Remnos; Somnite; Surem; Unisomnia.

1,3-Dihydro-7-nitro-5-phenyl-2H-1,4-benzodiazepin-2-one

$C_{15}H_{11}N_3O_3 = 281.3$

CAS—146-22-5

A yellow crystalline powder. M.p. 226° to 230°.

Practically **insoluble** in water; soluble 1 in 120 of ethanol, 1 in 45 of chloroform, and 1 in 900 of ether.

Dissociation Constant. pK_a 3.2, 10.8 (20°).

Partition Coefficient. Log *P* (octanol/pH 7.4), 2.1.

Colour Test. Formaldehyde-Sulphuric Acid—orange.

Thin-layer Chromatography. System *TA*—Rf 68; system *TB*—Rf 00; system *TC*—Rf 36; system *TD*—Rf 35; system *TE*—Rf 59; system *TF*—Rf 45. (*Dragendorff* spray, positive; *acidified iodoplatinate* solution, positive.)

Gas Chromatography. System *GA*—nitrazepam RI 2750, 7-acetamidonitrazepam RI 3205, 7-aminonitrazepam RI 2828, 2-amino-5-nitrobenzophenone RI 2388; system *GG*—RI 3450.

High Pressure Liquid Chromatography. System *HA*— k' 0.1; system *HI*—nitrazepam k' 2.96, 7-acetamidonitrazepam k' 0.68, 7-aminonitrazepam k' 0.46; system *HK*—nitrazepam k' 1.49, 7-acetamidonitrazepam k' 1.93, 7-aminonitrazepam k' 0.00.

Ultraviolet Spectrum. Methanolic acid—280 nm ($A_1^1 = 910$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1690, 1610, 698, 1536, 745, 784 (KBr disk).

Mass Spectrum. Principal peaks at m/z 280, 253, 281, 206, 234, 252, 254, 264; 7-acetamidonitrazepam 293, 265, 264, 292, 43, 222, 223, 294; 7-aminonitrazepam 251, 222, 223, 250, 252, 195, 110, 97; 2-amino-5-nitrobenzophenone 241, 77, 242, 105, 44, 43, 195, 57.

Quantification. **SPECTROFLUORIMETRY.** In plasma or urine: nitrazepam and metabolites, sensitivity about 10 ng/ml for nitrazepam, 25 ng/ml for the sum of the 7-amino and 7-acetamido metabolites—J. Rieder, *Arzneimittel-Forsch.*, 1973, 23, 207-211.

GAS CHROMATOGRAPHY. In urine: detection limits 200 pg/ml for nitrazepam using ECD, and 50 ng/ml for metabolites using AFID—L. Kangas, *J. Chromat.*, 1979, 172, 273-278. In plasma:

comparison of two procedures using the hydrolysis product and intact drug, sensitivity 200 pg/ml and 1 ng/ml respectively, ECD—L. Kangas, *J. Chromat.*, 1977, 136, 259-270.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma, serum or whole blood: limits of detection 5 ng/ml for nitrazepam and 7-acetamidonitrazepam, 50 ng/ml for 7-aminonitrazepam, UV detection—H. Kelly *et al.*, *Clin. Chem.*, 1982, 28, 1478-1481.

RADIOIMMUNOASSAY. In plasma: sensitivity 4 ng/ml—R. Dixon *et al.*, *Life Sci.*, 1979, 25, 311-316.

Disposition in the Body. Readily absorbed after oral administration. The major metabolites, 7-aminonitrazepam and the 7-acetamido derivative accumulate to some extent in plasma. Other metabolites include 2-amino-5-nitrobenzophenone and 2-amino-3-hydroxy-5-nitrobenzophenone; all the metabolites are inactive. After oral administration, about 50 to 70% of a dose is excreted in the urine in 120 hours and up to 20% is eliminated in the faeces. Up to about 37% of a dose may be excreted in the

first 24 hours with about 5 to 10% of the dose as free 7-acetamidonitrazepam, 5% as 7-aminonitrazepam, 5% as conjugated 2-amino-3-hydroxy-5-nitrobenzophenone, and 20% as unknown acidic compounds. After intravenous administration, about 90% is excreted in the urine in 120 hours and up to about 10% is eliminated in the faeces. Only a small amount (less than 4%) is excreted as unchanged nitrazepam after oral or intravenous administration.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.03 to 0.07 µg/ml.

Following a single oral dose of 5 mg to 9 subjects, peak plasma concentrations of 0.028 to 0.045 µg/ml (mean 0.04) were attained in 0.5 to 4 hours (D. D. Breimer *et al.*, *Br. J. clin. Pharmac.*, 1977, 4, 709–711).

Following daily oral doses of 5 mg to 4 subjects, steady-state plasma-nitrazepam concentrations of 0.035 to 0.044 µg/ml (mean 0.04) were reported; combined steady-state concentrations of the 7-amino and 7-acetamido metabolites were in the range 0.018 to 0.053 µg/ml (mean 0.03) (J. Rieder and G. Wendt, *Pharmacokinetics and Metabolism of the Hypnotic Nitrazepam*, in *The Benzodiazepines*, S. Garattini, E. Mussini and L. O. Randall (Ed.), New York, Raven Press, 1973, pp. 99–127).

TOXICITY. Blood concentrations greater than 0.2 µg/ml may produce toxic effects.

In 2 fatalities due to overdoses of nitrazepam, postmortem urine concentrations of 5.9 and 6.0 µg/ml were reported; in the first case alcohol was also present at a blood concentration of 2100 µg/ml (J. S. Oliver and H. Smith, *Forens. Sci.*, 1974, 4, 183–186).

In a fatality due to ingestion of up to 250 mg of nitrazepam, postmortem blood and liver concentrations of 9 µg/ml and 4 µg/g, respectively, were reported (M. R. Loveland, *Bull. int. Ass. forens. Toxicol.*, 1974, 10 (1), 16–18).

HALF-LIFE. Plasma half-life, 18 to 38 hours (mean 28).

VOLUME OF DISTRIBUTION. About 2 to 3 litres/kg, increased in elderly subjects.

CLEARANCE. Plasma clearance, about 1 ml/min/kg.

PROTEIN BINDING. In plasma, 85 to 88%.

NOTE. For a review of the pharmacokinetics of nitrazepam see L. Kangas and D. D. Breimer, *Clin. Pharmacokin.*, 1981, 6, 346–366.

Dose. Usually 5 to 10 mg.

Nitrobenzene

Synonyms. Nitrobenzol; Oil of Mirbane.

$C_6H_5NO_2 = 123.1$

CAS—98-95-3

A pale yellow, oily liquid. Wt per ml about 1.203 g. B.p. 210° to 212°.

Practically **insoluble** in water; miscible with ethanol and ether.

Ultraviolet Spectrum. Ethanol—258 nm ($A_1^1 = 697$ b).

Mass Spectrum. Principal peaks at m/z 77, 51, 123, 50, 65, 93, 30, 78.

Nitrofurantoin

Antibacterial (Urinary)

Synonym. Furadonium

Proprietary Names. Berkfurin; Cyantin; Furadantin(e); Furadione; Furan; Furatine; Ituran; Macrodantin; Nephronex; Nifuran; Nitrex; Novofuran; Trantoin; Urantoin; Urolong. It is an ingredient of Ceduran.

1-(5-Nitrofurfurylideneamino)hydantoin

$C_8H_6N_4O_5 = 238.2$

CAS—67-20-9 (anhydrous); 17140-81-7 (monohydrate)

Yellow crystals or fine powder. It is discoloured by alkalis and by exposure to light. M.p. about 271°.

Soluble 1 in 5000 of water, 1 in 2000 of ethanol, 1 in 200 of acetone, and 1 in 16 of dimethylformamide.

Nitrofurantoin Sodium

Proprietary Name. Iবাদانتين

$C_8H_5N_4NaO_5 = 260.1$

CAS—54-87-5

A yellow to orange-coloured powder.

Dissociation Constant. pK_a 7.2 (25°).

Colour Test. Methanolic Potassium Hydroxide—yellow-orange.

Ultraviolet Spectrum. After solution in dimethylformamide and dilution with water—266 nm, 367 nm ($A_1^1 = 765$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1718, 1237, 1205, 1770, 1513, 1126 (KBr disk).

Quantification. SPECTROFLUORIMETRY. In plasma or urine—N. Watari *et al.*, *J. pharm. Sci.*, 1980, 69, 106–107.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: sensitivity 20 ng/ml, UV detection—T. B. Vree *et al.*, *J. Chromat.*, 1979, 162; *Biomed. Appl.*, 4, 110–116. In plasma or urine: aminofurantoin and cyanofurantoin, sensitivity 4 µg/ml in plasma, UV detection—B.-A. Hoener and J. L. Wolff, *J. Chromat.*, 1980, 182; *Biomed. Appl.*, 8, 246–251.

Disposition in the Body. Readily and almost completely absorbed after oral administration. About 40% of a dose is excreted in the urine unchanged in 24 hours together with small amounts of the reduced metabolite, aminofurantoin.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 50 mg to 6 fasting subjects, peak plasma concentrations of 0.29 to 0.66 µg/ml (mean 0.43) were attained in 1 to 4 hours (B.-A. Hoener and S. E. Patterson, *Clin. Pharmac. Ther.*, 1981, 29, 808–816).

HALF-LIFE. Plasma half-life, about 0.5 to 1 hour.

VOLUME OF DISTRIBUTION. About 0.6 litre/kg.

CLEARANCE. Plasma clearance, about 10 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 1.3.

PROTEIN BINDING. In plasma, about 60%.

Dose. Usually 400 mg daily.

Nitrofurazone

Antibacterial

Synonyms. Furacilinum; Nitrofurazone.

Proprietary Name. Furacin(e)

5-Nitro-2-furaldehyde semicarbazone

$C_6H_6N_4O_4 = 198.1$

CAS—59-87-0

A lemon to brownish-yellow crystalline powder which slowly darkens on exposure to light and discolours in contact with alkalis. M.p. about 236°, with decomposition.

Soluble 1 in 4200 of water and 1 in 600 of ethanol; soluble in dimethylformamide; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 10.0.

Colour Test. Methanolic Potassium Hydroxide—red.

Ultraviolet Spectrum. Aqueous acid—261 nm ($A_1^1 = 610$ b); aqueous alkali—284 nm ($A_1^1 = 475$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1023, 1250, 1200, 970, 1718, 1585 (Nujol mull).

Uses. Topically in a concentration of 0.2%; doses of 0.4 to 2 g daily have been given orally.

Nitroxoline

Antibacterial (Urinary)

Proprietary Names. Nibiol; Uro-Coli.

5-Nitroquinolin-8-ol

$C_9H_6N_2O_3 = 190.2$

CAS—4008-48-4

A yellow crystalline powder. M.p. 179° to 182°.

Sparingly **soluble** in ethanol and ether; freely soluble in alkalis and hot hydrochloric acid.

Colour Tests. Mandelin's Test—green; Methanolic Potassium Hydroxide—yellow.

Thin-layer Chromatography. System TA—Rf 13, streaking. (Visible yellow spot; acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—249 nm ($A_1^1 = 1914$ a), 293 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1504, 1277, 1307, 1189, 1149, 1565 (KBr disk).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: absorbance detection (436 nm)—R. H. A. Sorel *et al.*, *J. Chromat.*, 1981, 222; *Biomed. Appl.*, 11, 241–248.

Disposition in the Body. Readily and almost completely absorbed after oral administration. About 60% of a dose is excreted in the urine in 24 hours, mainly as conjugated nitroxoline.

REFERENCE. A. Mrhar *et al.*, *Int. J. clin. Pharmac. Biopharm.*, 1979, 17, 476–481.

Dose. 300 to 500 mg daily.

Nitroxynil*Anthelmintic (Veterinary)*

Synonym. Nitroxinil

4-Hydroxy-3-iodo-5-nitrobenzonitrile

 $C_7H_3IN_2O_3 = 290.0$

CAS—1689-89-0

A yellow powder. M.p. 136° to 139°.

Practically **insoluble** in water; soluble 1 in 120 of ethanol and 1 in 60 of ether; soluble in solutions of alkali hydroxides.**Nitroxynil (Eglumine Salt)**

Proprietary Name. Trodax

 $C_7H_3IN_2O_3 \cdot C_8H_{19}NO_5 = 499.3$

CAS—27917-82-4

Readily **soluble** in water.**Colour Tests.** Iodine Test—positive; Methanolic Potassium Hydroxide—yellow.**Thin-layer Chromatography.** System TA—Rf 83. (Acidified iodoplatinate solution, positive.)**Gas Chromatography.** System GA—RI 1754.**Ultraviolet Spectrum.** Aqueous acid—243 nm, 350 nm; aqueous alkali—271 nm ($A_1^1 = 660$ a).**Infra-red Spectrum.** Principal peaks at wavenumbers 1529, 1245, 1123, 730, 1309, 1600 (KBr disk).**Nomifensine***Antidepressant*

8-Amino-1,2,3,4-tetrahydro-2-methyl-4-phenylisoquinoline

 $C_{16}H_{18}N_2 = 238.3$

CAS—24526-64-5

M.p. 179° to 181°.

Nomifensine Maleate

Proprietary Names. Alival; Merital; Psiconizer.

 $C_{16}H_{18}N_2 \cdot C_4H_4O_4 = 354.4$

CAS—32795-47-4

A white or slightly yellowish powder. M.p. about 195°.

Soluble in dimethylformamide and methanol.**Colour Tests.** Coniferyl Alcohol—yellow; Diazotisation—red; Liebermann's Test—orange; Marquis Test—orange (slow).**Thin-layer Chromatography.** System TA—Rf 56; system TB—Rf 08; system TC—Rf 29.**Gas Chromatography.** System GA—RI 2122; system GF—RI 2670.**High Pressure Liquid Chromatography.** System HA— k' 0.9; system HF— k' 0.42.**Ultraviolet Spectrum.** Aqueous alkali—284 nm ($A_1^1 = 75$ b); methanol—241 nm ($A_1^1 = 461$ b), 292 nm ($A_1^1 = 124$ a).**Infra-red Spectrum.** Principal peaks at wavenumbers 1580, 877, 741, 1000, 708, 775 (nomifensine maleate).**Mass Spectrum.** Principal peaks at m/z 194, 195, 238, 193, 72, 178, 45, 196.**Quantification.** GAS CHROMATOGRAPHY. In plasma: detection limit 5 ng/ml, AFID—I. M. McIntyre *et al.*, *Br. J. clin. Pharmac.*, 1981, 12, 691–694.RADIOIMMUNOASSAY. In plasma: detection limit 1 ng/ml—I. M. McIntyre *et al.*, *ibid.*

Disposition in the Body. Readily absorbed after oral administration. More than 99% of the dose is excreted within 48 hours, about 96% in the urine and about 3% in the faeces. Of the material excreted in the urine, about 60% is the glucuronide conjugate of nomifensine; the metabolites found in urine include 4'-hydroxynomifensine, which is active, 4'-hydroxy-3'-methoxynomifensine, and 3'-hydroxy-4'-methoxynomifensine, each of which account for about 7% of the dose. A further four metabolites, accounting for less than 1% of the dose, have also been identified and the remaining material is present as unidentified stable conjugates. After a single dose, less than 5% is usually excreted as unchanged drug. The proportion of free nomifensine found in the urine is dependent on the urinary pH, the time and temperature of storage of the sample, and the extraction procedure, because the glucuronide is readily hydrolysed if the pH is below 7.1 and the sample is not frozen.

THERAPEUTIC CONCENTRATION. A relationship between plasma concentration and clinical effect has not been established. Nomifensine is present in plasma mainly as the glucuronide conjugate; when both free and conjugated nomifensine concentrations are required to be measured, plasma samples must be deep-frozen immediately after collection to prevent hydrolysis. Steady-state concentrations are usually achieved within 5 days.

Following a single oral dose of 100 mg to 6 male subjects, peak plasma concentrations of 0.09 to 0.18 µg/ml (mean 0.13) of free nomifensine and 2.65 to 3.68 µg/ml (mean 3.1) of total nomifensine were attained in 1 to 2 hours; after a single oral dose of 100 mg to 6 female subjects, the corresponding peak plasma concentrations were 0.03 to 0.05 µg/ml (mean 0.04), and 1.95 to 3.32 µg/ml (mean 2.6), for free and total nomifensine respectively (I. M. McIntyre *et al.*, *Br. J. clin. Pharmac.*, 1982, 13, 740-743).

Following oral administration of 25 mg three times a day to 9 subjects for 6 days, plasma concentrations of 0.005 to 0.017 µg/ml (mean 0.011) were reported 6 hours after a dose (E. Bailey *et al.*, *J. Chromat.*, 1977, 131, 347-355).

TOXICITY. Ingestion of 3.5 g has been reported without serious toxic effects.

In 26 cases of suspected overdose where the estimated mean dose was 1.15 g, there were few serious toxic reactions; of the subjects who had ingested only nomifensine, only one became comatose and all eventually recovered (S. Dawling *et al.*, *Lancet*, 1979, I, 56).

In a fatality involving the ingestion of alcohol and nomifensine, the following postmortem concentrations of nomifensine were reported: blood 17 µg/ml, kidney 141 µg/g, liver 32 µg/g, urine 400 µg/ml; a blood-alcohol concentration of 5000 µg/ml was also reported (A. F. Reyfer *et al.*, *Beitr. Gerichtl. Med.*, 1979, 37, 313-318).

HALF-LIFE. Plasma half-life, 1.5 to 4 hours, prolonged in severe renal impairment.

PROTEIN BINDING. In plasma, 60 to 75%.

NOTE. For a review of nomifensine see R. N. Brogden *et al.*, *Drugs*, 1979, 18, 1-24.

Dose. 75 to 200 mg of nomifensine maleate daily.

Noradrenaline

Sympathomimetic

Synonyms. *l*-Arterenol; Levarterenol; Norepinephrine.

(*R*)-2-Amino-1-(3,4-dihydroxyphenyl)ethanol

$C_8H_{11}NO_3 = 169.2$

CAS—51-41-2

Microcrystals. M.p. 217°, with decomposition.

Slightly **soluble** in water, ethanol, and ether.

Noradrenaline Acid Tartrate

Synonyms. Noradrenaline Tartrate; Norepinephrine Bitartrate.

Proprietary Names. Levophed; Noradrec.

$C_8H_{11}NO_3 \cdot C_4H_6O_6 \cdot H_2O = 337.3$

CAS—51-40-1 (anhydrous); 69815-49-2 (monohydrate)

A white or faintly grey, crystalline powder which darkens on exposure to air and light. M.p. 98° to 104°, with decomposition.

Soluble 1 in 2.5 of water and 1 in 300 of ethanol; practically insoluble in chloroform and ether.

Noradrenaline Hydrochloride

Proprietary Name. Arterenol

$C_8H_{11}NO_3 \cdot HCl = 205.6$

CAS—329-56-6

Crystals. M.p. about 145° to 146°.

Freely **soluble** in water.

Dissociation Constant. pK_a 8.6, 9.8, 12.0 (20°).

Colour Tests. Ammoniacal Silver Nitrate (room temperature)—black; Ferric Chloride—green; Folin-Ciocalteu Reagent—blue; Mandelin's Test—orange; Marquis Test—brown; Methanolic Potassium Hydroxide—blue → orange; Nessler's Reagent—black; Potassium Dichromate (Method 1)—green → brown (30s).

Thin-layer Chromatography. *System TA*—Rf 0.0; *system TB*—Rf 0.0; *system TC*—Rf 0.0. (Acidified potassium permanganate solution, positive.)

High Pressure Liquid Chromatography. *System HB*— k' 0.10.

Ultraviolet Spectrum. Aqueous acid—279 nm ($A_1^1 = 160$ a); aqueous alkali—296 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1265, 1293, 1216, 1200, 1066, 1137 (noradrenaline acid tartrate, KBr disk).

Mass Spectrum. Principal peaks at m/z 44, 45, 58, 76, 60, 43, 42, 46 (no peaks above 90); normetanephrine 153, 93, 30, 65, 152, 154, 125, 110.

Quantification. GAS CHROMATOGRAPHY. In plasma, erythrocytes, serum or urine: FID—H. G. Lovelady and L. L. Foster, *J. Chromat.*, 1975, 108, 43–52.

RADIOENZYMATIC ASSAY. In plasma: sensitivity 30 pg/ml—H. Hörtnagl *et al.*, *Br. J. clin. Pharmacol.*, 1977, 4, 553–558.

Disposition in the Body. Rapidly metabolised before reaching the systemic circulation and therefore ineffective after oral administration; poorly absorbed after subcutaneous injection; widely distributed throughout the body. The principal metabolic reaction is *O*-methylation catalysed by catechol-*O*-methyltransferase to form normetanephrine; this is followed by oxidative deamination catalysed by monoamine oxidase, to form 4-hydroxy-3-methoxymandelic aldehyde which is converted to 4-hydroxy-3-methoxymandelic acid (vanillylmandelic acid) and to 4-hydroxy-3-methoxyphenyl glycol; the reaction sequence also occurs in reverse, producing 3,4-dihydroxymandelic acid which is methylated to 4-hydroxy-3-methoxymandelic acid; the metabolites are conjugated with glucuronic acid or sulphate or further metabolised. Up to about 16% of an intravenous dose is excreted unchanged in the urine together with methylated and deaminated metabolites in free and conjugated forms; negligible amounts of endogenous noradrenaline are excreted in the urine in normal subjects.

Noradrenaline is a metabolite of dopamine and levodopa.

Endogenous plasma concentrations are approximately in the range 0.0001 to 0.0003 $\mu\text{g/ml}$.

Dose. Initially, the equivalent of 8 to 12 $\mu\text{g/min}$ of noradrenaline by intravenous infusion.

Norbormide

Rodenticide

5-[α -Hydroxy- α -(2-pyridyl)benzyl]-7-[α -(2-pyridyl)benzylidene]-8,9,10-trinorborn-5-ene-2,3-dicarboximide

$\text{C}_{33}\text{H}_{25}\text{N}_3\text{O}_3 = 511.6$

CAS—991-42-4

A white crystalline powder consisting of a mixture of stereoisomers. M.p. 190° to 198°.

Practically **insoluble** in water, ethanol, and ether; very slightly soluble in chloroform.

Colour Tests. Koppanyi–Zwicker Test—violet; Liebermann's Test—green-brown.

Thin-layer Chromatography. System TA—Rf 70; system TB—Rf 00; system TC—Rf 62. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2050.

Ultraviolet Spectrum. Methanolic acid—238 nm, 300 nm ($A_1^1 = 136$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1708, 701, 751, 1590, 1190, 1754 (KBr disk).

Mass Spectrum. Principal peaks at m/z 91, 58, 86, 106, 231, 45, 77, 230.

Norcodeine

Narcotic Analgesic

Synonyms. *N*-Demethylcodeine; Normorphine 3-Methyl Ether.3-*O*-Methyl-17-normorphineC₁₇H₁₉NO₃ = 285.3

CAS—467-15-2

Crystals. M.p. 185°.

Slightly **soluble** in water and ether; soluble in ethanol.**Norcodeine Hydrochloride**C₁₇H₁₉NO₃·HCl·3H₂O = 375.8

CAS—14648-14-7 (anhydrous)

Crystals. The anhydrous form decomposes at 309°.

Sparingly **soluble** in water; freely soluble in ethanol.**Dissociation Constant.** pK_a 5.7.**Colour Test.** Marquis Test—yellow → violet.

Thin-layer Chromatography. System *TA*—Rf 13; system *TB*—Rf 00; system *TC*—Rf 05. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, blue-violet; ninhydrin spray, positive.)

Gas Chromatography. System *GA*—RI 2388.

High Pressure Liquid Chromatography. System *HA*—k' 3.1 (tailing peak); system *HC*—k' 3.51.

Ultraviolet Spectrum. Aqueous acid—284 nm. No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 800, 1515, 1065, 1130, 1290, 1205 (KBr disk). Polymorphism may occur.

Mass Spectrum. Principal peaks at *m/z* 285, 81, 215, 148, 286, 164, 110, 115.

Disposition in the Body. Norcodeine is a metabolite of codeine.**Wavelength****Nordazepam**

Tranquilliser

Synonyms. Demethyldiazepam; Desmethyldiazepam; *N*-Desmethyldiazepam; Nordiazepam.

Proprietary Name. Madar

7-Chloro-1,3-dihydro-5-phenyl-2*H*-1,4-benzodiazepin-2-oneC₁₅H₁₁ClN₂O = 270.7

CAS—1088-11-5

A white or pale yellow crystalline powder. M.p. about 216°.

Practically **insoluble** in water; slightly soluble in ethanol and chloroform.**Dissociation Constant.** pK_a 3.5, 12.0.**Colour Test.** Formaldehyde-Sulphuric Acid—orange.

Thin-layer Chromatography. System *TA*—Rf 62; system *TB*—Rf 04; system *TC*—Rf 55; system *TD*—Rf 34; system *TE*—Rf 67; system *TF*—Rf 45. (Dragendorff spray, positive; acidified iodoplatinate solution, positive.)

Gas Chromatography. System *GA*—nordazepam RI 2496, oxazepam RI 2336; system *GG*—nordazepam RI 3041, oxazepam RI 2803.

High Pressure Liquid Chromatography. System *HA*—k' 0.2; system *HI*—nordazepam k' 8.00, oxazepam k' 4.62; system *HK*—nordazepam k' 1.99, oxazepam k' 0.73.

Ultraviolet Spectrum. Aqueous acid—238 nm ($A_1^1 = 1140$ b), 283 nm, 361 nm; aqueous alkali—240 nm, 340 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1680, 700, 1602, 820, 738, 790 (KBr disk).

Mass Spectrum. Principal peaks at m/z 242, 269, 270, 241, 243, 271, 244, 272; oxazepam 257, 77, 268, 239, 205, 267, 233, 259.

Quantification. See also under Diazepam.

GAS CHROMATOGRAPHY. In plasma: sensitivity 1 ng/ml, ECD—A. Viala *et al.*, *J. Chromat.*, 1978, 147, 349–357.

RADIOIMMUNOASSAY. In serum: sensitivity 3 ng/ml—R. Dixon *et al.*, *J. pharm. Sci.*, 1979, 68, 1471.

Disposition in the Body. Absorbed after oral administration, maximum blood concentrations being attained in 2 to 4 hours; bioavailability about 50%. It is metabolised to oxazepam and then to oxazepam glucuronide.

Nordazepam is a metabolite of several benzodiazepines including chlordiazepoxide, clorazepate, diazepam, medazepam, and prazepam.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 10 mg to 2 subjects, a mean peak plasma concentration of 0.17 $\mu\text{g/ml}$ was reported (G. M. Pacifici *et al.*, *Eur. J. drug Met. Pharmacokinet.*, 1982, 7, 69–72).

Following daily oral doses of 20 to 30 mg to 9 subjects for 10 days, plasma concentrations of 0.63 to 1.84 $\mu\text{g/ml}$ (mean 1.1) were reported 10 hours after a dose (G. Tognoni *et al.*, *Br. J. clin. Pharmac.*, 1975, 2, 227–232).

HALF-LIFE. The plasma half-life is very variable and values ranging from 25 to over 200 hours have been reported. Mean values which have been reported are usually in the range 40 to 100 hours in normal subjects. The plasma half-life is prolonged in elderly subjects and in subjects with liver disease.

VOLUME OF DISTRIBUTION. 0.5 to 2.5 litres/kg, increased in elderly subjects.

CLEARANCE. Plasma clearance, about 0.1 to 0.3 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 1.7.

PROTEIN BINDING. In plasma, about 97%.

Dose. Nordazepam has been given in doses of 10 mg daily.

Norethandrolone

Anabolic Steroid

Synonym. 17 α -Ethyl-19-nortestosterone

Proprietary Name. Nilevar

17 β -Hydroxy-19-nor-17 α -pregn-4-en-3-one

$\text{C}_{20}\text{H}_{30}\text{O}_2 = 302.5$

CAS—52-78-8

A white crystalline powder. M.p. about 135°.

Practically **insoluble** in water; soluble 1 in 8 of ethanol, 1 in 5 of chloroform, and 1 in 3 of methanol; very soluble in acetone; soluble in ether.

Colour Tests. Antimony Pentachloride—brown; Naphthol-Sulphuric Acid—orange, green dichroism/red-orange; Sulphuric Acid—orange (green-yellow fluorescence under ultraviolet light).

Thin-layer Chromatography. System TP—Rf 71; system TQ—Rf 20; system TR—Rf 95; system TS—Rf 78. (p-Toluenesulphonic acid solution, positive.)

Ultraviolet Spectrum. Methanol—240 nm ($A_1^1 = 565$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1650, 1263, 1612, 1210, 894, 1185 (KBr disk).

Mass Spectrum. Principal peaks at m/z 302, 57, 85, 231, 91, 110, 79, 215.

Dose. 10 to 30 mg daily.

Norethisterone*Progestational Steroid*

Synonyms. Ethinylnortestosterone; Norethindrone; Norpregneninone.

Proprietary Names. Micronor; Micronovum; Norfor; Noriday; Norlutin; Nor-QD; Primolut N; Utovlan.

Norethisterone is an ingredient of many proprietary preparations—see *Martindale, The Extra Pharmacopoeia*, 28th Edn.

17 β -Hydroxy-19-nor-17 α -pregn-4-en-20-yn-3-one

$C_{20}H_{26}O_2 = 298.4$

CAS—68-22-4

A white or creamy-white crystalline powder. M.p. 201° to 208°. Practically **insoluble** in water; soluble 1 in 150 of ethanol, 1 in 30 of chloroform, and 1 in 5 of pyridine; slightly soluble in ether.

Norethisterone Acetate

Synonym. Norethindrone Acetate

Proprietary Names. Milligynon; Norlutate; Primolut Nor; SH 420.

Norethisterone acetate is an ingredient of many proprietary preparations—see *Martindale, The Extra Pharmacopoeia*, 28th Edn.

$C_{22}H_{28}O_3 = 340.5$

CAS—51-98-9

A white or creamy-white crystalline powder. M.p. about 163°.

Practically **insoluble** in water; soluble 1 in about 12 of ethanol, 1 in 4 of acetone, 1 in less than 1 of chloroform, 1 in 2 of dioxan, and 1 in 18 of ether.

Colour Tests. Antimony Pentachloride—brown; Naphthol-Sulphuric Acid—orange/orange-brown; Sulphuric Acid—orange (orange fluorescence under ultraviolet light).

Thin-layer Chromatography. Norethisterone: *system TP*—Rf 71; *system TQ*—Rf 22; *system TR*—Rf 87; *system TS*—Rf 63, streaking may occur. Norethisterone acetate: *system TP*—Rf 87; *system TQ*—Rf 39; *system TR*—Rf 98; *system TS*—Rf 90.

Gas Chromatography. *System GA*—RI 2625.

Ultraviolet Spectrum. Ethanol—240 nm ($A_1^1 = 570$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1649, 1068, 1617, 689, 1272, 660 (KBr disk).

Mass Spectrum. Principal peaks at m/z 43, 340, 298, 325, 91, 41, 231, 280 (norethisterone acetate).

Dose. 5 to 25 mg of norethisterone or 2.5 to 15 mg of norethisterone acetate daily; doses of up to 60 mg daily have been given.

Norethynodrel*Progestational Steroid*

17 β -Hydroxy-19-nor-17 α -pregn-5(10)-en-20-yn-3-one

$C_{20}H_{26}O_2 = 298.4$

CAS—68-23-5

A white crystalline powder. M.p. about 174° to 184°.

Practically **insoluble** in water; soluble 1 in 30 of ethanol, 1 in 7 of chloroform, and 1 in 60 of ether; soluble in acetone.

Colour Tests. Antimony Pentachloride—green-brown; Naphthol-Sulphuric Acid—orange-red/brown-red; Sulphuric Acid—orange (orange fluorescence under ultraviolet light).

Dissolve 2 mg in 0.3 ml of a 0.5% solution of dinitrobenzene in ethanol and add 2 drops of *benzalkonium chloride solution*. Mix, and add 2 ml of *dilute ammonia solution*—intense violet immediately, changing to red-brown in about 5 minutes.

Thin-layer Chromatography. *System TP*—Rf 79; *system TQ*—Rf 32; *system TR*—Rf 91; *system TS*—Rf 71.

Gas Chromatography. *System GA*—RI 2551.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1066, 1690, 1729, 1140, 1008, 1242 (KBr disk).

Mass Spectrum. Principal peaks at m/z 91, 215, 79, 105, 77, 55, 41, 298.

Dose. 5 to 40 mg daily.

Norharman*Putrefactive Base*

Synonym. β -Carboline
 9H-Pyrido[3,4-b]indole
 $C_{11}H_8N_2 = 168.2$
 CAS—244-63-3

Colourless crystals. M.p. 199°.

Soluble in hot water, ethanol, and ether.

Colour Tests. Mandelin's Test—green \rightarrow yellow; Marquis Test—green.

Thin-layer Chromatography. *System TA*—Rf 64; *system TB*—Rf 00; *system TC*—Rf 30. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—247 nm ($A_1^1 = 1723$ a), 300 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1247, 731, 747, 1630, 813, 1280 (KBr disk).

Mass Spectrum. Principal peaks at m/z 168, 140, 169, 114, 141, 167, 113, 63.

Normetanephine

Synonym. Normetadrenaline

(*R*)-2-Amino-1-(4-hydroxy-3-methoxyphenyl)ethanol
 $C_9H_{13}NO_3 = 183.2$
 CAS—97-31-4

Colour Tests. Liebermann's Test—black; Mandelin's Test—green; Marquis Test—orange \rightarrow violet-brown.

Thin-layer Chromatography. *System TA*—Rf 33. (Acidified potassium permanganate solution, positive.)

High Pressure Liquid Chromatography. *System HC*— k' 1.08.

Ultraviolet Spectrum. Aqueous acid—278 nm ($A_1^1 = 85$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1529, 1162, 1250, 1037, 1290, 1123 (normetanephine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 153, 93, 30, 65, 152, 154, 125, 110.

Disposition in the Body. Normetanephine is a metabolite of noradrenaline.

Normethadone*Narcotic Analgesic*

Synonyms. Desmethylnormethadone; Phenylidimazone.

6-Dimethylamino-4,4-diphenylhexan-3-one

$C_{20}H_{25}NO = 295.4$

CAS—467-85-6

An oily liquid.

Normethadone Hydrochloride

$C_{20}H_{25}NO \cdot HCl = 331.9$

CAS—847-84-7

Crystals. M.p. 174° to 177°.

Soluble in water and ethanol.

Dissociation Constant. pK_a 9.2.

Colour Test. Mandelin's Test—yellow-green.

Thin-layer Chromatography. *System TA*—Rf 56; *system TB*—Rf 40; *system TC*—Rf 34. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 2091.

High Pressure Liquid Chromatography. *System HC*— k' 0.53.

Ultraviolet Spectrum. Aqueous acid—253 nm, 259 nm, 265 nm, 292 nm ($A_1^1 = 19$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1711, 701, 1495, 1122, 1032, 760 (KBr disk).

Mass Spectrum. Principal peaks at m/z 58, 72, 29, 42, 71, 57, 59, 224.

Normorphine

Narcotic Analgesic

Synonym. Desmethylnormorphine

(–)-(5*R*,6*S*)-4,5-Epoxymorphin-7-en-3,6-diol

$C_{16}H_{17}NO_3 = 271.3$

CAS—466-97-7

Crystals. M.p. 273° to 277°.

Slightly **soluble** in water and ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 9.8.

Partition Coefficient. Log P (ether/pH 7.0), –2.8.

Colour Tests. Mandelin's Test—grey-green; Marquis Test—violet.

Thin-layer Chromatography. System *TA*—Rf 17. (*Acidified iodoplatinate solution*, positive.)

Gas Chromatography. System *GA*—RI 2438.

High Pressure Liquid Chromatography. System *HA*— k' 2.9 (tailing peak); system *HC*— k' 3.92.

Ultraviolet Spectrum. Aqueous acid—285 nm ($A_1^1 = 57$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1312, 790, 1258, 1066, 1275, 1030 (KBr disk).

Mass Spectrum. Principal peaks at m/z 271, 81, 150, 201, 148, 110, 272, 82.

Disposition in the Body. Normorphine is a metabolite of codeine, diamorphine, and morphine.

Norpipanone

Narcotic Analgesic

4,4-Diphenyl-6-piperidinohexan-3-one

$C_{23}H_{29}NO = 335.5$

CAS—561-48-8

Norpipanone Hydrochloride

$C_{23}H_{29}NO \cdot HCl = 371.9$

Crystals. M.p. 181° to 182°.

Soluble in water and ethanol.

Colour Test. Mandelin's Test—brown → blue.

Thin-layer Chromatography. System *TA*—Rf 68; system *TB*—Rf 59; system *TC*—Rf 50. (*Dragendorff spray*, positive; *acidified iodoplatinate solution*, positive; *Marquis reagent*, dull orange.)

Gas Chromatography. System *GA*—RI 2488.

High Pressure Liquid Chromatography. System *HC*— k' 0.35.

Ultraviolet Spectrum. Aqueous acid—260 nm ($A_1^1 = 17$ b), 294 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1705, 700, 1115, 1492, 1600, 1157 (KBr disk).

Mass Spectrum. Principal peaks at m/z 98, 111, 99, 42, 55, 41, 29, 112.

Dose. Norpipanone hydrochloride has been given in doses of 18 mg daily.

Nortriptyline

Antidepressant

3-(10,11-Dihydro-5H-dibenzo[*a,d*]cyclohepten-5-ylidene)-*N*-methylpropylamine

$C_{19}H_{21}N = 263.4$

CAS—72-69-5

Nortriptyline Hydrochloride

Proprietary Names. Allegron; Altilev; Aventyl; Noritren; Nortab; Nortilen; Pamelor; Psychostyl; Sensival; Vividyl. It is an ingredient of Motipress and Motival.

$C_{19}H_{21}N \cdot HCl = 299.8$

CAS—894-71-3

A white powder. M.p. 215° to 220°.

Soluble 1 in 50 of water, 1 in 10 of ethanol, and 1 in 5 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 9.7.

Partition Coefficient. Log *P* (octanol/pH 7.4), 1.7.

Colour Tests. Mandelin's Test—brown → green; Marquis Test—orange-brown; Sulphuric Acid—orange.

Thin-layer Chromatography. System *TA*—Rf 34; system *TB*—Rf 27; system *TC*—Rf 16. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, brown.)

Gas Chromatography. System *GA*—nortriptyline RI 2210, 10-hydroxynortriptyline RI 2385.

High Pressure Liquid Chromatography. System *HA*—nortriptyline k' 2.0, 10-hydroxynortriptyline k' 1.8; system *HF*— k' 4.58.

Ultraviolet Spectrum. Aqueous acid—239 nm ($A_1^1 = 517$ a). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 756, 742, 768, 720, 775, 1590 (nortriptyline hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 44, 202, 45, 220, 218, 215, 91, —; 10-hydroxynortriptyline 44, 45, 26, 218, 215, 203, 202, 42.

Quantification. See under Amitriptyline.

Disposition in the Body. Readily absorbed after oral administration; bioavailability about 50 to 60% due to first-pass metabolism.

(3S)-6,7-Dimethoxy-3-[(5R)-5,6,7,8-tetrahydro-4-methoxy-6-methyl-1,3-dioxolo[4,5-g]isoquinolin-5-yl]phthalide
 $C_{22}H_{23}NO_7 = 413.4$
 CAS—128-62-1

The main metabolic reactions are *N*-demethylation and 10-hydroxylation; glucuronide conjugation of nortriptyline and its metabolites also occurs. Up to 60% of the daily dose is excreted in the urine within 24 hours, with less than 5% as unchanged drug, 30 to 50% as free or conjugated 10-hydroxynortriptyline, 6 to 15% as free and conjugated 10-hydroxydinortriptyline, and about 1% as dinortriptyline.

Nortriptyline is a metabolite of amitriptyline.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.05 to 0.15 µg/ml. Plasma concentrations vary considerably between individuals and are influenced by exposure to other drugs.

Following a single oral dose of 100 mg to 10 subjects, peak plasma concentrations of 0.015 to 0.050 µg/ml (mean 0.03) of nortriptyline and 0.039 to 0.172 µg/ml (mean 0.10) of 10-hydroxynortriptyline were attained in 3 to 24 hours (S. Nakano and L. E. Hollister, *Clin. Pharmac. Ther.*, 1978, 23, 199–203).

Following average daily oral doses of 82 mg to 62 subjects, the following steady-state plasma concentrations were reported: nortriptyline 0.03 to 0.34 µg/ml (mean 0.12), 10-hydroxynortriptyline 0.04 to 0.42 µg/ml (mean 0.16), conjugated 10-hydroxynortriptyline 0.075 to 1.07 µg/ml (mean 0.37) (S. Dawling *et al.*, *Clin. Pharmac. Ther.*, 1982, 32, 322–329).

TOXICITY. Relatively few cases of serious intoxication have been attributed to nortriptyline in comparison to the tertiary amine tricyclic antidepressants. Toxic effects are usually associated with blood concentrations greater than 0.25 µg/ml and concentrations above 1 µg/ml may produce coma. Recovery has occurred after the ingestion of 2.5 g.

The following distribution was reported in 9 fatal cases: blood 0 to 26 µg/ml (mean 11, 3 cases), kidney 7 to 94 µg/g (mean 43, 5 cases), liver 8 to 220 µg/g (mean 90, 9 cases), urine 25 to 120 µg/ml (mean 76, 4 cases) (R. Bonnicksen *et al.*, *Z. Rechtsmed.*, 1970, 67, 190–200).

HALF-LIFE. Plasma half-life, 15 to 90 hours (mean 30).

VOLUME OF DISTRIBUTION. 14 to 40 litres/kg (mean 23).

PROTEIN BINDING. In plasma, 90 to 95%.

NOTE. For a review of tricyclic antidepressants see G. Molnar and R. N. Gupta, *Biopharm. Drug Disp.*, 1980, 1, 283–305.

Dose. The equivalent of 30 to 100 mg of nortriptyline daily.

Noscapine

Cough Suppressant

Synonyms. Narcotine; L- α -Narcotine.

Proprietary Names. Longatin; Noscatuss; Tusscapine. It is an ingredient of Extil.

An alkaloid obtained from opium.

Colourless crystals or a fine white crystalline powder. M.p. 174° to 176°, with decomposition.

Practically **insoluble** in water; slightly soluble in ethanol and ether; soluble in acetone and chloroform.

Noscapine Hydrochloride

Proprietary Names. Narcotussin; Noscapect. It is an ingredient of Triotussic.

$C_{22}H_{23}NO_7 \cdot HCl \cdot H_2O = 467.9$

CAS—912-60-7 (anhydrous)

Hygroscopic, colourless crystals or a fine white crystalline powder. M.p. about 200°, with decomposition.

Soluble 1 in 4 of water and 1 in 8 of ethanol; freely soluble in chloroform; practically insoluble in ether. Aqueous solutions may deposit the base on standing.

Dissociation Constant. pK_a 6.2 (20°).

Colour Tests. Liebermann's Test—black; Marquis Test—blue-violet (fades).

Thin-layer Chromatography. System TA—Rf 64; system TB—Rf 22; system TC—Rf 74. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 3120.

High Pressure Liquid Chromatography. System HA— k' 0.3; system HC— k' 0.15; system HS— k' 0.01.

Ultraviolet Spectrum. Aqueous acid—290 nm, 312 nm ($A_1^1 = 84$ a); aqueous alkali—281 nm, 315 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1745, 1276, 1038, 1010, 1498, 1080 (KBr disk).

Mass Spectrum. Principal peaks at m/z 220, 221, 205, 147, 42, 193, 77, 118.

Quantification. SPECTROFLUORIMETRY. In plasma or urine: sensitivity 50 ng/ml—S. Vedso, *Acta pharmac. tox.*, 1961, 18, 119–128.

Disposition in the Body. Rapidly absorbed after oral administration; bioavailability about 30%. About 1% of a dose is excreted in the urine in 6 hours as free and conjugated nescapine.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 150 mg to 5 subjects, peak plasma concentrations of 0.20 to 0.35 µg/ml (mean 0.27) were attained in 0.5 to 2.5 hours (B. Dahlström *et al.*, *Eur. J. clin. Pharmac.*, 1982, 22, 535–539).

HALF-LIFE. Plasma half-life, 1.5 to 4 hours (mean 2.5).

VOLUME OF DISTRIBUTION. 3 to 7 litres/kg (mean 5).

CLEARANCE. Plasma clearance, about 20 ml/min/kg.

REFERENCE. B. Dahlström *et al.*, *ibid.*

Dose. Usually 45 to 120 mg daily.

Noxiptyline

Antidepressant

Synonyms. Dibenzoxine; Noxiptiline.

10,11 - Dihydro - 5H - dibenzo[*a,d*]cyclohepten - 5 - one O-(2-methylaminoethyl)oxime

$C_{19}H_{22}N_2O = 294.4$

CAS—3362-45-6

Soluble in chloroform.

Noxiptyline Hydrochloride

Proprietary Names. Agedal; Nogédal.

$C_{19}H_{22}N_2O \cdot HCl = 330.9$

CAS—4985-15-3

A white crystalline powder. M.p. 189° to 191°.

Soluble in water.

Colour Test. Liebermann's Test—black.

Thin-layer Chromatography. System TA—Rf 53; system TB—Rf 43; system TC—Rf 35. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2267.

High Pressure Liquid Chromatography. System HF— k' 1.63.

Ultraviolet Spectrum. Aqueous acid—250 nm ($A_1^1 = 477$ a).

No alkaline shift.

Mass Spectrum. Principal peaks at m/z 58, 71, 208, 72, 59, 42, 89, 57.

Quantification. GAS CHROMATOGRAPHY. In plasma, urine or tablets: detection limit 100 ng/ml, AFID—E. Szyszko and W. Wejman, *J. Chromat.*, 1981, 219, 291–296.

Dose. The equivalent of 10 to 200 mg of noxiptyline daily.

Noxythiolin

Antibacterial/Antifungal

Synonym. Noxytiolin

Proprietary Name. Noxyflex 'S'

1-Hydroxymethyl-3-methyl-2-thiourea

$C_3H_8N_2OS = 120.2$

CAS—15599-39-0

A white crystalline powder. Decomposes between 88° and 90°.

Soluble 1 in 10 of water; soluble in chloroform.

Colour Test. Palladium Chloride—brown.

Thin-layer Chromatography. System TA—Rf 74. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 2370.

Ultraviolet Spectrum. Methanol—244 nm ($A_1^1 = 1180$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1558, 1042, 1230, 987, 1026, 1517 (KBr disk).

Use. In concentrations of 1 to 2.5%.

Nystatin

Antifungal

Synonyms. Fungicidin; Nistatina.

Proprietary Names. Nyspes; Nystan; Nystavescent.

Nystatin is an ingredient of many proprietary preparations—see *Martindale, The Extra Pharmacopoeia*, 28th Edn.

CAS—1400-61-9

A mixture of antifungal polyenes produced by the growth of certain strains of *Streptomyces noursei*, or by any other means. It consists largely of nystatin A_1 . Approximate molecular formula: $C_{47}H_{75}NO_{17} = 926.1$.

A yellow to light brown, hygroscopic powder.

Very slightly **soluble** in water; sparingly soluble in ethanol; practically insoluble in chloroform and ether; freely soluble in dimethylformamide and formamide.

Gas Chromatography. *System GA*—RI 1945.

Ultraviolet Spectrum. Aqueous alkali—291 nm ($A_1^1 = 405$ b), 305 nm ($A_1^1 = 600$ b), 319 nm ($A_1^1 = 530$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1067, 1000, 1570, 1175, 1316, 847 (Nujol mull).

Uses. Topically in preparations containing 100 000 units per g; orally in doses of 1 500 000 to 4 000 000 units daily.

Obidoxime Chloride

Cholinesterase Reactivator

Proprietary Name. Toxogonin

1,1' - (Oxydimethylene)bis(4 - hydroxyiminomethylpyridinium) dichloride

$C_{14}H_{16}Cl_2N_4O_3 = 359.2$

CAS—7683-36-5 (obidoxime); 114-90-9 (chloride)

White crystals, occurring in two interchangeable isomeric forms. M.p. 225°, with decomposition.

Freely **soluble** in water; slightly soluble in ethanol and methanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 7.6, 8.3 (25°).

Colour Tests. Mandelin's Test—green → blue; Methanolic Potassium Hydroxide—orange.

Thin-layer Chromatography. *System TA*—Rf 01. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—285 nm ($A_1^1 = 947$ a); aqueous alkali—353 nm ($A_1^1 = 1440$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 996, 1090, 1637, 1600, 1282, 847 (KBr disk).

Quantification. POLAROGRAPHY. In serum or urine: sensitivity 4 µg/ml—Z. Korićanac *et al.*, *Acta pharm. jugosl.*, 1982, 32, 297–302.

Disposition in the Body. Poorly absorbed after oral administration. After intramuscular administration, more than 80% of a dose is excreted unchanged in the urine in 24 hours.

THERAPEUTIC CONCENTRATION.

Following intramuscular doses of 2.5 to 10 mg/kg to 10 subjects, peak plasma concentrations of 6.3 to 26.5 µg/ml were attained in about 20 minutes (F. R. Sidell and W. A. Groff, *J. pharm. Sci.*, 1970, 59, 793–797).

HALF-LIFE. Plasma half-life, about 1.4 hours.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 1.9.

Dose. Obidoxime chloride has been given parenterally in doses of 250 mg.

Octamylamine*Antispasmodic**Synonym.* Octisamyl*N*-Isopentyl-1,5-dimethylhexamine $C_{13}H_{29}N = 199.4$ *CAS*—502-59-0

An oily liquid.

Octamylamine Hydrochloride*Proprietary Name.* Octometine $C_{13}H_{29}N \cdot HCl = 235.8$ *CAS*—5964-56-7

White crystals. M.p. 121°.

Soluble in water, ethanol, and ether.**Thin-layer Chromatography.** *System TA*—Rf 22; *system TB*—Rf 28; *system TC*—Rf 11. (Acidified iodoplatinate solution, positive.)**Gas Chromatography.** *System GA*—RI 1303.**Mass Spectrum.** Principal peaks at m/z 30, 44, 41, 45, 86, 55, 43, 69.**Dose.** Octamylamine hydrochloride is given in doses of 100 to 200 mg.**Octaphonium Chloride***Cationic Disinfectant**Synonym.* Phenocide

Benzyl-diethyl{2-[4-(1,1,3,3-tetramethylbutyl)phenoxy]ethyl}-ammonium chloride monohydrate

 $C_{27}H_{42}ClNO \cdot H_2O = 450.1$ *CAS*—15687-40-8 (anhydrous)

A white crystalline powder.

Soluble 1 in 5 of water; soluble in ethanol and chloroform.**Colour Tests.** Liebermann's Test—black; Mandelin's Test—violet-brown; Marquis Test—grey-brown; Sulphuric Acid—grey-brown.**Thin-layer Chromatography.** *System TA*—Rf 15, streaking. (Dragendorff spray, positive.)**Gas Chromatography.** *System GA*—RI 2013.**Ultraviolet Spectrum.** Aqueous acid—269 nm ($A_1^1 = 32$ a), 274 nm, 281 nm; ethanol—263 nm ($A_1^1 = 25$ b), 269 nm ($A_1^1 = 30$ b), 274 nm ($A_1^1 = 29$ b), 282 nm ($A_1^1 = 25$ b).**Infra-red Spectrum.** Principal peaks at wavenumbers 1240, 840, 760, 1515, 708, 1185 (Nujol mull).**Octatropine Methylbromide***Anticholinergic**Synonyms.* Anisotropine Methobromide; Anisotropine Methylbromide.*Proprietary Name.* Valpin(1*R*,3*r*,5*S*)-8-Methyl-3-(2-propylvaleryloxy)tropanium bromide $C_{17}H_{32}BrNO_2 = 362.3$ *CAS*—80-50-2

A white, glistening, hygroscopic powder. M.p. 329°.

Soluble in water; freely soluble in ethanol and chloroform; practically insoluble in ether.**Thin-layer Chromatography.** *System TA*—Rf 02. (Acidified iodoplatinate solution, positive.)**Infra-red Spectrum.** Principal peaks at wavenumbers 1735, 1155, 1178, 1040, 1237, 1203 (KBr disk).**Dose.** 30 to 150 mg daily.**Oestradiol***Oestrogen**Synonyms.* Beta-oestradiol; Dihydrofolliculine; Dihydrotheelin; Dihydroxyoestrin; Estradiol.*Proprietary Names.* Estrace; Farmacyrol; Gynosteryl; Oestrogel; Progynon. It is an ingredient of Hormonin and Trisequens.

Estra-1,3,5(10)-triene-3,17 β -diol
 $C_{18}H_{24}O_2 = 272.4$
 CAS—50-28-2

White or creamy-white, hygroscopic crystals or crystalline powder. M.p. 173° to 179°.

Practically **insoluble** in water; soluble 1 in 28 of ethanol, 1 in 17 of acetone, 1 in 435 of chloroform, and 1 in 150 of ether; soluble in dioxan and solutions of alkali hydroxides.

Oestradiol Benzoate

Synonyms. Estradiol Benzoate; Oestradiol Monobenzoate.

Proprietary Names. Benzo-Gynoestryl 5; Benztrone; Gynécormone; Oestramine; Ovocylin M; Progynon B. It is an ingredient of Mixogen (injection) and Plex-Hormone (injection).

$C_{25}H_{28}O_3 = 376.5$

CAS—50-50-0

Colourless crystals or white or creamy-white crystalline powder. M.p. 190° to 198°.

Practically **insoluble** in water; slightly soluble in ethanol; soluble 1 in 5 of chloroform and 1 in 150 of ether; soluble in dioxan.

Oestradiol Cypionate

Synonyms. Estradiol Cypionate; Oestradiol Cyclopentylpropionate.

Proprietary Names. Depo-Estradiol Cypionate; Neoginon Depositum.

$C_{26}H_{36}O_3 = 396.6$

CAS—313-06-4

A white crystalline powder. M.p. 149° to 153°.

Practically **insoluble** in water; soluble 1 in 40 of ethanol and 1 in 7 of chloroform; soluble in acetone and dioxan; very slightly soluble in ether.

Oestradiol Undecanoate

Synonym. Estradiol Undecylate

Proprietary Names. Progynon Depot; Progynon-Retard.

$C_{29}H_{44}O_3 = 440.7$

CAS—33613-02-4

Oestradiol Valerate

Synonym. Estradiol Valerate

Proprietary Names. Delestrogen; Femogex; Östrogynol sine; Primogyn Depot; Progynon Depot; Progynova. It is an ingredient of Cyclacur and Cyclo-Progynova.

$C_{23}H_{32}O_3 = 356.5$

CAS—979-32-8

A white crystalline powder. M.p. 143° to 150°.

Practically **insoluble** in water; soluble in dioxan and methanol.

Colour Tests. Antimony Pentachloride—brown; Liebermann's Test—black; Naphthol-Sulphuric Acid—blue-green, yellow dichroism/orange; Sulphuric Acid—yellow (green fluorescence under ultraviolet light).

Thin-layer Chromatography. Oestradiol benzoate: *system TP*—Rf 79; *system TQ*—Rf 32; *system TR*—Rf 96; *system TS*—Rf 79.

Gas Chromatography. *System GA*—RI 2659.

Ultraviolet Spectrum. Oestradiol benzoate: ethanol—231 nm ($A_1^1 = 490$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1245, 1054, 1227, 1493, 1276, 821 (KBr disk).

Dose. Up to 2 mg daily, by mouth.

Oestriol

Oestrogen

Synonyms. Estriol; Theelol.

Proprietary Names. Hormomed; Ovestin. It is an ingredient of Hormonin and Trisequens.

Estra-1,3,5(10)-triene-3,16 α ,17 β -triol

$C_{18}H_{24}O_3 = 288.4$

CAS—50-27-1

A white crystalline powder. M.p. about 280°.

Practically **insoluble** in water; soluble 1 in about 500 of ethanol; soluble in acetone, chloroform, dioxan, and ether.

Dissociation Constant. pK_a 10.4.

Colour Tests. Antimony Pentachloride—brown; Liebermann's Test—black; Naphthol-Sulphuric Acid—green, yellow dichroism/orange; Sulphuric Acid—no initial colour (yellow-green fluorescence under ultraviolet light).

Gas Chromatography. *System GA*—RI 2970.

Ultraviolet Spectrum. Ethanol—280 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1228, 1067, 917, 1147, 1250, 1605 (Nujol mull).

Dose. 0.25 to 1 mg daily.

Oestrone

Oestrogen

Synonyms. Estrone; Folliculin; Ketohydroxyoestrin.

Proprietary Names. Cristallovir; Femogen; Kolpon; Oestrilin (vaginal preparations). It is an ingredient of Hormonin.

3-Hydroxyestra-1,3,5(10)-trien-17-one

$C_{18}H_{22}O_2 = 270.4$

CAS—53-16-7

Colourless crystals or white to creamy-white crystalline powder. M.p. about 260°, with decomposition.

Practically **insoluble** in water; soluble 1 in 250 of ethanol and 1 in 110 of chloroform; soluble in dioxan; slightly soluble in ether.

Colour Tests. Antimony Pentachloride—brown; Liebermann's Test—black; Naphthol-Sulphuric Acid—green, yellow dichroism/orange; Sulphuric Acid—green-yellow (green fluorescence under ultraviolet light).

Gas Chromatography. *System GA*—RI 2612.

Ultraviolet Spectrum. Methanol—280 nm ($A_1^1 = 78$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1282, 820, 1709, 1244, 921, 1493.

Dose. Oestrone has been given in doses of 0.1 to 5 mg daily by intramuscular injection.

Oleandomycin*Antibiotic**Proprietary Name.* Triolmicina $C_{35}H_{61}NO_{12}$ = 687.9*CAS*—3922-90-5An antimicrobial substance produced by the growth of *Streptomyces antibioticus*.

A white amorphous powder.

Moderately **soluble** in water; freely soluble in ethanol, acetone, and methanol.**Oleandomycin Phosphate** $C_{35}H_{61}NO_{12} \cdot H_3PO_4$ = 785.9*CAS*—7060-74-4

A white crystalline powder.

Soluble 1 in 2.5 of water and 1 in 3 of ethanol; slightly soluble in ether.**Colour Tests.** Mandelin's Test—green; Marquis Test—green.**Thin-layer Chromatography.** *System TA*—Rf 45. (Acidified potassium permanganate solution, positive.)**Ultraviolet Spectrum.** Aqueous acid—242 nm ($A_1^1 = 7$ b).**Infra-red Spectrum.** Principal peaks at wavenumbers 1111, 1052, 1075, 1010, 1162, 1190 (oleandomycin phosphate).**Dose.** Oleandomycin phosphate has been given in doses of 1 to 2 g daily.**Opipramol***Antidepressant*2-[4-[3-(5*H*-Dibenz[*b,f*]azepin-5-yl)propyl]piperazin-1-yl]-ethanol $C_{23}H_{29}N_3O$ = 363.5*CAS*—315-72-0

Crystals. M.p. 100° to 101°.

Opipramol Hydrochloride*Proprietary Name.* Insidon $C_{23}H_{29}N_3O \cdot 2HCl$ = 436.4*CAS*—909-39-7

A light yellow, crystalline powder which develops a reddish tinge on prolonged exposure to light. M.p. about 210°, with decomposition.

Very **soluble** in water; soluble in ethanol.**Dissociation Constant.** pK_a 3.8.**Colour Tests.** Forrest Reagent—blue; Mandelin's Test—yellow-green.**Thin-layer Chromatography.** *System TA*—Rf 54; *system TB*—Rf 06; *system TC*—Rf 22. (Acidified iodoplatinate solution, positive.)**High Pressure Liquid Chromatography.** *System HA*— k' 2.2; *system HF*— k' 1.63.**Ultraviolet Spectrum.** Aqueous acid—253 nm ($A_1^1 = 870$ a). No alkaline shift.**Infra-red Spectrum.** Principal peaks at wavenumbers 755, 1155, 790, 1237, 1115, 1126 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 363, 206, 143, 42, 70, 207, 218, 113.**Quantification.** DOUBLE RADIOISOTOPE TECHNIQUE. In biological samples—W. Riess, *Analytica chim. Acta*, 1977, 88, 109–115.**Disposition in the Body.** Readily absorbed after oral administration.**TOXICITY.**Somnolence was reported in a 27-year-old subject following an overdose of opipramol; a maximum serum concentration of 0.115 μg/ml was determined; ethanol was also detected (O. L. Pedersen *et al.*, *Eur. J. clin. Pharmac.*, 1982, 23, 513–521).**Dose.** 150 to 300 mg of opipramol hydrochloride daily.

Orciprenaline

Sympathomimetic

Synonym. Metaproterenol

 (\pm) -1-(3,5-Dihydroxyphenyl)-2-isopropylaminoethanol $C_{11}H_{17}NO_3 = 211.3$

CAS—586-06-1

Crystals. M.p. 100°.

Orciprenaline Sulphate

Proprietary Names. Alupent; Dosalupent; Metaprel.

 $(C_{11}H_{17}NO_3)_2 \cdot H_2SO_4 = 520.6$

CAS—5874-97-5

A white crystalline powder. M.p. about 205°.

Soluble 1 in 2 of water and 1 in 1 of ethanol; practically insoluble in chloroform and ether.**Dissociation Constant.** pK_a 9.0 (—OH), 10.1 (—NH—), 11.4 (—OH), (25°).**Colour Tests.** *p*-Dimethylaminobenzaldehyde—orange/violet; Folin-Ciocalteu Reagent—blue; Marquis Test—yellow; Potassium Dichromate (Method 1)—brown (slow).**Thin-layer Chromatography.** *System TA*—Rf 48; *system TB*—Rf 01; *system TC*—Rf 03. (Acidified potassium permanganate solution, positive.)**Gas Chromatography.** *System GA*—not eluted.**Ultraviolet Spectrum.** Aqueous acid—276 nm ($A_1^1 = 89$ a); aqueous alkali—297 nm ($A_1^1 = 155$ a).**Infra-red Spectrum.** Principal peaks at wavenumbers 1086, 1173, 1605, 1010, 1305, 995 (orciprenaline sulphate, KBr disk).**Mass Spectrum.** Principal peaks at m/z 72, 43, 73, 41, 70, 65, 40, 39.**Dose.** 80 mg of orciprenaline sulphate daily.**Orphenadrine**

Anticholinergic

Synonyms. Mephenamine; Orphenadin.

NN-Dimethyl-2-(2-methylbenzhydryloxy)ethylamine $C_{18}H_{23}NO = 269.4$

CAS—83-98-7

A liquid.

Orphenadrine Citrate

Proprietary Names. Norflex; Tega-Flex; X-Otag. It is an ingredient of Norgesic.

 $C_{18}H_{23}NO \cdot C_6H_8O_7 = 461.5$

CAS—4682-36-4

A white crystalline powder. M.p. 134° to 138°.

Soluble 1 in 70 of water; slightly soluble in ethanol; practically insoluble in chloroform and ether.**Orphenadrine Hydrochloride**

Proprietary Names. Biorphen; Disipal.

 $C_{18}H_{23}NO \cdot HCl = 305.8$

CAS—341-69-5

A white crystalline powder. M.p. 159° to 162°.

Soluble 1 in 1 of water, 1 in 1 of ethanol, and 1 in 2 of chloroform; practically insoluble in ether.**Dissociation Constant.** pK_a 8.4.**Partition Coefficient.** Log *P* (heptane), 1.5.**Colour Tests.** Mandelin's Test—orange; Marquis Test—yellow-orange; Sulphuric Acid—orange.**Thin-layer Chromatography.** *System TA*—Rf 55; *system TB*—Rf 48; *system TC*—Rf 33. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, yellow.)**Gas Chromatography.** *System GA*—orphenadrine RI 1936, *N*-monodesmethylorphenadrine RI 1920; *system GF*—RI 2185.**High Pressure Liquid Chromatography.** *System HA*—orphenadrine k' 3.0, *N*-monodesmethylorphenadrine k' 1.7, orphenadrine *N*-oxide k' 1.1 (tailing peak).**Ultraviolet Spectrum.** Aqueous acid—258 nm, 264 nm ($A_1^1 = 24$ a). No alkaline shift. (See below)**Infra-red Spectrum.** Principal peaks at wavenumbers 1718, 1216, 1108, 1285, 1585, 1265 (orphenadrine citrate, KBr disk). (See below)**Mass Spectrum.** Principal peaks at m/z 58, 73, 44, 45, 165, 42, 40, 181 (no peaks above 200); *N*-monodesmethylorphenadrine 44, 59, 165, 166, 181, 179, 178, 43; orphenadrine *N*-oxide 58, 181, 43, 45, 60, 44, 165, 73.**Quantification.** GAS CHROMATOGRAPHY. In plasma or urine: orphenadrine and metabolites, sensitivity 10 ng/ml, AFID—J. J. M. Labout *et al.*, *J. Chromat.*, 1977, 144, 201–208. In postmortem tissues: FID—L. F. Wilkinson *et al.*, *J. analyt. Toxicol.*, 1983, 7, 72–75.**Disposition in the Body.** Readily absorbed after oral administration and rapidly distributed. Up to about 60% of an oral dose is excreted in the urine in 3 days. During 24 hours after dosage, under uncontrolled conditions, about 4% of a dose is excreted as unchanged drug, about 5% as *N*-monodesmethylorphenadrine (tofenacin), about 3% as *NN*-didesmethylorphenadrine, about

3% as orphenadrine *N*-oxide, about 8% as a conjugate of 2-methylbenzhydroxyacetic acid, and about 6% as a conjugate of 2-methylbenzhydrol. The urinary excretion appears to be dependent on urinary pH.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.1 to 0.2 µg/ml.

TOXICITY. The lethal dose is estimated to be in excess of about 2 g. Blood concentrations greater than about 0.5 µg/ml may cause toxic reactions and concentrations greater than 5 µg/ml may be lethal.

In a survey of 9 fatalities attributed to orphenadrine overdose, blood concentrations ranged from 1.1 to 37 µg/ml (mean 15); in 5 cases the bile

concentration was 85 to 234 µg/ml (mean 150), and in 7 cases the urine concentration was 3 to 122 µg/ml (mean 53). In one case in which a more complete analysis was reported, the concentrations were: blood 33 µg/ml, bile 202 µg/ml, brain 3.3 µg/g, kidney 15 µg/g, liver 23 µg/g, lung 19.5 µg/g, spleen 26.5 µg/g (A. E. Robinson *et al.*, *Forens. Sci.*, 1977, 9, 53–62). In a fatality due to an orphenadrine overdose in which death occurred within 2.5 hours of ingestion, the following postmortem concentrations were reported: blood 18.1 µg/ml, liver 242 µg/g, urine 7 µg/ml (L. F. Wilkinson *et al.*, *J. analyt. Toxicol.*, 1983, 7, 72–75).

HALF-LIFE. Plasma half-life, about 14 hours.

PROTEIN BINDING. In plasma, about 20%.

Dose. 150 to 400 mg of orphenadrine hydrochloride daily.

Ouabain

Cardiac Glycoside

Synonyms. G-Strophanthin; Strophanthin-G; Strophanthinum; Strophanthoside-G; Uabaina; Ubaína.

Proprietary Names. Ouabaine Arnaud; Purostrophan; Strodival; Stroperm.

3β-(α-L-Rhamnopyranosyloxy)-1β,5,11α,14,19-pentahydroxy-5β,14β-card-20(22)-enolide octahydrate

$C_{29}H_{44}O_{12} \cdot 8H_2O = 728.8$

CAS—630-60-4 (anhydrous); 11018-89-6 (octahydrate)

A glycoside obtained from the seeds of *Strophanthus gratus* or from the wood of *Acokanthera schimperi* or *A. ouabaio* (Apocynaceae).

Colourless crystals or white crystalline powder. M.p. about 190°, with decomposition.

Slowly **soluble** 1 in 75 of water; soluble 1 in 100 of ethanol and 1 in 30 of methanol; practically insoluble in chloroform and ether.

Colour Test. Sulphuric Acid—orange-brown (slow).

Thin-layer Chromatography. *System TK*—Rf 0.9. (*Perchloric acid solution*, followed by examination under ultraviolet light, yellow-green fluorescence; *p-anisaldehyde reagent*, yellow.)

Mass Spectrum. Principal peaks at *m/z* 183, 43, 29, 60, 41, 129, 91, 73.

Quantification. **RADIOIMMUNOASSAY.** In plasma or urine: sensitivity 50 pg/ml—R. Selden and T. W. Smith, *Circulation*, 1972, 45, 1176–1182.

Disposition in the Body. Irregularly absorbed after oral administration. About 30 to 60% of a dose is excreted in the urine in 24 hours and about 25% is eliminated in the faeces in 3 days. Under steady-state conditions about 40% of the daily dose is excreted in the 24-hour urine.

THERAPEUTIC CONCENTRATION.

After a single intravenous dose of 0.5 mg to 3 subjects, a plasma concentration of about 0.012 µg/ml was reported in 5 minutes; following daily intravenous administration of 0.25 mg to 3 subjects, steady-state plasma concentrations of about 0.0005 µg/ml were attained on the 4th or 5th day (R. Selden and T. W. Smith, *ibid.*).

HALF-LIFE. Plasma half-life, about 10 to 20 hours.

PROTEIN BINDING. In plasma, about 5 to 10%.

Dose. 250 to 500 µg intravenously; further injections of 100 µg may be given up to a total dose of 1 mg in 24 hours.

Oxalic Acid

HOOC·COOH, 2H₂O = 126.1

CAS—144-62-7 (anhydrous); 6153-56-6 (dihydrate)

Colourless, transparent, efflorescent crystals.

Soluble 1 in 12 of water, 1 in 3 of ethanol, and 1 in 100 of ether; practically insoluble in chloroform.

Dissociation Constant. pK_a 1.2, 4.2 (25°).

Colour Test. Add a few drops of a strong solution of ferrous sulphate to the acid or to a slightly acid solution of an oxalate—yellow.

Infra-red Spectrum. Principal peaks at wavenumbers 1666, 1250, 1123, 724.

Quantification. COLORIMETRY. In urine—H. Baadenhuijsen and A. P. Jansen, *Clinica chim. Acta*, 1975, 62, 315–324.

GAS CHROMATOGRAPHY. In blood or serum: FID—P. Nuret and M. Offner, *Clinica chim. Acta*, 1978, 82, 9–12. In postmortem blood or urine: sensitivity 13 µg/ml, AFID—G. Gauthier *et al.*, *J. Can. Soc. forens. Sci.*, 1980, 13(4), 1–9.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In urine: sensitivity 1 µg/ml, electrochemical detection—W. J. Mayer *et al.*, *J. chromatogr. Sci.*, 1979, 17, 656–660.

Disposition in the Body. Less than 5% of ingested oxalic acid is absorbed in healthy adults. About 8 to 40 mg of oxalic acid is normally excreted in the urine daily; this is derived mainly from the metabolism of dietary ascorbic acid and glycine with small amounts from dietary oxalic acid and other minor metabolic sources. Calcium oxalate is a major constituent of kidney stones and is frequently found as crystals in freshly-voided urine. In normal subjects concentrations of oxalic acid in blood range from about 1 to 3 µg/ml. Small amounts of oxalate are produced as a metabolite of ethylene glycol.

After intravenous administration of oxalic acid to normal subjects, more than 90% of the dose was excreted in the urine in 36 hours (T. D. Elder and J. B. Wyngaarden, *J. clin. Invest.*, 1960, 39, 1337–1344).

TOXICITY. In dilute solution, oxalic acid and its salts are toxic owing to withdrawal of ionisable calcium from the blood and tissues with resulting tetany. Strong solutions of oxalic acid are corrosive. The mean adult lethal dose is about 15 to 30 g, although a fatality has been reported after the intravenous injection of only 1.2 g. Blood concentrations greater than 10 µg/ml are usually lethal. The maximum permissible atmospheric concentration is 1 mg/m³.

In a fatal poisoning case, a blood concentration of 110 µg/ml of oxalic acid was reported 6 hours after the ingestion of potassium hydrogen oxalate; postmortem tissue concentrations of 21 µg/g in the brain and 382 µg/g in the liver were also reported; a second subject who survived the ingestion of potassium hydrogen oxalate had a blood concentration of 3.7 µg/ml after 6 hours. Postmortem blood concentrations of 18 and 77 µg/ml were reported in 2 other fatalities (P. M. Zarembski and A. Hodgkinson, *J. clin. Path.*, 1967, 20, 283–285).

In a fatality due to oxalic acid poisoning, a postmortem blood concentration of 370 µg/ml was reported (G. Gauthier *et al.*, *J. Can. Soc. forens. Sci.*, 1980, 13(4), 1–9).

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 0.8.

PROTEIN BINDING. In plasma, not significantly bound at physiological pH values.

NOTE. For a review of oxalic acid metabolism in man, see A. Hodgkinson and P. M. Zarembski, *Calc. Tiss. Res.*, 1968, 2, 115–132.

Oxazepam

Tranquilliser

Proprietary Names. Adumbran; Benzotran; Isodin; Murelax; Oxanid; Praxiten; Serax; Sernal; Sernid-D; Serepax; Seresta; Serpax; Sobril.

7-Chloro-1,3-dihydro-3-hydroxy-5-phenyl-2H-1,4-benzodiazepin-2-one

C₁₅H₁₁ClN₂O₂ = 286.7

CAS—604-75-1

A white to pale yellow crystalline powder. M.p. about 198°. Practically **insoluble** in water; soluble 1 in 220 of ethanol, 1 in 270 of chloroform, and 1 in 2200 of ether; soluble in dioxan.

Dissociation Constant. pK_a 1.7, 11.6 (20°).

Partition Coefficient. Log *P* (octanol/pH 7.4), 2.2.

Colour Test. Formaldehyde-Sulphuric Acid—orange.

Thin-layer Chromatography. System TA—Rf 56; system TB—Rf 00; system TC—Rf 40; system TD—Rf 22; system TE—Rf 44; system TF—Rf 37. (Acidified iodoplatinate solution, positive; acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 2336; system GG—RI 2803.

High Pressure Liquid Chromatography. System HI—k' 4.62; system HK—k' 0.73.

Ultraviolet Spectrum. Aqueous acid—234 nm, 280 nm; aqueous alkali—233 nm, 344 nm; ethanol—230 nm (A₁¹ = 1235 a), 315 nm (A₁¹ = 85 a). (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 1687, 1706, 693, 830, 1136, 1123 (KBr disk). (See below)

Mass Spectrum. Principal peaks at *m/z* 257, 77, 268, 239, 205, 267, 233, 259.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 10 ng/ml, ECD—H. G. Giles *et al.*, *Can. J. pharm. Sci.*, 1978, 13, 64–65.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: sensitivity 30 ng/ml, UV detection—T. B. Vree *et al.*, *J. Chromat.*, 1979, 162; *Biomed. Appl.*, 4, 605–614.

Disposition in the Body. Readily absorbed after oral administration. About 70 to 80% of a single dose is excreted in the urine in 72 hours almost entirely as oxazepam glucuronide, with only traces of unchanged oxazepam and other minor metabolites. Up to 10% of a dose is eliminated in the faeces, mostly as unchanged drug.

Oxazepam is a metabolite of several benzodiazepines including chlordiazepoxide, clorazepate, demoxepam, desmethyldiazepam (nordazepam), diazepam, ketazolam, medazepam, prazepam, and temazepam.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.5 to 2 µg/ml.

A single oral dose of 45 mg administered to 8 subjects, produced serum concentrations of 0.88 to 1.44 µg/ml (mean 1.1) of oxazepam in about 2 hours, and concentrations of 0.7 to 1.4 µg/ml (mean 0.9) of oxazepam glucuronide in 2 to 4 hours. Daily oral doses of 10 mg every six hours administered to 6 subjects, produced serum concentrations of 0.14 to 0.56 µg/ml (mean 0.3) of oxazepam 2 hours after a dose, and concentrations of 0.22 to 0.40 µg/ml (mean 0.3) of oxazepam glucuronide 4 hours after a

dose (J. A. Knowles and H. W. Ruelius, *Arzneimittel-Forsch.*, 1972, 22, 687-692).

TOXICITY. Blood concentrations greater than 2 µg/ml may produce toxic effects.

HALF-LIFE. Plasma half-life, 4 to 25 hours (mean 8).

VOLUME OF DISTRIBUTION. 0.5 to 2 litres/kg.

CLEARANCE. Plasma clearance, about 1 to 2 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 0.9.

PROTEIN BINDING. In plasma, about 95%.

NOTE. For a review of the clinical pharmacokinetics of oxazepam see D. J. Greenblatt, *Clin. Pharmacokinet.*, 1981, 6, 89-105.

Dose. 30 to 180 mg daily.

Oxedrine

Sympathomimetic

Synonyms. Oxyphenylmethylaminoethanol; Sympaethaminum; Synephrine.

Note. *m*-Synephrine has been used as a synonym for phenylephrine.

(±)-1-(4-Hydroxyphenyl)-2-methylaminoethanol

$C_9H_{13}NO_2 = 167.2$

CAS—94-07-5

Crystals. M.p. 184° to 185°.

Oxedrine Tartrate

Synonym. Aethaphenum Tartaricum

Proprietary Names. Dulcidrine; Sympatol.

$(C_9H_{13}NO_2)_2 \cdot C_4H_6O_6 = 484.5$

CAS—16589-24-5; 67-04-9 (±)

Colourless crystals or white crystalline powder. M.p. about 185°, with decomposition.

Soluble 1 in 2 of water and 1 in 400 of ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 9.3 (—OH), 10.2 (—NH—), (25°).

Thin-layer Chromatography. *System TA*—Rf 25; *system TB*—Rf 04; *system TC*—Rf 01. (Acidified potassium permanganate solution, positive.)

High Pressure Liquid Chromatography. *System HB*— k' 0.27.

Ultraviolet Spectrum. Aqueous acid—273 nm ($A_1^1 = 81$ a); aqueous alkali—241 nm ($A_1^1 = 810$ b), 291 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 835, 1510, 1054, 1271, 1098, 1611 (KBr disk).

Mass Spectrum. Principal peaks at m/z 44, 108, 42, 77, 107, 149, 95, 123.

Dose. Oxedrine tartrate has been given in doses of about 300 mg daily.

Oxeladin

Cough Suppressant

2-(2-Diethylaminoethoxy)ethyl 2-ethyl-2-phenylbutyrate

$C_{20}H_{33}NO_3 = 335.5$

CAS—468-61-1

A yellow oil.

Practically **insoluble** in water; soluble in ethanol, acetone, and ether.

Oxeladin Citrate

Proprietary Names. Dorex-retard; Paxeladine.

$C_{20}H_{33}NO_3 \cdot C_6H_8O_7 = 527.6$

CAS—52432-72-1

A white crystalline powder. M.p. 90° to 91°.

Soluble in water.

Colour Test. Marquis Test—orange.

Thin-layer Chromatography. *System TA*—Rf 50; *system TB*—Rf 51; *system TC*—Rf 22. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 2198.

High Pressure Liquid Chromatography. *System HA*—k' 3.0.

Ultraviolet Spectrum. Aqueous acid—252 nm, 258 nm, 264 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1731, 1128, 1221, 1100, 700, 1080 (KBr disk).

Mass Spectrum. Principal peaks at m/z 86, 91, 105, 87, 144, 58, 100, 56.

Dose. 80 to 120 mg of oxeladin citrate daily.

Oxethazaine

Local Anaesthetic

Synonym. Oxetacaine

Proprietary Names. It is an ingredient of Mucaïne, Mucoxin, Mutesa, Muthesa, Oxaine, and Tepilta.

2,2'-(2-Hydroxyethylimino)bis[*N*-(α -dimethylphenethyl)-*N*-methylacetamide]

$C_{28}H_{41}N_3O_3 = 467.7$

CAS—126-27-2

A white crystalline powder. M.p. about 104°.

Practically **insoluble** in water; soluble in ethanol and in dilute acids.

Oxethazaine Hydrochloride

Proprietary Name. Emoren

CAS—13930-31-9 (xHCl)

M.p. 146° to 147°.

Soluble in water.

Colour Tests. Mandelin's Test—violet-brown; Marquis Test—red-brown.

Thin-layer Chromatography. *System TA*—Rf 52; *system TB*—Rf 10; *system TC*—Rf 07; *system TL*—Rf 15. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 2525.

High Pressure Liquid Chromatography. System HR— k' 4.14.

Ultraviolet Spectrum. Aqueous acid—248 nm, 252 nm, 258 nm, 264 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1645, 756, 707, 1219, 1101, 1068.

Mass Spectrum. Principal peaks at m/z 72, 91, 114, 145, 75, 160, 117, 92.

Dose. 30 to 80 mg daily, by mouth.

Oxpentifylline

Vasodilator

Synonym. Pentoxifylline

Proprietary Names. Torental; Trental.

3,7-Dimethyl-1-(5-oxohexyl)xanthine

$C_{13}H_{18}N_4O_3 = 278.3$

CAS—6493-05-6

A white crystalline powder. M.p. 102° to 105°.

Soluble in water; sparingly soluble in ethanol; freely soluble in chloroform and methanol; slightly soluble in ether.

Dissociation Constant. pK_a 0.3.

Colour Test. Amalic Acid Test—pink/violet.

Gas Chromatography. System GA—RI 2406.

Ultraviolet Spectrum. Aqueous acid—274 nm ($A_1^1 = 380$ a). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1660, 1700, 1720, 1550, 762, 752 (KBr disk).

Quantification. GAS CHROMATOGRAPHY. In plasma: oxpentifylline and 5-hydroxyhexyl metabolite, sensitivity 3 to 10 ng/ml, AFID—T. A. Bryce and J. L. Burrows, *J. Chromat.*, 1980, 181; *Biomed. Appl.*, 7, 355–361.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: oxpentifylline and 5-hydroxyhexyl metabolite, sensitivity 150 ng/ml, UV detection—W. Rieck and D. Platt, *J. Chromat.*, 1984, 305; *Biomed. Appl.*, 30, 419–427.

Disposition in the Body. Readily absorbed after oral administration. It is extensively metabolised and several metabolites have been identified in the urine. About 60% of a dose is excreted in the urine as metabolites in 24 hours, mostly in the first 4 hours; the major urinary metabolite, 1-(3-carboxypropyl)-3,7-dimethylxanthine (inactive), accounts for about 80% of the material excreted in the urine; less than 1% is excreted as unchanged drug. Other metabolites include 1-(5-hydroxyhexyl)-3,7-dimethylxanthine, which is active and is the major metabolite detected in blood, 1-(5,6-dihydroxyhexyl)-3,7-dimethylxanthine, 1-(4,5-dihydroxyhexyl)-3,7-dimethylxanthine, 1-(4-carboxybutyl)-3,7-dimethylxanthine, 3-methyl-1-(5-oxohexyl)xanthine, and 1-(5-hydroxyhexyl)-3-methylxanthine, all of which are inactive.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 400 mg to 16 fasting subjects, mean peak plasma concentrations of 1.3 $\mu\text{g/ml}$ of oxpentifylline and 1.8 $\mu\text{g/ml}$ of the 5-hydroxy metabolite were attained in 0.8 and 1.3 hours, respectively (R. J. Wills *et al.*, *Drug Dev. & ind. Pharm.*, 1981, 7, 385–396).

HALF-LIFE. Plasma half-life, oxpentifylline, about 1 hour, 5-hydroxy metabolite about 1 hour; 1-(3-carboxypropyl)-3,7-dimethylxanthine, derived from urinary excretion data, about 1.4 hours.

VOLUME OF DISTRIBUTION. About 5 litres/kg.

CLEARANCE. Plasma clearance, about 70 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 1.2.

Dose. Usually 300 to 600 mg daily; sustained-release tablets are given in doses of 0.8 to 1.2 g daily.

Oxprenolol*Beta-adrenoceptor Blocking Agent*

Synonym. Oxyprenolol

 (\pm) -1-(2-Allyloxyphenoxy)-3-isopropylaminopropan-2-ol $C_{15}H_{23}NO_3 = 265.4$ CAS—6452-71-7; 22972-98-1 (\pm)

Crystals. M.p. 75° to 80°.

Oxprenolol Hydrochloride

Proprietary Names. Apsolox; Laracor; Slow-Pren; Slow-Trasicor; Trasicor. It is an ingredient of Trasidrex.

 $C_{15}H_{23}NO_3 \cdot HCl = 301.8$ CAS—6452-73-9; 22972-97-0 (\pm)

A white to slightly cream-coloured crystalline powder. M.p. 106° to 109°.

Soluble 1 in less than 1 of water and 1 in 1.5 of ethanol; very slightly soluble in ether.**Dissociation Constant.** pK_a 9.5.**Colour Tests.** Liebermann's Test—black; Mandelin's Test—grey-violet; Marquis Test—violet; Sulphuric Acid—orange-red (fluoresces under ultraviolet light at 350 nm).**Thin-layer Chromatography.** System TA—Rf 48; system TB—Rf 11; system TC—Rf 11. (Acidified iodoplatinate solution, positive.)**Gas Chromatography.** System GA—RI 1870; system GF—RI 2270.**High Pressure Liquid Chromatography.** System HA— k' 1.3.**Ultraviolet Spectrum.** Aqueous acid—273 nm ($A_1^1 = 85$ a). No alkaline shift.**Infra-red Spectrum.** Principal peaks at wavenumbers 1258, 750, 1500, 1120, 1092, 1037 (oxprenolol hydrochloride, KBr disk).**Mass Spectrum.** Principal peaks at m/z 72, 41, 56, 43, 221, 73, 57, 45.**Quantification.** GAS CHROMATOGRAPHY. In serum: detection limit 2 pg, ECD—D. DeBruyne *et al.*, *J. pharm. Sci.*, 1979, 68, 511–512.HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma, blood or urine: sensitivity 10 ng/ml, UV detection—S. Tsuei *et al.*, *J. Chromat.*, 1980, 181; *Biomed. Appl.*, 7, 135–140.THIN-LAYER CHROMATOGRAPHY—SPECTROFLUORIMETRY. In plasma: sensitivity 10 ng/ml—M. Schaefer and E. Mutschler, *J. Chromat.*, 1979, 164; *Biomed. Appl.*, 6, 247–252.**Disposition in the Body.** Readily absorbed after oral administration but subject to extensive first-pass metabolism. The major metabolite is oxprenolol glucuronide. About 70 to 90% of a dose is excreted in the urine in 24 hours, with less than 5% as unchanged drug.**THERAPEUTIC CONCENTRATION.**Following a single oral dose of 40 mg to 7 subjects, peak blood concentrations of 0.09 to 0.24 $\mu\text{g/ml}$ (mean 0.15) of oxprenolol and 0.11 to 0.35 $\mu\text{g/ml}$ (mean 0.24) of oxprenolol glucuronide were attained in 0.5 to 1.5 hours and 1 to 2.5 hours respectively (P. Dayer *et al.*, *Eur. J. drug Met. Pharmacokinet.*, 1983, 8, 181–188).Following oral administration of 160 mg twice daily to 27 subjects, steady-state plasma concentrations of 0.1 to 1.8 $\mu\text{g/ml}$ (mean 0.9) were reported, determined 1 hour after a dose (B. Silke *et al.*, *Eur. J. clin. Pharmac.*, 1983, 24, 7–14).**TOXICITY.**In a fatality attributed to oxprenolol overdose, a postmortem liver concentration of 58 $\mu\text{g/g}$ was reported (J. S. Oliver and A. A. Watson, *Medicine, Sci. Law*, 1977, 17, 279–281).In a fatality in which death occurred 2 hours after the ingestion of 4.5 g, the following postmortem concentrations were reported: blood 10 $\mu\text{g/ml}$, brain 71 $\mu\text{g/g}$, liver 230 $\mu\text{g/g}$ (A. Khan and J. M. Muscat-Baron, *Br. med. J.*, 1977, 1, 552).**HALF-LIFE.** Plasma half-life, 1 to 3 hours.**VOLUME OF DISTRIBUTION.** About 1 litre/kg.**PROTEIN BINDING.** In plasma, about 80%.**Dose.** 80 to 480 mg of oxprenolol hydrochloride daily.

Oxybuprocaine*Local Anaesthetic**Synonym.* Benoxinate

2-Diethylaminoethyl 4-amino-3-butoxybenzoate

 $C_{17}H_{28}N_2O_3 = 308.4$ *CAS*—99-43-4**Oxybuprocaine Hydrochloride***Proprietary Names.* Cèbésine; Conjuncaïn; Novesine. $C_{17}H_{28}N_2O_3 \cdot HCl = 344.9$ *CAS*—5987-82-6

White crystals or crystalline powder. M.p. about 158°.

Soluble 1 in 0.8 of water, 1 in 2.6 of ethanol, and 1 in 2.5 of chloroform; practically insoluble in ether.**Colour Tests.** Coniferyl Alcohol—orange; Diazotisation—red.**Thin-layer Chromatography.** *System TA*—Rf 62; *system TB*—Rf 23; *system TC*—Rf 41; *system TL*—Rf 36. (*Acidified iodoplatinate solution*, positive.)**Gas Chromatography.** *System GA*—RI 2471.**High Pressure Liquid Chromatography.** *System HQ*— k' 16.25; *system HR*— k' 0.86.**Ultraviolet Spectrum.** Aqueous acid—235 nm ($A_1^1 = 437$ b), 298 nm; aqueous alkali—231 nm, 310 nm.**Infra-red Spectrum.** Principal peaks at wavenumbers 1709, 1214, 1261, 1613, 1294, 1311 (oxybuprocaine hydrochloride, KBr disk).**Mass Spectrum.** Principal peaks at m/z 86, 99, 29, 30, 100, 71, 87, 192.**Use.** Oxybuprocaine hydrochloride is used as a 0.4% solution.**Oxyclozanide***Anthelmintic (Veterinary)**Proprietary Name.* ZaniI

3,3',5,5',6-Pentachloro-2'-hydroxysalicylanilide

 $C_{13}H_6Cl_5NO_3 = 401.5$ *CAS*—2277-92-1

A cream-coloured powder. M.p. about 208°.

Very slightly **soluble** in water; soluble 1 in 20 of ethanol, 1 in 5 of acetone, and 1 in 600 of chloroform; soluble in solutions of alkali hydroxides and carbonates.**Colour Test.** Mandelin's Test—violet → orange.**Thin-layer Chromatography.** *System TA*—Rf 87. (*Acidified potassium permanganate solution*, positive.)**Gas Chromatography.** *System GA*—not eluted.**Ultraviolet Spectrum.** Aqueous alkali—324 nm ($A_1^1 = 338$ b); methanol—303 nm ($A_1^1 = 188$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1203, 1527, 1166, 1587, 1155, 1219 (KBr disk).

Oxycodone

Narcotic Analgesic

Synonyms. 7,8-Dihydro-14-hydroxycodineone; Dihydrone; Oxycone.

6-Deoxy-7,8-dihydro-14-hydroxy-3-O-methyl-6-oxomorphine

$C_{18}H_{21}NO_4 = 315.4$

CAS—76-42-6

M.p. 218° to 220°.

Practically **insoluble** in water and ether; soluble in ethanol and chloroform.

Oxycodone Hydrochloride

Synonym. Thecodine

Proprietary Names. Endone; Eubine; Eukodal; Supeudol. It is an ingredient of Percocet and Percodan.

$C_{18}H_{21}NO_4 \cdot HCl \cdot 3H_2O = 405.9$

CAS—124-90-3 (anhydrous)

A white crystalline powder. M.p. about 275°.

Soluble 1 in 6 of water, 1 in 60 of ethanol, and 1 in 600 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 8.9 (20°).

Colour Test. Marquis Test—yellow → brown → violet.

Thin-layer Chromatography. *System TA*—Rf 50; *system TB*—Rf 23; *system TC*—Rf 51. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, violet.)

Gas Chromatography. *System GA*—oxycodone RI 2524, oxymorphone RI 2532.

High Pressure Liquid Chromatography. *System HA*—oxycodone k' 6.9 (tailing peak), oxymorphone k' 6.7 (tailing peak); *system HC*— k' 0.85.

Ultraviolet Spectrum. Aqueous acid—280 nm ($A_1^1 = 44$ a). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1719, 1501, 1033, 1255, 934, 980 (KBr disk).

Mass Spectrum. Principal peaks at m/z 315, 230, 316, 70, 44, 42, 258, 140; oxymorphone 301, 216, 44, 42, 70, 302, 203, 57.

Quantification. GAS CHROMATOGRAPHY. In urine: oxycodone and oxymorphone, ECD—R. C. Baselt and C. B. Stewart, *J. analyt. Toxicol.*, 1978, 2, 107–109. In plasma: sensitivity 2 ng/ml, AFID—N. L. Renzi and J. N. Tam, *J. pharm. Sci.*, 1979, 68, 43–45. In plasma or urine: oxycodone and noroxycodone, sensitivity 1 ng/ml, ECD—S. H. Weinstein and J. C. Gaylord, *ibid.*, 527–528.

Disposition in the Body. Absorbed after oral administration. Metabolised to some extent by *O*-demethylation to oxymorphone which is active, and by *N*-demethylation to noroxycodone. About 30 to 60% of a dose is excreted in the urine in 24 hours as free and conjugated oxycodone, conjugated oxymorphone, and noroxycodone.

THERAPEUTIC CONCENTRATION.

After a single oral dose containing 4.5 mg of oxycodone hydrochloride and 0.38 mg of oxycodone terephthalate, administered to 6 subjects, peak plasma concentrations of 0.017 to 0.037 $\mu\text{g/ml}$ (mean 0.024) were attained in 1 to 2 hours (N. L. Renzi and J. N. Tam, *J. pharm. Sci.*, 1979, 68, 43–45).

TOXICITY. The estimated minimum lethal dose is 500 mg. Prolonged use of oxycodone may lead to dependence of the morphine type.

The following postmortem concentrations were reported in a subject who died while underwater diving: blood 5 $\mu\text{g/ml}$, bile 28 $\mu\text{g/ml}$, brain 28 $\mu\text{g/g}$, liver 12 $\mu\text{g/g}$ (P. Sedgwick, *Bull. int. Ass. forens. Toxicol.*, 1973, 9(3&4), 16).

Dose. Oxycodone hydrochloride may be given by mouth in doses of 5 to 20 mg.

Oxymetazoline

Sympathomimetic

6-*tert*-Butyl-3-(2-imidazolin-2-ylmethyl)-2,4-xyleneol $C_{16}H_{24}N_2O = 260.4$

CAS—1491-59-4

Crystals. M.p. 181° to 183°.

Oxymetazoline Hydrochloride*Proprietary Names.* Afrazine; Afrin; Drixine; Durazol; Hazol; Iliadin-Mini; Nafrine; Nasivin; Rhinolitan. $C_{16}H_{24}N_2O \cdot HCl = 296.8$

CAS—2315-02-8

A white, hygroscopic, crystalline powder. M.p. about 300°, with decomposition.

Soluble 1 in 6.7 of water and 1 in 3.6 of ethanol; practically insoluble in chloroform and ether.**Colour Test.** Mandelin's Test—green.**Thin-layer Chromatography.** *System TA*—Rf 0.9; *system TB*—Rf 0.1; *system TC*—Rf 0.1. (Acidified iodoplatinate solution, positive.)**Gas Chromatography.** *System GA*—RI 2168.**High Pressure Liquid Chromatography.** *System HA*— k' 1.7.**Ultraviolet Spectrum.** Aqueous acid—280 nm ($A_1^1 = 68$ a); aqueous alkali—303 nm ($A_1^1 = 164$ b).**Infra-red Spectrum.** Principal peaks at wavenumbers 1595, 1199, 1285, 1250, 1070, 765 (oxymetazoline hydrochloride, KBr disk).**Mass Spectrum.** Principal peaks at m/z 245, 260, 44, 217, 218, 246, 261, 259.**Use.** Oxymetazoline hydrochloride is used as a 0.05% solution.**Oxymetholone**

Anabolic Steroid

Proprietary Names. Adroyd; Anadrol-50; Anapolon; Anasteron; Nastenon; Pardroyd; Plenastiril.17 β -Hydroxy-2-hydroxymethylene-17 α -methyl-5 α -androstane-3-one $C_{21}H_{32}O_3 = 332.5$

CAS—434-07-1

A white to creamy-white crystalline powder. M.p. 172° to 180°. Practically **insoluble** in water; soluble 1 in 50 of ethanol; freely soluble in chloroform; soluble in dioxan; slightly soluble in ether.**Colour Tests.** Antimony Pentachloride—brown; Naphthol-Sulphuric Acid—brown/pink-orange; Sulphuric Acid—orange.**Thin-layer Chromatography.** *System TP*—Rf 69; *system TQ*—Rf 23; *system TR*—Rf 85; *system TS*—Rf 82. (p-Toluenesulphonic acid solution, positive.)**Gas Chromatography.** *System GA*—RI 2835.**Ultraviolet Spectrum.** Methanolic acid—277 nm ($A_1^1 = 300$ b); methanolic alkali—315 nm ($A_1^1 = 547$ a).**Infra-red Spectrum.** Principal peaks at wavenumbers 1612, 1204, 1219, 1306, 1157, 935 (KBr disk).**Dose.** Usually 5 to 10 mg daily; doses of 100 to 350 mg daily may be given.

Oxymorphone*Narcotic Analgesic*

Synonyms. 7,8-Dihydro-14-hydroxymorphinone; Oximorphone; Oxydimorphone.

6-Deoxy-7,8-dihydro-14-hydroxy-6-oxomorphine

$C_{17}H_{19}NO_4 = 301.3$

CAS—76-41-5

Crystals. M.p. 248° to 249° , with decomposition.

Soluble in boiling ethanol and in chloroform.

Oxymorphone Hydrochloride

Proprietary Name. Numorphan

$C_{17}H_{19}NO_4 \cdot HCl = 337.8$

CAS—357-07-3

A white powder which darkens on exposure to light.

Soluble 1 in 4 of water, 1 in 100 of ethanol, and 1 in 25 of methanol; very slightly soluble in chloroform and ether.

Dissociation Constant. pK_a 8.5, 9.3.

Partition Coefficient. Log P (octanol/pH 7.4), 0.

Colour Test. Marquis Test—grey-violet.

Thin-layer Chromatography. System TA—Rf 48; system TB—Rf 10; system TC—Rf 37. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, grey.)

Gas Chromatography. System GA—RI 2532.

High Pressure Liquid Chromatography. System HA— k' 6.7 (tailing peak).

Ultraviolet Spectrum. Aqueous acid—281 nm ($A_1^1 = 34$ a); aqueous alkali—292 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1730, 1240, 1225, 1145, 941, 953 (KBr disk).

Mass Spectrum. Principal peaks at m/z 301, 216, 44, 42, 70, 302, 203, 57.

Disposition in the Body. Absorbed after oral administration. About 50% of an oral dose is excreted in the urine in 5 days (mostly in the first 24 hours), mainly as conjugated oxymorphone together with small quantities of unchanged drug and the conjugated 6 α - and 6 β -hydroxy metabolites.

Oxymorphone is a metabolite of oxycodone.

TOXICITY. The estimated minimum lethal dose is 50 mg. Prolonged use of oxymorphone may lead to dependence of the morphine type.

REFERENCE. E. J. Cone *et al.*, *Drug Met. Disp.*, 1983, 11, 446–450.

Dose. 0.5 to 1.5 mg of oxymorphone hydrochloride given parenterally; doses of 5 to 10 mg have been given by mouth.

Oxypertine*Tranquilliser*

Proprietary Names. Equipertine; Forit; Integrin; Opertil.

5,6 - Dimethoxy - 2 - methyl - 3 - [2 - (4 - phenylpiperazin - 1 - yl)ethyl]indole

$C_{23}H_{29}N_3O_2 = 379.5$

CAS—153-87-7

A white crystalline powder.

Slightly **soluble** in water and ethanol.

Colour Tests. Liebermann's Test—blue; Mandelin's Test—grey; Marquis Test—grey-green.

Thin-layer Chromatography. System TA—Rf 68; system TB—Rf 04; system TC—Rf 65. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2355.

High Pressure Liquid Chromatography. System HA— k' 0.7; system HF— k' 1.33.

Ultraviolet Spectrum. Aqueous acid—301 nm ($A_1^1 = 212$ b). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1233, 1153, 1205, 1592, 762, 1003 (KBr disk).

Mass Spectrum. Principal peaks at m/z 175, 70, 176, 132, 379, 204, 56, 217.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: sensitivity 20 ng/ml, UV detection—Y. Minatogawa *et al.*, *J. Chromat.*, 1983, 274; *Biomed. Appl.*, 25, 413–416.

Dose. Usually up to 300 mg daily.

Oxyphenbutazone

Analgesic

Synonym. Hydroxyphenylbutazone

Proprietary Names. Imbun; Isobutil; Oxalid; Oxybutazone; Phlogase; Rheumapax; Tandearil; Tanderil.

4 - Butyl - 1 - (4 - hydroxyphenyl) - 2 - phenylpyrazolidine - 3,5 - dione monohydrate

$C_{19}H_{20}N_2O_3 \cdot H_2O = 342.4$

CAS—129-20-4 (anhydrous); 7081-38-1 (monohydrate)

A white to yellowish-white crystalline powder. M.p. 85° to 100°. Practically **insoluble** in water; soluble 1 in 3 of ethanol, 1 in 6 of acetone, 1 in 20 of chloroform, and 1 in 20 of ether.

Dissociation Constant. pK_a 4.7 (22°).

Partition Coefficient. Log P (octanol), 3.3.

Colour Test. Marquis Test—yellow.

Thin-layer Chromatography. System TA—Rf 77; system TD—Rf 52; system TE—Rf 07; system TF—Rf 62; system TG—Rf 25. (Chromic acid solution, yellow; Ludy Tenger reagent, orange; mercurous nitrate spray, positive; acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 1630; system GD—retention time of methyl derivative 2.11 relative to $n\text{-C}_{16}\text{H}_{34}$.

High Pressure Liquid Chromatography. System HD— k' 1.95; system HV—retention time 0.69 relative to meclofenamic acid.

Ultraviolet Spectrum. Aqueous acid—237 nm; aqueous alkali—254 nm ($A_1^1 = 750$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1683, 1736, 1275, 1512, 765, 1600 (KBr disk).

Mass Spectrum. Principal peaks at m/z 199, 324, 93, 77, 65, 55, 121, 135.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 2.5 µg/ml, AFID—M. Bertrand *et al.*, *J. Chromat.*, 1979, 171, 377–383.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 250 ng/ml, UV detection—N. J. Pound and R. W. Sears, *J. pharm. Sci.*, 1975, 64, 284–287.

Disposition in the Body. Almost completely absorbed after oral administration. It is slowly metabolised by glucuronide conjugation and by hydroxylation; it is slowly excreted in the urine, less than 2% of a dose being excreted as unchanged drug and about 1 to 5% as the *O*-glucuronide conjugate in 24 hours. Oxyphenbutazone is a major metabolite of phenylbutazone.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 200 mg to 10 subjects, peak plasma concentrations of 11.4 to 43.7 µg/ml were attained in 2 to 12 hours (M. Bertrand *et al.*, *J. Chromat.*, 1979, 171, 377–383).

Following daily oral doses of 300 to 400 mg to 6 subjects, steady-state plasma concentrations determined immediately before a dose ranged from 27 to 95 µg/ml (mean 62) (M. Weiner *et al.*, *Proc. Soc. exp. Biol. Med.*, 1967, 124, 1170–1173).

TOXICITY. The estimated minimum lethal dose is 5 g.

HALF-LIFE. Plasma half-life, about 2 to 3 days.

VOLUME OF DISTRIBUTION. About 0.1 litre/kg.

PROTEIN BINDING. In plasma, about 99%.

Dose. Oxyphenbutazone has been given in doses of 100 to 800 mg daily.

Oxyphencyclimine

Anticholinergic

1,4,5,6 - Tetrahydro - 1 - methylpyrimidin - 2 - ylmethyl α -cyclohexylmandelate

$C_{20}H_{28}N_2O_3 = 344.5$

CAS—125-53-1

Oxyphencyclimine Hydrochloride

Proprietary Names. Daricon; Manir; Vagogastrin. It is an ingredient of Enarax and Vistrax.

$C_{20}H_{28}N_2O_3 \cdot HCl = 380.9$

CAS—125-52-0

A white crystalline powder. M.p. about 234°.

Soluble 1 in 100 of water, 1 in 75 of ethanol, 1 in 500 of chloroform, 1 in 3000 of ether, and 1 in 20 of methanol.

Partition Coefficient. Log *P* (heptane), 3.3.

Colour Test. Mandelin's Test—grey-green.

Thin-layer Chromatography. System TA—Rf 02; system TB—Rf 01; system TC—Rf 03. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2550; system GF—RI 2900.

High Pressure Liquid Chromatography. System HA—*k'* 2.8.

Infra-red Spectrum. Principal peaks at wavenumbers 1656, 1737, 1227, 705, 1201, 1211 (oxyphencyclimine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 105, 129, 112, 77, 42, 313, 41, 55.

Dose. 10 to 20 mg of oxyphencyclimine hydrochloride daily; up to 50 mg daily has been given.

Oxyphenisatin

Purgative

Synonym. Dihydroxyphenylisatin

Proprietary Name. Veripaque

3,3-Bis(4-hydroxyphenyl)indolin-2-one

$C_{20}H_{15}NO_3 = 317.3$

CAS—125-13-3

**Oxyphenisatin Acetate**

Synonyms. Acetphenolisatin; Bisatin; Diacetoxydiphenylisatin; Diacetyldiphenolisatin; Diasatin; Diphesatin; Isaphenin; Oxyphenisatin Diacetate.

$C_{24}H_{19}NO_5 = 401.4$

CAS—115-33-3

A white crystalline powder. M.p. about 245°.

Practically **insoluble** in water; soluble 1 in 70 of chloroform; very slightly soluble in ethanol and ether.

Colour Tests. Folin–Ciocalteu Reagent—blue; Koppanyi–Zwicker Test—violet; Liebermann's Test—black; Mandelin's Test—violet; Marquis Test—violet; Mercurous Nitrate—black.

Thin-layer Chromatography. System TA—Rf 82. (Acidified potassium permanganate solution, positive.)

Infra-red Spectrum. Principal peaks at wavenumbers 1188, 1727, 1495, 1232, 1162, 1011 (KBr disk).

Mass Spectrum. Principal peaks at m/z 317, 288, 359, 401, 43, 318, 289, 196 (oxyphenisatin acetate).

Dose. Oxyphenisatin acetate has been given in a dose of 5 to 20 mg.

Oxyphenonium Bromide

Anticholinergic

Proprietary Names. Antrenil; Antrenyl.

2 - (α - Cyclohexylmandeloyloxy)ethyl-diethyl-methylammonium bromide

$C_{21}H_{34}BrNO_3 = 428.4$

CAS—14214-84-7 (oxyphenonium); 50-10-2 (bromide)

A white crystalline powder. M.p. about 190°.

Freely **soluble** in water, ethanol, and chloroform.

Thin-layer Chromatography. System TA—Rf 03. (Acidified iodoplatinate solution, positive.)

High Pressure Liquid Chromatography. System HA— k' 2.6 (tailing peak).

Ultraviolet Spectrum. Aqueous acid—252 nm, 258 nm ($A_1^1 = 5.3$ a), 264 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1225, 1719, 729, 704, 1030, 1111 (KBr disk).

Dose. 20 to 40 mg daily.

**Oxytetracycline Dihydrate**

Antibiotic

Synonyms. 5-Hydroxytetracycline; Oxytetracycline; Terrafungine.

Proprietary Names. Abbocin; Chemocycline (tablets); Galenomylin; Imperacin; Oxymed; Oxymycin; Terramycin (tablets).

5 β -Hydroxytetracycline dihydrate

$C_{22}H_{24}N_2O_9 \cdot 2H_2O = 496.5$

CAS—79-57-2 (anhydrous); 6153-64-6 (dihydrate)

A yellow to tan-coloured crystalline powder. Stable in air but darkens on exposure to strong sunlight.

Soluble 1 in 4150 of water, 1 in 66 of dehydrated alcohol, and 1 in 6250 of ether; sparingly soluble in ethanol; practically insoluble in chloroform; soluble in dilute acids and alkalis.

Oxytetracycline Calcium

Proprietary Names. Chemocycline (syrup); Terramycin (syrup).

$C_{44}H_{46}CaN_4O_{18} = 958.9$

CAS—15251-48-6 (xCa)

A yellow to light brown crystalline powder.

Practically **insoluble** in water; soluble in dilute solutions of sodium hydroxide.

Oxytetracycline Hydrochloride

Proprietary Names. Macocyn; Terramycin (capsules); Unimycin. It is an ingredient of Bisolvomycin and Terra-Cortril.

$C_{22}H_{24}N_2O_9 \cdot HCl = 496.9$

CAS—2058-46-0

A yellow, hygroscopic, crystalline powder, which darkens on exposure to sunlight or to moist air above 90°. It decomposes above 180°.

Soluble 1 in 2 of water, 1 in 45 of ethanol, and 1 in 45 of methanol; less soluble in dehydrated alcohol; practically insoluble in chloroform and ether. Solutions in water become turbid on standing owing to precipitation of oxytetracycline base.

Dissociation Constant. pK_a 3.3, 7.3, 9.1 (25°).

Partition Coefficient. Log P (octanol/pH 7.5), -1.6 .

Colour Tests. Benedict's Reagent—red; Formaldehyde—Sulphuric Acid—brown-red; Liebermann's Test—red; Mandelin's Test—violet \rightarrow red \rightarrow orange; Marquis Test—orange; Sulphuric Acid—violet-red.

Thin-layer Chromatography. System TA—Rf 05, streaking. (Location under ultraviolet light, orange fluorescence; acidified potassium permanganate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—268 nm ($A_1^1 = 400$ a), 352 nm; aqueous alkali—246 nm, 269 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1616, 1584, 1665, 1235, 1180, 1138 (oxytetracycline hydrochloride, KBr disk).

Quantification. SPECTROFLUORIMETRY. In blood or plasma: sensitivity < 100 ng/ml—B. Scales and D. A. Assinder, *J. pharm. Sci.*, 1973, 62, 913–917.

Disposition in the Body. Incompletely and irregularly absorbed after oral administration and widely distributed throughout the body. About 70% of a dose is excreted in the urine; biliary excretion also occurs.

THERAPEUTIC CONCENTRATION.

Following oral doses of 500 mg to 4 subjects, peak plasma concentrations of 1.2 to 3.4 $\mu\text{g/ml}$ (mean 2.1) were attained in 2 to 3 hours (B. Scales and D. A. Assinder, *ibid.*).

HALF-LIFE. Plasma half-life, about 9 hours, increased in renal impairment.

PROTEIN BINDING. In plasma, about 20 to 35%.

Dose. Up to 3 g of oxytetracycline hydrochloride daily.

Padimate

Sunscreen Agent

Synonyms. Amyl Dimethylaminobenzoate; Isoamyl Dimethylaminobenzoate; Padimate A.

Proprietary Names. Escalol 506; Pabafilm; SpectraBAN 4; Uvosan.

A mixture of pentyl, isopentyl, and 2-methylbutyl 4-dimethylaminobenzoates.

$C_{14}H_{21}NO_2 = 235.3$

CAS—14779-78-3

A yellow liquid.

Practically **insoluble** in water; soluble in ethanol, chloroform, and isopropyl alcohol.

Padimate O

Synonyms. 2-Ethylhexyl 4-(dimethylamino)benzoate; Octyl Dimethyl PABA.

Proprietary Names. Eclipse; Escalol 507; Phiasol; PreSun 4. It is an ingredient of Super Shade 15.

$C_{17}H_{27}NO_2 = 277.4$

CAS—21245-02-3

A light yellow, mobile liquid.

Practically **insoluble** in water; soluble in ethanol and isopropyl alcohol.

Colour Tests. Aromaticity (Method 2)—yellow/orange; Liebermann's Test (100°)—blue.

Thin-layer Chromatography. System TA—Rf 75. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 1964.

Use. Typically in a concentration of 2.5%.

Pancuronium Bromide

Muscle Relaxant

Synonym. Pancuronium Bromide

Proprietary Name. Pavulon

1,1'-(3 α ,17 β -Diacetoxy-5 α -androstan-2 β ,16 β -ylene)bis(1-methylpiperidinium) dibromide

$C_{35}H_{60}Br_2N_2O_4 = 732.7$

CAS—15500-66-0

White, hygroscopic crystals or crystalline powder. M.p. 215°, with decomposition. A solution in water is dextrorotatory.

Soluble 1 in 1 of water, 1 in 5 of ethanol, 1 in 5 of chloroform, and 1 in 1 of methanol; practically insoluble in ether.

Colour Test. Antimony Pentachloride—green.

Thin-layer Chromatography. System TA—Rf 01; system TN—Rf 80. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1225, 1745, 1031, 1056, 1013, 907 (KBr disk). (See below)

Quantification. SPECTROFLUORIMETRY. In serum: sensitivity 50 ng/ml—L. B. Wingard *et al.*, *J. pharm. Sci.*, 1979, 68, 914–916.

Disposition in the Body. Metabolised by hydroxylation to 3-hydroxypancuronium which is about half as active as pancuronium, and to a small extent to the 17-hydroxy and 3,17-dihydroxy derivatives which are virtually inactive. About 25% of a dose is

excreted in the urine unchanged and 15% as the 3-hydroxy metabolite, in about 30 hours; about 10% of a dose is excreted in the bile.

THERAPEUTIC CONCENTRATION.

After an intravenous injection of 4 mg to 6 subjects, plasma concentrations of about 0.6 μg/ml were reported at 5 minutes, decreasing to 0.07 μg/ml at 4 hours (K. McLeod *et al.*, *Br. J. Anaesth.*, 1976, 48, 341–345).

TOXICITY.

In a suicide case due to the intravenous administration of pancuronium bromide, postmortem concentrations were: blood 1.6 μg/ml, urine 1.5 μg/ml; thiopentone and thioridazine were also detected (A. Poklis and E. G. Melanson, *J. analyt. Toxicol.*, 1980, 4, 275–280).

HALF-LIFE. Plasma half-life, about 2 hours.

VOLUME OF DISTRIBUTION. 0.1 to 0.4 litre/kg.

CLEARANCE. Plasma clearance, about 1 to 2 ml/min/kg.

PROTEIN BINDING. In plasma, about 87%.

NOTE. For a review of the pharmacokinetics of muscle relaxants see M. I. Ramzan *et al.*, *Clin. Pharmacokinet.*, 1981, 6, 25–60.

Dose. Initially 40 to 100 μg/kg intravenously.

Papaverine

Antispasmodic

Proprietary Name. It is an ingredient of Riddovydin.

6,7-Dimethoxy-1-(3,4-dimethoxybenzyl)isoquinoline

$C_{20}H_{21}NO_4 = 339.4$

CAS—58-74-2

An alkaloid obtained from opium or prepared synthetically. Crystals or white crystalline powder. M.p. 146° to 148°. Practically **insoluble** in water; sparingly soluble in ethanol and ether.

Papaverine Hydrochloride

Proprietary Names. Cerebid; Cerespan; Dilaspan; Dipav; Dylate; Kavrin; Myobid; P-200; Panergon; Pava-2 Caps; Pavabid; Pavacap; Pavacen; Pavakey; Pavased; Pavatran; Pava-Wol; Pavine TD; Qua-Bid; Sustaverine; Therapav; Vasal; Vasocap; Vaso-Pav; Vasospan. It is an ingredient of Asma-Vydrin, Bepro, Brovon Inhalant Solution, Pavacol-D, Pholcomed (linctus), Riddobron Inhalant, Riddofan, and Rybarvin.

$C_{20}H_{21}NO_4 \cdot HCl = 375.9$

CAS—61-25-6

White crystals or crystalline powder. M.p. about 220°, with decomposition.

Soluble 1 in 30 to 1 in 40 of water, 1 in 120 of ethanol, and 1 in 10 of chloroform; practically insoluble in ether.

Papaverine Sulphate

$(C_{20}H_{21}NO_4)_2 \cdot H_2SO_4 \cdot 5H_2O = 866.9$

CAS—32808-09-6 (anhydrous)

White crystals or crystalline powder.

Soluble 1 in 2 of water, 1 in 20 of ethanol, and 1 in 5000 of ether; slightly soluble in chloroform.

Dissociation Constant. pK_a 6.4 (25°).

Partition Coefficient. Log P (ether), 0.5.

Colour Tests. Liebermann's Test—black; Mandelin's Test—grey-green.

Thin-layer Chromatography. System TA —Rf 61; system TB —Rf 08; system TC —Rf 65. (Dragendorff spray, positive; acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA —RI 2825.

High Pressure Liquid Chromatography. System HA — k' 0.3; system HC — k' 0.16; system HS — k' 0.04.

Ultraviolet Spectrum. Aqueous acid—250 nm ($A_1^1 = 1830$ a); aqueous alkali—236 nm ($A_1^1 = 1994$ b), 277 nm, 326 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1279, 1508, 1263, 1026, 1292, 1238 (papaverine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 339, 324, 338, 325, 340, 308, 154, 292.

Quantification. GAS CHROMATOGRAPHY. In blood: sensitivity 5 ng/ml, AFID—V. Bellia *et al.*, *J. Chromat.*, 1978, 161, 231–235.

GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In blood: sensitivity 5 ng/ml—J. De Graeve *et al.*, *J. Chromat.*, 1977, 133, 153–160.

White crystals or crystalline powder. M.p. 168° to 172°.

Soluble 1 in 70 of water, 1 in 7 to 1 in 10 of ethanol, and 1 in 13 of acetone; very slightly soluble in chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 9.5 (25°).

Colour Tests. Ferric Chloride—blue; Folin-Ciocalteu Reagent—blue; Liebermann's Test—violet; Nessler's Reagent—brown (slow).

Boil 0.1 g with 1 ml of hydrochloric acid for 3 minutes, add 10 ml of water, cool, and add 0.05 ml of 0.02M potassium dichromate—violet, developing slowly (which in contrast to phenacetin does not become red).

Thin-layer Chromatography. System TD—Rf 15; system TE—Rf 45; system TF—Rf 34. (Ferric chloride solution, faint blue; acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 1687.

High Pressure Liquid Chromatography. System HD—k' 0.1; system HW—k' 0.32.

Ultraviolet Spectrum. Aqueous acid—245 nm (A₁¹ = 668 a); aqueous alkali—257 nm (A₁¹ = 715 a).

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 2 ng/ml, UV detection—S. L. Pierson *et al.*, *J. pharm. Sci.*, 1979, 68, 1550–1551. In blood: detection limit 5 ng/ml, UV detection—G. Hoogewijs *et al.*, *J. Chromat.*, 1981, 226; *Biomed. Appl.*, 15, 423–430.

Disposition in the Body. Readily and completely absorbed after oral administration but undergoes extensive first-pass metabolism; bioavailability about 30%. Metabolised by demethylation and glucuronic acid and sulphate conjugation of the resulting phenolic groups. About 50% to 80% of a dose is excreted in the urine in 48 hours as conjugated phenolic metabolites, mostly 6-hydroxypapaverine (37% of the dose) and 4'-hydroxypapaverine (about 8.5% of the dose). Less than 1% of a dose is excreted in the urine unchanged.

THERAPEUTIC CONCENTRATION.

After oral administration of single doses of 150 mg given as an elixir and tablets, respectively, to 6 subjects, mean peak plasma concentrations of 0.58 and 0.53 μg/ml were attained in about 1 hour (M. C. Meyer *et al.*, *J. clin. Pharmac.*, 1980, 19, 435–444).

HALF-LIFE. Plasma half-life, about 7 hours.

PROTEIN BINDING. In plasma, about 90%.

Dose. Up to 600 mg of papaverine hydrochloride daily.

Paracetamol

Analgesic

Synonyms. Acetaminophen; *N*-Acetyl-*p*-aminophenol.

Proprietary Names. Acephen; Alba-Temp; Anuphen; Atasol; Bakeke 2; Calpol; Campaign; Capital; Datril; Dolanex; Exdol; Febrigesic; Febrilix; Fendon; Hedex; Korum; Liquiprin; Lyteca; Nebs; Oraphen-PD; Paldesic; Pamol (tablets); Panadol; Panaleve; Panasorb; Panets; Panofen; Phenaphen; Phendex; Placidex; Proval; Q-Panol; Robigesic; Rounox; Salzone; SK-APAP; Tapar; Temptra; Ticelgesic; Tivrin; Tylenol; Valadol.

Paracetamol is an ingredient of many proprietary preparations—see *Martindale, The Extra Pharmacopoeia*, 28th Edn.

4'-Hydroxyacetanilide

C₈H₉NO₂ = 151.2

CAS—103-90-2

Infra-red Spectrum. Principal peaks at wavenumbers 1506, 1657, 1565, 1263, 1227, 1612 (KBr disk). (See below)

Mass Spectrum. Principal peaks at *m/z* 109, 151, 43, 80, 108, 81, 53, 52; cysteine conjugate 141, 43, 183, 44, 140, 80, 108, 52; mercapturic acid conjugate 43, 141, 183, 42, 87, 41, 140, 165.

Quantification. GAS CHROMATOGRAPHY. In serum: detection limit 7.5 μg/ml, FID—E. Kaa, *J. Chromat.*, 1980, 221; *Biomed. Appl.*, 10, 414–418.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 50 ng/ml, UV detection—J. N. Buskin *et al.*, *J. Chromat.*, 1982, 230; *Biomed. Appl.*, 19, 443–447. In urine: paracetamol and 7 metabolites, electrochemical and UV detection—J. M. Wilson *et al.*, *J. Chromat.*, 1982, 227; *Biomed. Appl.*, 16, 453–462. In blood or postmortem tissues: UV detection—J. C. West, *J. analyt. Toxicol.*, 1981, 5, 118–121.

Disposition in the Body. Small doses are readily absorbed but the absorption of larger doses varies considerably and is influenced by gastric emptying rate, the presence of food, and the time of day; bioavailability 70 to 90%. Paracetamol is widely distributed throughout most body fluids and is present in the saliva at concentrations paralleling those in plasma. It undergoes first-pass metabolism and is metabolised mainly by conjugation to form glucuronides and ethereal sulphates; 3-hydroxylation also occurs followed by conjugation or *O*-methylation of the hydroxy group. Oxidation to a reactive metabolite thought to be acetylimino-*p*-benzoquinone occurs to a small extent after therapeutic doses but becomes more significant after larger doses, and this metabolite appears to be responsible for hepatic necrosis in paracetamol overdose; it is normally detoxified by glutathione conjugation to form mercapturic acid and cysteine conjugates but once sources of glutathione are depleted, the free metabolite is available to bind covalently with liver cell protein; this binding occurs about 10 to 12 hours after dosing. About 90% of a therapeutic dose is excreted in the urine in 24 hours; of the excreted material, 1 to 4% is unchanged, 20 to 30% is conjugated with sulphate, 40 to 60% is conjugated with glucuronic acid, 5 to 10% consists of the 3-hydroxy-3-sulphate, the 3-methoxyglucuronide and the 3-methoxy-3-sulphate metabolites, and about 5 to 10% consists of the mercapturic acid and cysteine conjugates; 3-methylthio-4-hydroxyacetanilide has also been identified at concentrations of less than 1%. Larger amounts of the mercapturic acid and cysteine conjugates are excreted in overdose. Paracetamol is a metabolite of benorylate and phenacetin.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 10 to 20 µg/ml. Plasma concentrations vary considerably between subjects. The glucuronide and sulphate conjugates accumulate in subjects with impaired renal function.

After a single oral dose of 1.5 g to 14 subjects, peak plasma-paracetamol concentrations of 7.4 to 37 µg/ml (mean 24) were attained in 0.5 to 3 hours (mean 1.4) (R. C. Heading *et al.*, *Br. J. Pharmac.*, 1973, 47, 415–421).

Following daily oral doses of 1.8 to 3.6 g to 8 subjects, peak plasma concentrations obtained 1 to 2 hours after a dose ranged from 9.9 to 43.3 µg/ml (mean 23.7) (L. F. Prescott *et al.*, *Clin. Pharmac. Ther.*, 1968, 9, 605–614).

TOXICITY. The minimum lethal dose is about 10 g. Symptoms of hepatic damage do not occur for at least 12 hours after overdose but may not appear until 4 to 6 days later. Plasma concentrations have been used to indicate possible hepatic necrosis; at 4 hours, hepatic necrosis is possible at concentrations of paracetamol of 120 to 300 µg/ml, probable at concentrations above 300 µg/ml, and unlikely at concentrations below 120 µg/ml. Similarly, at 12 hours, concentrations above 120 µg/ml indicate the probability of necrosis, concentrations of 50 to 120 µg/ml indicate that it is possible, and concentrations below 50 µg/ml indicate that it is unlikely.

The following postmortem tissue concentrations were reported in 3 fatalities: blood 160, 200 and 387 µg/ml, bile 180, –, 900 µg/ml, liver –, –, 385 µg/g, liver blood 200, –, 475 µg/ml, urine 180, 620, – µg/ml (A. E. Robinson *et al.*, *J. forens. Sci.*, 1977, 22, 708–717).

HALF-LIFE. Plasma half-life after therapeutic doses, adults about 1.5 to 3 hours, neonates, about 5 hours; plasma half-lives greater than about 4 hours in adults are indicative of possible liver damage.

VOLUME OF DISTRIBUTION. About 1 litre/kg.

CLEARANCE. Plasma clearance, about 5 ml/min/kg.

PROTEIN BINDING. In plasma, not bound at concentrations less than 60 µg/ml. In poisoned subjects, protein binding has been reported to vary between about 8% and 40%.

NOTE. For a review of the pharmacokinetics of paracetamol see J. A. H. Forrest *et al.*, *Clin. Pharmacokinet.*, 1982, 7, 93–107. For a review of paracetamol overdose see L. F. Prescott, *Drugs*, 1983, 25, 290–314.

Dose. Up to 4 g daily.

Parachlorophenol

Disinfectant

Synonym. *p*-Chlorophenol

4-Chlorophenol

$C_6H_5ClO = 128.6$

CAS—106-48-9

White or pink crystals. M.p. about 42°.

Soluble 1 in 60 of water; very soluble in ethanol, chloroform, and ether.

Dissociation Constant. pK_a 9.2 (20°).

Colour Test. Ferric Chloride—blue.

Ultraviolet Spectrum. Aqueous alkali—298 nm ($A_1^1 = 194$ b); ethanol—284 nm ($A_1^1 = 149$ b), inflexion at 291 nm.

Mass Spectrum. Principal peaks at m/z 128, 130, 65, 39, 64, 63, 129, 99.

Paradichlorobenzene*Insecticide**Synonym.* Dichlorbenzol*Proprietary Name.* Santochlor

1,4-Dichlorobenzene

 $C_6H_4Cl_2 = 147.0$

CAS—106-46-7

Colourless shining crystals; slowly volatile in air. M.p. 53° to 54°.

Practically **insoluble** in water; soluble in most organic solvents.

Ultraviolet Spectrum. Ethanol—272 nm ($A_1^1 = 27$ b), 265 nm ($A_1^1 = 20$ b), 282 nm ($A_1^1 = 17$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1012, 1091, 817, 1121, 951, 1000.

Mass Spectrum. Principal peaks at m/z 146, 148, 111, 75, 50, 150, 113, 147.

Disposition in the Body.

Toxicity. The estimated minimum lethal dose is 25 g and the maximum permissible atmospheric concentration is 75 ppm or 450 mg/m³. Paradichlorobenzene is very irritant to the eyes, mucous membranes and skin, and it may cause narcosis.

**Paraldehyde***Anticonvulsant/Hypnotic/Sedative**Synonym.* Paracetaldehyde*Proprietary Name.* Paral

The trimer of acetaldehyde; 2,4,6-trimethyl-1,3,5-trioxane.

 $(C_2H_4O)_3 = 132.2$

CAS—123-63-7

A clear colourless or pale yellow liquid which decomposes and increases in toxicity on storage. Relative density 0.993 to 0.996. F.p. 10° to 12°. B.p. 123° to 126°. At low temperatures it solidifies to form a crystalline mass.

Soluble 1 in 9 of water; miscible with ethanol, chloroform, and ether.

Gas Chromatography. *System GA*—paraldehyde RI 786, acetaldehyde RI 372; *system GI*—paraldehyde retention time 23.2 min, acetaldehyde retention time 0.70 min.

Infra-red Spectrum. Principal peaks at wavenumbers 1095, 1170, 946, 860, 846, 763 (thin film).

Mass Spectrum. Principal peaks at m/z 43, 44, 87, 31, 45, 42, 131, 71; acetaldehyde 29, 44, 43, 42, 26, 41, 28, 27.

Quantification. **GAS CHROMATOGRAPHY.** In blood, plasma or urine: headspace analysis; sensitivity 2 µg/ml—R. M. Anthony *et al.*, *J. analyt. Toxicol.*, 1978, 2, 262–264. In blood or gastric fluid: headspace analysis after conversion to acetaldehyde—J. P. Hancock *et al.*, *J. analyt. Toxicol.*, 1977, 1, 161–163.

Disposition in the Body. Readily absorbed after oral, rectal or intramuscular administration and distributed throughout the tissues. Probably metabolised by depolymerisation to acetaldehyde which is oxidised to acetic acid and ultimately to carbon dioxide. About 7% of an oral dose is exhaled unchanged in 4 hours.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 30 to 100 µg/ml. Concentrations in the cerebrospinal fluid are about 70% of those in plasma.

After oral doses of 100 mg/kg, peak blood concentrations of 100 to 150 µg/ml were attained in 0.5 hour; following rectal administration of 100 mg/kg, peak blood concentrations of 50 to 100 µg/ml were reported at 1.5 to 2 hours (R. M. Anthony *et al.*, *J. analyt. Toxicol.*, 1978, 2, 262–264).

Following an intramuscular injection of 10 ml to 1 subject, a peak plasma concentration of 77 µg/ml was attained in 1.2 hours (R. Maes *et al.*, *J. forens. Sci.*, 1969, 14, 235–254).

TOXICITY. The minimum lethal dose has been estimated as 25 ml orally and 12 ml rectally, although recovery has occurred after the ingestion of 125 ml. Toxic effects have been associated with blood concentrations of 200 to 400 µg/ml. Blood concentrations of about 500 µg/ml, or less if alcohol has also been ingested, may be lethal. On storage, paraldehyde may depolymerise to acetaldehyde and acetic acid; severe acidosis and fatalities may follow the use of partly depolymerised material.

In 15 fatalities attributed to paraldehyde overdose, blood concentrations of 490 to 1600 µg/ml were reported (J. N. Hayward and B. R. Boshell, *Am. J. Med.*, 1957, 23, 965–976).

The following postmortem tissue concentrations were reported in 3 fatalities, 2 of which involved alcohol: blood 115, 480 and 140 µg/ml, brain 150, 300 and 370 µg/g, kidney 190, 50 and 260 µg/g, liver 210, 200 and 600 µg/g, urine —, —, 130 µg/ml (C. J. Rehling, *Poison Residues in Human Tissues*, in *Progress in Chemical Toxicology*, Vol. 3, A. Stolman (Ed.), New York, Academic Press Inc., 1967, pp. 363–386).

HALF-LIFE. Plasma half-life, 4 to 10 hours.

VOLUME OF DISTRIBUTION. About 1 litre/kg.

CLEARANCE. Plasma clearance, about 2 ml/min/kg.

Dose. 5 to 10 ml by mouth or by intramuscular injection.

Paramethadione

Anticonvulsant

Proprietary Name. Paradione

5-Ethyl-3,5-dimethylloxazolidine-2,4-dione

 $C_7H_{11}NO_3 = 157.2$

CAS—115-67-3

A clear colourless liquid. Refractive index, at 25°, 1.4485 to 1.4505.

Sparingly **soluble** in water; freely soluble in ethanol, chloroform, and ether.

Colour Test. Koppanyi-Zwicker Test—violet.

Thin-layer Chromatography. System TD—Rf 00; system TE—Rf 07; system TF—Rf 60.

Gas Chromatography. System GA—RI 1120; system GE—paramethadione retention time 0.06, *N*-desmethylparamethadione retention time 0.22, both relative to phenytoin.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1730, 1805, 1100, 1040, 1280, 1070 (thin film).

Mass Spectrum. Principal peaks at *m/z* 43, 129, 57, 56, 41, 72, 39, 58.

Quantification. GAS CHROMATOGRAPHY. In serum: paramethadione and 5-ethyl-5-methyloxazolidine-2,4-dione, sensitivity 200 ng/ml, FID—D. J. Hoffman and A. H. C. Chun, *J. pharm. Sci.*, 1975, 64, 1702–1703.

Disposition in the Body. Readily absorbed after oral administration. Metabolised by *N*-demethylation to 5-ethyl-5-methyloxazolidine-2,4-dione which is active and accumulates during chronic administration; 30 to 80% of a dose is excreted slowly in the urine as the *N*-desmethyl metabolite with less than 1% as unchanged drug.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 300 mg to 3 subjects, peak serum concentrations of paramethadione of 5.4 to 7.6 µg/ml (mean 6.3) were attained in 0.5 to 1 hour; concentrations of the *N*-desmethyl metabolite gradually increased to a plateau of 8.1 to 8.6 µg/ml (mean 8.4) at 32 hours (D. J. Hoffman and A. H. C. Chun, *ibid.*).

Following oral administration of 900 mg daily to 2 subjects for 14 days, peak plasma concentrations of the *N*-desmethyl metabolite of about 240 µg/ml were reported (T. C. Butler, *J. Pharmac. exp. Ther.*, 1955, 113, 178–185).

TOXICITY. The estimated minimum lethal dose is 5 g.

HALF-LIFE. Plasma half-life, paramethadione about 16 hours after a single dose, *N*-desmethylparamethadione about 7 to 14 days during chronic administration.

PROTEIN BINDING. In plasma, not significantly bound.

Dose. 0.9 to 1.8 g daily.

Paramethasone

Corticosteroid

6α-Fluoro-11β,17α,21-trihydroxy-16α-methylpregna-1,4-diene-3,20-dione

 $C_{22}H_{29}FO_5 = 392.5$

CAS—53-33-8

**Paramethasone Acetate**

Synonym. 6α-Fluoro-16α-methylprednisolone 21-Acetate

Proprietary Names. Depodillar; Dilar; Haldrone; Metilar; Monocortin; Paramezone.

 $C_{24}H_{31}FO_6 = 434.5$

CAS—1597-82-6

A white to creamy-white, fluffy, crystalline powder. M.p. about 240°, with decomposition.

Practically **insoluble** in water; soluble in ethanol, acetone, and ether; soluble 1 in 50 of chloroform.

Ultraviolet Spectrum. Paramethasone acetate: methanol—241 nm ($A_1^1 = 500$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1658, 1227, 1600, 905, 1745, 1034 (Nujol mull).

Dose. Up to 12 mg of paramethasone acetate daily.

Paraphenylenediamine

Dye

Synonyms. 'Para'; *p*-Phenylenediamine.

 $C_6H_4(NH_2)_2 = 108.1$

CAS—106-50-3

White or reddish crystals. M.p. 145° to 147°.

Soluble 1 in 100 of water; soluble in ethanol, chloroform, and ether.

Colour Tests. Ferric Chloride—green; Mandelin's Test—yellow.

Thin-layer Chromatography. System TA—Rf 61. (Acidified iodoplatinate solution, positive.)

Paraquat

Herbicide

1,1'-Dimethyl-4,4'-bipyridylium ion

 $C_{12}H_{14}N_2 = 186.3$

CAS—4685-14-7

Paraquat Dichloride

Proprietary Names. Dextrone X; Gramoxone. It is an ingredient of Dextron, Pathclear, and Weedol.

$C_{12}H_{14}Cl_2N_2$; $M_r = 257.2$

CAS—1910-42-5

A white crystalline solid. Decomposes at about 300°.

Very soluble in water. Hydrolysed by alkalis.

Note. Unless otherwise stated, the analytical information given below refers to paraquat dichloride. For information on the monoene and diene reduction products for GC-MS analysis, see under Quaternary Ammonium Herbicides, p. 80.

Colour Test. Sodium Dithionite—blue.

Thin-layer Chromatography. System TA—Rf 00; system TN—Rf 22; system TO—Rf 10. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GK—monoene reduction product retention time 0.36, diene reduction product retention time 0.58, both relative to caffeine.

Ultraviolet Spectrum. Aqueous acid—257 nm ($A_1^1 = 693$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1174, 1638, 1064, 1229, 1284, 850 (KBr disk).

Mass Spectrum. Principal peaks at m/z 96, 42, 70, 72, 150, 122, 194, 43 (monoene reduction product); 96, 42, 148, 192, 94, 122, 134, 44 (diene reduction product).

Quantification. COLORIMETRY. In plasma or serum: sensitivity 50 ng/ml—D. R. Jarvie and M. J. Stewart—*Clinica chim. Acta*, 1979, 94, 241–251.

AS CHROMATOGRAPHY. In plasma: sensitivity 30 ng/ml, AFID—A. van Dijk *et al.*, *J. analyt. Toxicol.*, 1977, 1, 151–154.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In postmortem blood or liver: detection limit 50 ng/ml and 100 ng/g respectively, UV detection—E. A. Querée *et al.*, *J. analyt. Toxicol.*, 1985, 9, 10–14. In urine: paraquat and diquat, detection limit < 1 µg/ml, UV detection—R. Gill *et al.*, *J. Chromat.*, 1983, 255, 483–490.

RADIOIMMUNOASSAY. In plasma: sensitivity 5 ng/ml—T. Levitt, *Proc. Analyt. Div. Chem. Soc.*, 1979, 16, 72–76. In plasma—D. Fatori and W. M. Hunter, *Clinica chim. Acta*, 1980, 100, 81–90.

Disposition in the Body. Less than 10% is absorbed after ingestion. It is slowly excreted unchanged in the urine and faeces, detectable concentrations have been found in the urine for up to 26 days after acute ingestion.

TOXICITY. Several hundred fatalities due to the accidental or suicidal ingestion of paraquat have occurred. The estimated minimum lethal dose is about 1 g. The maximum permissible atmospheric concentration is 0.1 mg/m³ and the maximum acceptable daily intake is 2 µg/kg as the dichloride. Large amounts of paraquat produce death in a few hours or days due to pulmonary oedema, haemorrhage, and toxic effects on the kidney, liver, and heart. Smaller doses may result in later mortality by progressive respiratory failure and death may still ensue even after concentrations in blood or urine are almost undetectable. Tissue concentrations in fatal cases therefore vary considerably according to the length of survival after ingestion. Blood concentrations greater than about 2 µg/ml at 4 hours and 0.1 µg/ml at 24 hours are likely to be lethal in most subjects but individual response is variable and some subjects with much higher concentrations have recovered.

In a review of 26 fatalities attributed to paraquat poisoning, the following postmortem tissue concentrations, µg/ml or µg/g (mean, *n*) were reported:

	Death within 24 hours	Death within 1 to 7 days	Death after 8 days or more
Blood	1.4–52 (14, 5)	0.2–4.4 (1.3, 8)	not detected
Kidney	22.5–279 (79, 6)	1.4–74 (16, 10)	0.6–2.8 (1.5, 5)
Liver	8.8–141 (41, 6)	0.3–57.6 (8, 10)	0.2, 1.4 (2)
Lung	12.8–186 (78, 3)	1.6–21.4 (7, 6)	—
Urine	1210 (1)	4–15.8 (9, 3)	trace, 2.2 (2)

(D. J. L. Carson and E. D. Carson, *Forens. Sci.*, 1976, 7, 151–160).

NOTE. For a review of the toxicology of paraquat see T. J. Haley, *Clin. Toxicol.*, 1979, 14, 1–46.

Parathion

Pesticide

Other Names. Alkron; Aphamite; Fosferno 20; Niran; Nitro-stigmine; Paraphos; Thiophos.

OO-Diethyl O-4-nitrophenyl phosphorothioate

$C_{10}H_{14}NO_5PS$; $M_r = 291.3$

CAS—56-38-2

A pale yellow liquid which is decomposed by heat and darkens on exposure to light. M.p. 6°. B.p. 360° to 375°. Refractive index, at 25°, 1.5367.

Practically **insoluble** in water; miscible with most organic solvents. It is rapidly hydrolysed in alkaline solution.

Colour Tests. Palladium Chloride—brown; Phosphorus Test—yellow.

Thin-layer Chromatography. System TW—parathion Rf 81, parathion-methyl Rf 77.

Gas Chromatography. System GA—parathion RI 1942, aminoparathion RI 1885, paraoxon RI 1880; system GK—retention time 1.04 relative to caffeine.

Ultraviolet Spectrum. Ethanol—274 nm ($A_1^1 = 343$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1020, 925, 1515, 1219, 1587, 970.

Mass Spectrum. Principal peaks at m/z 97, 109, 291, 139, 125, 137, 155, 123.

Quantification. GAS CHROMATOGRAPHY. In urine: 4-nitrophenol, detection limit 20 ng/ml, ECD—D. E. Bradway and T. M. Shafik, *Bull. envir. Contam. Toxicol.*, 1973, 9, 134–139.

RADIOIMMUNOASSAY. In plasma: sensitivity 100 ng/ml—C. D. Ercegovich *et al.*, *J. agric. Fd Chem.*, 1981, 29, 559–563.

Disposition in the Body. Parathion is activated in the liver by metabolism to paraoxon. Parathion and paraoxon are further metabolised to diethylthiophosphoric acid (DETP), diethylphosphoric acid (DEP), and 4-nitrophenol which are the major urinary excretion products although DETP and DEP are unstable in stored urine. Urinary 4-nitrophenol concentrations may be indicative of the extent of exposure to parathion. 4-Nitrophenol is rapidly excreted in the urine and is not detectable 48 hours after exposure by inhalation or ingestion, but excretion is more prolonged after exposure of intact skin due to the much slower absorption of parathion by this route. Aminoparathion has been detected in postmortem blood and tissues.

Urinary 4-nitrophenol concentrations ranged from 0.4 to 13.2 µg/ml in 23 occupationally exposed asymptomatic workers and correlated well with serum-parathion concentrations which were in the range 0.003 to 0.20 µg/ml (C. C. Roan *et al.*, *Bull. envir. Contam. Toxicol.*, 1969, 4, 362–369).

TOXICITY. The estimated minimum lethal dose by inhalation or ingestion is 20 mg and the maximum permissible atmospheric concentration is 0.1 mg/m³. Urinary concentrations of about 2 µg/ml or more of 4-nitrophenol may be associated with severe toxicity. Numerous fatalities have occurred due to contamination of food by parathion and also from suicidal ingestion.

The following postmortem tissue concentrations were reported in 19 fatalities due to parathion poisoning (determined by a bioassay based on cholinesterase inhibition): blood 0.5 to 34 µg/ml (mean 9.0, 11 cases); brain 0.9 to 12.5 µg/g (mean 4.9, 4 cases); kidney 0.2 to 11.9 µg/g (mean 3.3, 9 cases); liver 0.08 to 120 µg/g (mean 11, 13 cases); urine 0.4 to 78 µg/ml (mean 10, 10 cases) (A. Heyndrickx and F. De Clerc, *J. Pharm. Belg.*, 1977, 32, 149–161).

In 2 fatalities due to parathion, the following postmortem tissue concentrations, µg/ml or µg/g, were reported:

	Parathion	Aminoparathion
Blood	0.01, 0.15	0.27, 6.7
Bile	—, 0.63	—, 0.31
Liver	ND, ND	0.47, 32
Urine	ND, —	0.02, —

(ND = not detected)

(L. T. F. Chan *et al.*, *J. forens. Sci.*, 1983, 28, 122–127).

HALF-LIFE. Derived from urinary excretion data, about 8 hours.

Parbendazole

Anthelmintic (Veterinary)

Proprietary Name. Helmatac

Methyl 5-butylbenzimidazol-2-ylcarbamate

$C_{13}H_{17}N_3O_2 = 247.3$

CAS—14255-87-9

A white crystalline powder. M.p. 224° to 227°, with decomposition.

Practically **insoluble** in water; soluble 1 in 900 of ethanol and 1 in 300 of chloroform; very slightly soluble in ether; soluble in dilute mineral acids.

Colour Test. Dissolve 5 mg in 5 ml of 0.1M hydrochloric acid and add 3 mg of *p*-phenylenediamine dihydrochloride; shake to dissolve and add 0.1 g of zinc powder. After mixing, allow to stand for 2 minutes and add 10 ml of *ferric ammonium sulphate solution*—a blue or violet-blue colour develops.

Thin-layer Chromatography. System TA—Rf 70. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—not eluted.

Ultraviolet Spectrum. Aqueous acid—281 nm, 288 nm ($A_1^1 = 760$ a); aqueous alkali—254 nm, 297 nm ($A_1^1 = 816$ b), 303 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1626, 1600, 1274, 1093, 1100, 1193 (KBr disk).

Pargyline

Antihypertensive (Monoamine Oxidase Inhibitor)

N-Methyl-*N*-prop-2-ynylbenzylamine

$C_{11}H_{13}N = 159.2$

CAS—555-57-7

Pargyline Hydrochloride*Proprietary Name.* Eutonyl $C_{11}H_{13}N, HCl = 195.7$

CAS—306-07-0

A white crystalline powder. M.p. 158° to 162° ; sublimation occurs when kept at raised temperatures.**Soluble** 1 in 0.6 of water, 1 in 5 of ethanol, and 1 in about 7 of chloroform. Aqueous solutions are unstable.**Dissociation Constant.** pK_a 6.9.**Thin-layer Chromatography.** *System TA*—Rf 70. (*Acidified iodoplatinate solution*, positive.)**Gas Chromatography.** *System GA*—RI 1214; *system GB*—RI 1218; *system GC*—RI 1440.**High Pressure Liquid Chromatography.** *System HA*— k' 0.2.**Ultraviolet Spectrum.** Aqueous acid—251 nm, 256 nm, 261 nm ($A_1^1 = 16$ a), 268 nm; aqueous alkali—252 nm, 257 nm, 263 nm.**Infra-red Spectrum.** Principal peaks at wavenumbers 697, 746, 714, 724, 1052, 1515 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 82, 68, 91, 159, 42, 158, 92, 65.**Dose.** Usually 25 to 50 mg of pargyline hydrochloride daily; maximum of 200 mg daily.**Pecazine***Tranquilliser**Synonym.* Mepazine

10-(1-Methyl-3-piperidylmethyl)phenothiazine

 $C_{19}H_{22}N_2S = 310.5$

CAS—60-89-9

**Pecazine Hydrochloride** $C_{19}H_{22}N_2S, HCl, H_2O = 364.9$

CAS—2975-36-2

A white crystalline powder. M.p. 171° to 174° , with decomposition.Very slightly **soluble** in water; freely soluble in dehydrated alcohol; soluble in chloroform; practically insoluble in ether.**Dissociation Constant.** pK_a 9.7 (24°).**Colour Tests.** Mandelin's Test—green \rightarrow violet; Marquis Test—violet.**Thin-layer Chromatography.** *System TA*—Rf 53; *system TB*—Rf 46; *system TC*—Rf 44. (*Acidified iodoplatinate solution*, positive.)**Gas Chromatography.** *System GA*—RI 2524.**High Pressure Liquid Chromatography.** *System HA*— k' 3.9.**Ultraviolet Spectrum.** Aqueous acid—253 nm ($A_1^1 = 892$ a), 300 nm; aqueous alkali—265 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 750, 768, 1219, 1250, 1162, 1282 (pecazine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 310, 58, 199, 112, 311, 111, 212, 41.

Dose. Pecazine hydrochloride has been given in doses equivalent to 37.5 to 75 mg of the base daily.

Pemoline

Central Stimulant

Synonyms. Phenilone; 5-Phenylisohydantoin.

Proprietary Names. Cylert; Deltamine; Ronyl; Sigmodyn; Stimul; Tradon; Volital.

2-Imino-5-phenyloxazolidin-4-one

$C_9H_8N_2O_2 = 176.2$

CAS—2152-34-3

A white crystalline powder. M.p. 259°.

Practically **insoluble** in water, acetone, and ether; soluble 1 in 100 of propylene glycol.

Dissociation Constant. pK_a 10.5.

Colour Test. Koppanyi-Zwicker Test—violet.

Thin-layer Chromatography. System TA—Rf 60; system TB—Rf 00; system TC—Rf 23. (Marquis reagent, yellow-brown; ninhydrin spray, positive; acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—pemoline RI 2160, mandelic acid RI 1487.

High Pressure Liquid Chromatography. System HA— k' 0.2; system HC— k' 0.14.

Ultraviolet Spectrum. Aqueous acid—256 nm ($A_1^1 = 20$ a), 262 nm, 268 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1218, 1653, 695, 1560, 1137, 1275 (KBr disk).

Mass Spectrum. Principal peaks at m/z 107, 176, 90, 77, 70, 105, 42, 79; mandelic acid 107, 79, 77, 51, 152, 105, 50, 78; 5-phenyloxazolidine-2,4-dione 90, 177, 105, 77, 106, 51, 89, 50.

Quantification. GAS CHROMATOGRAPHY. In serum or urine: sensitivity 50 ng/ml, AFID—D. J. Hoffman, *J. pharm. Sci.*, 1979, 68, 445–447. In horse plasma or urine: sensitivity 50 ng/ml and 100 ng/ml, respectively, ECD—O. J. Igwe and J. W. Blake, *J. chromatogr. Sci.*, 1981, 19, 617–624.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma, saliva, or urine: detection limit 20 ng/ml, UV detection—K. Nishihara *et al.*, *Ther. Drug Monit.*, 1984, 6, 232–237.

Disposition in the Body. Slowly absorbed after oral administration. About 50% of a dose is excreted in the urine as unchanged drug in 48 hours and about 4% as 5-phenyloxazolidine-2,4-dione; the remainder is excreted in the urine as conjugated pemoline and unidentified polar metabolites; mandelic acid is also a metabolite of pemoline. Less than 1% of a dose is eliminated in the faeces.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 50 mg given to 3 subjects, peak plasma concentrations of 0.77 to 1.22 $\mu\text{g/ml}$ (mean 1.0) were attained in about 2 to 3 hours; peak concentrations in saliva of 0.47 to 0.75 $\mu\text{g/ml}$ (mean 0.59) were reported after 2 to 4 hours; following administration of 37.5 mg to 1 subject, peak plasma and saliva concentrations of 0.89 and 0.58 $\mu\text{g/ml}$, respectively, were attained in about 4 hours (N. P. E. Vermeulen *et al.*, *Br. J. clin. Pharmac.*, 1979, 8, 459–463).

After daily oral doses of 37.5 and 75 mg to 28 hyperactive children for seven days, mean plasma concentrations of about 2 and 4 $\mu\text{g/ml}$ respectively, were reported 3 hours after the last dose (C. P. Tomkins *et al.*, *Ther. Drug Monit.*, 1980, 2, 255–260).

TOXICITY. Estimated minimum lethal dose, 2 g for an adult, 0.2 g for children up to 2 years, although recovery has occurred following the ingestion of up to 1.8 g by young children.

HALF-LIFE. Plasma half-life, about 10 to 18 hours.

PROTEIN BINDING. In plasma, about 30%.

Dose. Usually 40 mg daily; maximum of 120 mg daily.

Pempidine

1,2,2,6,6-Pentamethylpiperidine

 $C_{10}H_{21}N = 155.3$

CAS—79-55-0

Antihypertensive

A liquid.

Pempidine Tartrate $C_{10}H_{21}N \cdot C_4H_6O_6 = 305.4$

CAS—546-48-5

A white crystalline powder. M.p. 160°.

Soluble 1 in 2 of water and 1 in 14 of ethanol; very slightly soluble in acetone; practically insoluble in chloroform and ether.**Thin-layer Chromatography.** System TA—Rf 24; system TB—Rf 68; system TC—Rf 03. (Acidified iodoplatinate solution, positive.)**Infra-red Spectrum.** Principal peaks at wavenumbers 1308, 1261, 1210, 1136, 1063, 675 (pempidine tartrate, KBr disk).**Mass Spectrum.** Principal peaks at m/z 140, 84, 56, 41, 72, 69, 29, 39.**Dose.** 7.5 to 80 mg of pempidine tartrate daily.**Penfluridol**

Tranquilliser

Proprietary Name. Semap

1-[4,4-Bis(4-fluorophenyl)butyl]-4-(4-chloro-3-trifluoromethylphenyl)piperidin-4-ol

 $C_{28}H_{27}ClF_5NO = 524.0$

CAS—26864-56-2

A white crystalline or microcrystalline powder. M.p. 104° to 109°.

Practically **insoluble** in water; very soluble in ethanol, acetone, and chloroform; freely soluble in ether.**Colour Test.** Liebermann's Test—brown.**Thin-layer Chromatography.** System TA—Rf 76; system TB—Rf 17; system TC—Rf 60. (Dragendorff spray.)**Gas Chromatography.** System GA—RI 3380.**Ultraviolet Spectrum.** Aqueous acid—267 nm ($A_1^{1\%} = 47$ a), 273 nm. No alkaline shift.**Infra-red Spectrum.** Principal peaks at wavenumbers 1500, 1138, 1225, 1315, 1157, 825 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 42, 292, 56, 294, 109, 203, 201, 44.**Quantification.** GAS CHROMATOGRAPHY. In plasma: sensitivity 1 to 2 ng/ml, ECD—S. F. Cooper *et al.*, *Int. Pharmacopsychiat.*, 1975, 10, 78–88.**Disposition in the Body.** Incompletely absorbed after oral administration. It has a very long duration of action. About 5% of a dose is excreted in the urine in 7 days, mainly as 4,4'-bis(4-fluorophenyl)butyric acid; about 80% of a dose is eliminated in the faeces, mostly as unchanged drug.**THERAPEUTIC CONCENTRATION.**Following weekly oral administration of 30, 60 and 120 mg for 13 weeks to 7, 7 and 8 subjects, mean steady-state plasma concentrations of about 0.004 to 0.01, 0.006 to 0.012, and 0.008 to 0.025 $\mu\text{g/ml}$ were reported. In all subjects maximum concentrations were attained within 12 hours of a dose; concentrations declined rapidly between 12 and 24 hours followed by a much slower decline during the next 120 hours and were still significant (about 0.001 $\mu\text{g/ml}$) 168 hours after the dose (S. F. Cooper *et al.*, *Clin. Pharmac. Ther.*, 1975, 18, 325–329).**Dose.** Usually 20 to 60 mg weekly, by mouth; doses of up to 120 mg weekly have been given.**Penicillamine**

Chelating Agent

Synonyms. (–)- $\beta\beta$ -Dimethylcysteine; D-3-Mercaptovalline; D-Penicillamine.**Proprietary Names.** Cuprimine; Depen; Distamine; D-Penammine; Kelatin; Metalcaptase; Pemine; Pendramine; Trolovol. 3,3-Dimethyl-D-cysteine $C_5H_{11}NO_2S = 149.2$

CAS—52-67-5

A white, finely crystalline powder. M.p. 201°, with decomposition.

Soluble 1 in 9 of water and 1 in 530 of ethanol; practically insoluble in chloroform and ether.

Penicillamine Hydrochloride

$C_5H_{11}NO_2S \cdot HCl = 185.7$

CAS—2219-30-9

A white, hygroscopic, finely crystalline powder. M.p. 160° to 165°.

Soluble 1 in 1 of water, 1 in 1.5 of ethanol, and 1 in 230 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 1.8, 7.9, 10.5.

Colour Tests. Mandelin's Test—yellow; Palladium Chloride—yellow.

Thin-layer Chromatography. System TA—Rf 36; system TB—Rf 01; system TC—Rf 03. (Acidified iodoplatinate solution, positive.)

Infra-red Spectrum. Principal peaks at wavenumbers 1595, 1525, 1615, 1550, 1090, 1055 (Nujol mull). Two polymorphic forms occur.

Mass Spectrum. Principal peaks at m/z 75, 41, 57, 70, 43, 59, 56, 47.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In whole blood, plasma or urine: sensitivity 75 ng/ml for plasma and urine, 450 ng/ml for whole blood, electrochemical detection—R. F. Bergström *et al.*, *J. Chromat.*, 1981, 222; *Biomed. Appl.*, 11, 445–452. In serum: sensitivity 130 ng/ml, fluorescence detection—E. P. Lankmayr *et al.*, *J. Chromat.*, 1981, 222; *Biomed. Appl.*, 11, 249–255.

REVIEWS. For reviews of assay methods see D. R. Lecavalier and J. C. Crawhall, *J. Rheumatol.*, 1981, *Suppl.* 7, 20–27, and N. Kucharczyk and S. Shahinian, *ibid.*, 28–34.

Disposition in the Body. Readily but incompletely absorbed after oral administration. About 50% of an oral dose is excreted in the urine in 48 hours with about 10% as unchanged drug, up to 25% as cysteine-penicillamine disulphide, about 15% as penicillamine disulphide, and less than 10% as *S*-methyl-*D*-penicillamine; about 35% of an oral dose is eliminated in the faeces in 3 days. After intravenous administration, about 80% of the dose is excreted in the urine in 24 hours; traces of penicillamine remain in the plasma after 48 hours due to protein binding.

THERAPEUTIC CONCENTRATION.

Following daily oral doses of 500 to 750 mg to 10 subjects, peak plasma concentrations of 1.7 to 5.6 $\mu\text{g/ml}$ (mean 3.7) were attained 1.5 to 3 hours after a dose (M. Butler *et al.*, *Arthritis Rheum.*, 1982, 25, 111–116).

HALF-LIFE. Plasma half-life, about 2 to 6 hours.

PROTEIN BINDING. In plasma, up to 90%.

NOTE. For further details of penicillamine metabolism and kinetics see R. F. Bergström *et al.*, *Clin. Pharmac. Ther.*, 1981, 30, 404–413, and J. C. Crawhall *et al.*, *Biopharm. Drug Disp.*, 1979, 1, 73–95.

Dose. 0.125 to 4 g daily.

Pentachlorophenol

Synonym. PCP

$C_6HCl_5O = 266.3$

CAS—87-86-5

Preservative

White crystals. M.p. about 191°.

Very slightly **soluble** in water; freely soluble in ethanol and ether.

Dissociation Constant. pK_a 4.8.

Colour Test. Fuming Nitric Acid—red/red/brown-violet.

Gas Chromatography. System GA—RI 1749.

Ultraviolet Spectrum. Aqueous alkali—319 nm ($A_1^1 = 194$ b); ethanol—295 nm ($A_1^1 = 89$ b), 303 nm ($A_1^1 = 115$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1307, 774, 1222, 711, 1196, 1553 (KBr disk).

Mass Spectrum. Principal peaks at m/z 266, 268, 264, 167, 165, 270, 202, 132.

Quantification. GAS CHROMATOGRAPHY. In serum, whole blood or urine: detection limit 1 ng/ml, ECD—L. L. Needham *et al.*, *J. analyt. Toxicol.*, 1981, 5, 283–286. In plasma or urine: sensitivity 10 ng/ml, ECD—D. L. Rick *et al.*, *J. analyt. Toxicol.*, 1982, 6, 297–300.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In urine: sensitivity 30 ng/ml, UV detection—K. Pekari and A. Aitio, *J. Chromat.*, 1982, 232; *Biomed. Appl.*, 21, 129–136.

Disposition in the Body. Readily absorbed after ingestion, inhalation or through intact skin. Pentachlorophenol and its oxidised metabolite, tetrachlorohydroquinone, are excreted in the urine in free and conjugated forms, with about 74% of a dose being excreted unchanged in 7 days. About 4% of a dose is eliminated in the faeces.

Urinary concentrations in 130 pest-control operators exposed to pentachlorophenol ranged from 0.003 to 35.7 $\mu\text{g/ml}$ (mean 1.8) (A. Bevenue *et al.*, *Bull. envir. Contam. Toxicol.*, 1967, 2, 319–332).

BLOOD CONCENTRATION.

Plasma concentrations of 0.99 to 9.1 $\mu\text{g/ml}$ were reported in 6 occupationally-exposed subjects and blood concentrations of 0.34 to 6.0 $\mu\text{g/ml}$ were reported in 7 exposed workers (A. Bevenue *et al.*, *J. Chromat.*, 1968, 38, 467–472).

TOXICITY. The estimated minimum lethal dose is 1 g and the maximum permissible atmospheric concentration is 0.5 mg/m^3 . Blood concentrations greater than 30 $\mu\text{g/ml}$ are usually toxic. Numerous fatalities after absorption, inhalation or ingestion have been reported.

In two fatalities, the following postmortem tissue concentrations ($\mu\text{g/ml}$ or $\mu\text{g/g}$) were reported: blood 113, 156; brain 14, 35; kidney —, 123; liver 94, 134; urine —, 520 (M. F. Mason *et al.*, *J. forens. Sci.*, 1965, 10, 136–147).

In one fatality, the following postmortem tissue concentrations were reported: blood 173 µg/ml, kidney 116 µg/g, liver 225 µg/g, urine 75 µg/ml (M. J. Cretney, *Bull. int. Ass. forens. Toxicol.*, 1976, 12(3), 10).

HALF-LIFE. Plasma half-life, about 30 hours.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 1.8.

PROTEIN BINDING. In plasma, about 99%.

Pentaerythritol Tetranitrate *Anti-anginal Vasodilator*

Synonyms. Erynite; Nitropentaerythrol; Nitropenthrate; Penta-nitrol.

Proprietary Names. Antime; Cardiacap; Dilcoran; Duotrate; El-Petn; Metranil; Mycardol; Mycardal; Nitrodex; Penta-fin; Pentanitrate; Pentritol; Pentryate; Peritrate; Quintrate; Ter-pate; Tranite; Vasolate. It is an ingredient of Cartrax, Miltrate, and Pentoxylon.

2,2-Bis(hydroxymethyl)propane-1,3-diol tetranitrate

$C_5H_8N_4O_{12}$ = 316.1

CAS—115-77-5 (pentaerythritol); 78-11-5 (tetranitrate)

A white crystalline powder. M.p. 140°.

Practically **insoluble** in water; slightly soluble in ethanol; soluble in acetone.

Note. For medicinal purposes pentaerythritol tetranitrate is supplied diluted with an inert substance such as lactose, since the undiluted compound may explode upon percussion or on exposure to heat.

Ultraviolet Spectrum. Aqueous acid—255 nm; aqueous alkali—294 nm.

Mass Spectrum. Principal peaks at m/z 46, 76, 57, 55, 56, 60, 47, 97.

Quantification. GAS CHROMATOGRAPHY. In blood or urine: pentaerythritol tetranitrate and de-esterified metabolites, detec-

tion limits 100 pg/ml to 2 ng/ml in blood, ECD—G. B. Neurath and M. Dünger, *Arzneimittel-Forsch.*, 1977, 27, 416–419.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: detection limit 100 pg—W. C. Yu and E. U. Goff, *Analyt. Chem.*, 1983, 55, 29–32.

Disposition in the Body. Incompletely absorbed from the gastro-intestinal tract; it may be absorbed through intact skin. The main metabolic reaction is stepwise de-esterification ultimately to pentaerythritol. The nitrate ester metabolites may be conjugated with glucuronic acid. About 50 to 60% of a dose is excreted in the urine in 48 hours, mainly as pentaerythritol and pentaerythritol mononitrate, with small amounts of the dinitrate ester. About 30 to 40% of a dose is eliminated in the faeces in 72 hours, partly as unchanged drug, with the main metabolite present being pentaerythritol, together with small quantities of the dinitrate and mononitrate esters.

HALF-LIFE. About 7 hours.

PROTEIN BINDING. In plasma, about 85%.

Dose. 30 to 240 mg daily.

Pentamidine

Antiprotozoal

4,4'-(Pentamethylenedioxy)dibenzamidine

$C_{19}H_{24}N_4O_2$ = 340.4

CAS—100-33-4

Pentamidine Isethionate

$C_{19}H_{24}N_4O_2 \cdot 2C_2H_6O_4S$ = 592.7

CAS—140-64-7

White, hygroscopic crystals or powder. M.p. 188° to 192°.

Soluble 1 in 10 of water; slightly soluble in ethanol; practically insoluble in chloroform and ether.

Pentamidine Mesylate

Synonyms. Pentamidine Dimethylsulphonate; Pentamidine Methanesulphonate.

Proprietary Name. Lomidine

$C_{19}H_{24}N_4O_2 \cdot 2CH_3SO_3H$ = 532.6

CAS—6823-79-6

A white or very faintly pink granular powder.

Slightly **soluble** in water and ethanol; practically insoluble in chloroform and ether.

Thin-layer Chromatography. System TA—Rf 01; system TB—Rf 01; system TC—Rf 00. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—262 nm (A_1^1 = 840 a); aqueous alkali—249 nm. (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 1188, 1604, 1260, 1028, 1676, 1003 (pentamidine isethionate, KBr disk). (See below)

Dose. Usually the equivalent of 2 to 4 mg/kg of pentamidine daily, by intramuscular injection.

Pentapiperide Methylsulphate

Anticholinergic

Synonyms. Pentapiperium Methylsulphate; Valpipamate Methylsulphate.

Proprietary Names. Crilin; Crylène.

Note. Pentapiperide methylsulphate and pentapiperium methylsulphate are identical but pentapiperide differs from pentapiperium in having one less methyl group.

1,1-Dimethyl-4-(3-methyl-2-phenylvaleryloxy)piperidinium methylsulphate

$C_{19}H_{30}NO_2 \cdot CH_3SO_4 = 415.5$

CAS—7009-54-3 (pentapiperide); 26372-86-1 (pentapiperium); 7681-80-3 (pentapiperide methylsulphate or pentapiperium methylsulphate)

A white crystalline powder. M.p. 140° to 148°.

Freely **soluble** in water, chloroform, and methanol; soluble in ethanol.

Colour Tests. Liebermann's Test—red-orange; Marquis Test—orange.

Thin-layer Chromatography. System *TA*—Rf 01; system *TB*—Rf 00; system *TC*—Rf 01. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System *GA*—not eluted.

Ultraviolet Spectrum. Aqueous acid—253 nm, 258 nm, 265 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1210, 1730, 1252, 755, 1008, 1162 (Nujol mull).

Mass Spectrum. Principal peaks at *m/z* 96, 97, 98, 91, 136, 31, 29, 55.

Dose. 20 to 30 mg daily.

Pentazocine

Narcotic Analgesic

(2*R**,6*R**,11*R**)-1,2,3,4,5,6-Hexahydro-6,11-dimethyl-3-(3-methylbut-2-enyl)-2,6-methano-3-benzazocin-8-ol

$C_{19}H_{27}NO = 285.4$

CAS—359-83-1

A white or pale tan-coloured powder. M.p. 147° to 158°.

Practically **insoluble** in water; soluble 1 in about 15 of ethanol, 1 in 2 of chloroform, and 1 in 33 of ether.

Pentazocine Hydrochloride

Proprietary Names. Algopent (tablets); Fortral (capsules and tablets); Talwin (tablets). It is an ingredient of Fortagesic.

$C_{19}H_{27}NO \cdot HCl = 321.9$

CAS—2276-52-0; 64024-15-3

A white to pale cream-coloured crystalline powder. There are 2 forms, melting at about 218° and about 254°.

Soluble 1 in 30 of water, 1 in 16 of ethanol, and 1 in 4 of chloroform; practically insoluble in ether.

Pentazocine Lactate

Proprietary Names. Algopent (injection); Fortral (injection and suppositories); Pentalgina; Talwin (injection and suppositories).

$C_{19}H_{27}NO \cdot C_3H_5O_3 = 375.5$

CAS—17146-95-1

A white to cream-coloured powder.

Soluble 1 in 25 of water, 1 in 12 of ethanol, 1 in 25 of chloroform, and 1 in 1500 of ether.

Dissociation Constant. pK_a 8.5, 10.0 (20°).

Partition Coefficient. Log *P* (octanol/pH 7.4), 2.0.

Colour Tests. Folin-Ciocalteu Reagent—blue; Mandelin's Test—green; Marquis Test—red → green.

Thin-layer Chromatography. System *TA*—Rf 61; system *TB*—Rf 15; system *TC*—Rf 12. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System *GA*—RI 2275; system *GB*—RI 1528; system *GC*—RI 2225; system *GF*—RI 3030.

High Pressure Liquid Chromatography. System *HA*—*k'* 1.8; system *HC*—*k'* 0.67.

Ultraviolet Spectrum. Aqueous acid—278 nm ($A_1^1 = 69$ a); aqueous alkali—240 nm ($A_1^1 = 330$ a), 300 nm ($A_1^1 = 106$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1238, 1264, 1609, 1214, 854, 1054 (KBr disk). Polymorphism may occur.

Mass Spectrum. Principal peaks at m/z 45, 217, 70, 41, 69, 110, 285, 202.

Quantification. GAS CHROMATOGRAPHY. In blood: pentazocine and tripeleminamine, AFID—M. A. Mackell and A. Poklis, *J. Chromat.*, 1982, 235, 445–452. In blood, plasma or urine: sensitivity 5 ng, ECD—S. E. Swezey *et al.*, *J. Chromat.*, 1978, 154, 256–260. In plasma or urine: pentazocine and metabolites, ECD and FID—K. A. Pittman and C. Davison, *J. pharm. Sci.*, 1973, 62, 765–769.

RADIOIMMUNOASSAY. In plasma: detection limit 1 ng/ml—J. E. Peterson *et al.*, *J. pharm. Sci.*, 1979, 68, 626–628.

Disposition in the Body. Well absorbed after oral, intramuscular, or rectal administration, but undergoes extensive first-pass

metabolism after oral administration; bioavailability about 20%. Metabolism occurs mainly by extensive oxidation of the methyl groups of the dimethylallyl side-chain to produce the *cis*-hydroxy and the *trans*-carboxylic acid metabolites; the *trans*-hydroxy metabolite appears to be rapidly oxidised to the acid and is not detectable. Glucuronic acid conjugation of unchanged drug and metabolites also occurs; the 3-(3-hydroxy-3-methylbutyl) derivative has also been detected in the urine after overdoses. There is considerable intersubject variation in the rate of metabolism, and smokers appear to metabolise 40% more pentazocine than non-smokers. After intramuscular administration, 65 to 76% of a dose is excreted in the urine in 48 hours. After an oral dose, up to 13% is excreted as unchanged drug and 12 to 30% as the conjugate in 24 hours, the major proportion being excreted in the first 12 hours. Less than 2% of a dose is eliminated in the faeces.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.05 to 0.20 $\mu\text{g/ml}$. Blood concentrations may be erratic and after intramuscular or oral administration, more than one peak may occur.

After an intramuscular dose of 45 mg given to 8 subjects, peak plasma concentrations of 0.11 to 0.24 $\mu\text{g/ml}$ (mean 0.14) were attained in 1 hour. After a single oral dose of 75 mg given to 5 subjects, peak plasma concentrations of 0.11 to 0.30 $\mu\text{g/ml}$ (mean 0.16) were attained in 1 to 3 hours (B. A. Berkowitz *et al.*, *Clin. Pharmac. Ther.*, 1969, 10, 320–328).

TOXICITY. The estimated minimum lethal dose is 0.3 g, although recovery after ingestion of 1.2 g has been reported. Blood concentrations of 1 $\mu\text{g/ml}$ or more may be lethal. Some cases of abuse have been reported resulting in a mild form of addiction. Pentazocine abuse has been reported to be widespread among 'street addicts' in the United States of America, in combination with tripeleminamine ('T's and Blues').

In 2 fatalities due to pentazocine ingestion, the following postmortem tissue concentrations were reported: blood 9.2 and 3.3 $\mu\text{g/ml}$, liver 43 and 34 $\mu\text{g/g}$, urine, –, 4.5 $\mu\text{g/ml}$; ethanol was also detected in blood at concentrations of 200 and 1760 $\mu\text{g/ml}$. Blood- and liver-pentazocine concentrations in other cases taken from the literature were reported to range from 0.8 to 38 $\mu\text{g/ml}$ and 3 to 197 $\mu\text{g/g}$ respectively (A. Poklis and M. A. Mackell, *Forens. Sci. Int.*, 1982, 20, 89–95).

In 17 fatalities involving intravenous abuse of pentazocine and tripeleminamine, pentazocine blood concentrations of 0 to 11 $\mu\text{g/ml}$ (mean 3) were reported; tripeleminamine concentrations ranged from 0 to 3.0 $\mu\text{g/ml}$ (mean 0.5) (J. R. Monforte *et al.*, *J. forens. Sci.*, 1983, 28, 90–101).

HALF-LIFE. Plasma half-life, about 2 to 4 hours.

VOLUME OF DISTRIBUTION. About 5 litres/kg.

CLEARANCE. Plasma clearance, about 18 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 0.93.

PROTEIN BINDING. In plasma, about 60 to 70%.

NOTE. For a review of the pharmacokinetics of narcotic agonists-antagonists, see R. E. S. Bullingham *et al.*, *Clin. Pharmacokinet.*, 1983, 8, 332–343.

Dose. The equivalent of up to 600 mg of pentazocine daily, by mouth; up to 360 mg daily, given parenterally.

Pentetrazol

Respiratory Stimulant

Synonyms. Corazol; Leptazol; Pentamethazol; 1,5-Pentamethylenetetrazole; Pentazol; Pentylene-tetrazol.

Proprietary Names. Cardiazol; Metrazol.

6,7,8,9-Tetrahydro-5H-tetrazoloazepine

$\text{C}_6\text{H}_{10}\text{N}_4 = 138.2$

CAS—54-95-5

Colourless crystals or white crystalline powder. M.p. 57° to 60°. **Soluble** 1 in less than 1 of water, of ethanol, and of chloroform, and 1 in less than 4 of ether.

Thin-layer Chromatography. *System TA*—Rf 72; *system TB*—Rf 07; *system TC*—Rf 64. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 1552; *system GB*—RI 1578; *system GC*—RI 2021.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1535, 1115, 1250, 1000, 900, 800 (KBr disk).

Mass Spectrum. Principal peaks at m/z 55, 82, 41, 39, 54, 42, 56, 109.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 100 ng/ml, AFID—L. D. Bo *et al.*, *J. pharmacol. Methods*, 1979, 2, 29–33. In plasma or urine: sensitivity 500 ng/ml, FID—H. W. Jun *et al.*, *J. pharm. Sci.*, 1975, 64, 1843–1846.

Disposition in the Body. Readily absorbed after oral or parenteral administration and rapidly metabolised. About 60% of an oral dose is excreted in the urine in 24 hours with about 10% as unchanged drug and the remainder as metabolites.

THERAPEUTIC CONCENTRATION.

Following an oral dose of 100 mg to 3 subjects, who were taking the drug regularly, peak plasma concentrations of 1.5 to 3.1 µg/ml (mean 2.2) were attained in 1.3 to 5 hours (H. W. Jun *et al.*, *ibid.*).

Dose. Usually 100 mg parenterally.

Penthienate Methobromide

Anticholinergic

Synonym. Penthienate Bromide

Proprietary Name. Monodral

2-[2-Cyclopentyl-2-(2-thienyl)glycolyloxy]ethyl-diethylmethyl-ammonium bromide

$C_{18}H_{30}BrNO_3S = 420.4$

CAS—22064-27-3 ($C_{18}H_{30}NO_3S$); 60-44-6 (methobromide)

A white crystalline powder. M.p. 122° to 128°.

Soluble in water and ethanol; freely soluble in chloroform; practically insoluble in ether.

Colour Tests. The following tests are performed on the nitrate (see p. 128): Liebermann's Test—violet; Mandelin's Test—violet; Marquis Test—violet; Sulphuric Acid—orange.

Thin-layer Chromatography. *System TA*—Rf 02. (Acidified iodoplatinate solution, positive.)

High Pressure Liquid Chromatography. *System HA*— k' 3.2.

Ultraviolet Spectrum. Aqueous acid—238 nm ($A_1^1 = 188$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1739, 1227, 1234, 704, 1064, 1130 (KBr disk).

Dose. 7.5 to 40 mg daily.

Pentifylline

Vasodilator

Synonym. 1-Hexyltheobromine

1-Hexyl-3,7-dimethylxanthine

$C_{13}H_{20}N_4O_2 = 264.3$

CAS—1028-33-7

A crystalline solid. M.p. about 82°.

Practically **insoluble** in water; soluble in ethanol, chloroform, and hydrochloric acid.

Colour Test. Amalic Acid Test—pink-orange/violet.

Thin-layer Chromatography. System TA—Rf 55; system TB—Rf 06; system TC—Rf 66. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2195.

Ultraviolet Spectrum. Aqueous acid—275 nm ($A_1^1 = 335$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1652, 1700, 1548, 1220, 760, 750 (KBr disk).

Mass Spectrum. Principal peaks at m/z 180, 264, 193, 109, 194, 181, 67, 42.

Dose. Pentifylline has been given in doses of up to 800 mg daily.

Pentobarbitone

Barbiturate

Synonyms. Mébubarbital; Mebumal; Pentobarbital.

Proprietary Names. Nembutal (elixir); Neodorm.

5-Ethyl-5-(1-methylbutyl)barbituric acid

$C_{11}H_{18}N_2O_3 = 226.3$

CAS—76-74-4

Colourless crystals or a white crystalline powder. M.p. 127° to 133°. A polymorphic form may occur, with a m.p. of about 115°; it gradually reverts to the more stable form on heating at about 110°.

Very slightly **soluble** in water; soluble 1 in 4.5 of ethanol, 1 in 4 of chloroform, and 1 in 10 of ether; very soluble in acetone and methanol.

Pentobarbitone Calcium

Synonym. Pentobarbital Calcium

Proprietary Name. Repocal

$(C_{11}H_{17}N_2O_3)_2Ca = 490.6$

CAS—7563-42-0 ($C_{11}H_{18}N_2O_3 \cdot xCa$)

A fine white crystalline powder.

Sparsingly **soluble** in water; slightly soluble in ethanol; practically insoluble in ether.

Pentobarbitone Sodium

Synonyms. Ethaminal Sodium; Mebumal Sodium; Pentobarbital Sodium; Soluble Pentobarbitone.

Proprietary Names. Nembutal; Nova-Rectal; Penbon; Pentogen; Pentone; Petab. It is an ingredient of Carbrital.

$C_{11}H_{17}N_2NaO_3 = 248.3$

CAS—57-33-0

A white, hygroscopic, crystalline powder or granules.

Very **soluble** in water and ethanol; practically insoluble in ether. A solution in water slowly decomposes.

Dissociation Constant. pK_a 8.0 (20°).

Partition Coefficient. Log P (octanol/pH 7.4), 1.9.

Colour Tests. Koppanyi-Zwicker Test—violet; Mercurous Nitrate—black; Vanillin Reagent—brown-red/violet.

Thin-layer Chromatography. System TD—Rf 55; system TE—Rf 45; system TF—Rf 66; system TH—Rf 76. (Mercuric chloride-diphenylcarbazon reagent, positive; mercurous nitrate spray, black; Zwicker's reagent, pink.)

Gas Chromatography. System GA—RI 1740; system GF—RI 2465.

High Pressure Liquid Chromatography. System HG— k' 10.96; system HH— k' 8.07.

Ultraviolet Spectrum. Borax buffer 0.05M (pH 9.2)—239 nm ($A_1^1 = 438$ a); M sodium hydroxide (pH 13)—255 nm ($A_1^1 = 327$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1685, 1719, 1744, 1315, 1218, 845 (KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 141, 156, 43, 41, 157, 55, 39, 98; 3'-hydroxypentobarbitone 45, 156, 141, 69, 41, 43, 157, 55.

Quantification. See also under Amylobarbitone.

GAS CHROMATOGRAPHY. In serum: sensitivity 80 ng/ml, AFID—S.-R. Sun and D. J. Hoffman, *J. pharm. Sci.*, 1979, 68, 386–388. In plasma: sensitivity 500 ng/ml, FID—A. Hulshoff *et al.*, *Analytica chim. Acta*, 1979, 105, 139–146.

Disposition in the Body. More than 90% of the sodium salt is absorbed after oral administration. About 80% of a dose is excreted in the urine in 5 days, with about 7% as (+)-3'-

hydroxypentobarbitone, 30% as the (–)-3'-hydroxy isomer, up to 13% as the *N*-hydroxy metabolite, 7 to 14% as the 3'-oxo metabolite, and about 10 to 15% as the 3'-carboxy derivative. About 1% of a dose is excreted in the urine unchanged. Pentobarbitone is a metabolite of thiopentone.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 1 to 10 µg/ml.

Following a single oral dose of 50 mg to 5 fasting subjects, peak plasma concentrations of 0.62 to 0.88 µg/ml (mean 0.73) were attained in 1 hour (R. B. Smith *et al.*, *J. Pharmacokinet. Biopharm.*, 1973, 1, 5–16).

After an intravenous injection of 100 mg to 7 subjects, mean plasma concentrations of 3 µg/ml were reported in 6 minutes (M. Ehrnebo, *J. pharm. Sci.*, 1974, 63, 1114–1118).

TOXICITY. The estimated minimum lethal dose is 1 g. Toxic effects are usually associated with blood concentrations greater than about 8 µg/ml and concentrations of 12 µg/ml or more may produce coma. Fatalities have been associated with plasma concentrations of 8 to 24 to 73 µg/ml.

In 55 fatalities the following postmortem concentrations were reported: blood 5 to 169 µg/ml (mean 30), liver 23 to 550 µg/g (mean 130) (R. C. Baselt and R. H. Cravey, *J. analyt. Toxicol.*, 1977, 1, 81–103).

The following postmortem tissue distribution (mean, *n*) was reported in 8 fatalities attributed to pentobarbitone: blood 19 to 90 µg/ml (46, 6), brain 21 to 117 µg/g (67, 7), kidney 16 to 156 µg/g (70, 6), liver 50 to 435 µg/g (198, 5), spleen 28 to 186 µg/g (120, 5), and urine 50 µg/ml (1 case) (C. J. Rehling, *Poison Residues in Human Tissues*, in *Progress in Chemical Toxicology*, Vol. 3, A. Stolman (Ed.), New York, Academic Press Inc., 1967, p. 370).

In 3 fatalities due to pentobarbitone, the following postmortem tissue distribution, µg/ml or µg/g, was reported:

	Pentobarbitone	3'-Hydroxy metabolite
Blood	51, 10, 25	ND, ND, 4
Bile	152, 148, 59	–, –, 13
Kidney (left)	46, 16, 38	4, 7, 7
Liver	165, 20, 46	5, 8, 9
Urine	7, 5, 62	–, 82, 65

(ND = not detected)

(A. E. Robinson and R. D. McDowall, *J. Pharm. Pharmac.*, 1979, 31, 357–365).

HALF-LIFE. Plasma half-life, about 15 to 48 hours (mean 27).

VOLUME OF DISTRIBUTION. About 0.7 to 1 litre/kg.

CLEARANCE. Plasma clearance, about 0.3 to 0.5 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 0.93.

SALIVA. Plasma: saliva ratio, about 3.

PROTEIN BINDING. In plasma, about 65%.

NOTE. For a review of the pharmacokinetics of hypnotic drugs see D. D. Breimer, *Clin. Pharmacokinet.*, 1977, 2, 93–109.

Dose. 100 to 200 mg, as a hypnotic.

Pentolinium Tartrate

Antihypertensive

Synonyms. Pentapyrrolidinium Bitartrate; Pentolonium Tartrate.

Proprietary Name. Ansolsen

NN'-Pentamethylenebis(1-methylpyrrolidinium) bis(hydrogen tartrate)

$C_{23}H_{42}N_2O_{12} = 538.6$

CAS—144-44-5 (pentolinium); 52-62-0 (tartrate)

A white powder. M.p. about 206°, with decomposition.

Soluble 1 in 0.4 of water and 1 in 800 of ethanol; practically insoluble in chloroform and ether.

Thin-layer Chromatography. *System* TA—Rf 00. (*Acidified iodoplatinate solution*, positive.)

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1299, 1256, 1064, 1208, 1129, 676 (KBr disk).

Disposition in the Body. Incompletely and irregularly absorbed after oral administration. Excreted in the urine as unchanged drug.

Dose. 2.5 to 25 mg intravenously. Doses of 20 to 900 mg daily have been given by mouth.

Perazine

Tranquilliser

Synonym. Pemazine

10-[3-(4-Methylpiperazin-1-yl)propyl]phenothiazine

$C_{20}H_{25}N_3S = 339.5$

CAS—84-97-9

Crystals. M.p. 54° to 57°.

Perazine Dimalonate*Proprietary Name.* Taxilan $C_{20}H_{25}N_3S_2C_3H_4O_4 = 547.6$ *CAS*—14777-25-4

A white crystalline powder. M.p. 114° to 116°.

Soluble 1 in 1 of water, 1 in 33 of ethanol, and 1 in 250 of chloroform.**Partition Coefficient.** Log *P* (octanol/pH 7.4), 2.9.**Colour Tests.** Formaldehyde–Sulphuric Acid—red-violet; Forest Reagent—brown-orange; FPN Reagent—brown-orange; Mandelin's Test—green → violet; Marquis Test—violet; Sulphuric Acid—violet.**Thin-layer Chromatography.** *System TA*—Rf 48; *system TB*—Rf 24; *system TC*—Rf 37. (Acidified iodoplatinate solution, positive.)**Gas Chromatography.** *System GA*—RI 2845.**Ultraviolet Spectrum.** Aqueous acid—251 nm ($A_1^1 = 875$ a), 300 nm.**Infra-red Spectrum.** Principal peaks at wavenumbers 748, 1279, 1244, 1163, 1143, 1570 (KBr disk).**Mass Spectrum.** Principal peaks at *m/z* 113, 339, 44, 70, 141, 43, 60, 340.**Quantification.** GAS CHROMATOGRAPHY. In serum: sensitivity 20 ng/ml, FID—J. Schley *et al.*, *J. clin. Chem. clin. Biochem.*, 1978, 16, 307–311.**THIN-LAYER CHROMATOGRAPHY.** In plasma: perazine and desmethylperazine, sensitivity 10 ng/ml—M. Kresse *et al.*, *J. Chromat.*, 1980, 183; *Biomed. Appl.*, 9, 475–482.**Disposition in the Body.** Absorbed after oral administration but undergoes extensive metabolism by demethylation, sulfoxidation, *N*-oxidation and aromatic hydroxylation, followed by conjugation with glucuronic acid. About 15 to 30% of an oral dose is excreted in the urine mainly as conjugated phenolic metabolites.**THERAPEUTIC CONCENTRATION.**

Following daily oral doses of 300 to 400 mg given to 14 subjects for at least 4 days, plasma concentrations of 0.02 to 0.34 µg/ml (mean 0.11) of

perazine and 0.04 to 0.54 µg/ml (mean 0.17) of the desmethyl metabolite were reported (U. Breyer and K. Villumsen, *Eur. J. clin. Pharmacol.*, 1976, 9, 457–465).**PROTEIN BINDING.** In plasma, about 94 to 97%.**Dose.** Usually the equivalent of 50 to 300 mg of perazine daily.**Perhexiline***Anti-anginal*

2-(2,2-Dicyclohexylethyl)piperidine

 $C_{19}H_{35}N = 277.5$ *CAS*—6621-47-2**Perhexiline Maleate***Proprietary Name.* Pexid $C_{19}H_{35}N, C_4H_4O_4 = 393.6$ *CAS*—6724-53-4

A white crystalline powder. M.p. about 189°.

Slightly **soluble** in water; soluble in chloroform and methanol.**Thin-layer Chromatography.** *System TA*—Rf 41; *system TB*—Rf 57; *system TC*—Rf 08. (Acidified iodoplatinate solution, strong reaction.)**Gas Chromatography.** *System GA*—RI 2153.**High Pressure Liquid Chromatography.** *System HA*—*k'* 0.2.**Ultraviolet Spectrum.** No significant absorption, 230 to 360 nm.**Infra-red Spectrum.** Principal peaks at wavenumbers 1582, 873, 990, 730, 1029, 1081 (perhexiline maleate, KBr disk).**Mass Spectrum.** Principal peaks at *m/z* 84, 194, 55, 85, 56, 41, 30, 99.**Quantification.** GAS CHROMATOGRAPHY. In plasma: sensitivity 20 ng/ml, AFID—N. Grgurinovich, *J. Chromat.*, 1983, 274; *Biomed. Appl.*, 25, 361–365.**HIGH PRESSURE LIQUID CHROMATOGRAPHY.** In plasma: sensitivity 5 ng/ml, fluorescence detection—J. D. Horowitz *et al.*, *J. pharm. Sci.*, 1981, 70, 320–322.**Disposition in the Body.** Incompletely absorbed after oral administration. It is metabolised by hydroxylation to mono- and dihydroxylated derivatives which are slowly excreted in the urine and faeces; very little unchanged drug is excreted in the urine.**THERAPEUTIC CONCENTRATION.**After a single oral dose of 150 mg given to 5 subjects, peak plasma concentrations of 0.02 to 0.12 µg/ml (mean 0.07) were attained in about 6 hours; following a single oral dose of 300 mg to the same subjects, peak plasma concentrations of 0.14 to 0.44 µg/ml (mean 0.27) were reported at 7 hours; absorption was considerably delayed in one subject with both doses (J. D. Horowitz *et al.*, *ibid.*).

Following chronic oral doses of 100 to 400 mg daily to 14 subjects, minimum steady-state plasma-perhexiline concentrations of 0.35 to 2.8 µg/ml (mean 1.07) were reported; steady-state plasma concentrations of the major monohydroxylated metabolite ranged from 1.25 to 7.4 µg/ml (mean 3.8). Steady-state plasma concentrations in 13 subjects who had been receiving similar daily doses but had developed toxic effects were:

perhexiline 2.2 to 6.5 µg/ml (mean 3.8), monohydroxy metabolite 0.6 to 3.8 µg/ml (mean 1.6) (E. Singlas *et al.*, *Eur. J. clin. Pharmac.*, 1978, 14, 195-201).

HALF-LIFE. Plasma half-life, about 2 to 6 days; the rate of elimination appears to be decreased in subjects with toxic effects, and may be dose-dependent.

Dose. 100 to 400 mg of perhexiline maleate daily.

Pericyazine

Tranquilliser

Synonyms. Periciazine; Propericiazine.

Proprietary Names. Aolept; Neulactil; Neuleptil.

10-[3-(4-Hydroxypiperidino)propyl]phenothiazine-2-carbonitrile

$C_{21}H_{23}N_3OS = 365.5$

CAS—2622-26-6

A yellow crystalline powder. M.p. 115°.

Practically **insoluble** in water; soluble in ethanol and acetone; freely soluble in chloroform; slightly soluble in ether.

Partition Coefficient. Log *P* (octanol), 3.5.

Colour Tests. Formaldehyde-Sulphuric Acid—red; Forrest Reagent—brown-orange; FPN Reagent—orange; Mandelin's Test—red; Marquis Test—red.

Thin-layer Chromatography. System *TA*—Rf 58; system *TB*—Rf 03; system *TC*—Rf 16. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System *GA*—RI 3285.

High Pressure Liquid Chromatography. System *HA*—*k'* 1.3.

Ultraviolet Spectrum. Aqueous acid—232 nm, 268 nm ($A_1^1 = 761$ a); aqueous alkali—272 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 736, 1066, 811, 746, 1245, 1260 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 114, 44, 142, 365, 42, 223, 115, 205.

Dose. 10 to 75 mg daily.

Perphenazine

Tranquilliser

Synonym. Chlorpiprazine

Proprietary Names. Decantan; Fentazin; Phenazine; Trilafon; Trilifan. It is an ingredient of Etrafon, Triavil, and Triptafen.

2-{4-[3-(2-Chlorophenothiazin-10-yl)propyl]piperazin-1-yl}-ethanol

$C_{21}H_{26}ClN_3OS = 404.0$

CAS—58-39-9

A white or creamy-white powder. M.p. 94° to 100°.

Practically **insoluble** in water; soluble 1 in 20 of ethanol, 1 in 1 of chloroform, and 1 in 80 of ether.

Dissociation Constant. pK_a 7.8 (24°).

Partition Coefficient. Log *P* (octanol/pH 7.0), 3.1.

Colour Tests. Formaldehyde-Sulphuric Acid—violet; Forrest Reagent—violet-red; FPN Reagent—violet-red; Liebermann's Test—red-brown; Mandelin's Test—violet; Marquis Test—violet

Thin-layer Chromatography. System TA—Rf 55; system TB—Rf 07; system TC—Rf 29. (Dragendorff spray, positive; FPN reagent, pink; acidified iodoplatinate solution, positive; Marquis reagent, pink; ninhydrin spray, positive.)

Gas Chromatography. System GA—RI 2207.

High Pressure Liquid Chromatography. System HA— k' 1.9.

Ultraviolet Spectrum. Aqueous acid—254 nm ($A_1^1 = 805$ a), 307 nm; aqueous alkali—257 nm ($A_1^1 = 791$ a), 310 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 757, 1294, 917, 1145, 1247, 1155 (KBr disk).

Mass Spectrum. Principal peaks at m/z 246, 143, 403, 70, 404, 42, 248, 113.

Quantification. GAS CHROMATOGRAPHY. In plasma: perphenazine and perphenazine sulfoxide, sensitivity 200 pg/ml, ECD—N.-E. Larsen and J. Naestoft, *J. Chromat.*, 1975, 109, 259–264.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: perphenazine and *N*-deshydroxyethylperphenazine, sensitivity 1 ng/ml, UV detection—M. Larsson and A. Forsman, *Ther. Drug Monit.*, 1983, 5, 225–228.

RADIOIMMUNOASSAY. In plasma: detection limit 250 pg/ml—K. K. Midha *et al.*, *Br. J. clin. Pharmacol.*, 1981, 11, 85–88.

Disposition in the Body. Absorbed after oral administration but subject to first-pass metabolism. The main metabolic reactions are oxidation to the sulfoxide, which may have some pharmacological activity, *N*-dealkylation to form the *N*-deshydroxyethyl metabolite, *N*-oxidation, cleavage of the piperazine ring, and phenolic hydroxylation, followed by glucuronide conjugation. After oral administration, about 1 to 2% of the daily dose is excreted in the urine as unchanged drug, with about 13% as the sulfoxide and 30% as perphenazine glucuronide; after chronic administration of perphenazine enanthate intramuscularly, excretion of unchanged drug and the sulfoxide is increased to about 6% and 22% of the dose, respectively.

THERAPEUTIC CONCENTRATION.

After daily oral doses of 12 to 48 mg to 16 subjects, steady-state plasma concentrations of 0.0003 to 0.025 µg/ml (mean 0.004) of perphenazine and 0.0004 to 0.018 µg/ml (mean 0.004) of the sulfoxide were reported (L. B. Hansen and N.-E. Larsen, *Psychopharmacologia*, 1977, 53, 127–130).

TOXICITY.

The following postmortem tissue concentrations were reported in a fatality due to the ingestion of about 1 g of perphenazine: blood 3 µg/ml, brain 11 µg/g, liver 149 µg/g; a blood-alcohol concentration of 1700 µg/ml was also reported (R. H. Cravey, per R. C. Baselt, *Disposition of Toxic Drugs and Chemicals in Man*, 2nd Edn, Davis, California, Biomedical Publications, 1982, pp. 610–612).

HALF-LIFE. Plasma half-life, about 8 to 12 hours.

VOLUME OF DISTRIBUTION. 10 to 35 litres/kg.

CLEARANCE. Plasma clearance, about 12 to 38 ml/min/kg.

Dose. Usually 12 to 24 mg daily; up to 64 mg daily has been given.

Pethidine

Narcotic Analgesic

Synonyms. Isonipeccaine; Meperidine.

Ethyl 1-methyl-4-phenylpiperidine-4-carboxylate

$C_{15}H_{21}NO_2 = 247.3$

CAS—57-42-1

An oily liquid which slowly crystallises.

Pethidine Hydrochloride

Proprietary Names. Demer-Idine; Demerol; Dolantin(e); Dolosal; Pethoid. It is an ingredient of Mepergan and Pethilorfan.

$C_{15}H_{21}NO_2 \cdot HCl = 283.8$

CAS—50-13-5

A white crystalline powder. M.p. 186° to 190°.

Very **soluble** in water; soluble 1 in 20 of ethanol; soluble in chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 8.7 (20°).

Partition Coefficient. Log *P* (octanol), 1.6.

Colour Tests. Liebermann's Test—red-orange; Marquis Test—orange.

Thin-layer Chromatography. System TA—Rf 52; system TB—Rf 37; system TC—Rf 34. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, brown.)

Gas Chromatography. System GA—pethidine RI 1751, norpethidine RI 1745; system GB—RI 1753; system GC—RI 2025; system GF—RI 1995.

High Pressure Liquid Chromatography. System HA—pethidine k' 2.8 (tailing peak), norpethidine k' 1.7 (tailing peak), pethidinic acid k' 2.8 (tailing peak); system HC—pethidine k' 0.55, norpethidine k' 2.04.

Ultraviolet Spectrum. Aqueous acid—251 nm, 257 nm ($A_1^1 = 8.5$ a), 263 nm. No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1708, 1218, 1166, 1148, 688, 730 (pethidine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 71, 70, 44, 57, 42, 247, 43, 246; norpethidine 57, 233, 42, 56, 158, 43, 160, 103; pethidinic acid 71, 70, 57, 43, 219, 42, 218, 44.

Quantification. GAS CHROMATOGRAPHY. In blood, plasma or urine: pethidine and norpethidine, sensitivity 5 ng/ml for pethidine and 2.5 ng/ml for norpethidine, AFID—P. Jacob *et al.*, *J. pharm. Sci.*, 1982, 71, 166–168. In plasma: pethidine and norpethidine, sensitivity 20 ng/ml, ECD—P. Hartvig and C. Fagerlund, *J. Chromat.*, 1983, 274; *Biomed. Appl.*, 25, 355–360.

GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In plasma or serum: pethidine and norpethidine, detection limit 170 pg/ml for pethidine and 500 pg/ml for norpethidine—E. L. Todd *et al.*, *J. analyt. Toxicol.*, 1979, 3, 256–259. In urine: pethidinic and norpethidinic acids, sensitivity 500 ng/ml—C. Lindberg *et al.*, *Acta pharm. suec.*, 1978, 15, 327–336.

Disposition in the Body. Readily absorbed after oral administration and rapidly and extensively distributed throughout the tissues. It undergoes considerable first-pass metabolism; bioavailability about 55%. The major metabolites are the *N*-demethylated derivative, norpethidine, and the hydrolysis product, pethidinic acid, and its conjugates. Norpethidine is about half as active an analgesic and about twice as toxic as pethidine; it may accumulate in the plasma on chronic administration, particularly in subjects with renal failure. The excretion of pethidine and its metabolites is dependent on the urinary pH. In normal subjects, about 70% of a dose is excreted in the urine in 24 hours, up to 10% as unchanged drug, 10% as norpethidine, 20% as pethidinic acid, 16% as conjugated pethidinic acid, 8% as norpethidinic acid, and 10% as conjugated norpethidinic acid; other metabolites identified in the urine in minor amounts include the *N*-hydroxy and *N*-hydroxyphenyl derivatives and pethidine *N*-oxide. Urinary excretion of pethidine and norpethidine may both be enhanced to about 30% of a dose if the urine is acid; in alkaline urine, less than 5% is excreted as pethidine and norpethidine. In pregnant women and in women taking oral contraceptives, the excretion of unchanged pethidine appears to be increased; less unchanged drug is eliminated in older subjects and, in subjects with cirrhosis, excretion of pethidine is delayed. Pethidine is a metabolite of phenoperidine.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.2 to 0.8 $\mu\text{g/ml}$. Higher plasma concentrations are found in elderly subjects.

Following a single oral dose of 50 mg to 6 subjects, a mean peak serum concentration of 0.14 $\mu\text{g/ml}$ was attained in 2 hours; after an intramuscular injection of 50 mg to the same subjects, a mean peak serum concentration of 0.20 $\mu\text{g/ml}$ in 1 hour was reported, and a mean serum concentration of 0.52 $\mu\text{g/ml}$ was obtained one minute after an intravenous injection of 50 mg (J. E. Stambaugh *et al.*, *J. clin. Pharmacol.*, 1976, 16, 245–256).

Following multiple oral doses of 75 to 100 mg to 4 subjects, plasma concentrations of 0.16 to 0.54 $\mu\text{g/ml}$ (mean 0.36) of pethidine and 0.13 to 0.48 $\mu\text{g/ml}$ (mean 0.27) of norpethidine were reported 1 to 4 hours after a dose (H. H. Szeto *et al.*, *J. Chromat.*, 1976, 125, 503–510).

TOXICITY. The estimated minimum lethal dose is 1 g. Toxic effects are usually associated with blood concentrations greater than 2 $\mu\text{g/ml}$ but fatalities involving pethidine are uncommon.

The following postmortem tissue concentrations, $\mu\text{g/ml}$ or $\mu\text{g/g}$, were reported in 6 fatalities due to the suicidal ingestion or accidental intravenous overdose of pethidine:

	Oral		Intravenous	
	Pethidine	Norpethidine	Pethidine	Norpethidine
Blood	8, 9, 20	18, 8, 30	1, 4, 8	7, 0.5, ND
Bile	13, –, –	16, –, –	–, –, –	–, –, –
Liver	7, 5, 10	66, 11, 15	2, 7, 16	12, 10, ND
Urine	–, 150, –	–, 50, –	20, 24, 2	69, 79, 0.1

(ND = not detected)

(T. J. Siek, *J. forens. Sci.*, 1978, 23, 6–13).

HALF-LIFE. Plasma half-life, pethidine 3 to 10 hours (mean 5), increased in neonates and in renal impairment; norpethidine about 18 hours.

VOLUME OF DISTRIBUTION. About 4 litres/kg.

CLEARANCE. Plasma clearance, about 14 ml/min/kg, decreased in subjects with liver disease and in the elderly.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 0.9.

PROTEIN BINDING. In plasma, about 40 to 50%.

NOTE. For reviews of the pharmacokinetics of pethidine see L. E. Mather and P. J. Meffin, *Clin. Pharmacokinet.*, 1978, 3, 352–368, and D. J. Edwards *et al.*, *ibid.*, 1982, 7, 421–433.

Dose. Usually 50 to 100 mg of pethidine hydrochloride, every 4 hours, by mouth or by intramuscular injection.

Phanquone

Anti-amoebic/Antibacterial

Synonym. Phanquinone

Proprietary Name. Entobex

4,7-Phenanthroline-5,6-dione

$C_{12}H_6N_2O_2 = 210.2$

CAS—84-12-8

An orange crystalline powder. M.p. 295°, with decomposition. Slightly **soluble** in water; practically insoluble in ethanol and chloroform.

Colour Tests. Marquis Test—yellow; Methanolic Potassium Hydroxide—yellow → brown-violet.

Thin-layer Chromatography. *System TA*—Rf 49; *system TB*—Rf 03; *system TC*—Rf 45. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—265 nm ($A_1^1 = 500$ a), 272 nm ($A_1^1 = 500$ a), 292 nm ($A_1^1 = 480$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1700, 1283, 1584, 1275, 1683, 950 (KBr disk).

Dose. 150 to 300 mg daily.

Phenacaine

Local Anaesthetic

Synonym. Phenetidylphenacetin

NN'-Bis(4-ethoxyphenyl)acetamidine

$C_{18}H_{22}N_2O_2 = 298.4$

CAS—101-93-9

Phenacaine Hydrochloride

Proprietary Name. Holocaine

$C_{18}H_{22}N_2O_2 \cdot HCl \cdot H_2O = 352.9$

CAS—620-99-5 (anhydrous); 6153-19-1 (monohydrate)

White crystals. M.p. about 190°.

Soluble 1 in 50 of water; freely soluble in ethanol and chloroform; practically insoluble in ether.

Gas Chromatography. *System GA*—RI 2617.

Infra-red Spectrum. Principal peaks at wavenumbers 1646, 1520, 1256, 1300, 1046, 815 (KBr disk).

Uses. Phenacaine hydrochloride has been used as a 1% aqueous solution or as a 1 or 2% ointment.

Phenacemide

Anticonvulsant

Synonym. Carbamidum Phenylacetum

Proprietary Name. Phenurone

(Phenylacetyl)urea

$C_9H_{10}N_2O_2 = 178.2$

CAS—63-98-9

A white crystalline powder. M.p. about 213°.

Very slightly **soluble** in water, ethanol, chloroform, and ether; slightly soluble in acetone and methanol.

Colour Tests. Liebermann's Test—red-orange; Nessler's Reagent—brown-orange (slow).

Thin-layer Chromatography. *System TD*—Rf 22; *system TE*—Rf 65; *system TF*—Rf 40.

Gas Chromatography. *System GA*—RI 1473.

Ultraviolet Spectrum. Methanol—258 nm ($A_1^1 = 18$ a), 265 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1660, 1090, 716, 1618, 1170, 970 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 91, 92, 118, 44, 43, 135, 65, 178.

Disposition in the Body. Well absorbed after oral administration. It is extensively metabolised to inactive metabolites, principally by *p*-hydroxylation of the phenyl ring; the metabolites are excreted in the urine.

Toxicity. The estimated minimum lethal dose is 5 g.

Dose. 1.5 to 3 g daily.

Phenacetin

Analgesic

Synonyms. Aceto-*p*-phenetidine; Acetophenetidin; Acetylphenetidin; Paracetophenetidin.

Proprietary Names. It is an ingredient of A.S.A. Compound, Coriforte, Fiorinal, P-A-C Compound, and Percodan.

4'-Ethoxyacetanilide

$C_{10}H_{13}NO_2 = 179.2$

CAS—62-44-2

White glistening crystalline scales or fine white crystalline powder. M.p. 134° to 137°.

Soluble 1 in 1300 of water, 1 in 20 of ethanol, and 1 in 20 of chloroform; slightly soluble in ether.

Dissociation Constant. pK_a 2.2.

Partition Coefficient. Log *P* (octanol/pH 7.4), 1.6.

Colour Tests. Liebermann's Test—violet.

Boil 0.1 g with 1 ml of hydrochloric acid for 3 minutes, dilute with 10 ml of water, cool, filter, and add 1 drop of 0.02M potassium dichromate to the filtrate—violet → red.

Thin-layer Chromatography. System *TD*—Rf 38; system *TE*—Rf 68; system *TF*—Rf 38. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. System *GA*—phenacetin RI 1675, paracetamol RI 1687; system *GF*—RI 2325.

High Pressure Liquid Chromatography. System *HD*—phenacetin k' 0.6, paracetamol k' 0.1; system *HW*—phenacetin k' 4.4, paracetamol k' 0.32.

Ultraviolet Spectrum. Aqueous acid—244 nm ($A_1^1 = 649$ a). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1244, 1655, 1513, 1555, 1265, 836 (KBr disk).

Mass Spectrum. Principal peaks at m/z 108, 109, 179, 137, 43, 81, 80, 110; paracetamol 109, 151, 43, 80, 108, 81, 53, 52.

Quantification. See also under Paracetamol.

GAS CHROMATOGRAPHY. In plasma: phenacetin and paracetamol, detection limit < 100 ng/ml, FID—M. A. Evans and R. D. Harbison, *J. pharm. Sci.*, 1977, 66, 1628–1629.

GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In plasma: phenacetin and paracetamol, sensitivity 1 ng/ml for phenacetin and 100 ng/ml for paracetamol—W. A. Garland *et al.*, *J. pharm. Sci.*, 1977, 66, 340–344.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: phenacetin and paracetamol, sensitivity 500 ng/ml, UV detection—G. R. Gotelli *et al.*, *Clin. Chem.*, 1977, 23, 957–959.

Disposition in the Body. Readily absorbed after oral administration, but subject to extensive first-pass metabolism. It is metabolised mainly in the liver by *O*-dealkylation to paracetamol and acetaldehyde, followed by conjugation of the paracetamol with sulphate or glucuronic acid (see under Paracetamol); other reactions are deacetylation to phenetidine (*p*-ethoxyaniline), *N*-, 2-, and α -hydroxylation forming mainly 2-hydroxyphenetidine and also 2-hydroxyphenacetin, sulphate conjugation of deacetylated metabolites, and glutathione conjugation to form *S*-(1-acetamido-4-hydroxyphenyl)cysteine and its corresponding mercapturic acid.

2-Hydroxyphenetidine appears to be the nephrotoxic metabolite and is possibly involved in the formation of methaemoglobinae-

mia. As the dose is increased so the percentage of the dose which is deacetylated is increased, producing proportionately more phenetidine and 2-hydroxyphenetidine; production of these metabolites is also increased by concomitant administration of aspirin, caffeine, and codeine. Phenacetin is not hepatotoxic despite being converted to paracetamol; this is because the enzyme systems which convert paracetamol to its toxic metabolite are also involved in the conversion of phenacetin to paracetamol and the two conversions therefore compete, resulting in reduced paracetamol oxidation. Phenacetin metabolism is stimulated by cigarette smoking. The extent of *O*-dealkylation appears to be genetically determined. About 80 to 90% of a dose is excreted in the urine in 24 hours with 50 to 80% of the dose as the sulphate and glucuronide conjugates of paracetamol, 6 to 8% as 2-hydroxyphenetidine sulphate, about 2% as *S*-(1-acetamido-4-hydroxyphenyl)cysteine, about 0.3% as phenetidine and 2-hydroxyphenacetin, 0.2% as unchanged drug, and 2 to 3% as unconjugated paracetamol.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 0.9 g to 9 subjects, peak plasma-phenacetin concentrations of 0.2 to 7.4 µg/ml (mean 2.3) were attained in 1 to 2 hours, and peak plasma-paracetamol concentrations of 3.1 to 11.9 µg/ml (mean 7.9) were attained in 2 to 3.5 hours; plasma-phenacetin concentrations were reported to be lower in 9 smokers (E. J. Pantuck *et al.*, *Clin. Pharmac. Ther.*, 1974, 15, 9-17).

TOXICITY. The estimated minimum lethal dose is 5 g. Prolonged use of phenacetin is associated with analgesic nephropathy; it may also produce haemolytic anaemia and methaemoglobinemia.

In a fatality involving the intentional overdosage of a preparation containing codeine, aspirin, phenacetin and caffeine, a blood-phenacetin concentration of 136 µg/ml was reported; the codeine and salicylate blood concentrations were 5.3 and 265 µg/ml respectively (J. A. Wright *et al.*, *Clin. Toxicol.*, 1975, 8, 457-463).

HALF-LIFE. Plasma half-life, phenacetin 0.7 to 1.5 hours, paracetamol 1.5 to 3 hours.

VOLUME OF DISTRIBUTION. About 1 to 2 litres/kg.

CLEARANCE. Plasma clearance, about 20 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 0.93.

PROTEIN BINDING. In plasma, about 30%.

Dose. Phenacetin has been given as a single dose of 300 to 600 mg; maximum daily dose of 3 g.

Phenaglycodol

Tranquilliser

Proprietary Name. Felixyn

2-(4-Chlorophenyl)-3-methylbutane-2,3-diol

$C_{11}H_{15}ClO_2 = 214.7$

CAS—79-93-6

A crystalline solid. M.p. 77° to 78°.

Practically **insoluble** in water; soluble in ethanol.

Colour Tests. Liebermann's Test—brown; Mandelin's Test—blue.

Ultraviolet Spectrum. Ethanol—259 nm, 266 nm ($A_1^1 = 13.5$ a), 275 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1095, 1085, 1015, 1180, 807, 830 (KBr disk).

Mass Spectrum. Principal peaks at m/z 43, 59, 155, 121, 156, 31, 157, 158.

Quantification. ULTRAVIOLET SPECTROPHOTOMETRY. In blood or urine—J. E. Wallace, *J. pharm. Sci.*, 1968, 57, 426-429.

Dose. 0.9 to 1.2 g daily.

Phenazocine

Narcotic Analgesic

Synonym. Phenethylazocine

1,2,3,4,5,6 - Hexahydro-6,11-dimethyl-3-phenethyl-2,6-methano-3-benzazocin-8-ol

$C_{22}H_{27}NO = 321.5$

CAS—127-35-5

Phenazocine Hydrobromide

Proprietary Name. Narphen

$C_{22}H_{27}NO \cdot HBr \cdot \frac{1}{2}H_2O = 411.4$

CAS—1239-04-9 (anhydrous)

A white microcrystalline powder, which can exist in 3 polymorphic forms. M.p. about 164°.

Soluble 1 in 350 of water, 1 in 45 of ethanol, and 1 in 140 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 8.5.

Colour Test. Marquis Test—brown.

Thin-layer Chromatography. System TA—Rf 68; system TB—Rf 16; system TC—Rf 39. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, brown.)

Gas Chromatography. System GA—RI 2684.

High Pressure Liquid Chromatography. System HA— k' 1.3; system HC— k' 0.30.

Ultraviolet Spectrum. Aqueous acid—278 nm ($A_1^1=64$ a); aqueous alkali—238 nm, 298 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1224, 1497, 1241, 705, 1613, 758 (phenazocine hydrobromide, Nujol mull).

Mass Spectrum. Principal peaks at m/z 230, 231, 58, 44, 42, 105, 173, 159.

Disposition in the Body. Readily absorbed after oral, sublingual, or intramuscular administration; metabolised in the liver.

TOXICITY. The estimated minimum lethal dose is 0.2 g. Phenazocine is addictive although tolerance develops more slowly and to a lesser extent than with morphine.

Dose. Usually 5 mg of phenazocine hydrobromide every 4 to 6 hours; single doses of 20 mg may be given.

Phenazone

Analgesic

Synonyms. Analgésine; Antipyrin(e); Azophenum; Fenazona.

Proprietary Names. It is an ingredient of Auralgan, Auralgicin, Auraltone, and Taumasthman.

1,5-Dimethyl-2-phenyl-4-pyrazolin-3-one

$C_{11}H_{12}N_2O=188.2$

CAS—60-80-0

Small, colourless crystals or white crystalline powder. M.p. 110° to 113°.

Soluble 1 in 1 of water, 1 in 1 of ethanol, 1 in 1 of chloroform, and 1 in 50 of ether.

Dissociation Constant. pK_a 1.5 (25°).

Partition Coefficient. Log P (octanol/pH 7.4), 0.4.

Colour Tests. *p*-Dimethylaminobenzaldehyde (100°, 5 min)—red/violet; Ferric Chloride—red; Liebermann's Test (100°)—orange; Mandelin's Test—green; Nitrous Acid—green.

Thin-layer Chromatography. System TA—Rf 65; system TD—Rf 18; system TE—Rf 49; system TF—Rf 14. (Ferric chloride solution, red-brown; acidified iodoplatinate solution, positive; mercuric chloride-diphenylcarbazone reagent, positive; acidified potassium permanganate solution, positive; Van Urk reagent, pink.)

Gas Chromatography. System GA—phenazone RI 1848, 4-hydroxyphenazone RI 1874; system GF—RI 2445.

High Pressure Liquid Chromatography. System HA— k' 0.2; system HD— k' 0.1; system HW— k' 0.95.

Ultraviolet Spectrum. Aqueous acid—230 nm ($A_1^1=590$ a); aqueous alkali—242 nm ($A_1^1=494$ a), 256 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1660, 770, 1318, 1305, 1590, 1580, (KBr disk).

Mass Spectrum. Principal peaks at m/z 188, 96, 77, 56, 105, 189, 55, 51; norphenazone 174, 77, 91, 105, 132, —, —, —.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 1 µg/ml, AFID—D. R. Abernethy *et al.*, *J. Chromat.*, 1981, 223; *Biomed. Appl.*, 12, 432–437.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 500 ng/ml, UV detection—T. M. Campbell *et al.*, *J. Chromat.*, 1979, 163; *Biomed. Appl.*, 5, 236–238. In urine: phenazone, 3-hydroxymethylphenazone, 4-hydroxyphenazone and norphenazone, sensitivity 1 to 2 µg/ml, UV detection—M. Eichelbaum *et al.*, *Pharmacology*, 1981, 23, 192–202.

RADIOIMMUNOASSAY. In plasma or saliva: sensitivity 10 ng/ml—R. L. Chang *et al.*, *Clin. Pharmac. Ther.*, 1976, 20, 219–226.

Disposition in the Body. Rapidly and completely absorbed after oral administration. Metabolised by 4-hydroxylation followed by glucuronic acid conjugation; demethylation also occurs. The rate of biotransformation is variable and appears to be genetically determined. Phenazone and its metabolites are excreted in the urine mainly as glucuronides, although sulphate conjugation has also been reported. About 30 to 40% of a dose is excreted in the urine in 48 hours as conjugated 4-hydroxyphenazone, 10 to 40% as the 3-hydroxymethyl derivative, up to about 20% as norphenazone, 3 to 6% as 4,4'-dihydroxyphenazone, 8 to 12% as 4,5-dioxypyrazoline, and less than 5% as unchanged drug; 3-carboxyphenazone has also been identified in the urine. A total of about 95% of a dose is excreted in the urine in 4 days.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 10 mg/kg to 5 subjects, peak plasma concentrations of 10 to 15.5 µg/ml (mean 13.4) were attained in 1 hour. Concentrations in saliva were similar to those in plasma (C. J. van Boxtel, *et al.* *Eur. J. clin. Pharmac.*, 1976, 9, 327–332).

TOXICITY. The estimated minimum lethal dose is 5 g, but fatalities from acute poisoning are rare. Prolonged therapeutic administration may give rise to agranulocytosis.

In a suicide due to ingestion of phenazone, a postmortem blood concentration of 110 µg/ml was reported; alcohol was also detected in the blood at a concentration of 260 µg/ml (C. Péclet and M. Rousseau, *Bull. int. Ass. forens. Toxicol.*, 1981, 16(1), 32).

HALF-LIFE. Plasma half-life, about 7 to 15 hours (mean 10); increased in subjects with renal impairment or hypothyroidism and in the elderly, decreased in subjects with hyperthyroidism; the half-life is also readily influenced by concomitant administration of other drugs.

VOLUME OF DISTRIBUTION. About 0.6 litre/kg.

CLEARANCE. Plasma clearance, about 0.7 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 0.93.

PROTEIN BINDING. In plasma, less than 10%.

Dose. Phenazone has been given in doses of 300 to 600 mg; maximum daily dose of 4 g.

Phenazopyridine

Analgesic

3-Phenylazopyridine-2,6-diylidiamine

$C_{11}H_{11}N_5 = 213.2$

CAS—94-78-0

Phenazopyridine Hydrochloride

Proprietary Names. Phenazo; Pyridacil; Pyridium. It is an ingredient of Azo Gantanol, Azo Gantrisin, Azo-Mandelamine, Azotrex, and Uro-mide.

$C_{11}H_{11}N_5 \cdot HCl = 249.7$

CAS—136-40-3

A light or dark red to dark violet crystalline powder. M.p. about 235°, with decomposition.

Soluble 1 in 300 of cold water, 1 in 20 of boiling water, 1 in about 60 of ethanol, and 1 in about 330 of chloroform; very slightly soluble in ether; soluble in glacial acetic acid. Phenazopyridine hydrochloride readily forms supersaturated aqueous solutions which deposit slowly on storage.

Colour Tests. Mandelin's Test—green; Marquis Test—red.

Thin-layer Chromatography. System TA—Rf 59; system TB—Rf 01; system TC—Rf 50. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—phenazopyridine RI 2245, 4-aminophenol RI 1265, aniline RI 1158.

Ultraviolet Spectrum. Ethanol—238 nm ($A_1^1 = 455$ a), 277 nm. (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 1585, 1656, 762, 685, 1248, 1493 (Nujol mull). (See below)

Mass Spectrum. Principal peaks at m/z 108, 81, 213, 54, 77, 136, 51, 43; 4-aminophenol 109, 80, 53, 81, 108, 52, 54, 110.

Disposition in the Body. Absorbed after oral administration. Rapidly eliminated by the kidneys, giving an orange-red colour to the urine; about 90% of a dose is excreted in the urine in 24 hours, of which 7% is aniline, 20% is *N*-acetyl-4-aminophenol, 25% is 4-aminophenol, and 45% is unchanged drug.

TOXICITY. Methaemoglobinaemia and acute renal failure have been reported after overdoses.

Dose. Usually 600 mg of phenazopyridine hydrochloride daily.

**Phenbutrazate Hydrochloride**C₂₃H₂₉NO₃·HCl=403.9

CAS—6474-85-7

A fine white crystalline powder.

Slightly **soluble** in water; soluble in ethanol and acetone; practically insoluble in ether.**Colour Tests.** Liebermann's Test—red-orange; Marquis Test—yellow (slow).**Thin-layer Chromatography.** System TA—Rf 72; system TB—Rf 47; system TC—Rf 78. (Acidified iodoplatinate solution, positive.)**Gas Chromatography.** System GA—RI 2670.**High Pressure Liquid Chromatography.** System HA—k' 0.3.**Ultraviolet Spectrum.** Aqueous acid—252 nm, 257 nm (A₁¹=10 b), 261 nm, 267 nm.**Infra-red Spectrum.** Principal peaks at wavenumbers 1715, 1100, 1200, 690, 760, 1020 (KBr disk).**Mass Spectrum.** Principal peaks at *m/z* 69, 56, 71, 91, 261, 84, 119, 70.**Dose.** Phenbutrazate hydrochloride has been given in doses of 40 to 60 mg daily.**Phenbutrazate***Anorectic**Synonym.* Fenbutrazate

In cerebrospinal fluid, serum or urine: detection limit 5 ng/ml, AFID—J. N. Miceli *et al.*, *J. analyt. Toxicol.*, 1981, 5, 29–32.GAS CHROMATOGRAPHY (CAPILLARY COLUMN). In plasma, serum, saliva, tissues or urine: sensitivity 5 pg/ml, AFID—F. N. Pitts, jun. *et al.*, *J. Chromat.*, 1980, 193, 157–159.GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In urine: phencyclidine and two monohydroxy metabolites, sensitivity for phencyclidine 10 ng/ml—E. J. Cone *et al.*, *J. Chromat.*, 1981, 223; *Biomed. Appl.*, 12, 331–339.RADIOIMMUNOASSAY. In serum: sensitivity 500 pg/ml—S. M. Owens *et al.*, *Clin. Chem.*, 1982, 28, 1509–1513.**Disposition in the Body.** Phencyclidine is a drug of abuse which is self-administered orally, intravenously, by nasal insufflation,

or by smoking impregnated plant material. The main metabolic reaction is hydroxylation and two metabolites have been identified in the urine as glucuronide conjugates: 4-phenyl-4-piperidinocyclohexanol and 1-(1-phenylcyclohexyl)-4-hydroxypiperidine. The product of *N*-dealkylation (1-phenylcyclohexylamine) has also been identified in urine, together with an oxidised derivative, 5-(1-phenylcyclohexylamino)valeric acid. About 73% of a dose is excreted in the urine and 5% is eliminated in the faeces in 10 days, of which about 16% of the dose is unchanged and 30% is conjugated hydroxylated metabolites; the rate of excretion of unchanged drug is increased in acidic urine.

BLOOD CONCENTRATION.

Following an oral dose of 1 mg, given to 5 subjects, a mean peak plasma concentration of 0.0027 µg/ml was reported at 2.5 hours (C. E. Cook *et al.*, *Clin. Pharmac. Ther.*, 1982, 31, 625–634).

TOXICITY. Blood concentrations in the region of 0.1 µg/ml produce abnormal behaviour and concentrations of about 0.3 µg/ml or more cause severe toxic symptoms which may be followed by death although there is considerable intersubject variation. Many deaths have been due, not to the toxic effects of phencyclidine itself, but to the effects of irrational behaviour caused by the drug. In 53 cases of death reported in the literature as not directly due to phencyclidine, blood concentrations ranged from 0.01 to 2.1 µg/ml (mean 0.36); in 22 of these cases urine concentrations ranged from 0.1 to 10.6 µg/ml (mean 2.1); alcohol was also present in a number of these cases.

In 50 non-fatal cases of phencyclidine intoxication, blood concentrations were reported as 0.01 to 0.18 µg/ml (mean 0.07) (D. O. Clardy *et al.*, *J. analyt. Toxicol.*, 1979, 3, 238–241).

In 9 fatalities directly attributable to phencyclidine overdose, the following postmortem concentrations were reported: blood 0.3 to 12 µg/ml (mean 2.4, 8 cases), brain 0.1 to 32 µg/g (mean 7.3, 6 cases), liver 0.9 to 80 µg/g (mean 20, 9 cases), urine 0.4 to 48.6 µg/ml (mean 21.7, 5 cases) (R. H. Cravey *et al.*, *J. analyt. Toxicol.*, 1979, 3, 199–201).

HALF-LIFE. Plasma half-life, 7 to 46 hours (mean 17), increased up to 4 days in severe poisoning cases.

VOLUME OF DISTRIBUTION. About 6 litres/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 1.0.

PROTEIN BINDING. In plasma, about 65 to 80%.

Phendimetrazine**(+)-3,4-Dimethyl-2-phenylmorpholine** $C_{12}H_{17}NO = 191.3$

Infra-red Spectrum. Principal peaks at wavenumbers 1016, 1108, 1050, 1080, 940, 699 (phenelzine sulphate, KBr disk).

Mass Spectrum. Principal peaks at m/z 31, 45, 46, 29, 27, 59, 74, 43.

Quantification. GAS CHROMATOGRAPHY. In plasma: detection limit 2 ng/ml, AFID—I. J. McGilveray *et al.*, *J. Pharm. Pharmac.*, 1982, 34, Suppl., 98P. In urine: detection limit 50 ng/ml, FID—B. Caddy and A. H. Stead, *Analyst, Lond.*, 1977, 102, 42–49.

GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In plasma: sensitivity 1 to 2 ng/ml—S. P. Jindal *et al.*, *J. Chromat.*, 1980, 221; *Biomed. Appl.*, 10, 301–308.

Disposition in the Body. Readily absorbed after oral administration and widely distributed throughout the body. It is believed to be metabolised by acetylation, followed by glutamine conjugation, producing phenylacetylglutamine. Aromatic hydroxylation and conjugation with glucuronic acid may also occur. Less than 5% of a dose is excreted in the urine unchanged.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 50 mg, given as a solution to 1 subject, a peak plasma concentration of 0.05 $\mu\text{g/ml}$ was reported at 0.25 hour (I. J. McGilveray *et al.*, *J. Pharm. Pharmac.*, 1982, 34, Suppl., 98P).

Following a single oral dose of 30 mg to 1 subject, a peak plasma concentration of 0.002 $\mu\text{g/ml}$ was attained in 2 hours. In a subject who had been receiving daily oral doses of 30 mg for 6 weeks, a trough steady-state plasma concentration of 0.0002 $\mu\text{g/ml}$ was reported (T. B. Cooper *et al.*, *Commun. Psychopharmacol.*, 1978, 2, 505–512).

TOXICITY.

In a fatality attributed to phenelzine and alcohol, postmortem urine concentrations were: phenelzine 58 $\mu\text{g/ml}$, alcohol 1700 $\mu\text{g/ml}$; in a second non-fatal overdose subject, blood and plasma concentrations of 1.5 and 1.26 $\mu\text{g/ml}$ were reported, 12 hours after ingestion (B. Caddy and A. H. Stead, *J. forens. Sci. Soc.*, 1978, 18, 207–208).

HALF-LIFE. Plasma half-life, about 7 hours.

Dose. The equivalent of 45 to 60 mg of phenelzine daily.

Phenethicillin

Antibiotic

Synonyms. Penicillin B; α -Phenoxyethylpenicillin.

(6*R*)-6-(2-Phenoxypropionamido)penicillanic acid

$\text{C}_{17}\text{H}_{20}\text{N}_2\text{O}_5\text{S} = 364.4$

CAS—147-55-7

Phenethicillin Potassium

Proprietary Names. Altocillin; Broxil; Optipen; Penorale; Pensig; Syncillin.

$\text{C}_{17}\text{H}_{19}\text{KNO}_5\text{S} = 402.5$

CAS—132-93-4

A white, fine, crystalline powder.

Soluble 1 in 1.5 of water, 1 in 85 of ethanol, and 1 in 800 of dehydrated alcohol; slightly soluble in chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 2.7 (25°).

Ultraviolet Spectrum. Phenethicillin potassium: aqueous acid—271 nm ($A_1^{1\%} = 44$ b), 275 nm. No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1610, 1778, 1510, 1238, 1690, 752 (phenethicillin potassium, KBr disk).

Dose. The equivalent of 1 to 2 g of phenethicillin daily.

Phenethylamine

Putrefactive Base

Synonym. β -Aminoethylbenzene

2-Phenylethylamine

 $C_8H_{11}N = 121.2$

CAS—64-04-0

A strongly basic liquid which absorbs carbon dioxide from the air. B.p. 194° to 195°.

Soluble in water; freely soluble in ethanol and ether.

Colour Test. Marquis Test—orange.

Thin-layer Chromatography. *System TA*—Rf 49; *system TB*—Rf 28; *system TC*—Rf 28. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 1111.

High Pressure Liquid Chromatography. *System HA*—k' 1.2; *system HB*—k' 3.64; *system HC*—k' 1.31.

Ultraviolet Spectrum. Aqueous acid—242 nm ($A_1^1 = 15$ b), 247 nm ($A_1^1 = 17.2$ b), 252 nm ($A_1^1 = 19.8$ b), 257 nm ($A_1^1 = 21.3$ b), 263 nm ($A_1^1 = 16$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 695, 745, 755, 942, 1146, 1608 (KBr disk).

Mass Spectrum. Principal peaks at m/z 30, 91, 65, 92, 51, 39, 121, 103.

Disposition in the Body. Phenethylamine is the putrefactive base obtained from phenylalanine by decarboxylation.

Pheneturide

Anticonvulsant

Synonym. Ethylphenacetamide*Proprietary Name.* Benuride

(2-Phenylbutyryl)urea

 $C_{11}H_{14}N_2O_2 = 206.2$

CAS—90-49-3

A white crystalline powder.

Practically **insoluble** in water and ether; slightly soluble in ethanol; very soluble in glacial acetic acid.

Colour Test. Nessler's Reagent—orange-brown (slow).

Thin-layer Chromatography. *System TA*—Rf 76; *system TD*—Rf 38; *system TE*—Rf 71; *system TF*—Rf 53.

Gas Chromatography. *System GA*—RI 1465.

High Pressure Liquid Chromatography. *System HE*—k' 6.84.

Ultraviolet Spectrum. Chloroform—259 nm ($A_1^1 = 18$ b), 265 nm ($A_1^1 = 11$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1672, 1700, 1093, 694, 1176, 1615 (KBr disk).

Mass Spectrum. Principal peaks at m/z 91, 146, 44, 119, 206, 41, 78, 77.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or serum: pheneturide and other anticonvulsants, sensitivity 1.4 μ g/ml, UV detection—J. A. Christofides and D. E. Fry, *Clin. Chem.*, 1980, 26, 499–501.

THIN-LAYER CHROMATOGRAPHY—ULTRAVIOLET SPECTROPHOTOMETRY. In plasma, serum or urine: sensitivity 500 ng/ml in serum—R. L. Galeazzi *et al.*, *J. Pharmacokinet. Biopharm.*, 1979, 7, 453–462.

Disposition in the Body. Slowly absorbed after oral administration. Pheneturide is thought to be completely metabolised as only traces of unchanged drug have been found in the urine. It may induce its own metabolism.

TOXICITY. Pheneturide has been reported to be less likely to cause toxic effects than phenacetamide, to which it is chemically related.

HALF-LIFE. Plasma half-life, 30 to 90 hours (mean 54) after single doses and about 40 hours after chronic administration.

VOLUME OF DISTRIBUTION. About 3 litres/kg.

CLEARANCE. Plasma clearance, about 0.7 ml/min/kg.

REFERENCE. R. L. Galeazzi *et al.*, *ibid.*

Dose. Pheneturide has been given in doses of 0.6 to 1 g daily.

Phenformin

Antidiabetic

1-Phenethylbiguanide

 $C_{10}H_{15}N_5 = 205.3$

CAS—114-86-3

**Phenformin Hydrochloride***Proprietary Names.* Dibotin; Insoral.

Note. Insoral is also used as a proprietary name for carbutamide.

 $C_{10}H_{15}N_5 \cdot HCl = 241.7$

CAS—834-28-6

A white crystalline powder. M.p. 176° to 179°.

Soluble 1 in 8 of water and 1 in 15 of ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 2.7, 11.8 (32°).

Colour Tests. Mandelin's Test—green; Marquis Test—orange \rightarrow brown.

Thin-layer Chromatography. *System TA*—Rf 03; *system TB*—Rf 00; *system TC*—Rf 00. (Marquis reagent, positive.)

Ultraviolet Spectrum. Aqueous acid—251 nm ($A_1^1 = 11$ a), 258 nm ($A_1^1 = 11$ a), 264 nm, 267 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1568, 1537, 1590, 1625, 1650, 1500 (phenformin hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 91, 30, 92, 42, 29, 146, 44, 104 (no peaks above 150).

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: phenformin and other biguanides, detection limit < 1 ng/ml in plasma, ECD—S. B. Matin *et al.*, *Analyt. Chem.*, 1975, 47, 545–548.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: sensitivity 10 ng/ml in plasma, UV detection—H. M. Hill and J. Chamberlain, *J. Chromat.*, 1978, 149, 349–358. In urine: phenformin and 4-hydroxyphenformin, sensitivity 1 μg/ml for phenformin and 500 ng/ml for 4-hydroxyphenformin, UV detection—N. S. Oates *et al.*, *J. Pharm. Pharmac.*, 1980, 32, 731–732.

Disposition in the Body. Well absorbed after oral administration. The major metabolic reaction is aromatic hydroxylation to form 4-hydroxyphenformin which is then conjugated with glucuronic acid. Up to about 50% of a dose is excreted in the urine in 24 hours, about two-thirds in the form of unchanged drug and one-third as the hydroxy metabolite.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 50 mg to 8 subjects, peak plasma concentrations of 0.08 to 0.18 μg/ml (mean 0.13) were attained in about 3 hours; plasma concentrations were higher in 4 subjects who were poor metabolisers of debrisoquine in comparison with the 4 extensive metabolisers (N. S. Oates *et al.*, *Clin. Pharmac. Ther.*, 1983, 34, 827–834). Following daily oral doses of 50 mg three times a day to 8 subjects, plasma concentrations of 0.10 to 0.24 μg/ml (mean 0.18) were reported 2 hours after a dose (J. Karam *et al.*, *Diabetes*, 1974, 23, Suppl. 1, 375).

TOXICITY.

A 44-year-old woman ingested 1.5 g in slow-release capsules and died 30 hours later. A postmortem blood concentration of 3 μg/ml and liver concentration of 60 μg/g were reported (J. P. Bingle *et al.*, *Br. med. J.*, 1970, 3, 752).

HALF-LIFE. Plasma half-life, 10 to 15 hours.

PROTEIN BINDING. In plasma, about 12% to 20%.

Dose. 50 to 100 mg of phenformin hydrochloride daily.

Phenglutarimide

Anticholinergic

2-(2-Diethylaminoethyl)-2-phenylglutarimide

$C_{17}H_{24}N_2O_2 = 288.4$

CAS—1156-05-4

Crystals. M.p. 125° to 127°.

Phenglutarimide Hydrochloride

$C_{17}H_{24}N_2O_2 \cdot HCl = 324.8$

CAS—1674-96-0

A white crystalline powder. M.p. about 177°, with decomposition.

Soluble 1 in 1 of water and 1 in 1.5 of ethanol; very slightly soluble in ether.

Colour Tests. Koppanyi–Zwicker Test—violet; Liebermann's Test—red-orange.

Thin-layer Chromatography. System TA—Rf 40; system TB—Rf 17; system TC—Rf 08. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2321.

High Pressure Liquid Chromatography. System HA—k' 2.9.

Ultraviolet Spectrum. Aqueous acid—251 nm, 257 nm ($A_1^1 = 13.3$ a), 263 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1698, 1194, 1181, 1250, 700, 1150 (phenglutarimide hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 86, 30, 216, 87, 58, 100, 99, 56.

Dose. Phenglutarimide hydrochloride has been given in doses of 10 to 50 mg daily.

Phenindamine*Antihistamine*2,3,4,9 - Tetrahydro - 2 - methyl - 9 - phenyl - 1*H* - indeno[2,1-*c*]-pyridine $C_{19}H_{19}N = 261.4$

CAS—82-88-2

Crystals. M.p. 91°.

Phenindamine Tartrate*Proprietary Names.* Nolahist; Thephorin. $C_{19}H_{19}N \cdot C_4H_6O_6 = 411.5$

CAS—569-59-5

A white voluminous powder. M.p. 160° to 162°; on further heating it solidifies and melts again at about 168°, with decomposition.

Soluble 1 in 70 of water and 1 in 300 of ethanol; practically insoluble in chloroform and ether.**Dissociation Constant.** pK_a 8.3 (25°).**Colour Tests.** Mandelin's Test—green; Marquis Test—grey-green.**Thin-layer Chromatography.** *System TA*—Rf 63; *system TB*—Rf 45; *system TC*—Rf 57. (*Dragendorff spray*, positive; *acidified iodoplatinate solution*, positive; *Marquis reagent*, grey-brown.)**Gas Chromatography.** *System GA*—RI 2167; *system GC*—RI 2926; *system GF*—RI 2515.**High Pressure Liquid Chromatography.** *System HA*— k' 2.5.**Ultraviolet Spectrum.** Aqueous acid—259 nm ($A_1^1 = 347$ a); aqueous alkali—263 nm ($A_1^1 = 385$ a).**Infra-red Spectrum.** Principal peaks at wavenumbers 1751, 1302, 1585, 752, 1072, 693 (phenindamine tartrate, KBr disk).**Mass Spectrum.** Principal peaks at m/z 260, 261, 42, 57, 184, 215, 217, 262.**Dose.** Up to 150 mg of phenindamine tartrate daily.

Wavelength

**Phenindione***Anticoagulant**Synonyms.* Phenylindanedione; Phenylum.*Proprietary Names.* Danilone; Dindevan; Hedulin; Pindione.

2-Phenylindan-1,3-dione

 $C_{15}H_{10}O_2 = 222.2$

CAS—83-12-5

Soft, white or creamy-white or pale yellow crystals or crystalline powder. M.p. 148° to 151°.

Very slightly **soluble** in water; soluble 1 in about 125 of ethanol, 1 in 6.5 of chloroform, and 1 in 110 of ether, forming yellow to red solutions.**Dissociation Constant.** pK_a 4.1.**Colour Tests.** Methanolic Potassium Hydroxide—red; Sulphuric Acid—violet.**Thin-layer Chromatography.** *System TD*—Rf 65; *system TE*—Rf 21; *system TF*—Rf 56.**Gas Chromatography.** *System GA*—RI 2055.**Ultraviolet Spectrum.** Aqueous alkali—278 nm ($A_1^1 = 1310$ a), 330 nm ($A_1^1 = 400$ b).**Infra-red Spectrum.** Principal peaks at wavenumbers 1700, 700, 766, 1219, 1740, 1280 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 222, 165, 76, 223, 166, 105, 104, 90.**Quantification.** POLAROGRAPHY. In serum: sensitivity 4 μ g/ml—E. Jacobsen and K. H. Klevan, *Analytica chim. Acta*, 1972, 62, 405-413.**Disposition in the Body.** Well absorbed after oral administration. The urine may be coloured red-orange due to the excretion of a metabolite.**TOXICITY.** Fatalities have occurred after therapeutic doses.**HALF-LIFE.** Plasma half-life, about 6 hours.**Dose.** Maintenance, 25 to 150 mg daily.

Pheniramine

Antihistamine

Synonym. Propenpyridamine

Proprietary Name. Inhiston

NN-Dimethyl-3-phenyl-3-(2-pyridyl)propylamine

$C_{16}H_{20}N_2 = 240.3$

CAS—86-21-5

A slightly yellow oily liquid.

Practically **insoluble** in water; soluble in ethanol, chloroform, and ether.

Pheniramine Aminosalicylate

Proprietary Names. Avil (tablets); Aviletten; Avilettes; Fenamine (tablets).

$C_{16}H_{20}N_2 \cdot C_7H_7NO_3 = 393.5$

CAS—3269-83-8

Crystals. M.p. 142°, with decomposition.

Soluble 1 in 10 of water; freely soluble in ethanol; sparingly soluble in ether.

Pheniramine Maleate

Proprietary Names. Avil (syrup and sustained-release tablets); Daneral-SA; Fenamine (syrup and sustained-release tablets). It is an ingredient of Robitussin AC, Syrtussar, Triominic, and Triotussic.

$C_{16}H_{20}N_2 \cdot C_4H_4O_4 = 356.4$

CAS—132-20-7

A white crystalline powder. M.p. 106° to 109°.

Soluble 1 in 0.3 of water, 1 in 2.5 of ethanol, and 1 in 1.5 of chloroform; very slightly soluble in ether.

Dissociation Constant. pK_a 4.2, 9.3 (25°).

Colour Tests. Cyanogen Bromide—orange; Liebermann's Test—red-orange.

Thin-layer Chromatography. *System TA*—Rf 45; *system TB*—Rf 35; *system TC*—Rf 13. (Dragendorff spray, positive; acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 1804; *system GB*—RI 1826; *system GF*—RI 2100.

High Pressure Liquid Chromatography. *System HA*— k' 4.1.

Ultraviolet Spectrum. Aqueous acid—261 nm ($A_1^1 = 305$ a), 266 nm ($A_1^1 = 310$ a); aqueous alkali—258 nm, 263 nm ($A_1^1 = 206$ a), 268 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1584, 690, 860, 870, 990, 1010 (pheniramine maleate, KBr disk).

Mass Spectrum. Principal peaks at m/z 169, 58, 168, 170, 72, 167, 44, 42 (no peaks above 200).

Quantification. GAS CHROMATOGRAPHY. In blood, urine or tissues: sensitivity 50 ng/ml, AFID—E. A. Quéré et al., *J. analyt. Toxicol.*, 1979, 3, 253–255.

Disposition in the Body. Absorbed after oral administration. About 17% of a dose is excreted in the urine as unchanged drug in 24 hours, increasing to 23% over a period of 6 days; after chronic oral administration about 24% is excreted daily as monodesmethylpheniramine, and 0.5% as didesmethylpheniramine.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 75 mg to 6 subjects, blood concentrations of 0.01 to 0.19 µg/ml (mean 0.11) were reported at 2 hours (E. A. Querée *et al.*, *ibid.*).

TOXICITY. The estimated minimum lethal dose is 25 mg/kg.

In a fatality due to pheniramine overdose, the following postmortem tissue concentrations were reported: blood 1.9 µg/ml, brain 5.3 µg/g, kidney 4.0 µg/g, liver 6.6 µg/g, urine 149 µg/ml; in a second fatality in which methadone, pentobarbitone, phenobarbitone, and alcohol had also been ingested, postmortem blood and liver concentrations of 30 µg/ml and 115 µg/g, respectively, were reported (E. A. Querée *et al.*, *ibid.*).

In a fatality due to the ingestion of 3.75 g of pheniramine, the following postmortem tissue concentrations were reported: blood 10.7 µg/ml, bile 109 µg/ml, liver 33 µg/g, urine 362 µg/ml (L. F. T. Chan and W. J. Allender, *Bull. int. Ass. forens. Toxicol.*, 1983, 17(2), 25–26).

Dose. Up to 150 mg of pheniramine maleate daily.

Phenmetrazine

Synonym. Oxazimédrine

(±)-*trans*-3-Methyl-2-phenylmorpholine

C₁₁H₁₅NO = 177.2

CAS—134-49-6

Anorectic

A liquid

Phenmetrazine Hydrochloride

Proprietary Name. Preludin

C₁₁H₁₅NO·HCl = 213.7

CAS—1707-14-8

A white crystalline powder. M.p. 172° to 182°.

Soluble 1 in 0.4 of water, 1 in 2 of ethanol, and 1 in 2 of chloroform; slightly soluble in ether.

Phenmetrazine Theoclate

Synonym. Phenmetrazine 8-Chlorotheophyllinate

C₁₁H₁₅NO·C₇H₇ClN₄O₂ = 391.9

CAS—13931-75-4

A white powder.

Soluble in water and ethanol; slightly soluble in acetone and ether.

Dissociation Constant. pK_a 8.4 (25°).

Colour Test. Liebermann's Test—red-orange.

Thin-layer Chromatography. System TA—Rf 50; system TB—Rf 14; system TC—Rf 21. (Acidified iodoplatinate solution, positive; acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 1431; system GB—RI 1473; system GC—RI 1873.

High Pressure Liquid Chromatography. System HA—k' 1.7.

Ultraviolet Spectrum. Aqueous acid—250 nm, 256 nm (A₁¹ = 13.3 a), 261 nm, 263 nm, 267 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1083, 757, 695, 965, 990, 1030 (phenmetrazine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at *m/z* 71, 42, 56, 43, 177, 77, 178, 105.

Quantification. GAS CHROMATOGRAPHY. In serum or urine: phendimetrazine and phenmetrazine, sensitivity 10 ng/ml, AFID—G. Long *et al.*, *Drug Dev. & ind. Pharm.*, 1982, 8, 203–213.

Disposition in the Body. Readily absorbed after oral administration. About 70% of a dose is excreted in the urine in 24 hours with about 19% as unchanged drug, 19% as the lactam (5-methyl-3-oxo-6-phenylmorpholine), 12% as free 4-hydroxyphenmetrazine, 10% as conjugated 4-hydroxyphenmetrazine, and about 5% as the *N*-oxide.

Phenmetrazine is a metabolite of phendimetrazine.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 75 mg given to 5 subjects, peak plasma concentrations of 0.10 to 0.24 µg/ml (mean 0.16) were attained in about 2 hours. Following a single oral dose of 75 mg of a slow-release preparation, average peak plasma concentrations of about 0.07 µg/ml were reported at 5 hours; concentrations remained almost constant over the period 5 to 24 hours (G. P. Quinn *et al.*, *Clin. Pharmac. Ther.*, 1967, 8, 369-373).

TOXICITY. Estimated minimum lethal dose for children up to 2 years of age, 200 mg. Large doses and prolonged treatment may lead to severe mental depression and dependence of the amphetamine type.

In a fatality following intravenous overdosage, the following postmortem distribution was reported: blood 4 µg/ml, bile 7 µg/ml, liver 5 µg/g, urine 24 µg/ml (G. Norheim, *J. forens. Sci. Soc.*, 1973, 13, 287-289).

The following postmortem tissue concentrations were reported in 12 fatalities: blood 0.1 to 4.9 µg/ml (mean 1.1), bile 0.2 to 23 µg/ml (mean 5.5), brain 0.1 to 15 µg/g (mean 2.9), kidney 0.1 to 8 µg/g (mean 1.5), liver 0.1 to 20 µg/g (mean 3.1), urine 0.1 to 90 µg/ml (mean 21) (L. Gottschalk, per R. C. Baselt, *Disposition of Toxic Drugs and Chemicals in Man*, 2nd Edn, Davis, California, Biomedical Publications, 1982, pp. 625-627).

HALF-LIFE. Plasma half-life, about 8 hours.

Dose. 25 to 75 mg of phenmetrazine hydrochloride daily.

Phenobarbitone*Barbiturate*

Synonyms. Fenobarbital; Phenemalum; Phenobarbital; Phenylethylbarbituric Acid; Phenylethylmalonylurea.

Proprietary Names. Gardenal; Luminal; Luminaletten; Nova-Pheno; Phenaemal; Sedadrops; Seda-Tabliten; Solfoton. It is an ingredient of Antrocol, Franol, Franyl, Phylbrox, Seominal, and Valpin 50-PB.

5-Ethyl-5-phenylbarbituric acid

$C_{12}H_{12}N_2O_3 = 232.2$

CAS—50-06-0

Colourless crystals or a white crystalline powder which may exhibit polymorphism. M.p. 174° to 178°.

Soluble 1 in 1000 of water, 1 in 10 of ethanol, 1 in 40 of chloroform, and 1 in 40 of ether.

Phenobarbitone Sodium

Synonyms. Phenemalnatium; Phenobarbital Sodium; Sodium Phenylethylbarbiturate; Soluble Phenobarbitone.

Proprietary Names. Luminal Sodium. It is an ingredient of Garoin.

$C_{12}H_{11}N_2NaO_3 = 254.2$

CAS—57-30-7

A white hygroscopic powder, granules, or flakes. M.p. about 175°.

Soluble 1 in 3 of water and 1 in 25 of ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 7.4 (25°).

Partition Coefficient. Log *P* (octanol), 1.4.

Colour Tests. Koppanyi-Zwikker Test—violet; Liebermann's Test—red-orange; Mercurous Nitrate—black.

Thin-layer Chromatography. *System TD*—Rf 47; *system TE*—Rf 28; *system TF*—Rf 65; *system TH*—Rf 38. (Mercuric chloride-diphenylcarbazone reagent, positive; mercurous nitrate spray, black; Zwikker's reagent, pink.)

Gas Chromatography. *System GA*—phenobarbitone RI 1957, 4-hydroxyphenobarbitone RI 2415; *system GE*—retention time 0.74 relative to phenytoin; *system GF*—RI 2960.

High Pressure Liquid Chromatography. *System HE*— k' 2.76; *system HG*— k' 3.09; *system HH*— k' 1.23.

Ultraviolet Spectrum. Borax buffer 0.05M (pH 9.2)—239 nm ($A_1^1 = 452$ a); M sodium hydroxide (pH 13)—254 nm ($A_1^1 = 342$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1712, 1684, 1670, 1770, 1310, 1300 (KBr disk).

Mass Spectrum. Principal peaks at m/z 204, 117, 146, 161, 77, 103, 115, 118; 4-hydroxyphenobarbitone 219, 248, 148, 220, 120, 218, 133, 64.

Quantification. See also under Amylobarbitone.

GAS CHROMATOGRAPHY. In serum: sensitivity 500 ng/ml, FID—A. Di Corcia *et al.*, *J. Chromat.*, 1982, 229; *Biomed. Appl.*, 18, 365–372.

GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In plasma or urine: phenobarbitone and 4-hydroxyphenobarbitone, detection limit 100 ng/ml—I. H. Patel *et al.*, *J. pharm. Sci.*, 1980, 69, 1218–1219.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or serum: phenobarbitone and other anticonvulsants, sensitivity about 600 ng/ml for phenobarbitone, UV detection—J. A. Christofides and D. E. Fry, *Clin. Chem.*, 1980, 26, 499–501.

POLARISATION FLUOROIMMUNOASSAY. In plasma or serum: detection limit 800 ng/ml—A. M. Sidki *et al.*, *Ther. Drug Monit.*, 1982, 4, 397–403.

Disposition in the Body. Readily absorbed after oral administration; bioavailability almost 100%. The major metabolites are *N*-glucopyranosylphenobarbitone and 4-hydroxyphenobarbitone, together with its glucuronide conjugate. Other metabolites include two dihydrodiol compounds and hydroxymethylphenylbarbituric acid. During chronic dosing, up to about 25% of a dose is excreted in the urine in 24 hours as unchanged drug and up to about 17% as total 4-hydroxyphenobarbitone, about half of which is the glucuronide conjugate. Urinary excretion of unchanged drug is increased when the urine is alkaline or when the urinary volume is increased; the excretion of conjugated 4-hydroxyphenobarbitone is reduced in patients with liver disease. After a single dose, about 80 to 90% is excreted in the urine in 16 days; the *N*-glucoside accounts for about 30% of a single dose. Phenobarbitone is a metabolite of methylphenobarbitone and primidone.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 2 to 30 µg/ml. However, there is considerable intersubject variation and there does not appear to be any correlation between plasma concentration and clinical effect. Concentrations in cerebrospinal fluid reach about 50% of those in plasma. Following a single oral dose of 100 mg to 6 subjects, peak serum concentrations of 2.1 to 3.8 µg/ml (mean 2.9) were attained in 0.5 to 4 hours (mean 1.5) (A. J. Wilensky *et al.*, *Eur. J. clin. Pharmacol.*, 1982, 23, 87–92).

Following daily oral doses of 100 mg to 10 subjects for 15 days, serum concentrations of 10.6 to 22.1 µg/ml (mean 17) were reported 12 hours after a dose (P. V. Luoma *et al.*, *Ther. Drug Monit.*, 1982, 4, 65–68).

TOXICITY. The estimated minimum lethal dose is 1.5 g although recovery has occurred after ingestion of as much as 16 g. Toxic effects have been associated with blood concentrations of 4 to 17 to 90 µg/ml and fatalities with concentrations of 4 to 45 to 120 µg/ml. However, a degree of tolerance may develop in chronic dosing.

Blood concentrations ranged from 10 to 300 µg/ml (mean 86) in 113 fatalities attributed to phenobarbitone overdose (K. D. Parker *et al.*, *Clin. Toxicol.*, 1970, 3, 131–145).

In 20 fatalities caused by phenobarbitone overdose, the following postmortem concentrations were reported: blood 15 to 540 µg/ml (mean 113), brain 0 to 833 µg/g (mean 135), kidney 17 to 867 µg/g (mean 152), liver 24 to 1450 µg/g (mean 236), spleen 0 to 850 µg/g (mean 137) (I. Sunshine and E. Hackett, *J. forens. Sci.*, 1957, 2, 149–158).

HALF-LIFE. Plasma half-life, about 50 to 150 hours (mean 100) in adults, reduced to about 40 to 70 hours in children; increased in subjects with liver disease.

VOLUME OF DISTRIBUTION. About 0.5 litre/kg.

CLEARANCE. Plasma clearance, about 0.06 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 0.93.

SALIVA. Plasma: saliva ratio, about 3.

PROTEIN BINDING. In plasma, about 50%.

Dose. 45 to 180 mg daily.

Phenol

Disinfectant

Synonyms. Carboic Acid; Fenol; Phenyl Hydrate.

Proprietary Name. It is an ingredient of Chloraseptic.

Hydroxybenzene

$C_6H_5 \cdot OH = 94.11$

CAS—108-95-2

Colourless or faintly pink, deliquescent crystals or crystalline masses, becoming pink on storage. F.p. 40° to 41°. B.p. about 181°.

Soluble 1 in about 13 of water, 6 in 1 of ethanol, 2 in 1 of chloroform, and 5 in 1 of ether.

Caution. Phenol is caustic to the skin.

Dissociation Constant. pK_a 10.0 (25°).

Partition Coefficient. Log *P* (octanol/pH 7.4), 0.6.

Colour Tests. *p*-Dimethylaminobenzaldehyde—orange/violet; Ferric Chloride—blue; Folin–Ciocalteu Reagent—blue; Liebermann's Test—green; Potassium Dichromate (Method 1)—yellow → brown (2 min).

Gas Chromatography. System GA—RI 981.

Ultraviolet Spectrum. Aqueous acid—270 nm ($A_1^1 = 172$ b); aqueous alkali—287 nm ($A_1^1 = 281$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 690, 755, 1235, 1595, 1497, 811 (Nujol mull).

Mass Spectrum. Principal peaks at *m/z* 94, 66, 39, 65, 40, 55, 38, 95.

Quantification. **GAS CHROMATOGRAPHY.** In urine: FID—D. L. Rick *et al.*, *J. analyt. Toxicol.*, 1982, 6, 297–300. In urine: FID—M. K. Baldwin *et al.*, *Analyst, Lond.*, 1981, 106, 763–767.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In urine: detection limit < 500 ng/ml, UV detection—C. V. Eadsforth and P. C. Coveney, *Analyst, Lond.*, 1984, 109, 175–176.

Disposition in the Body. Rapidly absorbed from the gastrointestinal tract and readily penetrates the skin. It is metabolised by conjugation to yield phenyl glucuronide and phenyl sulphate; small amounts are oxidised to catechol and quinol which are also conjugated. Oxidation of these metabolites to quinones may tint the urine green. Acid-labile phenol conjugates are present endogenously in serum at concentrations of about 0.1 µg/ml.

Phenol is a metabolite of benzene.

Endogenous phenol concentrations in urine average about 5 to 10 µg/ml.

TOXICITY. Phenol denatures and precipitates cellular proteins and thus may rapidly cause poisoning. The minimum lethal dose by mouth is about 1 g. Severe and even fatal poisoning may also arise from absorption of phenol from open wounds or through the intact skin. The maximum permissible atmospheric concentration is 5 ppm.

In a fatality due to the deliberate ingestion of a mixture containing phenol, the following postmortem tissue concentrations were reported: blood, phenol 56 µg/ml, alcohol 300 µg/ml; liver, phenol 74 µg/g. In a second fatality due to accidental percutaneous absorption, postmortem blood concentrations of 27 µg/ml of phenol and 300 µg/ml of alcohol were reported (E. R. Soares and J. P. Tift, *J. forens. Sci.*, 1982, 27, 729-731).

In a fatality due to accidental dermal exposure to phenol, the following postmortem concentrations were reported: blood 4.7 µg/ml, unhydrolysed liver 3.3 µg/g, hydrolysed liver 7.1 µg/g (J. F. Lewin and W. T. Cleary, *Forens. Sci. Int.*, 1982, 19, 177-179).

Phenolphthalein

Purgative

Synonym. Dihydroxyphthalophenone

Proprietary Names. Darmol; Euchessina; Evac-U-Gen; Ex-Lax (pills); Proulet; Purganol. It is an ingredient of Agarol, Alophen, Anodyn, Kest, and Petrolagar (Red Label).

3,3-Bis(4-hydroxyphenyl)phthalide

$C_{20}H_{14}O_4 = 318.3$

CAS—77-09-8

A white or yellowish-white crystalline or amorphous powder. M.p. 258° to 263°.

Practically **insoluble** in water; soluble 1 in 15 of ethanol, and 1 in 100 of ether; soluble in dilute solutions of alkali hydroxides.

Dissociation Constant. pK_a 9.7 (25°).

Partition Coefficient. Log P (octanol/pH 7.4), 2.4.

Colour Test. Folin-Ciocalteu Reagent—blue.

Thin-layer Chromatography. System TD—Rf 38; system TE—Rf 51; system TF—Rf 59. (Acidified potassium permanganate solution, positive.)

Ultraviolet Spectrum. Methanol—277 nm ($A_1^1 = 150$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1740, 1178, 1230, 1265, 1278, 1510 (KBr disk).

Mass Spectrum. Principal peaks at m/z 274, 225, 318, 273, 275, 226, 257, 121.

Quantification. COLORIMETRY. In serum or urine—S. M. Morris and D. W. Powell, *Analyt. Biochem.*, 1979, 95, 465-471.

Disposition in the Body. Poorly absorbed after oral administration (up to about 15%), and partly excreted in the bile as the active glucuronide, and in the urine; if the urine is alkaline the excreted compound will impart a red colour. The greater part of the ingested material is eliminated in the faeces in both free and conjugated forms.

TOXICITY. Phenolphthalein is usually non-toxic even in relatively large doses, although fatalities have occurred in young children after ingestion of 0.6 to 1.8 g.

Dose. 50 to 300 mg.

Phenoperidine

Narcotic Analgesic

Ethyl 1-(3-hydroxy-3-phenylpropyl)-4-phenylpiperidine-4-carboxylate

$C_{23}H_{29}NO_3 = 367.5$

CAS—562-26-5

Phenoperidine Hydrochloride*Proprietary Name.* Operidine*Note.* Operidine is used as a synonym for pethidine hydrochloride in *Jap.P.* $C_{23}H_{29}NO_3 \cdot HCl = 403.9$ *CAS*—2627-49-4

A white crystalline powder. M.p. 200° to 202°.

Soluble 1 in 50 of water, 1 in 10 of ethanol (90%), and 1 in 3 of chloroform; practically insoluble in ether.**Colour Test.** Marquis Test—red.**Thin-layer Chromatography.** *System TA*—Rf 71; *system TB*—Rf 26; *system TC*—Rf 64. (*Dragendorff spray*, positive; *acidified iodoplatinate solution*, positive; *Marquis reagent*, faint red.)**Gas Chromatography.** *System GA*—phenoperidine RI 2872, norpethidine RI 1745, pethidine RI 1751.**High Pressure Liquid Chromatography.** *System HA*—phenoperidine k' 0.8, norpethidine k' 1.7 (tailing peak), pethidine k' 2.8 (tailing peak); *system HC*—phenoperidine k' 0.10, norpethidine k' 2.04, pethidine k' 0.55.**Infra-red Spectrum.** Principal peaks at wavenumbers 1710, 698, 1230, 1136, 1175, 1205 (phenoperidine hydrochloride, KBr disk).**Mass Spectrum.** Principal peaks at m/z 246, 42, 367, 247, 57, 56, 91, 77; norpethidine 57, 233, 42, 56, 158, 43, 160, 103; pethidine 71, 70, 44, 57, 42, 247, 43, 246.**Quantification.** **GAS CHROMATOGRAPHY.** In plasma: sensitivity 2 ng/ml, AFID—K. Chan *et al.*, *J. Chromat.*, 1981, 223; *Biomed. Appl.*, 12, 213–218.**Disposition in the Body.** Absorbed from the gastro-intestinal tract but there is extensive first-pass metabolism; bioavailability about 30%. It is metabolised to pethidine and norpethidine. Up to about 5% of a dose is excreted unchanged in the urine, with about 18% as norpethidine and 2% as pethidine, in two to three days. The urinary excretion of unchanged phenoperidine is increased to about 7% when the urine is acidified.**THERAPEUTIC CONCENTRATION.**After a single intravenous dose of 2 mg administered to 5 patients during general anaesthesia, a mean plasma concentration of 0.02 µg/ml was reported at 2 minutes (L. Milne *et al.*, *Br. J. Anaesth.*, 1980, 52, 537–540).**HALF-LIFE.** Plasma half-life, about 1 hour.**VOLUME OF DISTRIBUTION.** About 2 litres/kg.**CLEARANCE.** Plasma clearance, about 20 ml/min/kg.**PROTEIN BINDING.** In plasma, about 80%.**Dose.** 0.5 to 1 mg of phenoperidine hydrochloride intravenously. With assisted ventilation, an initial intravenous dose of 2 to 5 mg may be given.**Phenothiazine***Anthelmintic (Veterinary)**Synonym.* Thiodiphenylamine $C_{12}H_9NS = 199.3$ *CAS*—92-84-2

An olive-green or greyish-green, crystalline or amorphous powder. It is slowly oxidised in air and darkens on exposure to light. M.p. about 184°.

Practically **insoluble** in water; soluble 1 in 60 of ethanol, 1 in 5 of acetone, and 1 in 20 of chloroform.**Colour Tests.** Ferric Chloride—green; Formaldehyde—Sulphuric Acid—red-violet; Forrest Reagent—orange; FPN Reagent—orange; Liebermann's Test—green; Sulphuric Acid—green.**Gas Chromatography.** *System GA*—RI 2024; *system GF*—RI 2845.**High Pressure Liquid Chromatography.** *System HA*— k' 0.1.**Ultraviolet Spectrum.** Ethanol—254 nm ($A_1^1 = 2160$ b), 317 nm ($A_1^1 = 266$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 735, 750, 1310, 710, 1300, 1590 (KBr disk).

Mass Spectrum. Principal peaks at m/z 199, 167, 198, 166, 99, 154, 69, 77.

Phenoxymethylpenicillin

Antihypertensive

N-(2-Chloroethyl)-*N*-(1-methyl-2-phenoxyethyl)benzylamine

$C_{18}H_{22}ClNO = 303.8$

CAS—59-96-1

Crystals. M.p. 38° to 40°.

Soluble in benzene.

Phenoxymethylpenicillin Hydrochloride

Proprietary Names. Dibenylene; Dibenzyline.

$C_{18}H_{22}ClNO \cdot HCl = 340.3$

CAS—63-92-3

A white crystalline powder. M.p. 136° to 141°.

Soluble 1 in 25 of water, 1 in 9 of ethanol, and 1 in 9 of chloroform; practically insoluble in ether. Neutral and alkaline solutions are unstable.

Caution. Phenoxymethylpenicillin hydrochloride in powder form should not be allowed to come into contact with eyes or skin, as it may cause irritation.

Colour Tests. Mandelin's Test—green → violet; Marquis Test—violet.

Thin-layer Chromatography. System TA—Rf 73; system TB—Rf 64; system TC—Rf 76. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2233; system GF—RI 2600.

High Pressure Liquid Chromatography. System HA— k' 0.1.

Ultraviolet Spectrum. Aqueous acid—262 nm, 268 nm ($A_1^1 = 48$ a), 274 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1240, 750, 698, 1494, 1598, 1586 (phenoxymethylpenicillin hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 91, 196, 198, 92, 197, 65, 77, 56.

Dose. 10 to 60 mg of phenoxymethylpenicillin hydrochloride daily; up to 200 mg daily has been given.

Phenoxymethylpenicillin

Antibiotic

Synonyms. Penicillin V; Phénomycilline.

Proprietary Names. Oracilline (powder and tablets); Penbec-V; V-Cillin.

(6*R*)-6-(2-Phenoxyacetamido)penicillanic acid

$C_{16}H_{18}N_2O_5S = 350.4$

CAS—87-08-1

An antimicrobial acid produced by the growth of certain strains of *Penicillium notatum* or related organisms.

A white crystalline powder.

Soluble 1 in 1700 of water, 1 in 7 of ethanol, and 1 in 6 of acetone; soluble in chloroform.

Phenoxymethylpenicillin Calcium

Synonym. Penicillin V Calcium

Proprietary Names. Calcipen; Crystapen V (suspension).

(C₁₆H₁₇N₂O₅S)₂Ca·2H₂O = 774.9

CAS—147-48-8 (anhydrous)

A white, finely crystalline powder.

Slowly **soluble** 1 in 20 of water.

Phenoxymethylpenicillin Potassium

Synonym. Penicillin V Potassium

Proprietary Names. Apsin VK; Betapen-VK; Co-Caps Penicillin V-K; Crystapen V (syrup and tablets); Distaquaine V-K; Dowpen VK; Econocil VK; Icipen; Ledericillin VK; Megacillin; Nadopen-V; Novopen-VK; Oспен (tablets); Paclin VK; Penapar VK; Pen-Vee-K; Pfizerpen VK; PVF K; Robicillin VK; Ro-Cillin VK; Stabillin V-K; Ticillin V-K; Uticillin VK; V-Cil-K; V-Cillin K; VC-K 500; Veetids.

Note. Megacillin is also used as a proprietary name for benzylpenicillin potassium, clemizol penicillin, and procaine penicillin.

C₁₆H₁₇KN₂O₅S = 388.5

CAS—132-98-9

A white crystalline powder.

Soluble 1 in 1.5 of water and 1 in 150 of ethanol; practically insoluble in ether.

Dissociation Constant. pK_a 2.7 (25°).

Ultraviolet Spectrum. Phenoxymethylpenicillin potassium: water—268 nm (A₁¹ = 31 b), 275 nm (A₁¹ = 25 b).

Infra-red Spectrum. Principal peaks at wavenumbers 1754, 1660, 1181, 1202, 1174, 1532 (KBr disk).

Disposition in the Body. Rapidly but incompletely absorbed after oral administration; peak plasma concentrations are attained about 2 hours after a dose. About 20 to 35% of an oral dose is excreted in the urine unchanged in 24 hours and about 34% is excreted as penicilloic acid in the same period.

HALF-LIFE. Plasma half-life, about 0.5 hour.

PROTEIN BINDING. In plasma, about 80%.

Dose. 0.5 to 3 g daily.

Phenprobamate

Tranquilliser

Synonym. Proformiphen

Proprietary Name. Gamaquil

3-Phenylpropyl carbamate

C₁₀H₁₃NO₂ = 179.2

CAS—673-31-4

A fine, white, crystalline powder. M.p. 101° to 104°.

Practically **insoluble** in water; soluble in ethanol and chloroform; slightly soluble in ether.

Colour Test. Marquis Test—red-brown.

Thin-layer Chromatography. System TA—Rf 75; system TD—Rf 47; system TE—Rf 74; system TF—Rf 55. (Furfuraldehyde reagent, positive.)

Gas Chromatography. System GA—RI 1520.

Ultraviolet Spectrum. Ethanol—254 nm, 259 nm (A₁¹ = 11.6 b), 261 nm (A₁¹ = 11.6 b), 265 nm, 269 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1690, 1088, 1064, 700, 1605, 1623 (KBr disk).

Mass Spectrum. Principal peaks at m/z 118, 117, 91, 92, 119, 65, 77, 103.

Quantification. COLORIMETRY AND THIN-LAYER CHROMATOGRAPHY. In blood or urine: phenprobamate and metabolites—F. Schatz and U. Jahn, *Arzneimittel-Forsch.*, 1966, 16, 866–870.

Disposition in the Body. Rapidly absorbed after oral administration and metabolised by oxidative degradation of the side chain and p-hydroxylation of the phenyl ring. About 7% of a dose is excreted unchanged in the urine in 48 hours and about 76% as metabolites, mostly as hippuric acid and free and conjugated 3-hydroxyphenprobamate. The 3-hydroxy metabolite, which is active, is present in blood at concentrations greater than those of unchanged drug.

HALF-LIFE. Plasma half-life, 5 to 8 hours.

REFERENCE. D. S. Farrier, *Arzneimittel-Forsch.*, 1975, 25, 813–817.

Dose. 1.2 to 2.4 g daily.

Phenprocoumon

Anticoagulant

Synonym. Phenylpropylhydroxycoumarin

Proprietary Names. Liquamar; Marcoumar; Marcumar.

4-Hydroxy-3-(1-phenylpropyl)coumarin

 $C_{18}H_{16}O_3 = 280.3$

CAS—435-97-2

A fine white crystalline powder. M.p. 177° to 181°.

Practically **insoluble** in water; soluble in chloroform, methanol, and solutions of alkali hydroxides.**Thin-layer Chromatography.** System TD—Rf 62; system TE—Rf 21; system TF—Rf 56.**Ultraviolet Spectrum.** Aqueous alkali—310 nm ($A_1^1 = 540$ b); methanol—285 nm ($A_1^1 = 394$ a), 310 nm ($A_1^1 = 440$ a).**Infra-red Spectrum.** Principal peaks at wavenumbers 1656, 759, 696, 1613, 1163, 1113 (Nujol mull).**Mass Spectrum.** Principal peaks at m/z 251, 280, 118, 91, 121, 119, 252, 189.**Quantification.** GAS CHROMATOGRAPHY. In plasma: sensitivity 125 ng/ml, FID—K. K. Midha *et al.*, *J. pharm. Sci.*, 1976, 65, 387–391.HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: sensitivity 100 ng/ml in plasma, UV detection—J. X. De Vries *et al.*, *J. Chromat.*, 1982, 231; *Biomed. Appl.*, 20, 83–92.THIN-LAYER CHROMATOGRAPHY—FLUORESCENCE DENSITOMETRY. In plasma: sensitivity 5 ng/ml—P. Haefelfinger, *J. Chromat.*, 1979, 162; *Biomed. Appl.*, 4, 215–222.**Disposition in the Body.** Well absorbed after oral administration. The *S*-enantiomer is stated to be considerably more potent as an anticoagulant than the *R*-form but there appears to be little difference in pharmacokinetic properties. Phenprocoumon is thought to be excreted almost entirely as a glucuronide conjugate with less than 10% of the dose as unchanged drug.

THERAPEUTIC CONCENTRATION.

Following an intravenous injection of 3 mg to 1 subject, a plasma concentration of 0.8 µg/ml was reported at 5 minutes; in a subject receiving daily doses of 1.6 mg, a steady-state plasma concentration of 1.8 µg/ml was reported (P. Haefelfinger, *ibid.*).

HALF-LIFE. Plasma half-life, 3 to 9 days (mean 5).

VOLUME OF DISTRIBUTION. 0.1 to 0.2 litre/kg.

CLEARANCE. Plasma clearance, about 0.01 ml/min/kg.

PROTEIN BINDING. In plasma, more than 99%.

NOTE. For a review of the clinical pharmacokinetics of oral anticoagulants see J. G. Kelly and K. O'Malley, *Clin. Pharmacokinet.*, 1979, 4, 1–15.**Dose.** Maintenance, 0.75 to 4.5 mg daily.**Phensuximide**

Anticonvulsant

Synonym. Fensuximid

Proprietary Name. Milontin

N-Methyl-2-phenylsuccinimide $C_{11}H_{11}NO_2 = 189.2$

CAS—86-34-0

A white crystalline powder. M.p. 68° to 74°.

Soluble 1 in 250 of water, 1 in 20 of ethanol, 1 in 1.5 of chloroform, and 1 in 35 of ether.**Colour Test.** Liebermann's Test—red-orange.**Thin-layer Chromatography.** System TA—Rf 75; system TD—Rf 71; system TE—Rf 77; system TF—Rf 59. (Acidified potassium permanganate solution, positive.)**Gas Chromatography.** System GA—RI 1634; system GE—retention time 0.39 relative to phenytoin.**Ultraviolet Spectrum.** Ethanol—247 nm ($A_1^1 = 17.2$ b), 252 nm ($A_1^1 = 16.2$ b), 258 nm ($A_1^1 = 14.5$ b), 264 nm ($A_1^1 = 9.6$ b). (See below)**Infra-red Spectrum.** Principal peaks at wavenumbers 1686, 1275, 1637, 1111, 695, 751 (KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 104, 189, 103, 78, 51, 77, 105, 52.

Quantification. GAS CHROMATOGRAPHY. In serum: phensuximide and other succinimide anticonvulsants, detection limit 1 to 5 µg/ml for phensuximide, FID—J. Bonitati, *Clin. Chem.*, 1976, 22, 341–345. In plasma or urine: sensitivity 2.5 µg/ml, FID—E. van der Kleijn *et al.*, *J. Pharm. Pharmac.*, 1973, 25, 324–327.

Disposition in the Body. Readily absorbed after oral administration and rapidly metabolised to the *N*-desmethyl derivative, which is active. About 27% of a dose is excreted in the urine in 48 hours, mostly as 4'-hydroxyphensuximide and its conjugate.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 1 g to 12 subjects, peak plasma concentrations of 10.6 to 15.6 µg/ml were attained in 0.5 to 1.5 hours (A. J. Glazko and

W. A. Dill, *Other Succinimides: Methsuximide and Phensuximide*, in *Antiepileptic Drugs*, D. M. Woodbury *et al.* (Ed.), New York, Raven Press, 1972, pp. 455–464).

Following daily oral doses of 3 g to 5 subjects with intractable seizures, steady-state plasma concentrations of 3.9 to 7.9 µg/ml (mean 5.7) of phensuximide and 1.5 to 2.1 µg/ml (mean 1.7) of *N*-desmethylphensuximide, were reported (R. J. Porter *et al.*, *Neurology, Minneap.*, 1977, 27, 375–376).

TOXICITY. The estimated minimum lethal dose is 5 g.

HALF-LIFE. Plasma half-life, 4 to 12 hours (mean 8).

PROTEIN BINDING. In plasma, not significantly bound.

Dose. 0.5 to 3 g daily.

Phentermine

Anorectic

Proprietary Names. Duromine; Ionamin; Linyl; Lipopill; Mira-pront.

$\alpha\alpha$ -Dimethylphenethylamine

$C_{10}H_{15}N = 149.2$

CAS—122-09-8

A colourless oily liquid.

Slightly **soluble** in water; soluble in ethanol, chloroform, and ether.

Note. Phentermine is an isomer of methylamphetamine.

Phentermine Hydrochloride

Proprietary Names. Adipex-P; Fastin; Pronidin; Teramine.

$C_{10}H_{15}N \cdot \text{HCl} = 185.7$

CAS—1197-21-3

A white crystalline powder. M.p. 198°.

Very **soluble** in water, ethanol, and chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 10.1.

Colour Test. Marquis Test—orange.

Thin-layer Chromatography. System TA—Rf 46; system TB—Rf 26; system TC—Rf 31. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 1147; system GB—RI 1182; system GC—RI 1450.

High Pressure Liquid Chromatography. System HA— k' 0.6; system HB— k' 19.46; system HC— k' 0.86.

Ultraviolet Spectrum. Aqueous acid—247 nm, 251 nm, 257 nm ($A_1^1 = 13.9$ b), 263 nm. No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 730, 1285, 705, 1495, 1610, 1510 (phentermine hydrochloride, KCl disk).

Mass Spectrum. Principal peaks at m/z 58, 91, 42, 41, 134, 65, 59, 40.

Quantification. GAS CHROMATOGRAPHY. In blood or urine: amphetamine and phentermine, sensitivity 10 ng/ml in blood, FID—J. E. O'Brien *et al.*, *J. chromatogr. Sci.*, 1972, 10, 336–341. In urine: phentermine, chlorphentermine and mephentermine, FID—A. H. Beckett and L. G. Brookes, *J. Pharm. Pharmac.*, 1971, 23, 288–294.

Disposition in the Body. Readily absorbed after oral administration. About 70 to 80% of a dose is excreted in the urine as unchanged drug in 24 hours together with small amounts of the *N*-hydroxy and nitroso metabolites and traces of free and conjugated 4-hydroxyphentermine.

Phentermine is a metabolite of mephentermine.

THERAPEUTIC CONCENTRATION.

The following postmortem tissue concentrations were reported in a subject who had been receiving daily oral doses of 40 mg of a slow-release preparation and who died of natural causes: blood 0.9 µg/ml, bile 6.5 µg/ml, liver 4 µg/g, urine 50 µg/ml (K. Price, *Bull. int. Ass. forens. Toxicol.*, 1974, 10(1), 12-13).

Following single oral doses of 0.375 mg/kg, peak blood concentrations of about 0.1 µg/ml were attained in about 4 hours (O. N. Hinsvark *et al.*, *J. Pharmacokinet. Biopharm.*, 1973, 1, 319-328).

TOXICITY.

In a fatality involving the ingestion of phentermine, the following postmortem tissue concentrations were reported: blood 7.6 µg/ml, kidney 16 µg/g, liver 14 µg/g, urine 88 µg/ml; amylorbarbitone and ethchlorvynol were also detected in blood at concentrations of 10 µg/ml and 12 µg/ml, respectively (B. Levine *et al.*, *J. forens. Sci.*, 1984, 29, 1242-1245).

HALF-LIFE. Plasma half-life, about 19 to 24 hours.

VOLUME OF DISTRIBUTION. About 3 to 4 litres/kg.

Dose. 15 to 30 mg daily.

Phentolamine

Antihypertensive

3-[*N*-(2-Imidazolin-2-ylmethyl)-*p*-toluidino]phenol

$C_{17}H_{19}N_3O = 281.4$

CAS—50-60-2

A white crystalline powder. M.p. 175°.

Phentolamine Hydrochloride

Proprietary Name. Regitin(e) (tablets)

$C_{17}H_{19}N_3O \cdot HCl = 317.8$

CAS—73-05-2

A white or faintly cream-coloured crystalline powder. M.p. about 240°.

Soluble 1 in 50 of water and 1 in about 120 of ethanol; very slightly soluble in chloroform and ether. Solutions in water foam on shaking.

Phentolamine Mesylate

Synonym. Phentolamine Methanesulphonate

Proprietary Names. Regitin(e) (injection); Rogitene.

$C_{17}H_{19}N_3O \cdot CH_3SO_3H = 377.5$

CAS—65-28-1

A white, slightly hygroscopic, crystalline powder. M.p. 177° to 181°.

Soluble 1 in 1 of water, 1 in 5 of ethanol, and 1 in 700 of chloroform.

Dissociation Constant. pK_a 7.7.

Colour Tests. Mandelin's Test—blue-green; Marquis Test—yellow.

Thin-layer Chromatography. *System TA*—Rf 32; *system TB*—Rf 01; *system TC*—Rf 03. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—not eluted.

High Pressure Liquid Chromatography. *System HA*— k' 1.7.

Ultraviolet Spectrum. Aqueous acid—278 nm; aqueous alkali—291 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1195, 1508, 1610, 1580, 1592, 1247 (KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 281, 120, 91, 122, 280, 160, 68, 282.

Dose. 5 to 10 mg of phentolamine mesylate intravenously. Phentolamine hydrochloride has been given in doses of 200 to 300 mg daily, by mouth.

Phenylbutazone

Analgesic

Synonyms. Butadione; Fenilbutazona.

Proprietary Names. Algovérine; Artrizin; Azolid; Butacote; Butagesic; Butazolidin(e); Butazone; Intrabutazone; Malgesic; Nadozone; Neo-Zoline; Phenbutazone; Tibutazone.

4-Butyl-1,2-diphenylpyrazolidine-3,5-dione

$C_{19}H_{20}N_2O_2 = 308.4$

CAS—50-33-9

A fine, white, crystalline powder. M.p. 104° to 107°.

Practically **insoluble** in water; soluble 1 in 28 of ethanol, 1 in 1.25 of chloroform, and 1 in 15 of ether.

Dissociation Constant. pK_a 4.4 (20°).

Partition Coefficient. Log P (octanol/pH 7.4), 0.7.

Colour Tests. Liebermann's Test (100°)—brown; Mandelin's Test—violet.

Thin-layer Chromatography. System TA—Rf 79; system TD—Rf 78; system TE—Rf 66; system TF—Rf 68; system TG—Rf 23. (Chromic acid solution, brown; Ludy Tenger reagent, orange; mercurous nitrate spray, positive; acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—phenylbutazone RI 2365, oxyphenbutazone RI 1630; system GD—phenylbutazone retention times 2.05 and 1.81, oxyphenbutazone retention time 2.11, both as methyl derivatives relative to n -C₁₆H₃₄; system GF—RI 2860.

High Pressure Liquid Chromatography. System HD—phenylbutazone k' 6.5, oxyphenbutazone k' 1.95; system HV—phenylbutazone retention time 0.95, oxyphenbutazone retention time 0.69, both relative to meclofenamic acid.

Ultraviolet Spectrum. Aqueous acid—237 nm ($A_1^1 = 456$ a); aqueous alkali—264 nm ($A_1^1 = 660$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1714, 1300, 1755, 755, 1492, 1275 (KBr disk).

Mass Spectrum. Principal peaks at m/z 77, 183, 308, 184, 105, 55, 51, 41; oxyphenbutazone 199, 324, 93, 77, 65, 55, 121, 135.

Quantification. GAS CHROMATOGRAPHY. In blood, plasma, bile, or urine: sensitivity 1 μ g/ml—R. D. Budd, *J. Chromat.*, 1982, 243, 368–371. In plasma: sensitivity 10 ng/ml, ECD—A. Sioufi *et al.*, *J. pharm. Sci.*, 1978, 67, 243–245.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: phenylbutazone, oxyphenbutazone and 3'-hydroxyphenylbutazone, detection limit 50 ng/ml, UV detection—T. Marunaka *et*

al., J. Chromat., 1980, 183; Biomed. Appl., 9, 331–338. In plasma: phenylbutazone, oxyphenbutazone and 3'-hydroxyphenylbutazone, sensitivity 5.5 µg/ml for phenylbutazone, UV detection—L. Aarons and C. Higham, *Clinica chim. Acta*, 1980, 105, 377–382.

Disposition in the Body. Readily absorbed after oral or rectal administration and slowly absorbed after intramuscular injection. The major metabolic reactions are C-glucuronidation at the 4-position of the pyrazolidine ring and 4-hydroxylation of one of the phenyl rings to form the active metabolite, oxyphenbutazone; 3-hydroxylation of the butyl side-chain to form 3'-hydroxyphenylbutazone, and formation of 4,3'-dihydroxyphenylbutazone also occur. About 61% of a dose is slowly excreted in the urine over a period of about 21 days, together with up to 27% in the faeces. Of the material excreted in the urine, the 4-C-glucuronide of phenylbutazone accounts for about 40%, free phenylbutazone and free oxyphenbutazone about 1%, 4,3'-dihydroxyphenylbutazone about 6%, 3'-hydroxyphenylbutazone about 3%, and the remainder consists of the C-glucuronide of 3'-hydroxyphenylbutazone (about 12%), oxyphenbutazone O-glucuronide and two other metabolites.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 50 to 100 µg/ml.

Following single oral doses of 100, 300 and 600 mg to 6 subjects, peak plasma concentrations of 12.5 to 17.1 µg/ml (mean 14), 30.8 to 46.3 µg/ml (mean 38), and 51.2 to 88.1 µg/ml (mean 75), respectively, were obtained in 1 to 7 hours (mean 3) (A. Sioufi *et al.*, *J. pharm. Sci.*, 1980, 69, 1413–1416).

After daily oral doses of 100, 200, and 300 mg to 7 subjects, mean steady-state plasma concentrations of 52, 83, and 95 µg/ml respectively were reported; in 3 subjects given 400 mg daily, the mean steady-state concentration was 99 µg/ml (M. Orme *et al.*, *Br. J. clin. Pharmacol.*, 1976, 3, 185–191).

Following daily oral doses of 200 mg to 1 subject for 7 days, the following plasma concentrations were found: phenylbutazone about 50 µg/ml, oxyphenbutazone about 20 µg/ml, and 3'-hydroxyphenylbutazone about 12 µg/ml (K. K. Midha *et al.*, *J. pharm. Sci.*, 1974, 63, 1751–1754).

TOXICITY. The estimated minimum lethal dose is 5 g. Toxic effects during treatment are frequent and may occur even when the dose does not exceed 400 mg daily; they are usually associated with plasma concentrations above 100 µg/ml. A considerable number of deaths have occurred, especially from blood disorders. In a fatality due to an accidental overdose by a 5-year-old child, the following postmortem concentrations were reported: blood 400 µg/ml, bile 475 µg/ml, kidney 250 µg/g, liver 250 µg/g (K. L. Lam and K. Chien, *Bull. int. Ass. forens. Toxicol.*, 1976, 12(2), 20).

A plasma concentration of 670 µg/ml was reported in one subject, 1 day after ingestion of 8 g. The concentration of phenylbutazone declined rapidly with a half-life of 23 hours but concentrations of 3'-hydroxyphenylbutazone were unusually high and exceeded those of unchanged drug after 48 hours; the subject recovered after about 3 days (L. F. Prescott *et al.*, *Br. med. J.*, 1980, 281, 1106–1107).

HALF-LIFE. Plasma half-life, phenylbutazone 2 to 5 days (mean 3), but dose-dependent and increased in subjects with renal failure and in the elderly; oxyphenbutazone about 2 to 3 days, 3'-hydroxyphenylbutazone about 32 hours.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 1.8.

PROTEIN BINDING. In plasma, about 99% at therapeutic concentrations; decreased at higher concentrations when the binding sites become saturated.

NOTE. For a review of the pharmacokinetics of phenylbutazone see J. Aarbakke, *Clin. Pharmacokinet.*, 1978, 3, 369–380.

Dose. Initially 300 to 600 mg daily; maintenance, 100 to 400 mg daily.

Phenylephrine

Sympathomimetic

Synonyms. Néosynéphrine; *m*-Synephrine.

Note. Synephrine has been used as a synonym for oxedrine.

Proprietary Name. It is an ingredient of Vibrocil.

(*R*)-1-(3-Hydroxyphenyl)-2-methylaminoethanol

$C_9H_{13}NO_2 = 167.2$

CAS—59-42-7

M.p. about 174°.

Phenylephrine Hydrochloride

Synonyms. Mesatonum; Metaoxedrin Chloridum.

Proprietary Names. Fenox; Isophrin; Mydfrin; Nazex; Neophryn; Optocrymal; Prefrin Liquifilm; Snef; Soothe; Visadron. It is an ingredient of Biomydrin, Bronchilator, Colrex Compound, Demazin, Dexylets, Dimotane (expectorant), Dimotapp, Dristan (tablets), Exyphen, Hayphryn, Isopto Frin, Naldecon, Neotep, Nethaprin Dospan, Tussils, Uniflu, and Zincfrin.

$C_9H_{13}NO_2 \cdot HCl = 203.7$

CAS—61-76-7

A white crystalline powder. M.p. 140° to 145°. A solution in water is laevorotatory.

Soluble 1 in 2 of water and 1 in 4 of ethanol.

Dissociation Constant. pK_a 8.9 (-OH), 10.1 (-NH-), (20°).

Colour Tests. Mandelin's Test—brown; Marquis Test—red.

Thin-layer Chromatography. *System TA*—Rf 33; *system TB*—Rf 01; *system TC*—Rf 01. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. *System GC*—RI 1934.

High Pressure Liquid Chromatography. *System HA*— k' 1.3; *system HC*— k' 1.64.

Ultraviolet Spectrum. Aqueous acid—273 nm ($A_1^1 = 110$ a); aqueous alkali—238 nm ($A_1^1 = 534$ a), 291 nm ($A_1^1 = 182$ a). (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 1594, 1273, 784, 696, 1304, 900 (phenylephrine hydrochloride, KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 44, 76, 77, 29, 45, 42, 95, 65.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 12.5 ng/ml, ECD—L. J. Dombrowski *et al.*, *J. pharm. Sci.*, 1973, 62, 1761–1763.

GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In urine: phenylephrine and four metabolites—K. E. Ibrahim *et al.*, *J. Pharm. Pharmacol.*, 1983, 35, 144–147.

Disposition in the Body. Readily absorbed after oral administration, but undergoes extensive first-pass metabolism; bioavailability about 38%. It is metabolised by conjugation with sulphate and glucuronic acid and by oxidative deamination to *m*-hydroxymandelic acid (MHMA) and *m*-hydroxyphenylglycol (MHPG). About 80% of an oral dose is excreted in the urine in 24 hours, mainly as sulphate conjugates of phenylephrine and MHPG; about 30% of a dose is excreted as unconjugated MHMA.

**THERAPEUTIC CONCENTRATION.**

After a single oral dose of 9 mg of ^3H -labelled phenylephrine hydrochloride to 6 subjects, peak plasma concentrations of 0.23 to 0.47 $\mu\text{g}/\text{ml}$ (mean 0.31) of total phenylephrine and metabolites were attained in 1 to 2 hours (C. J. Cavallito *et al.*, *J. pharm. Sci.*, 1963, 52, 259–263).

Following a single oral dose of 1 mg to 3 subjects, a mean peak plasma concentration of unconjugated phenylephrine of 0.0009 $\mu\text{g}/\text{ml}$ was attained in about 1.3 hours (J. H. Hengstmann and J. Goronzy, *Eur. J. clin. Pharmac.*, 1982, 21, 335–341).

TOXICITY. The estimated minimum lethal dose, for children up to 2 years is 100 mg intranasally and for adults is 1 g.

HALF-LIFE. Plasma half-life, about 2 to 3 hours.

VOLUME OF DISTRIBUTION. About 5 litres/kg.

CLEARANCE. Plasma clearance, about 30 ml/min/kg.

Dose. 30 to 40 mg of phenylephrine hydrochloride daily, by mouth.

Phenylmethylbarbituric Acid

Barbiturate

Synonym. Heptobarbitalum (distinguish from Heptabarbital).

5-Methyl-5-phenylbarbituric acid

$\text{C}_{11}\text{H}_{10}\text{N}_2\text{O}_3 = 218.2$

CAS—76-94-8

A white crystalline powder. M.p. about 226°.

Very slightly **soluble** in water; soluble 1 in 60 of ethanol; soluble in ether and aqueous solutions of alkalis.

Dissociation Constant. pK_a 7.7 (25°).

Colour Test. Liebermann's Test—red-orange.

Thin-layer Chromatography. System TD—Rf 29; system TE—Rf 24; system TF—Rf 61; system TH—Rf 27. (Mercurous nitrate spray, black; Zwikker's reagent, pink.)

Gas Chromatography. System GA—RI 1880.

High Pressure Liquid Chromatography. System HG— k' 1.48; system HH— k' 0.94.

Ultraviolet Spectrum. Borax buffer 0.05M (pH 9.2)—238 nm ($A_1^1 = 494$ b); M sodium hydroxide (pH 13)—253 nm ($A_1^1 = 350$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1702, 1720, 1751, 1240, 802, 716.

Mass Spectrum. Principal peaks at m/z 104, 132, 218, 51, 103, 77, 78, 52.

Dose. Phenylmethylbarbituric acid has been given in doses of 400 mg daily.

Phenylpropanolamine

Sympathomimetic

Synonym. *dl*-Norephedrine

(±)-2-Amino-1-phenylpropan-1-ol

$C_9H_{13}NO = 151.2$

CAS—14838-15-4

M.p. 101°.

Phenylpropanolamine Hydrochloride

Synonym. Mydratin

Proprietary Names. Coldecon; Control; Monydrin; Propadrine; Rhindec; Rinexin; Tepanil. It is an ingredient of Contac 400, Dimotane (expectorant), Dimotapp, Endecon, Eskornade, Exyphen, Hycomine, Naldecon, Nezcaam, Pholcolix, Rinurel, Sine-Off, Totolin, Triogesic, Triominic, Triotussic, and Vallex.

Note. The name Tepanil is also applied to diethylpropion hydrochloride.

$C_9H_{13}NO \cdot HCl = 187.7$

CAS—154-41-6

A white to creamy-white crystalline powder. M.p. 191° to 196°.

Soluble 1 in 2.5 of water and 1 in 9 of ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 9.4 (20°).

Thin-layer Chromatography. System TA—Rf 44; system TB—Rf 04; system TC—Rf 04. (Dragendorff spray, positive; FPN reagent, violet; acidified iodoplatinate solution, positive; Marquis reagent, yellow; ninhydrin spray, positive; acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 1313; system GB—RI 1353; system GC—RI 1383.

High Pressure Liquid Chromatography. System HA— k' 0.9; system HB— k' 3.87; system HC— k' 0.70.

Ultraviolet Spectrum. Aqueous acid—251 nm, 257 nm ($A_1^{1\%} = 11.7$ a), 262 nm. No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 700, 746, 1030, 1500, 1055, 1590 (phenylpropanolamine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 44, 77, 79, 51, 45, 42, 107, 105.

Quantification. GAS CHROMATOGRAPHY (CAPILLARY COLUMN). In plasma: sensitivity 1 ng/ml, ECD—N. Crisologo *et al.*, *J. pharm. Sci.*, 1984, 73, 1313–1315.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 5 ng/ml, fluorescence detection—W. D. Mason and E. N. Amick, *J. pharm. Sci.*, 1981, 70, 707–709.

Disposition in the Body. Absorbed after oral administration. More than 90% of a dose is excreted in the urine as unchanged drug in 24 hours, together with small amounts of hippuric acid. Phenylpropanolamine is a metabolite of amphetamine, diethylpropion, and ephedrine.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 25 mg to 12 subjects, a mean peak plasma concentration of about 0.08 µg/ml was attained in about 2 hours (W. D. Mason and E. N. Amick, *ibid.*).

TOXICITY.

In a fatality due to a phenylpropanolamine overdose, the following postmortem tissue concentrations were reported: blood 48 µg/ml, brain 86 µg/g, liver 460 µg/g (R. H. Cravey, per R. C. Baselt, *Disposition of Toxic Drugs and Chemicals in Man*, 2nd Edn, Davis, California, Biomedical Publications, 1982, pp. 641–643).

HALF-LIFE. Plasma half-life, about 4 hours.

Dose. 75 to 200 mg of phenylpropanolamine hydrochloride daily.

Phenyltoloxamine

Antihistamine

Synonyms. Phenyltolylloxamine; PRN.

Proprietary Name. It is an ingredient of Pholtex.

2-(2-Benzylphenoxy)-*NN*-dimethylethylamine

$C_{17}H_{21}NO = 255.4$

CAS—92-12-6

An oily liquid.

Note. Phenyltoloxamine is a structural isomer of diphenhydramine.

Phenyltoloxamine Citrate

Proprietary Names. It is an ingredient of Naldecon, Percogesic, and Rinurel.

$C_{17}H_{21}NO \cdot C_6H_8O_7 = 447.5$

CAS—1176-08-5

Crystals. M.p. 138° to 140°.

Soluble in water.

Dissociation Constant. pK_a 9.1.

Colour Tests. Mandelin's Test—green; Marquis Test—violet.

Thin-layer Chromatography. System TA—Rf 53; system TB—Rf 39; system TC—Rf 48. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 1938.

High Pressure Liquid Chromatography. System HA— k' 3.1.

Ultraviolet Spectrum. Aqueous acid—270 nm ($A_1^1 = 73$ b), 276 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1245, 1491, 752, 1030, 697, 1111 (KBr disk).

Mass Spectrum. Principal peaks at m/z 58, 255, 42, 71, 59, 44, 181, 165.

Dose. 75 to 200 mg of phenyltoloxamine citrate daily.

Phenylamidol

Analgesic/Muscle Relaxant

1-Phenyl-2-(2-pyridylamino)ethanol

$C_{13}H_{14}N_2O = 214.3$

CAS—553-69-5

Crystals. M.p. 82° to 85°.

Phenylamidol Hydrochloride

Proprietary Names. Analgin; Cabral; Miodar.

$C_{13}H_{14}N_2O \cdot HCl = 250.7$

CAS—326-43-2

A white crystalline powder. M.p. 140° to 142°.

Freely **soluble** in water; soluble in ethanol.

Dissociation Constant. pK_a 5.9.

Colour Tests. Cyanogen Bromide—orange-pink; Mandelin's Test—blue; Marquis Test—yellow.

Thin-layer Chromatography. System TA—Rf 69; system TB—Rf 09; system TC—Rf 52. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 2006.

Ultraviolet Spectrum. Aqueous acid—237 nm ($A_1^1 = 666$ a), 309 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1613, 1524, 700, 768, 1058, 752 (KBr disk).

Mass Spectrum. Principal peaks at m/z 107, 108, 78, 79, 80, 77, 51, 52.

Dose. Up to 3.2 g of phenylamidol hydrochloride daily.

Phenytoin

Anticonvulsant

Synonyms. Diphenylhydantoin; Fenitoina; Phenantoinum.

Proprietary Names of Phenytoin and Phenytoin Sodium. Dantoin; Di-Hydan; Dilantin; Diphenylan; Ditan; Epanutin; Phenhydant; Pyorédol; Solantyl; Zentropil. Phenytoin sodium is an ingredient of Garoin.

5,5-Diphenylimidazolidine-2,4-dione

$C_{15}H_{12}N_2O_2 = 252.3$

CAS—57-41-0

A white crystalline powder. M.p. about 295°, with decomposition.

Practically **insoluble** in water; slightly soluble in ethanol; soluble 1 in 500 of chloroform and 1 in 600 of ether; soluble in solutions of alkali hydroxides.

Phenytoin Sodium

Synonyms. Diphenin; Sodium Diphenylhydantoin; Soluble Phenytoin.

$C_{15}H_{11}N_2NaO_2 = 274.3$

CAS—630-93-3

A white, slightly hygroscopic, crystalline powder which on exposure to air absorbs carbon dioxide with the liberation of phenytoin.

Soluble in water and ethanol; practically insoluble in chloroform and ether. In aqueous solution it is partly hydrolysed to the base and turbidity develops.

Dissociation Constant. pK_a 8.3 (25°).

Colour Tests. Koppanyi-Zwicker Test—violet; Liebermann's Test—red-orange; Mercurous Nitrate—black.

Thin-layer Chromatography. System TD—Rf 33; system TE—Rf 36; system TF—Rf 53. (Mercuric chloride–diphenylcarbazone reagent, positive; mercurous nitrate spray, black.)

Gas Chromatography. System GA—RI 2330. Phenytoin is used as the reference substance in System GE.

High Pressure Liquid Chromatography. System HE— k' 9.71.

Ultraviolet Spectrum. Methanol—258 nm ($A_1^1 = 27$ a), 264 nm ($A_1^1 = 16$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1720, 1740, 1774, 748, 698, 785 (KBr disk).

Mass Spectrum. Principal peaks at m/z 180, 104, 223, 77, 209, 252, 51, 165; 5-(4-hydroxyphenyl)-5-phenylhydantoin 239, 196, 268, 120, 197, 225, 77, 104.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 0.5 to 1 µg/ml, FID—J. Gordos *et al.*, *J. Chromat.*, 1977, 143; *Biomed. Appl.*, 1, 171–181.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or serum: phenytoin and other anticonvulsants, sensitivity 1.3 µg/ml for phenytoin, UV detection—J. A. Christofides and D. E. Fry, *Clin. Chem.*, 1980, 26, 499–501. In plasma or urine: phenytoin and 5-(4-hydroxyphenyl)-5-phenylhydantoin, sensitivity 100 ng/ml for phenytoin and 50 ng/ml for the metabolite, UV detection—R. J. Sawchuk and L. L. Cartier, *Clin. Chem.*, 1980, 26, 835–839.

Disposition in the Body. Slowly but almost completely absorbed after oral administration; the rate of absorption is variable, being prolonged after large doses, and the bioavailability may vary considerably between different formulations. Aromatic hydroxylation is the major metabolic pathway and about 50 to 70% of a dose may be excreted as free or conjugated 5-(4-hydroxyphenyl)-5-phenylhydantoin (HPPH) in 24 hours; the excretion of this metabolite is dose-dependent and decreases as the dose is increased. Phenytoin hydroxylation is capacity-limited, and is therefore readily inhibited by agents which compete for its metabolic pathways. Less than 5% of a dose is excreted as unchanged drug. Minor metabolites include 5-(3-hydroxyphenyl)-5-phenylhydantoin, 3,4-dihydro-3,4-dihydroxyphenytoin, catechol, and 3-*O*-methylcatechol. Up to about 15% of a dose may be eliminated in the faeces.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 10 to 20 µg/ml.

A single oral dose of 100 mg given to 5 subjects produced peak plasma concentrations of 1.6 to 2.8 µg/ml (mean 2.2) in 2 to 4 hours; a second peak was observed at 10 to 12 hours (J. D. Robinson *et al.*, *Br. J. clin. Pharmac.*, 1975, 2, 345–349).

Following daily oral doses of 300 mg, mean steady-state plasma concentrations of 1.3 to 6.6 µg/ml (mean 3.6) were reported in 5 subjects with short phenytoin half-lives, in comparison to mean steady-state

plasma concentrations of 5.0 to 27.2 µg/ml (mean 13.4) in 4 subjects with long phenytoin half-lives; the corresponding concentrations of HPPH were 1.3 to 2.7 µg/ml (mean 2.0) and 0.7 to 1.3 µg/ml (mean 1.0), respectively (A. J. Glazko *et al.*, *Ther. Drug Monit.*, 1982, 4, 281–292).

Following oral doses of 100 mg three times a day to 18 subjects, maximum steady-state plasma concentrations of 3.4 to 30.5 µg/ml (mean 11.8) were reported (R. J. Sawchuk *et al.*, *J. Pharmacokin. Biopharm.*, 1982, 10, 365–382).

TOXICITY. The estimated minimum lethal dose is 5 g but few deaths from overdosage have been reported. Side-effects have been associated with plasma concentrations greater than 20 µg/ml and severe toxic effects with concentrations greater than 40 µg/ml. Fatalities have been associated with blood concentrations greater than 70 µg/ml.

A 4½-year-old girl ingested 2 g of phenytoin and 24 hours later the blood concentration was found to be 94 µg/ml. She died on the third day and postmortem concentrations were: blood 45 µg/ml, brain 78 µg/g, kidney 112 µg/g, liver 272 µg/g (F. A. Laubscher, *J. Am. med. Ass.*, 1966, 198, 1120–1121).

HALF-LIFE. Plasma half-life, varies considerably within the approximate range of 7 to 60 hours, and is dose-dependent, increasing as the dose increases.

VOLUME OF DISTRIBUTION. About 0.7 litre/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 1.6.

SALIVA. Plasma: saliva ratio, about 10.

PROTEIN BINDING. In plasma, about 90%.

NOTE. For a review of the pharmacokinetics of phenytoin see A. Richens, *Clin. Pharmacokinet.*, 1979, 4, 153–169.

Dose. 300 to 600 mg of phenytoin sodium daily.

Pholcodine

Cough Suppressant

Synonyms. MEM; Morpholinylethylmorphine.

Proprietary Names. Adaphol; Dia-Tuss; Duro-Tuss; Pectolin; Sancos; Sedlingtus; Triopaed; Tussinol. It is an ingredient of Copholco, Copholcoids, Davenol, Expulin, Falcodyl, Pavacol-D, PEM, Pholcolix, Pholcomed (linctus), Pholtex, Rinurel (linctus), Rubelix, and Triocos.

3-*O*-(2-Morpholinoethyl)morphine monohydrate

$C_{23}H_{30}N_2O_4 \cdot H_2O = 416.5$

CAS—509-67-1 (anhydrous)

Colourless crystals or a white crystalline powder. M.p. about 99°.

Soluble 1 in 50 of water and 1 in 3 of dehydrated alcohol; very soluble in acetone and chloroform; slightly soluble in ether.

Pholcodine Tartrate

$C_{23}H_{30}N_2O_4 \cdot 2C_4H_6O_6 \cdot 3H_2O = 752.7$

A white crystalline powder.

Soluble 1 in 8 of water; very slightly soluble in ethanol; slightly soluble in chloroform and ether.

Dissociation Constant. pK_a 8.0, 9.3 (37°).

Colour Tests. Liebermann's Test—black; Marquis Test—violet.

Thin-layer Chromatography. System TA—Rf 36; system TB—Rf 03; system TC—Rf 18. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, violet.)

Gas Chromatography. System GA—RI 3018.

High Pressure Liquid Chromatography. System HA— k' 6.0 (tailing peak); system HC— k' 1.63.

Ultraviolet Spectrum. Aqueous acid—283 nm ($A_1^1 = 40$ a). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1118, 969, 1250, 1043, 1500, 1098 (KBr disk).

Mass Spectrum. Principal peaks at m/z 114, 100, 56, 42, 115, 101, 70, 398.

Dose. Up to 60 mg daily.

Pholedrine

Synonyms. Isodrine; Sympropaminum.

4-(2-Methylaminopropyl)phenol

$C_{10}H_{15}NO = 165.2$

CAS—370-14-9

Crystals. M.p. 162° .

Slightly **soluble** in water; soluble in ethanol and ether.

Pholedrine Sulphate

Proprietary Name. Veritol

$(C_{10}H_{15}NO)_2 \cdot H_2SO_4 = 428.5$

CAS—6114-26-7

A white crystalline powder. M.p. about 321° , with decomposition.

Soluble 1 in 20 of water; practically insoluble in ethanol, chloroform, and ether.

Dissociation Constant. pK_a 9.4 (25°).

Colour Test. Marquis Test—grey \rightarrow green.

Thin-layer Chromatography. *System TA*—Rf 29; *system TB*—Rf 04; *system TC*—Rf 03. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. *System GA*—RI 1490.

Ultraviolet Spectrum. Aqueous acid—275 nm ($A_1^1 = 82$ a); aqueous alkali—238 nm ($A_1^1 = 640$ b), 295 nm ($A_1^1 = 150$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1258, 1513, 1274, 1590, 1610, 810 (KBr disk).

Mass Spectrum. Principal peaks at m/z 58, 30, 107, 59, 77, 56, 42, 43.

*Sympathomimetic***Disposition in the Body.****TOXICITY.**

In a fatality involving the ingestion of pholedrine, the following postmortem concentrations were reported: blood 15 $\mu\text{g/g}$, kidney 122 $\mu\text{g/g}$, liver 73 $\mu\text{g/g}$ (H.-J. Hammer *et al.*, *Die Gesundheitswes.*, 1980, 35, 1352–1354).

Dose. Pholedrine sulphate has been given parenterally in doses of up to 20 mg.

Phthalylsulphacetamide*Sulphonamide*

Synonym. Sulfanilacetamidum Phthalylatum

Proprietary Names. Talecid; Thalacet.

4'-(Acetylsulphamoyl)phthalanilic acid

$C_{16}H_{14}N_2O_6S = 362.4$

CAS—131-69-1

White or creamy-white crystals or crystalline powder. M.p. 186° to 202° , with decomposition.

Very slightly **soluble** in water; slightly soluble in ethanol; soluble in acetone; freely soluble in solutions of alkali hydroxides.

Colour Test. Copper Sulphate (Method 1)—blue.

Thin-layer Chromatography. *System TD*—Rf 00; *system TE*—Rf 00; *system TF*—Rf 00.

Ultraviolet Spectrum. Aqueous acid—268 nm (broad); aqueous alkali—265 nm (broad).

Infra-red Spectrum. Principal peaks at wavenumbers 1170, 1681, 1527, 837, 1302, 1592.

Mass Spectrum. Principal peaks at m/z 109, 76, 104, 92, 239, 65, 108, 43.

Dose. 6 to 12 g daily.

Phthalylsulphathiazole*Sulphonamide*

Synonyms. Ftalilsulfatiazol; Phthalazolum; Phthalylsulfathiazole.

Proprietary Names. Colicetina; Phthazol; Sulfathalidine; Talidine; Thalazole. It is an ingredient of Neo-Sulfazon.

4'-(Thiazol-2-ylsulphamoyl)phthalanilic acid

$C_{17}H_{13}N_3O_5S_2 = 403.4$

CAS—85-73-4

White or yellowish-white crystals, or powder, which darken on prolonged exposure to light. M.p. about 275°, with decomposition.

Practically **insoluble** in water, chloroform, and ether; soluble 1 in 600 of ethanol; freely soluble in dimethylformamide and solutions of alkali hydroxides and carbonates, and in hydrochloric acid.

Colour Test. Copper Sulphate (Method 1)—green.

Thin-layer Chromatography. *System TD*—Rf 00; *system TE*—Rf 00; *system TF*—Rf 00; *system TT*—Rf 02; *system TU*—Rf 04; *system TV*—Rf 04.

High Pressure Liquid Chromatography. *System HU*—k' 14.0.

Ultraviolet Spectrum. Aqueous acid—282 nm; aqueous alkali—260 nm ($A_1^1 = 600$ a); methanol—260 nm ($A_1^1 = 497$ a), 288 nm ($A_1^1 = 648$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1532, 1142, 1084, 1710, 1585, 1560 (KBr disk).

Mass Spectrum. Principal peaks at m/z 92, 156, 191, 65, 108, 76, 104, 50.

Disposition in the Body. Only about 5% of a dose is absorbed after oral administration and blood concentrations are therefore very low compared to other sulphonamides, usually less than 15 µg/ml. It is slowly hydrolysed to sulphathiazole in the gastrointestinal tract.

Dose. 2 to 12 g daily.

Physostigmine

Anticholinesterase

Synonyms. Eserine; Physostigmina.

(3aS,8aR)-1,2,3,3a,8,8a-Hexahydro-1,3a,8-trimethylpyrrolo-[2,3-b]indol-5-yl methylcarbamate

$C_{15}H_{21}N_3O_2 = 275.3$

CAS—57-47-6

An alkaloid obtained from the calabar bean, the seed of *Physostigma venenosum* (Leguminosae).

Colourless crystals, or a white microcrystalline powder. M.p. not lower than 103°.

Soluble 1 in 75 of water, 1 in 10 of ethanol, 1 in 1 of chloroform, and 1 in 30 of ether.

Physostigmine, its salts and their aqueous solutions become red on exposure to heat, light, air, and on contact with traces of metals, owing to the formation of rubreserine; the change is less rapid in acid solution.

Physostigmine Salicylate

Synonym. Eserine Salicylate

Proprietary Names. Antilirium; Fisostin.

$C_{15}H_{21}N_3O_2 \cdot C_7H_6O_3 = 413.5$

CAS—57-64-7

Colourless or white crystals or white powder. M.p. 184° to 186°.

Soluble 1 in 75 to 1 in 90 of water, 1 in 25 of ethanol, 1 in 6 of chloroform, and 1 in 250 of ether.

Physostigmine Sulphate

Synonym. Eserine Sulphate

$(C_{15}H_{21}N_3O_2)_2 \cdot H_2SO_4 = 648.8$

CAS—64-47-1

A white deliquescent, microcrystalline powder. M.p. 143° to 147°.

Soluble 1 in less than 1 of water and of ethanol; soluble in chloroform; very slightly soluble in ether.

Dissociation Constant. pK_a 1.8, 7.9 (25°).

Partition Coefficient. Log P (octanol), 1.6.

Colour Test. Mandelin's Test—yellow-brown.

Thin-layer Chromatography. *System TA*—Rf 55; *system TB*—Rf 12; *system TC*—Rf 36. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. *System GA*—RI 1804, 2035, and 2190.

High Pressure Liquid Chromatography. *System HA*—k' 2.6.

Ultraviolet Spectrum. Aqueous acid—246 nm ($A_1^1 = 462$ a), 302 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1724, 1243, 1200, 1495, 1120, 1162 (KBr disk).

Mass Spectrum. Principal peaks at m/z 218, 174, 160, 161, 275, 219, 175, 162.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 500 pg/ml, electrochemical detection—R. Whelpton, *J. Chromat.*, 1983, 272; *Biomed. Appl.*, 23, 216–220.

Disposition in the Body. Readily absorbed after oral or subcutaneous administration and from mucous membranes. Physostigmine readily penetrates the central nervous system. It is rapidly hydrolysed by cholinesterases and most of a dose is destroyed in 2 hours. Very little is excreted in the urine.

THERAPEUTIC CONCENTRATION.

After a single subcutaneous injection of 1 mg of physostigmine salicylate (equivalent to 0.67 mg base) to one subject, a peak plasma concentration of 0.0036 $\mu\text{g/ml}$ was achieved after 15 minutes (R. Whelpton, *ibid.*).

After a single oral dose of 4 mg of physostigmine salicylate to one subject, a peak plasma concentration of about 0.001 $\mu\text{g/ml}$ was attained in 0.75 hour (M. Gibson *et al.*, *Lancet*, 1985, *I*, 695–696).

TOXICITY. Fatalities have occurred following ingestion of 6 mg of physostigmine orally and administration of 1.2 mg intravenously. The ingestion of 6 calabar beans by a child has proved fatal.

Physostigmine Aminoxyde

Anticholinesterase

Synonyms. Eseridine; Eserine Aminoxyde; Physostigmine *N*-Oxide.

$\text{C}_{15}\text{H}_{21}\text{N}_3\text{O}_3 = 291.3$

CAS—25573-43-7

M.p. 129°.

Practically **insoluble** in water; soluble in ethanol, chloroform, and ether.

Physostigmine Aminoxyde Salicylate

Synonym. Physostigmine *N*-Oxide Salicylate

Proprietary Name. Génésérine 3

$\text{C}_{15}\text{H}_{21}\text{N}_3\text{O}_3 \cdot \text{C}_7\text{H}_6\text{O}_3 = 429.5$

Crystals which become red on exposure to heat, light, and air. M.p. 90°.

Thin-layer Chromatography. *System TA—Rf* 31. (*Acidified potassium permanganate solution*, positive.)

Ultraviolet Spectrum. Aqueous acid—241 nm ($A_1^1 = 411$ b), 300 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1720, 1250, 1204, 1268, 1495, 1289 (KBr disk).

Dose. Physostigmine aminoxyde salicylate has been given in doses of 9 mg daily.

Phytomenadione

Vitamin

Synonyms. Methylphytylnaphthochinonum; Phylloquinone; Phytanadione; Vitamin K_1 .

Proprietary Names. Aquamephyton; Konakion; Mephyton.

2-Methyl-3-phytyl-1,4-naphthoquinone

$\text{C}_{31}\text{H}_{46}\text{O}_2 = 450.7$

CAS—84-80-0

A clear, deep yellow, very viscous oil which is stable in air but decomposes on exposure to light. Sp. gr. about 0.967. Refractive index 1.5255 to 1.5285.

Practically **insoluble** in water; soluble 1 in 70 of ethanol; more soluble in dehydrated alcohol; freely soluble in chloroform and ether.

Colour Test. Methanolic Potassium Hydroxide—green-yellow \rightarrow violet \rightarrow brown.

Gas Chromatography. *System GA—RI* 3287.

Ultraviolet Spectrum. Methanol—244 nm, 249 nm ($A_1^1 = 394$ a), 263 nm ($A_1^1 = 350$ b), 270 nm ($A_1^1 = 349$ a), 331 nm ($A_1^1 = 68$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1285, 1650, 714, 1587, 690, 1610.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 500 pg, UV detection—M. J. Shearer *et al.*, *Lancet*, 1982, 2, 460–463.

Disposition in the Body. Absorbed from the gastro-intestinal tract in the presence of bile. Rapidly metabolised and excreted as conjugates in the urine, bile and faeces. Endogenous plasma concentrations are usually in the range 0.0001 to 0.0007 µg/ml.

HALF-LIFE. Plasma half-life, about 2 hours.

Dose. Initially 2.5 to 25 mg by subcutaneous or intramuscular injection, or 5 to 20 mg by mouth.

Picrotoxin

Respiratory Stimulant

Synonym. Cocculin

$C_{30}H_{34}O_{13} = 602.6$

CAS—124-87-8

An active principle from the seeds of *Anamirta cocculus* (= *A. paniculata*) (Menispermaceae). The fruits of *A. cocculus* are sometimes known as 'fish berries' or 'Levant berries'. Colourless, flexible, shining prismatic crystals or white microcrystalline powder. M.p. about 199°.

Soluble 1 in 350 of water and 1 in 16 of ethanol; soluble in glacial acetic acid and solutions of acids and alkali hydroxides; slightly soluble in chloroform and ether.

Colour Tests. Dissolve in *sulphuric acid*—yellow → red-brown (slow). Add 1 drop of *fuming nitric acid* to the material—blue-green, discharged by excess acid.

Infra-red Spectrum. Principal peaks at wavenumbers 1780, 1755, 1795, 1123, 990, 1162 (KBr disk).

Mass Spectrum. Principal peaks at m/z 95, 55, 41, 43, 59, 27, 39, 67.

Dose. Picrotoxin was formerly given in doses of 3 to 6 mg intravenously.

Pilocarpine

Parasympathomimetic

Proprietary Name. Ocusert Pilo

(3*S*,4*R*)-3-Ethylidihydro-4-[(1-methyl-1*H*-imidazol-5-yl)-methyl]furan-2(3*H*)-one

$C_{11}H_{16}N_2O_2 = 208.3$

CAS—92-13-7

An alkaloid obtained from the leaflets of *Pilocarpus microphyllus* (Rutaceae) and other species of *Pilocarpus*.

A viscous, hygroscopic, colourless, oily liquid or crystals. M.p. about 34°.

Soluble in water, ethanol, and chloroform; sparingly soluble in ether.

Pilocarpine Hydrochloride

Proprietary Names. Adsorbocarpine; Isopto Carpine; Mi-Pilo; Neutracarpine; Pilocar; Pilomann; Pilopt; Pilonina; PV Carpine; Sno Pilo; Spersacarpin(e). It is an ingredient of E-Pilo and PE.

$C_{11}H_{16}N_2O_2 \cdot HCl = 244.7$

CAS—54-71-7

Hygroscopic, colourless crystals or white crystalline powder. M.p. 199° to 205°.

Soluble 1 in less than 1 of water, 1 in 3 of ethanol, and 1 in 360 of chloroform; practically insoluble in ether.

Pilocarpine Nitrate

Proprietary Names. Dulcicarpine; Marticarpine; Miopos; Pilo; Pilopos; PV Carpine; Vistacarpin.

$C_{11}H_{16}N_2O_2 \cdot HNO_3 = 271.3$

CAS—148-72-1

Colourless crystals or white crystalline powder. M.p. 171° to 179°, with decomposition.

Soluble 1 in 8 of water and 1 in 160 of ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 1.6, 7.1 (15°).

Thin-layer Chromatography. System *TA*—Rf 53; system *TB*—Rf 00; system *TC*—Rf 32. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System *GA*—RI 2014.

Infra-red Spectrum. Principal peaks at wavenumbers 1752, 1168, 1104, 660, 1505, 1020 (thin film).

Mass Spectrum. Principal peaks at m/z 95, 96, 42, 109, 41, 208, 54, 39.

Use. Pilocarpine hydrochloride is used as a 0.5 to 5% ophthalmic solution.

Piminodine*Narcotic Analgesic*

Ethyl 1-(3-anilinopropyl)-4-phenylpiperidine-4-carboxylate

 $C_{23}H_{30}N_2O_2 = 366.5$

CAS—13495-09-5

**Piminodine Esylate***Synonym.* Piminodine Ethanesulphonate $C_{23}H_{30}N_2O_2 \cdot C_2H_5O_3S = 476.6$

CAS—7081-52-9

A colourless crystalline powder. M.p. 128° to 135°.

Slightly **soluble** in water and ether; soluble 1 in 6 of ethanol and 1 in 2 of chloroform.**Colour Test.** Marquis Test—orange.**Thin-layer Chromatography.** *System TA*—Rf 67. (*Acidified iodoplatinate solution*, positive; *acidified potassium permanganate solution*, positive.)**High Pressure Liquid Chromatography.** *System HA*—k' 1.0.**Ultraviolet Spectrum.** Aqueous acid—247 nm, 253 nm, 257 nm, 263 nm.**Mass Spectrum.** Principal peaks at m/z 246, 45, 42, 366, 58, 57, 43, 106.**Dose.** Piminodine esylate has been given in doses of 25 to 50 mg by mouth and 10 to 20 mg parenterally.**Pimozide***Tranquilliser**Proprietary Names.* Opiran; Orap.

1 - {1 - [4,4-Bis(4-fluorophenyl)butyl] - 4 - piperidyl} benzimidazolin-2-one

 $C_{28}H_{29}F_2N_3O = 461.6$

CAS—2062-78-4

A colourless microcrystalline powder. M.p. 214° to 218°.

Practically **insoluble** in water; soluble 1 in 140 of ethanol, 1 in 5 of chloroform, and 1 in 500 of ether.**Dissociation Constant.** pK_a 7.3.**Colour Tests.** Koppanyi-Zwicker Test—violet; Liebermann's Test—brown; Mandelin's Test—brown; Marquis Test—violet.**Thin-layer Chromatography.** *System TA*—Rf 71; *system TB*—Rf 04; *system TC*—Rf 60. (*Acidified iodoplatinate solution*, positive.)**Gas Chromatography.** *System GA*—not eluted.**High Pressure Liquid Chromatography.** *System HA*—k' 0.7.**Ultraviolet Spectrum.** Acid isopropyl alcohol—273 nm, 280 nm ($A_1 = 145$ a).**Infra-red Spectrum.** Principal peaks at wavenumbers 1695, 1505, 753, 1220, 1230, 825 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 230, 187, 42, 217, 83, 82, 461, 96.**Quantification.** GAS CHROMATOGRAPHY. In plasma: sensitivity 30 ng/ml, FID—M. P. Quaglio *et al.*, *Boll. chim.-farm.*, 1982, 121, 276-284.HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity <5 ng/ml, fluorescence detection—Y. Miyao *et al.*, *J. Chromat.*, 1983, 275; *Biomed. Appl.*, 26, 443-449.RADIOIMMUNOASSAY. In plasma: detection limit 50 pg—L. J. M. Michiels *et al.*, *Life Sci.*, 1975, 16, 937-944.**Disposition in the Body.** Readily but slowly absorbed after oral administration. About 40% of a dose is excreted in the urine in 4 days. Two metabolites which have been identified in the urine are 4-bis(4-fluorophenyl)butyric acid and 1-(4-piperidyl)-benzimidazolin-2-one. Very little unchanged drug is excreted in the urine. Both unchanged drug and the butyric acid metabolite are eliminated in the faeces.**THERAPEUTIC CONCENTRATION.**Following a single oral dose of 6 mg to 9 subjects, a mean peak plasma concentration of about 0.004 μ g/ml was attained in 4 to 12 hours (mean 8) (R. G. McCreddie *et al.*, *Br. J. clin. Pharmac.*, 1979, 7, 533-534).**HALF-LIFE.** Plasma half-life, about 2 days.**NOTE.** For a review of pimozide see R. M. Pinder *et al.*, *Drugs*, 1976, 12, 1-39.**Dose.** 2 to 20 mg daily.

Pindolol*Beta-adrenoceptor Blocking Agent**Synonyms.* Prindolol; Prinodolol.*Proprietary Names.* Visken. It is an ingredient of Viskaldix.

1-(Indol-4-yloxy)-3-isopropylaminopropan-2-ol

 $C_{14}H_{20}N_2O_2 = 248.3$

CAS—13523-86-9

A white crystalline powder. M.p. 171° to 173° .Practically **insoluble** in water; slightly soluble in dehydrated alcohol and chloroform; sparingly soluble in methanol.**Dissociation Constant.** pK_a 9.7 (24°).**Partition Coefficient.** Log P (octanol/pH 7.0), -0.9 .**Colour Tests.** *p*-Dimethylaminobenzaldehyde—red/violet; Liebermann's Test—blue-green; Mandelin's Test—green; Marquis Test—yellow \rightarrow brown.**Thin-layer Chromatography.** *System TA*—Rf 49; *system TB*—Rf 02; *system TC*—Rf 05.**Gas Chromatography.** *System GA*—RI 2260.**High Pressure Liquid Chromatography.** *System HA*— k' 1.2.**Ultraviolet Spectrum.** Aqueous acid—264 nm ($A_1^1 = 292$ b), 287 nm; methanol—264 nm ($A_1^1 = 330$ a), 287 nm ($A_1^1 = 182$ a). No alkaline shift.**Infra-red Spectrum.** Principal peaks at wavenumbers 768, 1096, 1250, 1288, 1053, 890.

Wavelength

**Mass Spectrum.** Principal peaks at m/z 72, 133, 30, 116, 248, 134, 56, 41.**Quantification.** GAS CHROMATOGRAPHY (CAPILLARY COLUMN). In plasma: sensitivity 500 pg/ml, ECD—M. Guerret, *J. Chromat.*, 1980, 221; *Biomed. Appl.*, 10, 387–392.**HIGH PRESSURE LIQUID CHROMATOGRAPHY.** In plasma: sensitivity 2 ng/ml, fluorescence detection—M. Bangah *et al.*, *J. Chromat.*, 1980, 183; *Biomed. Appl.*, 9, 255–259.**Disposition in the Body.** Well absorbed after oral administration. Metabolised by conjugation with glucuronic acid and sulphate. About 20 to 30% of an oral dose is excreted in the urine in 24 hours as unchanged drug.**THERAPEUTIC CONCENTRATION.**After a single oral dose of 5 mg given to 12 subjects, peak plasma concentrations of 0.02 to 0.08 $\mu\text{g/ml}$ (mean 0.04) were attained in 0.5 to 3 hours (R. Gugler *et al.*, *Eur. J. clin. Pharmac.*, 1974, 7, 17–24).After daily oral dosing of 6 subjects with 5 mg three times a day, a mean steady-state plasma concentration of 0.015 $\mu\text{g/ml}$ was reported (R. Gugler and G. Bodem, *Eur. J. clin. Pharmac.*, 1978, 13, 13–16).**HALF-LIFE.** Plasma half-life, 2 to 4 hours.**VOLUME OF DISTRIBUTION.** About 1 to 2 litres/kg.**CLEARANCE.** Plasma clearance, about 7 ml/min/kg.**DISTRIBUTION IN BLOOD.** Plasma: whole blood ratio, 1.5.**PROTEIN BINDING.** In plasma, 40 to 70%.**NOTE.** For a review of the pharmacokinetics of the beta-blocking agents see G. Johnsson and C.-G. Regårdh, *Clin. Pharmacokinet.*, 1976, 1, 233–263.**Dose.** Up to 45 mg daily.**Pipamperone***Tranquilliser**Synonym.* Floropipamide

1-[3-(4-Fluorobenzoyl)propyl]-4-piperidinopiperidine-4-carboxamide

 $C_{21}H_{30}FN_3O_2 = 375.5$

CAS—1893-33-0

**Pipamperone Hydrochloride**

Proprietary Names. Dipiperon; Piperonil.

$C_{21}H_{30}FN_3O_2 \cdot 2HCl = 448.4$

CAS—2448-68-2

Crystals. M.p. 125° to 126°.

Partition Coefficient. Log *P* (octanol), 2.4.

Thin-layer Chromatography. *System TA*—Rf 56; *system TB*—Rf 01; *system TC*—Rf 12. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. *System GA*—RI 3070.

Ultraviolet Spectrum. Aqueous acid—248 nm ($A_1^1 = 315$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1660, 1685, 1600, 1239, 1157, 1212 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 165, 138, 331, 123, 110, 194, 42, 41.

Dose. The equivalent of 120 to 360 mg of pipamperone daily.

Pipazethate

Cough Suppressant

Synonym. Piperestazine

2 - (2 - Piperidinoethoxy)ethyl pyrido[3,2 - *b*][1,4]benzothiazine-10-carboxylate

$C_{21}H_{25}N_3O_3S = 399.5$

CAS—2167-85-3

**Pipazethate Hydrochloride**

Proprietary Names. Selvigon; Selvigon.

$C_{21}H_{25}N_3O_3S \cdot HCl = 436.0$

CAS—6056-11-7

A white crystalline powder. M.p. about 162°.

Very **soluble** in water; soluble in ethanol and methanol.

Colour Tests. Aromaticity (Method 2)—colourless/yellow; Liebermann's Test—brown (→ red at 100°).

Thin-layer Chromatography. *System TA*—Rf 47; *system TB*—Rf 15; *system TC*—Rf 13. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 2037.

High Pressure Liquid Chromatography. *System HA*— $k' = 5.4$.

Ultraviolet Spectrum. Aqueous acid—251 nm ($A_1^1 = 210$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1717, 1225, 1315, 1300, 1095, 1050 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 98, 111, 99, 199, 41, 288, 200, 55.

Dose. Pipazethate hydrochloride has been given in doses of 60 to 120 mg daily.

Pipenzolate Bromide

Anticholinergic

Synonym. Pipenzolate Methobromide

Proprietary Names. Piper; Piptal. It is an ingredient of Piptalin.

3-Benziloyloxy-1-ethyl-1-methylpiperidinium bromide

$C_{22}H_{28}BrNO_3 = 434.4$

CAS—13473-38-6 (pipenzolate); 125-51-9 (bromide)

A white crystalline powder. M.p. about 180°.

Freely **soluble** in water.

Colour Tests. The following tests are performed on piperzolate nitrate (see p. 128): Mandelin's Test—orange → green; Marquis Test—orange → green → blue.

Thin-layer Chromatography. System *TA*—Rf 04. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—252 nm, 258 nm ($A_1^1 = 11$ a), 262 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1726, 698, 1220, 1160, 763, 1055 (KBr disk).

Mass Spectrum. Principal peaks at m/z 105, 111, 77, 96, 97, 183, 42, 51.

Dose. Usually 20 to 25 mg daily.

Piperacetazine

Tranquilliser

Proprietary Name. Quide

10 - {3 - [4 - (2 - Hydroxyethyl)piperidino]propyl}phenothiazin-2-yl methyl ketone

$C_{24}H_{30}N_2O_2S = 410.6$

CAS—3819-00-9

A yellow granular powder. M.p. 102° to 106°.

Practically **insoluble** in water; soluble 1 in 11 of ethanol, 1 in 1.3 of chloroform, and 1 in 1200 of ether.

Colour Tests. Formaldehyde-Sulphuric Acid—blue-violet; Forest Reagent—red; FPN Reagent—brown-orange; Mandelin's Test—green → red → violet; Marquis Test—red; Sulphuric Acid—yellow → red.

Thin-layer Chromatography. System *TA*—Rf 56; system *TB*—Rf 06; system *TC*—Rf 19. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System *GA*—not eluted.

High Pressure Liquid Chromatography. System *HA*—k' 1.9.

Ultraviolet Spectrum. Aqueous acid—243 nm, 278 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1675, 1222, 1269, 1592, 748, 1560 (KBr disk).

Mass Spectrum. Principal peaks at m/z 142, 170, 44, 410, 42, 143, 43, 41.

Dose. 20 to 160 mg daily.

Piperazine

Anthelmintic

$C_4H_{10}N_2 = 86.14$

CAS—110-85-0

Crystals. M.p. 106°.

Soluble in water and ethanol; practically insoluble in ether.

Piperazine Adipate

Proprietary Names. Divermex; Entacyl; Ismiverm; Vermicompre.

$C_4H_{10}N_2 \cdot C_6H_{10}O_4 = 232.3$

CAS—142-88-1

A white crystalline powder. M.p. about 250°, with decomposition.

Soluble 1 in 18 of water; practically insoluble in ethanol, chloroform, and ether.

Piperazine Calcium Edetate

Synonym. Piperazine Calcium Edathamil

$C_4H_{10}N_2 \cdot C_{10}H_{14}CaN_2O_8 = 416.4$

CAS—12002-30-1

Freely **soluble** in water; very slightly soluble in ethanol and chloroform; practically insoluble in ether.

Piperazine Citrate

Synonym. Hydrus Tripiperazine Dicitrate

Proprietary Names. Antepar; Ascalix; Citrazine; Helmezine (elixir); Pipérol Fort.

($C_4H_{10}N_2$)₃·2 $C_6H_5O_7$ · xH_2O = 642.7 (anhydrous)
 CAS—144-29-6 (anhydrous); 41372-10-5 (hydrate)
 A fine, white, crystalline or granular powder. M.p. about 190°.
Soluble 1 in 1.5 of water; practically insoluble in ethanol and ether.

Piperazine Hydrate

Synonyms. Diethylenediamine; Hexahydropyrazine; Piperazidine.
Proprietary Names. Antelmina; Antepar; Eraverm; Tasnon; Uvilon.

$C_4H_{10}N_2$ · $6H_2O$ = 194.2

CAS—142-63-2

Colourless, glassy, deliquescent crystals. M.p. about 43°.

Soluble 1 in 3 of water and 1 in 1 of ethanol; very slightly soluble in ether.

Piperazine Phosphate

Proprietary Names. Antepar; Helmezine (tablets); Tasnon. It is an ingredient of Pripsen.

$C_4H_{10}N_2$ · H_3PO_4 · H_2O = 202.1

CAS—14538-56-8 (anhydrous); 18534-18-4 (monohydrate)

A white crystalline powder.

Soluble 1 in about 60 of water; practically insoluble in ethanol, chloroform, and ether; soluble in dilute hydrochloric acid.

Dissociation Constant. pK_a 5.7, 9.8 (20°).

Partition Coefficient. Log P (octanol), -1.2.

Colour Test. Simon's Test—blue.

Thin-layer Chromatography. System TA—Rf 05; system TB—Rf 01; system TC—Rf 01. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 813.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1592, 955, 870, 1080, 1055, 1115 (piperazine citrate, KBr disk).

Mass Spectrum. Principal peaks at m/z 44, 100, 41, 60, 29, 27, 30, 86 (piperazine adipate).

Quantification. COLORIMETRY. In urine—S. Hanna and A. Tang, *J. pharm. Sci.*, 1973, 62, 2024–2025.

Disposition in the Body. Readily absorbed after oral administration and excreted in the urine as unchanged drug and metabolites. There is wide variation in the rate of excretion between individuals, 15 to 75% of a dose being excreted in 24 hours.

TOXICITY. Toxic effects are rare and are usually due to accumulation after large doses. Three children had symptoms of toxicity after doses of 6, 9, and 12 g but they subsequently recovered.

Dose. The equivalent of 4 g of piperazine hydrate as a single dose, or 2 g daily for 7 days.

Piperidolate

Anticholinergic

1-Ethyl-3-piperidyl diphenylacetate

$C_{21}H_{25}NO_2$ = 323.4

CAS—82-98-4

A liquid.

Piperidolate Hydrochloride

Proprietary Name. Dactil

$C_{21}H_{25}NO_2$ ·HCl = 359.9

CAS—129-77-1

A white or cream-coloured powder. M.p. 194° to 198°.

Soluble 1 in about 18 of water, 1 in about 52 of ethanol, 1 in about 4 of chloroform, and 1 in about 5 of methanol.

Colour Tests. Liebermann's Test—orange-brown; Mandelin's Test—brown; Marquis Test—orange.

Thin-layer Chromatography. System TA—Rf 69; system TB—Rf 55; system TC—Rf 81. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, yellow.)

Gas Chromatography. System GA—RI 2318; system GF—RI 2660.

High Pressure Liquid Chromatography. System HA— k' 1.7.

Ultraviolet Spectrum. Aqueous acid—252 nm, 258 nm (A_1^1 = 13.4 a), 264 nm. No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1192, 1715, 1163, 1101, 700, 1149 (piperidolate hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 111, 96, 167, 112, 165, 71, 43, 42.

Dose. 200 mg of piperidolate hydrochloride daily.

Piperocaine

Local Anaesthetic

3-(2-Methylpiperidino)propyl benzoate

$C_{16}H_{23}NO_2 = 261.4$

CAS—136-82-3

Piperocaine Hydrochloride

Proprietary Name. Metycaine Hydrochloride

$C_{16}H_{23}NO_2 \cdot HCl = 297.8$

CAS—24561-10-2

Small white crystals or white crystalline powder. M.p. 172° to 175°.

Soluble 1 in 1.5 of water and 1 in 4.5 of ethanol; soluble in chloroform; practically insoluble in ether.

Thin-layer Chromatography. *System TA*—Rf 55; *system TB*—Rf 53; *system TC*—Rf 37; *system TL*—Rf 27. (*Dragendorff spray*, positive; *acidified iodoplatinate solution*, positive.)

Gas Chromatography. *System GA*—RI 1980.

High Pressure Liquid Chromatography. *System HQ*— k' 4.59.

Ultraviolet Spectrum. Aqueous acid—231 nm, 274 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1278, 1703, 711, 1115, 1310, 1040 (piperocaine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 112, 246, 105, 77, 55, 41, 44, 247.

Use. Piperocaine hydrochloride is used in concentrations of 0.5 to 10%.

Pipobroman

Antineoplastic

Proprietary Names. Vercite 25; Vercyte.

1,4-Bis(3-bromopropionyl)piperazine

$C_{10}H_{16}Br_2N_2O_2 = 356.1$

CAS—54-91-1

A white crystalline powder. M.p. 101° to 105°.

Soluble 1 in 230 of water, 1 in 35 of ethanol, 1 in 4.8 of chloroform, and 1 in 530 of ether; soluble in acetone.

Colour Test. Add 2 mg to 2 ml of water and heat to dissolve; add 2 ml of *hydroxylamine hydrochloride solution* and 2 ml of 3M sodium hydroxide, mix, and allow to stand for 30 minutes; acidify with *dilute hydrochloric acid* and add 2 ml of a 9% ferric chloride solution—red-orange.

Thin-layer Chromatography. *System TA*—Rf 66; *system TB*—Rf 02; *system TC*—Rf 58. (*Acidified iodoplatinate solution*, positive.)

Gas Chromatography. *System GA*—RI 1811.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1626, 1219, 1003, 1266, 923, 892 (KBr disk).

Mass Spectrum. Principal peaks at m/z 85, 56, 69, 55, 27, 44, 42, 109.

Dose. Initially 1 to 1.5 mg/kg daily, by mouth; maintenance, 7 to 175 mg daily.

Pipothiazine

Tranquilliser

Synonym. Pipotiazine

Proprietary Name. Piportil

10-{3-[4-(2-Hydroxyethyl)piperidino]propyl}-*NN*-dimethyl-phenothiazine-2-sulphonamide $C_{24}H_{33}N_3O_3S_2 = 475.7$

CAS—39860-99-6

**Pipothiazine Palmitate**

Proprietary Names. Piportil Depot; Piportil L4.

 $C_{40}H_{63}N_3O_4S_2 = 714.1$

CAS—37517-26-3

A pale yellow crystalline powder.

Practically **insoluble** in water; sparingly soluble in ethanol; freely soluble in chloroform and ether.**Ultraviolet Spectrum.** Pipothiazine palmitate: ethanol—265 nm ($A_1^1 = 500$ b), 315 nm.**Infra-red Spectrum.** Principal peaks at wavenumbers 1165, 1735, 710, 745, 1250, 955 (pipothiazine palmitate, solution in carbon tetrachloride-carbon disulphide).**Mass Spectrum.** Principal peaks at m/z 142, 44, 140, 42, 198, 170, 41, 96.**Quantification.** GAS CHROMATOGRAPHY. In plasma: detection limit 10 ng/ml, ECD—S. F. Cooper and Y. D. Lapierre, *J. Chromat.*, 1981, 222; *Biomed. Appl.*, 11, 291–296.HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: sensitivity 250 pg/ml for plasma and 2 ng/ml for urine, fluorescence detection—Y. Le Roux *et al.*, *J. Chromat.*, 1982, 230; *Biomed. Appl.*, 19, 401–408.**Disposition in the Body.** Pipothiazine palmitate is very slowly absorbed from the site of intramuscular injections and gradually releases pipothiazine into the body. After oral administration of pipothiazine, about 1% of a dose is excreted in the urine unchanged in 24 hours.**THERAPEUTIC CONCENTRATION.**Following monthly intramuscular injections of 25 to 112.5 mg to 5 subjects, plasma concentrations of 0.018 to 0.058 μ g/ml (mean 0.038) were reported immediately before a dose (S. F. Cooper and Y. D. Lapierre, *J. Chromat.*, 1981, 222; *Biomed. Appl.*, 11, 291–296).**Dose.** Usually 10 to 20 mg of pipothiazine daily, by mouth. Pipothiazine palmitate is given intramuscularly in doses of 25 to 200 mg, at intervals of about 4 weeks.**Pipoxolan**

Antispasmodic

5,5-Diphenyl-2-(2-piperidinoethyl)-1,3-dioxolan-4-one

 $C_{22}H_{25}NO_3 = 351.4$

CAS—23744-24-3

**Pipoxolan Hydrochloride**

Proprietary Name. Rowaprxin

 $C_{22}H_{25}NO_3 \cdot HCl = 387.9$

CAS—18174-58-8

A white crystalline powder. M.p. 207° to 209°.

Soluble in water.**Colour Tests.** Liebermann's Test—brown; Mandelin's Test—green → brown; Marquis Test—violet → grey; Sulphuric Acid—red.**Thin-layer Chromatography.** System TA—Rf 77; system TB—Rf 53; system TC—Rf 68. (Acidified iodoplatinate solution, positive.)**Infra-red Spectrum.** Principal peaks at wavenumbers 1786, 1176, 1205, 1111, 1149, 698 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 98, 194, 166, 157, 55, 42, 165, 99.**Dose.** Pipoxolan hydrochloride has been given in doses of 20 to 90 mg daily.**Pipradrol**

Central Stimulant

 α -(2-Piperidyl)benzhydrol $C_{18}H_{21}NO = 267.4$

CAS—467-60-7

**Pipradrol Hydrochloride**

Proprietary Name. Detaril

 $C_{18}H_{21}NO \cdot HCl = 303.8$

CAS—71-78-3

Small white crystals or white crystalline powder. M.p. about 290°, with decomposition.

Soluble 1 in 30 of water, 1 in 35 of ethanol, 1 in 1000 of chloroform, and 1 in 8 of methanol; practically insoluble in ether.**Colour Test.** Marquis Test—yellow-orange.**Thin-layer Chromatography.** System TA—Rf 54; system TB—Rf 59; system TC—Rf 38. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, red-brown; ninhydrin spray, positive.)**Gas Chromatography.** System GA—RI 2145; system GB—RI 2215; system GC—RI 2478.**High Pressure Liquid Chromatography.** System HA— k' 1.2; system HC— k' 0.69.**Ultraviolet Spectrum.** Aqueous acid—252 nm, 258 nm ($A_1^1 = 17$ a). No alkaline shift. (See below)**Infra-red Spectrum.** Principal peaks at wavenumbers 701, 740, 690, 1585, 1300, 1065 (pipradrol hydrochloride, KBr disk).**Mass Spectrum.** Principal peaks at m/z 84, 56, 85, 77, 105, 55, 30, 42.**Dose.** Pipradrol hydrochloride has been given in doses of 2 to 6 mg daily.

**Pirenzepine***Treatment of Gastric Ulcers*

5,11 - Dihydro - 11 - (4 - methylpiperazin - 1 - ylacetyl)pyrido[2,3-*b*][1,4]benzodiazepin-6-one
 $C_{19}H_{21}N_5O_2 = 351.4$
 CAS—28797-61-7

**Pirenzepine Hydrochloride***Proprietary Name.* Gastrozepin $C_{19}H_{21}N_5O_2 \cdot 2HCl = 424.3$

CAS—29868-97-1

A white crystalline powder. M.p. 248° to 253°, with decomposition.
 Freely **soluble** in water; practically insoluble in ether; very slightly soluble in methanol.

Dissociation Constant. pK_a 2.1, 8.1.**High Pressure Liquid Chromatography.** *System HA*— k' 2.7.

Ultraviolet Spectrum. Aqueous acid—280 nm ($A_1^1 = 237$ a); aqueous alkali—297 nm ($A_1^1 = 282$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1665, 1703, 1318, 1300, 1278, 1593 (pirenzepine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 113, 70, 42, 211, 351, 43, 71, 56.

Disposition in the Body. Incompletely absorbed after oral administration; bioavailability about 20 to 30%. Excreted in the urine and faeces largely as unchanged drug with less than 10% of a dose as the desmethyl metabolite.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 50 mg to 87 subjects, a mean peak plasma concentration of 0.05 $\mu g/ml$ was attained in 2 hours (G. Bozler and R. Hammer, *Scand. J. Gastroenterol.*, 1980, 15, Suppl. 66, 27–33).

HALF-LIFE. Plasma half-life, about 11 hours.**CLEARANCE.** Plasma clearance, about 3.5 ml/min/kg.**PROTEIN BINDING.** In plasma, about 10%.**Dose.** 100 to 150 mg of pirenzepine hydrochloride daily.**Piritramide***Narcotic Analgesic**Synonym.* Pirinitramide*Proprietary Names.* Dipidolor; Piridolan.

1 - (3 - Cyano - 3,3 - diphenylpropyl) - 4 - piperidinopiperidine - 4 - carboxamide

 $C_{27}H_{34}N_4O = 430.6$

CAS—302-41-0

A crystalline powder. M.p. 149° to 150°.

Soluble in dilute acetic acid.

Thin-layer Chromatography. *System TA*—Rf 70; *system TB*—Rf 01; *system TC*—Rf 45. (*Dragendorff spray*, positive; *acidified iodoplatinate solution*, positive; *Marquis reagent*, orange; *ninhydrin spray*, positive.)

High Pressure Liquid Chromatography. *System HA*— k' 0.6; *system HC*— k' 0.14.

Infra-red Spectrum. Principal peaks at wavenumbers 1669, 701, 757, 1087, 1190, 1592 (KBr disk).

Mass Spectrum. Principal peaks at m/z 386, 138, 387, 84, 110, 42, 301, 263.

Dose. 20 mg by intramuscular injection.

Piroxicam*Analgesic**Proprietary Name.* Feldene4-Hydroxy-2-methyl-*N*-(2-pyridyl)-2*H*-1,2-benzothiazine-3-carboxamide 1,1-dioxide $C_{15}H_{13}N_3O_4S = 331.3$

CAS—36322-90-4

Crystals. M.p. 198° to 200°.

Colour Tests. Koppanyi–Zwikker Test (omit pyrrolidine)—orange; Liebermann's Test—yellow.**Thin-layer Chromatography.** *System TD*—Rf 51; *system TE*—Rf 17; *system TF*—Rf 46.**High Pressure Liquid Chromatography.** *System HD*—*k'* 0.6; *system HW*—*k'* 7.7.**Infra-red Spectrum.** Principal peaks at wavenumbers 1524, 1180, 1298, 1147, 1573, 770.**Mass Spectrum.** Principal peaks at *m/z* 173, 117, 145, 78, 104, 94, 76, 147.**Quantification.** HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: sensitivity 500 ng/ml, UV detection—A. D. Fraser and J. F. L. Woodbury, *Ther. Drug Monit.*, 1983, 5, 239–242.**Disposition in the Body.** Readily absorbed after oral or rectal administration. It is extensively metabolised to inactive metabolites; the major metabolite is produced by hydroxylation of the pyridyl ring and exists free and conjugated with glucuronic acid. About 10% of an oral dose is excreted in the urine as unchanged drug in 8 days.**THERAPEUTIC CONCENTRATION.** Piroxicam accumulates on repeated administration; steady-state plasma concentrations are attained after approximately 7 days.Following oral administration of 40 mg to 20 subjects, peak plasma concentrations of 1.7 to 6.8 µg/ml (mean 4.3) were reported; multiple peak concentrations were observed in 16 subjects, suggesting possible enterohepatic circulation. After daily oral administration of 10, 20, and 30 mg to 5 subjects for 14 days, maximum steady-state plasma concentrations of 2.1 to 4.3 (mean 3.2), 3.6 to 6.5 (mean 4.5), and 9.0 to 16.5 (mean 11.7) µg/ml were reported (D. C. Hobbs and T. M. Twomey, *J. clin. Pharmacol.*, 1979, 19, 270–281).**HALF-LIFE.** Plasma half-life, about 30 to 60 hours, increased in elderly subjects.**VOLUME OF DISTRIBUTION.** About 0.1 litre/kg.**CLEARANCE.** Plasma clearance, about 0.03 ml/min/kg.**PROTEIN BINDING.** In plasma, about 99%.**NOTE.** For a review of the pharmacokinetics of piroxicam see R. N. Brogden *et al.*, *Drugs*, 1984, 28, 292–323.**Dose.** Usually 20 mg daily; doses of 40 mg daily may be given for 7 days.**Pivampicillin***Antibiotic**Proprietary Names.* Pondocil; Pondocillin.Pivaloyloxymethyl (6*R*)-6-(α -D-phenylglycylamino)penicillanate $C_{22}H_{29}N_3O_6S = 463.5$

CAS—33817-20-8

**Pivampicillin Hydrochloride***Proprietary Name.* Maxifen $C_{22}H_{29}N_3O_6S \cdot HCl = 500.0$

CAS—26309-95-5

A white, hygroscopic, crystalline powder.

Soluble 1 in 2 of water and 1 in 1.5 of chloroform; very slightly soluble in ether.**Dissociation Constant.** pK_a 7.0.**Ultraviolet Spectrum.** Aqueous acid—256 nm, 261 nm, 268 nm; aqueous alkali—257 nm, 311 nm.**Infra-red Spectrum.** Principal peaks at wavenumbers 1760, 1742, 1104, 1683, 972, 1150 (KBr disk).**Dose.** 1 to 2 g daily.**Pizotifen***Migraine Prophylactic**Synonym.* Pizotyline9,10-Dihydro-4-(1-methyl-4-piperidylidene)-4*H*-benzo[4,5]cyclohepta[1,2-*b*]thiophene $C_{19}H_{21}NS = 295.4$

CAS—15574-96-6

A white to yellow crystalline powder. M.p. 261° to 263° , with decomposition.

Soluble in dilute acetic acid and in chloroform:methanol (1:1).

Pizotifen Malate

Proprietary Names. Mosegor; Sandomigran; Sanmigran; Sanomigran.

$C_{19}H_{21}NS, C_4H_6O_5 = 429.5$

CAS—5189-11-7

Crystals. M.p. 185° to 186° , with decomposition.

Dissociation Constant. pK_a 7.0.

Colour Tests. Liebermann's Test—black; Mandelin's Test—violet \rightarrow green; Marquis Test—orange \rightarrow red; Sulphuric Acid—orange-yellow \rightarrow violet.

Thin-layer Chromatography. *System TA—Rf* 48. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA—RI* 2375.

High Pressure Liquid Chromatography. *System HA—k'* 3.4.

Infra-red Spectrum. Principal peaks at wavenumbers 1577, 756, 1212, 1703, 1124, 1274 (KBr disk).

Disposition in the Body. Absorbed after oral administration. Peak blood concentrations of total radioactivity were attained in 5 to 7 hours after a single oral dose of 1 mg of 3H -pizotifen. About 62% of a dose is excreted in the urine and 24% is eliminated in the faeces in 120 hours, with about 36% of the dose being excreted in the first 24 hours.

HALF-LIFE. Derived from urinary excretion data (total radioactivity), about 26 hours.

REFERENCE. T. M. Speight and S. Avery, *Drugs*, 1972, 3, 159–203.

Dose. The equivalent of 0.5 to 6 mg of pizotifen daily.

Poldine Methylsulphate

Anticholinergic

Synonym. Poldine Methosulphate

Proprietary Names. Nactate; Nacton.

2 - Benziloyloxymethyl - 1,1 - dimethylpyrrolidinium methylsulphate

$C_{21}H_{26}NO_3, CH_3SO_4 = 451.5$

CAS—596-50-9 (poldine); 545-80-2 (methylsulphate)

A white to creamy-white crystalline powder. M.p. 134° to 142° .

Soluble 1 in 1 of water, 1 in 20 of ethanol, and 1 in 1000 of chloroform; practically insoluble in ether.

Colour Tests. Mandelin's Test—orange \rightarrow green \rightarrow violet; Marquis Test—orange \rightarrow green \rightarrow blue.

Thin-layer Chromatography. *System TA—Rf* 02. (Acidified iodoplatinate solution, positive.)

High Pressure Liquid Chromatography. *System HA—k'* 3.3 (tailing peak).

Ultraviolet Spectrum. Aqueous acid—252 nm, 258 nm ($A_1^{1\%} = 10.5$ a). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1222, 701, 1061, 1008, 765, 1751 (KBr disk).

Dose. 8 to 16 mg daily.

Polythiazide*Diuretic**Proprietary Names.* Drenasil; Nephрил; Renese.

6-Chloro-3,4-dihydro-2-methyl-3-(2,2,2-trifluoroethylthio-methyl)-2H-1,2,4-benzothiadiazine-7-sulphonamide 1,1-dioxide

 $C_{11}H_{13}ClF_3N_3O_4S_3 = 439.9$

CAS—346-18-9

A white crystalline powder. M.p. 207° to 217°, with decomposition.

Practically **insoluble** in water and chloroform; soluble 1 in 40 of ethanol; soluble in acetone and methanol.**Colour Tests.** Koppanyi-Zwicker Test—violet; Liebermann's Test—red-brown; Palladium Chloride—orange; Sulphuric Acid—orange.**Thin-layer Chromatography.** *System TD*—Rf 22; *system TE*—Rf 63; *system TF*—Rf 60.**Gas Chromatography.** *System GA*—RI 2380.**High Pressure Liquid Chromatography.** *System HN*—k' 15.09.**Ultraviolet Spectrum.** Methanol—268 nm ($A_1^1 = 500$ a), 317 nm.**Infra-red Spectrum.** Principal peaks at wavenumbers 1162, 1120, 1597, 1071, 1240, 1500 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 310, 206, 42, 64, 312, 299, 45, 48.**Quantification.** GAS CHROMATOGRAPHY. In plasma: sensitivity 200 pg/ml, ECD—D. C. Hobbs and T. M. Twomey, *Clin. Pharmac. Ther.*, 1978, 23, 241–246.**Disposition in the Body.** Well absorbed after oral administration. About 20% of a single oral dose is excreted in the urine as unchanged drug in 48 hours.**THERAPEUTIC CONCENTRATION.**After a single oral dose of 1 mg to 18 subjects, peak plasma concentrations of 0.002 to 0.007 µg/ml (mean 0.004) were attained in 5 to 12 hours (D. C. Hobbs and T. M. Twomey, *ibid.*).**HALF-LIFE.** Plasma half-life, about 26 hours.**PROTEIN BINDING.** In plasma, about 80 to 85%.**Dose.** 1 to 4 mg daily.**Practolol***Beta-adrenoceptor Blocking Agent**Proprietary Name.* Eraldin

(±)-4'-(2-Hydroxy-3-isopropylaminopropoxy)acetanilide

 $C_{14}H_{22}N_2O_3 = 266.3$

CAS—6673-35-4; 23313-50-0 (±)

A fine, white powder. M.p. 141° to 144°.

Soluble 1 in 400 of water, 1 in 40 of ethanol, and 1 in 200 of chloroform; very soluble in dilute solutions of acetic acid.**Dissociation Constant.** pK_a 9.5 (20°).**Partition Coefficient.** Log P (octanol/pH 8.0), −1.3.**Colour Test.** Liebermann's Test—black.**Thin-layer Chromatography.** *System TA*—Rf 45; *system TB*—Rf 00; *system TC*—Rf 01. (Acidified potassium permanganate solution, positive.)**Gas Chromatography.** *System GA*—not eluted.**High Pressure Liquid Chromatography.** *System HA*—k' 0.5.**Ultraviolet Spectrum.** Aqueous acid—243 nm ($A_1^1 = 467$ a); methanol—248 nm ($A_1^1 = 620$ a). (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 1642, 1497, 1234, 1515, 822, 1019 (KBr disk).

Mass Spectrum. Principal peaks at m/z 72, 30, 151, 43, 109, 56, 57, 108.

Quantification. SPECTROFLUORIMETRY. In blood or urine: sensitivity 200 ng/ml—G. Bodem and C. A. Chidsey, *Clin. Chem.*, 1972, 18, 363–365.

GAS CHROMATOGRAPHY. In plasma or urine: sensitivity 10 ng/ml, ECD—J. P. Desager and C. Harvengt, *J. Pharm. Pharmacol.*, 1975, 27, 52–54.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: detection limit 30 ng/ml, UV detection—A. C. Mehta and R. T. Calvert, *J. Chromat.*, 1983, 276; *Biomed. Appl.*, 27, 208–212.

Disposition in the Body. Completely absorbed after oral administration and almost entirely excreted in the urine as unchanged drug. Up to about 70% of a dose is excreted in the urine in 24 hours.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 200 mg to 13 subjects, a mean peak plasma concentration of 1.3 µg/ml was attained in 2 hours (C. M. Castleden *et al.*, *Br. J. clin. Pharmacol.*, 1975, 2, 303–306).

Daily oral doses of 200 mg, 400 mg, and 800 mg to 8 subjects produced mean steady-state serum concentrations of 1.6, 2.9, and 4.5 µg/ml, respectively (E. L. Alderman *et al.*, *Clin. Pharmacol. Ther.*, 1973, 14, 175–181).

HALF-LIFE. Plasma half-life, 10 to 13 hours.

VOLUME OF DISTRIBUTION. About 1.6 litres/kg.

CLEARANCE. Plasma clearance, about 2 ml/min/kg.

PROTEIN BINDING. In plasma, less than 10%.

Dose. Practolol has been given in doses of 0.2 to 1.2 g daily.

Prajmalium Bitartrate

Anti-arrhythmic

Synonym. NPAB

Proprietary Names. Neo Aritmina; Neo-Gilurytmal.

N-Propylajmalinium hydrogen tartrate

$C_{23}H_{33}N_2O_2 \cdot C_4H_5O_6 = 518.6$

CAS—35080-11-6 (prajmalium); 2589-47-1 (bitartrate)

A white to pale yellow powder. M.p. about 133°, with decomposition.

Soluble in water; readily soluble in ethanol, glacial acetic acid, and dilute mineral acids; moderately soluble in chloroform; practically insoluble in ether.

Colour Tests. Liebermann's Test—red; Mandelin's Test—red.

Thin-layer Chromatography. System TA—Rf 59. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 2925.

High Pressure Liquid Chromatography. System HA—k' 2.2 (tailing peak).

Ultraviolet Spectrum. Aqueous acid—246 nm, 290 nm.

Quantification. GAS CHROMATOGRAPHY. In plasma: detection limit 5 ng/ml, AFID—M. Thoma *et al.*, *Arzneimittel-Forsch.*, 1981, 31, 1020–1021.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: detection limit about 5 ng/ml, fluorescence detection—I. Grundevik and B. A. Persson, *J. liq. Chromat.*, 1982, 5, 141–150.

Disposition in the Body.**THERAPEUTIC CONCENTRATION.**

Following oral administration of 20 mg four times a day to 8 subjects, steady-state plasma concentrations of 0.08 to 0.55 µg/ml (mean 0.2) were reported (A. T. Trompler *et al.*, *Arzneimittel-Forsch.*, 1983, 33, 436-439).

HALF-LIFE. Plasma half-life, about 7 hours.

Dose. 20 to 40 mg daily.

Pralidoxime Chloride

Cholinesterase Reactivator

Synonyms. 2-PAM Chloride; 2-PAMCl; Pyraloxime Chloride; 2-Pyridine Aldoxime Methochloride.

Proprietary Name. Protopam Chloride

2-Hydroxyiminomethyl-1-methylpyridinium chloride

$C_7H_9ClN_2O = 172.6$

CAS—6735-59-7 (pralidoxime); 51-15-0 (chloride)

A white or pale yellow crystalline powder. M.p. 215° to 225°, with decomposition.

Soluble 1 in less than 2 of water and 1 in 100 of ethanol.

Pralidoxime Iodide

Synonyms. PAM; P-2-AM; 2-PAM Iodide; 2-PAMI; Pamium; Pyraloxime Iodide; 2-Pyridine Aldoxime Methiodide.

$C_7H_9IN_2O = 264.1$

CAS—94-63-3

A yellow, hygroscopic, crystalline powder. M.p. about 220°, with decomposition.

Soluble 1 in 20 of water; practically insoluble in ethanol, chloroform, and ether. Aqueous solutions are unstable.

Pralidoxime Mesylate

Synonyms. 2-PAMM; Pralidoxime Methanesulphonate; P2S; 2-Pyridine Aldoxime Methyl Mesylate.

$C_8H_{12}N_2O_4S = 232.3$

CAS—154-97-2

A colourless or white, hygroscopic, crystalline or granular powder. M.p. 155°.

Soluble 1 in 2 of water and 1 in 12 of ethanol; practically insoluble in chloroform and ether.

Pralidoxime Methylsulphate

Proprietary Name. Contrathion

$C_8H_{12}N_2O_5S = 248.3$

CAS—1200-55-1

A white crystalline powder. M.p. about 111°.

Very **soluble** in water; slightly soluble in chloroform.

Dissociation Constant. pK_a 8.0 (20°).

Thin-layer Chromatography. *System TA*—Rf 05. (*Acidified iodoplatinate solution*, positive.)

Ultraviolet Spectrum. Aqueous acid—242 nm, 292 nm; aqueous alkali—332 nm, inflexion at 280 nm.

Disposition in the Body. Pralidoxime chloride is slowly absorbed from the gastro-intestinal tract; the mesylate is more readily absorbed. After intravenous administration as the chloride, about 86% of a dose is excreted in the urine in 24 hours, mostly

in the first 3 hours. After oral administration as the mesylate, about 30% of a dose is excreted in the 24-hour urine. 1-Methyl-2-cyanopyridinium ion has been detected in urine as a metabolite.

HALF-LIFE. Plasma half-life, about 1 hour.

VOLUME OF DISTRIBUTION. About 0.6 litre/kg.

CLEARANCE. Plasma clearance, about 7 ml/min/kg.

PROTEIN BINDING. In plasma, not significantly bound.

REFERENCE. J. Josselson and F. R. Sidell, *Clin. Pharmac. Ther.*, 1978, 24, 95-100.

Dose. 1 to 2 g of pralidoxime chloride parenterally, repeated if necessary; up to 15 g daily, by mouth.

Pramoxine

Local Anaesthetic

Synonym. Pramocaine

4-[3-(4-Butoxyphenoxy)propyl]morpholine

$C_{17}H_{27}NO_3 = 293.4$

CAS—140-65-8

**Pramoxine Hydrochloride**

Proprietary Names. Proctofoam/non steroid; Tronothane.

$C_{17}H_{27}NO_3 \cdot HCl = 329.9$

CAS—637-58-1

A white crystalline powder. M.p. 170° to 174°.

Freely **soluble** in water and ethanol; soluble 1 in 35 of chloroform; very slightly soluble in ether.

Colour Test. Marquis Test—yellow → green.

Thin-layer Chromatography. *System TA*—Rf 70; *system TB*—Rf 43; *system TC*—Rf 55; *system TL*—Rf 41. (*Dragendorff spray*, positive; *acidified iodoplatinate solution*, positive; *Marquis reagent*, green.)

Gas Chromatography. *System GA*—RI 2281; *system GF*—RI 2600.

High Pressure Liquid Chromatography. *System HA*— k' 0.6; *system HR*— k' 2.48.

Ultraviolet Spectrum. Aqueous acid—286 nm ($A_1^1 = 80$ c). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1510, 1230, 1118, 1210, 824, 1635 (KBr disk).

Mass Spectrum. Principal peaks at m/z 100, 128, 70, 41, 42, 293, 56, 101.

Use. Pramoxine hydrochloride is used as a 1% cream or jelly.

Prazepam

Tranquilliser

Proprietary Names. Centrax; Demetrin; Lysanxia; Prazene.

7-Chloro-1-(cyclopropylmethyl)-1,3-dihydro-5-phenyl-2H-1,4-benzodiazepin-2-one

$C_{19}H_{17}ClN_2O = 324.8$

CAS—2955-38-6

A white crystalline powder. M.p. 143° to 148°.

Soluble in ethanol, chloroform, and dilute mineral acids.

Dissociation Constant. pK_a 2.7.

Partition Coefficient. Log P (octanol/pH 7.4), 3.7.

Colour Test. Formaldehyde-Sulphuric Acid—orange.

Thin-layer Chromatography. System *TA*—Rf 65; system *TB*—Rf 36; system *TC*—Rf 74; system *TD*—Rf 64; system *TE*—Rf 81; system *TF*—Rf 55. (Acidified iodoplatinate solution, positive; acidified potassium permanganate solution, positive.)

Gas Chromatography. System *GA*—prazepam RI 2641, desmethyldiazepam RI 2496, 3-hydroxyprazepam RI 2860, oxazepam RI 2336; system *GG*—prazepam RI 3145, oxazepam RI 2803.

High Pressure Liquid Chromatography. System *HJ*— k' 4.60; system *HK*—prazepam k' 2.19, desmethyldiazepam k' 1.99, oxazepam k' 0.73.

Ultraviolet Spectrum. Aqueous acid—240 nm ($A_1^1 = 1760$ a), 285 nm, 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1667, 1316, 740, 694, 1602, 704 (KBr disk).

Mass Spectrum. Principal peaks at m/z 91, 269, 324, 55, 296, 295, 323, 297; desmethyldiazepam 242, 269, 270, 241, 243, 271, 244, 272; 3-hydroxyprazepam 257, 55, 311, 77, 259, 313, 44, 312; oxazepam 257, 77, 268, 239, 205, 267, 233, 259.

Quantification. GAS CHROMATOGRAPHY. In serum: prazepam, desmethyldiazepam, 3-hydroxyprazepam and oxazepam, sensitivity 1 ng/ml, ECD—H. Nau *et al.*, *J. Chromat.*, 1978, 146; *Biomed. Appl.*, 3, 227–239.

Disposition in the Body. Slowly and variably absorbed after oral administration. Desmethyldiazepam (nordazepam) is the major metabolite found in plasma and accounts for most of the activity. Prazepam is excreted in the urine mainly as glucuronide conjugates of oxazepam and 3-hydroxyprazepam with only trace amounts of desmethyldiazepam or unchanged drug. Up to about 20% of a dose is excreted in the urine in 24 hours and about 60% over a period of 7 days; about 7% of a dose is eliminated in the faeces in 48 hours.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 30 mg to 10 subjects, peak plasma concentrations of 0.19 to 0.40 $\mu\text{g/ml}$ (mean 0.3) of desmethyldiazepam were reported in 2 to 8 hours; a second peak plasma concentration was reported for each subject. Following oral administration of 20 mg three times a day for 3 days to 5 subjects, plasma concentrations averaged 0.8 $\mu\text{g/ml}$ 12 hours after the final dose (R. R. Brodie *et al.*, *Biopharm. Drug Disp.*, 1981, 2, 59–68).

HALF-LIFE. Plasma half-life, desmethyldiazepam about 40 to 100 hours but there is considerable intersubject variation—see under Nordazepam.

VOLUME OF DISTRIBUTION. Desmethyldiazepam, 0.5 to 2.5 litres/kg, increased in elderly subjects.

CLEARANCE. Plasma clearance, desmethyldiazepam about 0.1 to 0.3 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, desmethyldiazepam about 1.7.

PROTEIN BINDING. In plasma, desmethyldiazepam about 97%.

Dose. 10 to 60 mg daily.

Prazosin

Antihypertensive

Synonym. Furazosin

1 - (4 - Amino - 6,7 - dimethoxyquinazolin - 2 - yl) - 4 - (2 - furoyl)piperazine

$\text{C}_{19}\text{H}_{21}\text{N}_5\text{O}_4 = 383.4$

CAS—19216-56-9

Crystals. M.p. 278° to 280°.

Prazosin Hydrochloride

Proprietary Names. Hypovase; Minipress; Peripress.

$C_{19}H_{21}N_5O_4 \cdot HCl = 419.9$

CAS—19237-84-4

A white to tan-coloured powder. M.p. about 264°, with decomposition.

Dissociation Constant. pK_a 6.5.

Colour Test. Liebermann's Test—brown-pink (→ red-orange at 100°).

Thin-layer Chromatography. *System TA*—Rf 60; *system TB*—Rf 01; *system TC*—Rf 47.

High Pressure Liquid Chromatography. *System HA*— k' 0.8.

Ultraviolet Spectrum. Aqueous acid—247 nm ($A_1^1 = 1470$ b), 331 nm ($A_1^1 = 281$ b); aqueous alkali—252 nm ($A_1^1 = 1642$ b), 345 nm ($A_1^1 = 150$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1603, 1643, 1293, 1125, 1252, 1540 (prazosin hydrochloride).

Mass Spectrum. Principal peaks at m/z 233, 383, 259, 245, 95, 56, 246, 234.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma, blood or urine: sensitivity 1 ng/ml, fluorescence detection—E. T. Lin *et al.*, *J. Chromat.*, 1980, 183; *Biomed. Appl.*, 9, 367–371. In plasma: sensitivity 500 pg/ml, fluorescence detection—P. A. Reece, *J. Chromat.*, 1980, 221; *Biomed. Appl.*, 10, 188–192.

Disposition in the Body. Readily absorbed after oral administration; bioavailability about 60%. Extensively metabolised by 6-*O*- and 7-*O*-demethylation and glucuronic acid conjugation; less than 5% of a dose is excreted in the urine as unchanged drug in 24 hours.

THERAPEUTIC CONCENTRATION.

After single oral doses of 0.5 mg and 1.5 mg given to 5 subjects, peak plasma concentrations of 0.001 to 0.005 µg/ml (mean 0.003) and 0.004 to 0.009 µg/ml (mean 0.006), respectively, were attained in 1 to 3 hours (M. K. Dynon *et al.*, *Clin. Pharmacokinet.*, 1980, 5, 583–590).

Following oral administration of 0.5 mg three times a day to 8 subjects, mean steady-state plasma concentrations of 0.001 to 0.007 µg/ml (mean 0.003) were reported; after dosing with 2 mg three times a day in 7 subjects, mean steady-state plasma concentrations were 0.008 to 0.019 µg/ml (mean 0.013) (A. Grahnén *et al.*, *Clin. Pharmac. Ther.*, 1981, 30, 439–446).

HALF-LIFE. Plasma half-life, about 3 hours.

VOLUME OF DISTRIBUTION. About 0.6 litre/kg.

CLEARANCE. Plasma clearance, about 3 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 1.4.

PROTEIN BINDING. In plasma, about 95%.

NOTE. For a review of the pharmacokinetics of prazosin see P. Jaillon, *Clin. Pharmacokinet.*, 1980, 5, 365–376.

Dose. 0.5 to 20 mg of prazosin hydrochloride daily.

Prednisolone

Corticosteroid

Synonyms. 1,2-Dehydrohydrocortisone; Deltahydrocortisone; Metacortandralone.

Proprietary Names. Codelcortone; Delta Phoricol; Delta-Cortef; Deltacortril; Deltalone; Deltastab (tablets); Marsolone; Meti-Derm; Precortisyl; Prednis; Ropredlone; Sterane; Ulacort. It is an ingredient of Anacal and Hydromycin-D.

11β,17α,21-Trihydroxypregna-1,4-diene-3,20-dione

$C_{21}H_{28}O_5 = 360.4$

CAS—50-24-8 (anhydrous); 52438-85-4 (sesquihydrate)

A white, hygroscopic, crystalline powder. M.p. about 230° to 235°, with decomposition.

Soluble 1 in 1300 of water, 1 in 30 of ethanol, 1 in 27 of dehydrated alcohol, and 1 in 180 of chloroform; soluble in dioxan and methanol.

Prednisolone Acetate

Synonym. Prednisolone 21-Acetate

Proprietary Names. Deltastab (injection); Econopred; Meticortelone Aqueous; Pred Forte; Pred Mild; Savacort; Ultracortol. It is an ingredient of Mydrapred.

$C_{23}H_{30}O_6 = 402.5$

CAS—52-21-1

A white crystalline powder. M.p. about 235°, with decomposition.

Practically **insoluble** in water; soluble 1 in 120 of ethanol, 1 in 170 of dehydrated alcohol, and 1 in 150 of chloroform.

Prednisolone Pivalate

Synonyms. Prednisolone 21-Pivalate; Prednisolone Trimethylacetate.

Proprietary Name. Ultracortol

$C_{26}H_{36}O_6 = 444.6$

CAS—1107-99-9

A white crystalline powder. M.p. about 229°.

Practically **insoluble** in water; soluble 1 in 150 of ethanol and 1 in 16 of chloroform.

Prednisolone Sodium Phosphate

Synonym. Prednisolone 21-(Disodium Phosphate)

Proprietary Names. Codelsol; Hydeltasol; Inflamase; Metreton; Prednesol; Predsol; PSP-IV; Savacort-S; Sodasone.

$C_{21}H_{27}Na_2O_8P = 484.4$

CAS—125-02-0

A white or slightly yellow, hygroscopic powder or granules.

Soluble 1 in 3 or 1 in 4 of water, 1 in 1000 of dehydrated alcohol, and 1 in 13 of methanol; practically insoluble in chloroform.

Prednisolone Stearate

Synonym. Prednisolone 21-Stearoylglycolate

Proprietary Name. Sintisone

$C_{41}H_{64}O_8 = 685.0$

CAS—5060-55-9

A white powder. M.p. about 105°.

Soluble in ethanol, acetone, and methanol.

Prednisolone Succinate

Synonym. Prednisolone 21-Hydrogen Succinate

Proprietary Name. Solu-Dacortin (sodium salt)

$C_{25}H_{32}O_8 = 460.5$

CAS—2920-86-7; 1715-33-9 (sodium salt)

A fine creamy-white powder with friable lumps. M.p. about 205°, with decomposition.

Very slightly **soluble** in water; soluble 1 in about 6 of ethanol and 1 in about 250 of ether; soluble in acetone; very slightly soluble in chloroform.

Prednisolone Tebutate

Synonyms. Prednisolone Butylacetate; Prednisolone 21-(3,3-Dimethylbutyrate); Prednisolone Tertiary-butylacetate.

Proprietary Names. Codelcortone TBA; Hydeltre-TBA.

$C_{27}H_{38}O_6 \cdot H_2O = 476.6$

CAS—7681-14-3 (anhydrous)

A white to slightly yellow, hygroscopic powder.

Very slightly **soluble** in water; sparingly soluble in ethanol; soluble in acetone; freely soluble in chloroform and dioxan.

Colour Tests. Naphthol-Sulphuric Acid—brown/brown; Sulphuric Acid—orange-pink.

Thin-layer Chromatography. Prednisolone: *system TP*—Rf 20; *system TQ*—Rf 00; *system TR*—Rf 02, streaking may occur; *system TS*—Rf 00. (DPST solution.) Prednisolone pivalate: *system TP*—Rf 69; *system TQ*—Rf 04; *system TR*—Rf 44; *system TS*—Rf 00. (DPST solution.) Prednisolone sodium phosphate: *system TP*—Rf 00; *system TQ*—Rf 00; *system TR*—Rf 00; *system TS*—Rf 00.

High Pressure Liquid Chromatography. *System HT*—k' 8.4.

Ultraviolet Spectrum. Ethanol—240 nm ($A_1^1 = 415$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1654, 1612, 1708, 887, 1112, 1085 (KBr disk).

Mass Spectrum. Principal peaks at m/z 121, 122, 91, 147, 225, 43, 135, 120.

Quantification. GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In plasma: prednisolone and prednisone—S. B. Matin and B. Amos, *J. pharm. Sci.*, 1978, 67, 923–926.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 10 ng/ml, UV detection—R. Hartley and J. T. Brocklebank, *J. Chromat.*, 1982, 232; *Biomed. Appl.*, 21, 406–412. In plasma, saliva, or urine: prednisolone, prednisone and hydrocortisone, sensitivity 5 ng/ml, UV detection—J. Q. Rose and W. J. Jusko, *J. Chromat.*, 1979, 162; *Biomed. Appl.*, 4, 273–280.

RADIOIMMUNOASSAY. In serum: sensitivity 10 ng/ml—A. Olivesi *et al.*, *Clin. Chem.*, 1983, 29, 1358–1362.

Dose. Usually 5 to 60 mg of prednisolone daily.

**Prednisone**

Corticosteroid

Synonyms. 1,2-Dehydrocortisone; Deltacortisone; Deltadehydrocortisone; Metacortandracin.

Proprietary Names. Colisone; Decortisyl; Deltacortone; Delta-Dome; Deltasone; Econosone; Lisacort; Marsone; Meticorten; Orasone; Paracort; Prednicen-M; Servisone; Sterapred; Winpred.

17 α ,21-Dihydroxypregna-1,4-diene-3,11,20-trione

$C_{21}H_{26}O_5 = 358.4$

CAS—53-03-2

A white crystalline powder. M.p. about 230°, with decomposition.

Practically **insoluble** in water; soluble 1 in about 190 of ethanol, 1 in 300 of dehydrated alcohol, and 1 in 200 of chloroform.

Prednisone Acetate

Synonym. Prednisone 21-Acetate

$C_{23}H_{28}O_6 = 400.5$

CAS—125-10-0

A white crystalline powder. M.p. about 240°, with decomposition.

Practically **insoluble** in water; soluble 1 in 120 of ethanol, 1 in 160 of dehydrated alcohol, and 1 in 6 of chloroform.

Colour Tests. Naphthol-Sulphuric Acid—brown/orange; Sulphuric Acid—yellow (green fluorescence under ultraviolet light).

Thin-layer Chromatography. *System TP*—Rf 41; *system TQ*—Rf 00; *system TR*—Rf 10; *system TS*—Rf 00. (DPST solution.)

High Pressure Liquid Chromatography. *System HT*—k' 3.4.

Ultraviolet Spectrum. Ethanol—240 nm ($A_1^1 = 420$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1668, 1707, 904, 1622, 1610, 1246 (KBr disk).

Dose. Usually 5 to 60 mg daily.

Prenalterol

Sympathomimetic

(-)-(S)-1-(4-Hydroxyphenoxy)-3-isopropylaminopropan-2-ol

$C_{12}H_{19}NO_3 = 225.3$

CAS—57526-81-5

Prenalterol Hydrochloride

Proprietary Names. Hyprenan; Varbian.

$C_{12}H_{19}NO_3 \cdot HCl = 261.7$

CAS—61260-05-7

A white crystalline powder. M.p. about 128°.

Freely **soluble** in water and ethanol; slightly soluble in acetone; very slightly soluble in ether.

Dissociation Constant. pK_a 9.5 (ammonium ion), 10.0 (phenol).

Thin-layer Chromatography. *System TA*—Rf 47; *system TB*—Rf 01; *system TC*—Rf 09; *system TD*—Rf 02; *system TE*—Rf 25; *system TF*—Rf 02. (Dragendorff spray, positive; ferric chloride solution, violet; acidified iodoplatinate solution, positive; Marquis reagent, green → black; acidified potassium permanganate solution, positive.)

Gas Chromatography. *System GA*—RI 1933.

Ultraviolet Spectrum. Aqueous acid—287 nm ($A_1^1 = 105$ a); aqueous alkali—235 nm ($A_1^1 = 444$ b), 305 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1518, 1242, 1213, 1099, 840, 772 (prenalterol hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 72, 30, 56, 43, 27, 41, 39, 110.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: sensitivity 2 ng/ml, ECD—P. H. Degen and M. Ervik, *J. Chromat.*, 1981, 222; *Biomed. Appl.*, 11, 437–444.

GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In plasma or urine: sensitivity 1 ng/ml—M. Ervik *et al.*, *J. Chromat.*, 1982, 229; *Biomed. Appl.*, 18, 87–94.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 1 ng/ml, fluorescence detection—C. J. Oddie *et al.*, *J. Chromat.*, 1982, 231; *Biomed. Appl.*, 20, 473–477.

Disposition in the Body. Rapidly and completely absorbed after oral administration, but subject to extensive first-pass metabolism; bioavailability about 25%. The main metabolic reaction is conjugation with sulphate at the phenol position; minor metabolites formed are β -(4-hydroxyphenoxy)lactic acid and prenalterol glucuronide. About 90% of a dose is excreted in the urine in 24 hours. After an intravenous dose, about 60% is excreted unchanged with about 35% as the sulphate; after oral administration, about 15% is excreted unchanged, with about 80% as the sulphate.

HALF-LIFE. Plasma half-life, about 2 hours.

VOLUME OF DISTRIBUTION. About 3.5 litres/kg.

CLEARANCE. Plasma clearance, about 20 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 0.9.

PROTEIN BINDING. In plasma, less than 5%.

Dose. 0.5 mg of prenalterol hydrochloride per minute by intravenous infusion, to a total of not more than 20 mg.

Prenylamine

Anti-anginal

N-(2-Benzhydrylethyl)- α -methylphenethylamine

$C_{24}H_{27}N = 329.5$

CAS—390-64-7

M.p. 36° to 38°.

Prenylamine Lactate

Proprietary Names. Angorsan; Eucardion; Reocorin; Segontin(e); Synadrin; Wasangor.

$C_{24}H_{27}N \cdot C_3H_5O_3 = 419.6$

CAS—69-43-2

A white crystalline powder. M.p. 137° to 140°.

Soluble 1 in about 200 of water, 1 in 5 of ethanol, and 1 in 2 of chloroform; very soluble in glacial acetic acid.

Colour Tests. Mandelin's Test—green; Marquis Test—red.

Thin-layer Chromatography. *System TA*—Rf 68; *system TB*—Rf 55; *system TC*—Rf 68. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 2557.

High Pressure Liquid Chromatography. *System HA*— k' 1.0.

Ultraviolet Spectrum. Methanol—253 nm, 258 nm ($A_1^1 = 18.8$ a), 268 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 700, 747, 1136, 1027, 1592, 1075 (KBr disk).

Mass Spectrum. Principal peaks at m/z 58, 238, 91, 45, 239, 167, 165, 56.

Quantification. GAS CHROMATOGRAPHY. In serum or urine: prenylamine and metabolites, detection limits 10 to 50 ng/ml, FID—M. Eichelbaum *et al.*, *Arzneimittel-Forsch.*, 1973, 23, 74–77.

Disposition in the Body. Readily absorbed after oral administration but extensively metabolised. Numerous metabolites, including traces of amphetamine, have been detected in the urine; some unchanged drug is eliminated in the faeces.

HALF-LIFE. Plasma half-life, about 7 hours.

PROTEIN BINDING. In plasma, about 97%.

Dose. The equivalent of 180 to 300 mg of prenylamine daily.

Prilocaine

Local Anaesthetic

Synonym. Propitocaine

2-Propylaminopropiono-*o*-toluidide

$C_{13}H_{20}N_2O = 220.3$

CAS—721-50-6

A white crystalline powder. M.p. 36° to 38°.

Freely **soluble** in ethanol, chloroform, and ether.

Prilocaine Hydrochloride

Proprietary Names. Citanest; Xylonest.

$C_{13}H_{20}N_2O \cdot HCl = 256.8$

CAS—1786-81-8

A white crystalline powder. M.p. 166° to 169°.

Soluble 1 in 5 of water, 1 in 6 of ethanol, and 1 in 175 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 7.9 (25°).

Colour Test. Mandelin's Test—violet.

Thin-layer Chromatography. *System TA*—Rf 77; *system TB*—Rf 29; *system TC*—Rf 64; *system TL*—Rf 60.

Gas Chromatography. *System GA*—prilocaine RI 1825, *o*-toluidine RI 2356.

High Pressure Liquid Chromatography. *System HA*— k' 1.0; *system HQ*— k' 1.38.

Ultraviolet Spectrum. Methanol—230 nm ($A_1^1 = 295$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1695, 1543, 766, 754, 1299, 1258 (prilocaine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 86, 44, 87, 107, 43, 106, 56, 41.

Quantification. GAS CHROMATOGRAPHY. In blood: prilocaine and lignocaine, sensitivity < 500 ng/ml, FID—J. B. Keenaghan, *Anesthesiology*, 1968, 29, 110–112.

Disposition in the Body. Metabolised by hydrolysis and hydroxylation resulting in deacetylated and hydroxylated metabolites which are excreted mainly as conjugates. About 35% of a dose is excreted in the urine as 4-hydroxy-2-methylaniline (*p*-hydroxy-toluidine), 3% as 6-hydroxy-2-methylaniline, 1% as 2-methylaniline (*o*-toluidine), and less than 5% as unchanged drug.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 1 to 5 μg/ml. 4-Hydroxy-2-methylaniline has been detected in plasma at concentrations similar to those of prilocaine.

After the epidural administration of 200, 400, and 600 mg to 10 subjects, mean peak plasma concentrations determined within 10 to 20 minutes were 1.69, 2.67, and 4.47 μg/ml, respectively; after the intercostal administration of 20 ml of a 2% solution, the mean peak concentration was 4.5 μg/ml (D. B. Scott *et al.*, *Br. J. Anaesth.*, 1972, 44, 1040–1049).

TOXICITY. Toxic effects are usually associated with plasma concentrations greater than 5 μg/ml. 4-Hydroxy-2-methylaniline is thought to be responsible for the methaemoglobinaemia which may occur after large doses.

HALF-LIFE. Plasma half-life, about 1 to 2 hours.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 0.80.

PROTEIN BINDING. In plasma, about 50%.

Dose. Maximum dose of prilocaine hydrochloride, 400 mg, or 600 mg in solutions with adrenaline.

Primaquine

Antimalarial

Synonym. Primachin

8-(4-Amino-1-methylbutylamino)-6-methoxyquinoline

$C_{15}H_{21}N_3O = 259.4$

CAS—90-34-6

A viscous liquid.
Moderately **soluble** in water.

Primaquine Phosphate

$C_{15}H_{21}N_3O_4 \cdot 2H_3PO_4 = 455.3$

CAS—63-45-6

An orange-red crystalline powder. M.p. about 200°.

Soluble 1 in about 16 of water; practically insoluble in ethanol, chloroform, and ether.

Colour Tests. Mandelin's Test—violet → orange; Marquis Test—orange.

Dissolve 10 mg in 5 ml of water and add 1 ml of a 5% solution of ceric ammonium sulphate in *dilute nitric acid*—violet (distinction from chloroquine).

Thin-layer Chromatography. System *TA*—Rf 19; system *TB*—Rf 13; system *TC*—Rf 05. (*Acidified iodoplatinate solution*, positive.)

Gas Chromatography. System *GA*—RI 2314.

High Pressure Liquid Chromatography. System *HA*— k' 1.4.

Ultraviolet Spectrum. Aqueous acid—265 nm ($A_1^1 = 579$ a), 282 nm ($A_1^1 = 574$ a), 334 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1611, 1595, 815, 1230, 1572, 1170 (KBr disk).

Mass Spectrum. Principal peaks at m/z 201, 81, 98, 175, 259, 176, 202, 242.

Quantification. GAS CHROMATOGRAPHY. In blood: sensitivity 10 ng/ml, ECD—T. G. Rajagopalan *et al.*, *J. Chromat.*, 1981, 224; *Biomed. Appl.*, 13, 265–273.

GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In plasma or urine—J. Greaves *et al.*, *Biomed. Mass Spectrom.*, 1979, 6, 109–112.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: detection limit 1 ng/ml, UV detection—S. A. Ward *et al.*, *J. Chromat.*, 1983, 305; *Biomed. Appl.*, 30, 239–243. In plasma or urine: carboxyprimaquine and *N*-acetylprimaquine, sensitivity 75 ng/ml and 10 ng/ml, respectively, UV detection—G. W. Mihaly *et al.*, *Br. J. clin. Pharmac.*, 1984, 17, 441–446.

Disposition in the Body. Readily absorbed after oral administration. It is extensively metabolised by oxidation to carboxyprimaquine which is the major plasma metabolite. Other reactions which may occur are demethylation and oxidation to the 5,6-diol, which is then converted to an active quinone, *N*-dealkylation to 8-amino-6-methoxyquinoline, and *N*-acetylation. Less than 5% of a dose is excreted in the urine unchanged in 24 hours.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 45 mg to 5 subjects, peak plasma concentrations of 0.13 to 0.18 $\mu\text{g/ml}$ (mean 0.15) were attained in 2 to 3 hours; peak plasma concentrations of carboxyprimaquine of 1.1 to 1.8 $\mu\text{g/ml}$ (mean 1.4) were attained in 2 to 12 hours (mean 7) (G. W. Mihaly *et al.*, *ibid.*).

HALF-LIFE. Plasma half-life, about 4 to 10 hours (mean 7).

VOLUME OF DISTRIBUTION. About 3 to 4 litres/kg.

PROTEIN BINDING. In plasma, extensively bound.

Dose. The equivalent of 15 to 45 mg of primaquine daily.

Primidone

Anticonvulsant

Synonyms. Hexamidine; Primaclone.

Note. The name Hexamidine is applied to a compound with antibacterial and fungistatic properties.

Proprietary Names. Liskantin; Midone; Mylepsin; Mylepsinum; Mysoline; Resimatil; Sertan.

5-Ethylperhydro-5-phenylpyrimidine-4,6-dione

$\text{C}_{12}\text{H}_{14}\text{N}_2\text{O}_2 = 218.3$

CAS—125-33-7

A white crystalline powder. M.p. 279° to 284°.

Soluble 1 in 2000 of water and 1 in 170 of ethanol; practically insoluble in most other organic solvents.

Thin-layer Chromatography. System TD—Rf 08; system TE—Rf 39; system TF—Rf 26. (Mercuric chloride–diphenylcarbazone reagent, positive; mercurous nitrate spray, positive.)

Gas Chromatography. System GA—primidone RI 2247, phenobarbitone RI 1957; system GE—primidone retention time 0.89, phenobarbitone retention time 0.74, and phenylethylmalondiamide retention time 0.65, all relative to phenytoin.

High Pressure Liquid Chromatography. System HE—primidone k' 1.35, phenobarbitone k' 2.76.

Ultraviolet Spectrum. Methanol—252 nm, 258 nm ($A_1^1 = 9.7$ c), 264 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1662, 1705, 1496, 700, 765, 1120 (KBr disk).

Mass Spectrum. Principal peaks at m/z 146, 190, 117, 118, 161, 189, 103, 91; phenobarbitone 204, 117, 146, 161, 77, 103, 115, 118; phenylethylmalondiamide 163, 148, 91, 103, 117, 120, 44, 77.

Quantification. GAS CHROMATOGRAPHY. In plasma: primidone, phenobarbitone and phenylethylmalondiamide, FID—K. W. Leal *et al.*, *J. analyt. Toxicol.*, 1978, 2, 214–218.

GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In serum, urine, saliva, breast-milk or tissues: primidone, phenobarbitone, 4-

hydroxyphenobarbitone and phenylethylmalondiamide, detection limits between 1.4 and 3.7 ng/ml—H. Nau *et al.*, *J. Chromat.*, 1980, 182; *Biomed. Appl.*, 8, 71–79.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or serum: primidone and phenobarbitone, sensitivity about 550 ng/ml for primidone, UV detection—J. A. Christofides and D. E. Fry, *Clin. Chem.*, 1980, 26, 499–501.

Disposition in the Body. Readily absorbed after oral administration. Rapidly metabolised to phenylethylmalondiamide (PEMA) and more slowly metabolised to phenobarbitone; both metabolites are active anticonvulsants. Aromatic hydroxylation to form 4-hydroxyphenobarbitone also occurs followed by glucuronic acid conjugation. The formation of phenobarbitone is stimulated by phenytoin. During chronic treatment, about 92% of the daily dose is excreted in the urine in 24 hours, of which 15 to 65% (mean 42) is unchanged drug, 16 to 65% (mean 45) is PEMA, and 1 to 8% (mean 5) is phenobarbitone or its hydroxylated metabolites and conjugates.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 5 to 12 µg/ml but there is considerable intersubject variation. At the beginning of treatment there is a delay of several days before phenobarbitone appears in the plasma. Concentrations of phenobarbitone and PEMA accumulate during chronic treatment, and steady-state plasma-phenobarbitone concentrations are often used to monitor therapy.

After daily oral dosing of a number of subjects at various dose levels, steady-state plasma concentrations were as follows: 26 subjects at 250 mg per day, 0 to 13 µg/ml (mean 3.2); 26 subjects at 500 mg per day, 1 to 14 µg/ml (mean 6.7); 78 subjects at 750 mg per day, 2 to 23 µg/ml (mean 8.7); 52 subjects at 1000 mg per day, 3 to 20 µg/ml (mean 10.5); 9 subjects at 1250 mg per day, 10 to 19 µg/ml (mean 14.7). In 30 subjects given primidone but no barbiturate, the mean primidone concentration was 9.2 µg/ml and the mean phenobarbitone concentration was 31 µg/ml (H. E. Booker *et al.*, *Epilepsia*, 1970, 11, 395–402).

Following oral doses of 75 to 250 mg three times a day to 7 subjects, the following steady-state serum concentrations were reported: primidone 5.0 to 13.4 µg/ml (mean 8.3), phenobarbitone 3.3 to 34.6 µg/ml (mean 12.6), PEMA 1.4 to 9.9 µg/ml (mean 4.6) (J. C. Cloyd *et al.*, *Clin. Pharmacol. Ther.*, 1981, 29, 402–407).

TOXICITY. The estimated minimum lethal dose is 5 g but instances of survival after the ingestion of 25 to 30 g have been reported. Toxic effects are usually associated with plasma concentrations greater than 10 µg/ml and concentrations greater than 50 µg/ml may be lethal.

In a fatality due to primidone ingestion, postmortem blood concentrations of 65 µg/ml of primidone and 3 µg/ml of phenobarbitone were reported (J. A. Wright per R. C. Baselt, *Disposition of Toxic Drugs and Chemicals in Man*, 2nd Edn, Davis, California, Biomedical Publications, 1982, pp. 657–661).

Serum concentrations of 95 µg/ml of primidone and 175 µg/ml of phenobarbitone were reported about 12 hours after a non-fatal suicide attempt by a 10-year-old epileptic subject; the corresponding urine concentrations were 1570 and 50 µg/ml, respectively (J. C. Cate and R. Tenser, *Clin. Toxicol.*, 1975, 8, 385–389).

HALF-LIFE. Plasma half-life, primidone 3 to 20 hours (mean 10), phenobarbitone 50 to 150 hours, PEMA 24 to 48 hours.

VOLUME OF DISTRIBUTION. In children after oral dosing, about 0.6 litre/kg.

CLEARANCE. Plasma clearance, after oral administration, about 0.7 ml/min/kg.

SALIVA. Plasma:saliva ratio, about 1.0.

PROTEIN BINDING. In plasma, less than 20%.

Dose. Initially 125 to 250 mg daily, increasing to 0.75 to 2 g daily.

Probenecid

Uricosuric

Proprietary Names. Benemid(e); Benuryl; Procid; Urocid.

4-(Dipropylsulphamoyl)benzoic acid

C₁₃H₁₉NO₄S = 285.4

CAS—57-66-9

A white crystalline powder. M.p. 198° to 200°.

Practically **insoluble** in water; soluble 1 in 25 of ethanol and 1 in 12 of acetone; soluble in chloroform.

Dissociation Constant. pK_a 3.4 (20°).

Thin-layer Chromatography. System TD—Rf 13; system TE—Rf 05; system TF—Rf 23.

Gas Chromatography. System GA—RI 2336.

Ultraviolet Spectrum. Ethanolic acid—248 nm (A₁¹ = 332 a).

Infra-red Spectrum. Principal peaks at wavenumbers 1683, 1156, 1285, 1307, 1125, 1180 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 256, 121, 185, 43, 257, 65, 42, 214.

Quantification. SPECTROFLUORIMETRY. In plasma—R. F. Cunningham *et al.*, *J. pharm. Sci.*, 1978, 67, 434–436.

GAS CHROMATOGRAPHY. In plasma or cerebrospinal fluid: sensitivity 20 ng/ml, ECD—B. E. Roos *et al.*, *Eur. J. clin. Pharmacol.*, 1980, 17, 223–226.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: sensitivity 500 ng/ml, UV detection—P. Hekman *et al.*, *J. Chromat.*, 1980, 182; *Biomed. Appl.*, 8, 252–256.

Disposition in the Body. Readily absorbed after oral administration. Metabolised by side-chain oxidation, glucuronic acid conjugation, and *N*-dealkylation. Up to about 90% of a dose is excreted in the urine, the major urinary metabolite, probenecid acyl glucuronide, accounting for up to 50% of a dose; up to 25% of a dose is excreted as hydroxylated and carboxylic acid

metabolites, and 5 to 15% as *N*-dealkylated metabolites. About 5 to 10% of a dose is excreted as unchanged drug but this appears to be variable, increasing with increasing urinary pH values and urinary flow.

THERAPEUTIC CONCENTRATION.

Following single oral doses of 0.5, 1.0, and 2.0 g to 5 subjects, mean peak plasma concentrations of 35.3, 69.6, and 149 µg/ml were reported at 3 to 4 hours (A. Selen *et al.*, *J. pharm. Sci.*, 1982, 71, 1238–1242).

After daily oral administration of 0.5 g four times a day to 19 subjects for 4 weeks, a mean plasma concentration of 22.5 µg/ml was reported (R. F. Cunningham *et al.*, *Clin. Pharmacokinet.*, 1981, 6, 135–151).

TOXICITY. Probenecid is relatively non-toxic and recovery has occurred after the ingestion of 47 g.

HALF-LIFE. Plasma half-life, 4 to 17 hours (dose-dependent).

VOLUME OF DISTRIBUTION. About 0.1 to 0.2 litre/kg.

PROTEIN BINDING. In plasma, about 90%.

NOTE. For a review of the clinical pharmacokinetics of probenecid see R. F. Cunningham *et al.*, *Clin. Pharmacokinet.*, 1981, 6, 135–151.

Dose. 0.5 to 2 g daily.

Procainamide

Anti-arrhythmic

4-Amino-*N*-(2-diethylaminoethyl)benzamide

$C_{13}H_{21}N_3O = 235.3$

CAS—51-06-9

Procainamide Hydrochloride

Synonym. Novocainamidum

Proprietary Names. Novocamid; Procamide; Procan SR; Procapan; Pronestyl.

$C_{13}H_{21}N_3O \cdot HCl = 271.8$

CAS—614-39-1

A white to tan-coloured, hygroscopic, crystalline powder. M.p. 165° to 169°.

Soluble 1 in 0.25 of water, 1 in 2 of ethanol, and 1 in 140 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 9.2 (20°).

Partition Coefficient. Log *P* (ethyl acetate/pH 7.4), −1.5.

Colour Tests. Coniferyl Alcohol—orange; Diazotisation—red; Ninhydrin—yellow.

Thin-layer Chromatography. *System TA*—Rf 49; *system TB*—Rf 01; *system TC*—Rf 05. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—procainamide RI 2248, *N*-acetylprocainamide RI 2698; *system GF*—RI 2965.

High Pressure Liquid Chromatography. *System HA*—procainamide k' 1.31, *N*-acetylprocainamide k' 3.0.

Ultraviolet Spectrum. Aqueous alkali—275 nm ($A_1^1 = 693$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1600, 1512, 1639, 1297, 1545, 1570 (procainamide hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 86, 99, 120, 30, 92, 87, 58, 65; *N*-acetylprocainamide 86, 58, 99, 56, 162, 132, 149, 205.

Quantification. **GAS CHROMATOGRAPHY.** In serum: sensitivity 100 ng, ECD—T. M. Ludden *et al.*, *J. pharm. Sci.*, 1978, 67, 371–373.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: procainamide, *N*-acetylprocainamide, and other anti-arrhythmic agents, sensitivity 500 ng/ml, UV detection—R. R. Bridges and T. A. Jennison, *J. analyt. Toxicol.*, 1983, 7, 65–68. In plasma: procainamide and *N*-acetylprocainamide, sensitivity 1 µg/ml, UV detection—K. Carr *et al.*, *J. Chromat.*, 1976, 129, 363–368. In plasma or urine: procainamide and *N*-acetylprocainamide, sensitivity 50 ng/ml in plasma, UV detection—C.-M. Lai *et al.*, *J. pharm. Sci.*, 1980, 69, 982–984.

Disposition in the Body. Readily absorbed after oral administration and widely distributed throughout the body; bioavailability 75 to 95%. The major metabolite, *N*-acetylprocainamide (acacainide), has similar pharmacological activity to procainamide; the acetylation of procainamide is subject to genetic polymorphism. Up to about 80% of a dose is excreted in the urine of normal subjects in 24 hours, about 50 to 60% as unchanged drug and up to about 30% as *N*-acetylprocainamide (less in slow acetylators). Other metabolites include monodesethylprocainamide and monodesethyl-*N*-acetylprocainamide.

THERAPEUTIC CONCENTRATION. There is considerable intersubject variation in plasma concentrations. The therapeutic effect has been correlated with plasma concentrations of about 4 to 10 µg/ml of procainamide and 5 to 30 µg/ml of combined procainamide and *N*-acetylprocainamide. *N*-Acetylprocainamide may accumulate during chronic administration in fast acetylators and in subjects with renal impairment.

After a single oral dose of 1 g to 5 normal subjects, peak plasma concentrations of 3.5 to 5.3 µg/ml of procainamide (mean 4.2) were attained in 1 to 2 hours; concentrations of *N*-acetylprocainamide reached a peak of 0.6 to 2.1 µg/ml (mean 1.6) in 3 to 8 hours (E.-G. V. Giardina *et al.*, *Clin. Pharmac. Ther.*, 1976, 19, 339–351).

The following steady-state plasma concentrations were reported in 10 subjects receiving maintenance treatment: procainamide, 2.6 to 20.7 µg/ml (mean 10.6); *N*-acetylprocainamide, 4.6 to 43.6 µg/ml (mean 15.9); monodesethyl-*N*-acetylprocainamide 0.4 to 11.9 µg/ml (mean 2.7) (T. I. Ruo *et al.*, *J. Pharmac. exp. Ther.*, 1981, 216, 357–362).

Following intravenous infusion of 84 to 374 mg/hour to 34 subjects, steady-state plasma concentrations of 1.7 to 17 µg/ml (mean 6.5) of procainamide and 1.1 to 20 µg/ml (mean 5.7) of *N*-acetylprocainamide were reported (J. J. Lima *et al.*, *Am. J. Cardiol.*, 1979, 43, 98–105).

TOXICITY. Toxic effects are usually associated with plasma-procainamide concentrations of about 12 µg/ml or more and fatalities with concentrations greater than 20 µg/ml. As little as 200 mg intravenously can be fatal.

In 4 fatalities attributed to procainamide intoxication in subjects receiving therapeutic doses, plasma-procainamide concentrations shortly before death ranged from 17.6 to 25.2 µg/ml (J. Koch-Weser and S. W. Klein, *J. Am. med. Ass.*, 1971, 215, 1454–1460).

The following postmortem concentrations were reported in a fatality attributed to procainamide: blood 114 µg/ml, liver 283 µg/g, urine 556 µg/ml (L. Kopjak and T. A. Jennison, *Bull. int. Ass. forens. Toxicol.*, 1976, 12(1), 12–13).

HALF-LIFE. Plasma half-life, procainamide about 3 hours in normal subjects, increased in subjects with renal failure or with heart disease; *N*-acetylprocainamide about 6 to 9 hours.

VOLUME OF DISTRIBUTION. About 2 litres/kg.

CLEARANCE. Plasma clearance, about 5 to 15 ml/min/kg.

PROTEIN BINDING. In plasma, about 15%.

NOTE. For a review of the clinical pharmacokinetics of procainamide see E. Karlsson, *Clin. Pharmacokinet.*, 1978, 3, 97–107.

Dose. Maintenance, 0.5 to 1 g of procainamide hydrochloride, by mouth, every 4 to 6 hours.

Procaine

Local Anaesthetic

Synonym. Ethocaine

2-Diethylaminoethyl 4-aminobenzoate

$C_{13}H_{20}N_2O_2 = 236.3$

CAS—59-46-1

M.p. 61°.

Soluble in ethanol, chloroform, and ether.

Procaine Hydrochloride

Synonyms. Allocaine; Novocainum; Syncaïne.

Proprietary Names. Gero H3 Aslan; Novocain; Recorcaïne. It is an ingredient of Mydracaine.

$C_{13}H_{20}N_2O_2 \cdot HCl = 272.8$

CAS—51-05-8

Colourless crystals or a white crystalline powder. M.p. 153° to 158°.

Soluble 1 in 1 of water, 1 in 25 of ethanol, and 1 in 30 of dehydrated alcohol; slightly soluble in chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 9.0 (20°).

Colour Test. Diazotisation—red-orange.

Thin-layer Chromatography. *System TA*—Rf 54; *system TB*—Rf 06; *system TC*—Rf 31; *system TL*—Rf 30. (*Dragendorff spray*, positive; *acidified iodoplatinate solution*, positive; *ninhydrin spray*, positive.)

Gas Chromatography. *System GA*—procaine RI 2018, 4-aminobenzoic acid RI 1547; *system GF*—RI 2580.

High Pressure Liquid Chromatography. *System HA*— k' 1.9; *system HQ*— k' 0.00.

Ultraviolet Spectrum. Aqueous acid—279 nm ($A_1^1 = 100$ a); methanol—296 nm ($A_1^1 = 954$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1690, 1274, 1605, 1174, 1116, 772 (procaine hydrochloride, KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 86, 99, 120, 58, 87, 30, 92, 71; 4-aminobenzoic acid 137, 120, 92, 65, 39, 138, 121, 63.

Quantification. **GAS CHROMATOGRAPHY.** In plasma: procaine and chlorprocaine, sensitivity 100 ng/ml, FID—R. H. Smith *et al.*, *Clin. Chem.*, 1978, 24, 1599–1601. In plasma: FID—R. L. Green *et al.*, *New Engl. J. Med.*, 1974, 291, 223–226.

Disposition in the Body. Readily absorbed after parenteral administration and rapidly hydrolysed in the plasma to 4-aminobenzoic acid and diethylaminoethanol. About 80% of the 4-aminobenzoic acid is excreted unchanged or conjugated in the urine, together with about 30% of the diethylaminoethanol, the remainder being metabolised in the liver; about 2% of a dose is excreted in the urine as unchanged drug.

**THERAPEUTIC CONCENTRATION.**

A mean steady-state plasma concentration of 12.7 µg/ml was reported during the continuous intravenous infusion of 1.0 mg/kg/min to 6 subjects; following continuous intravenous infusion of 1.5 mg/kg/min to a further 6 subjects, a mean steady-state plasma concentration of 42.7 µg/ml was reported (A. B. Seifen *et al.*, *Anesth. Analg. curr. Res.*, 1979, 58, 382-386).

TOXICITY.

Following intravenous injection to 10 subjects until convulsions were induced (total dose 18 to 55 mg/kg), plasma concentrations of 21 to 86 µg/ml (mean 49) of procaine and 0.6 to 80 µg/ml (mean 23) of 4-aminobenzoic acid were reported (J. E. Usubiaga *et al.*, *Anesth. Analg. curr. Res.*, 1966, 45, 611-620).

Following the accidental intravenous injection of 4 g to 1 subject, a peak blood concentration of 96 µg/ml was reported; the subject recovered (J. A. Wikinski *et al.*, *J. Am. med. Ass.*, 1970, 213, 621-623).

HALF-LIFE. Plasma half-life, about 0.1 hour.

Dose. Up to 1 g of procaine hydrochloride may be administered by injection with adrenaline.

Procaine Penicillin*Antibiotic*

Synonyms. Benzylpenicillin Novocaine; Penicillin G Procaine; Procaine Benzylpenicillin; Procaine Penicillin G.

Proprietary Names. Aquacaine G; Aquacillin; Ayercillin; Crys-ticillin AS; Depocillin; Duracillin AS; Megacillin; Pfizerpen AS; Wycillin. It is an ingredient of Bicillin and Triptopen.

Note. Bicillin is also used as a proprietary name for benzathine penicillin. Megacillin is also used for benzylpenicillin potassium, clemizole penicillin, and phenoxymethylpenicillin.

Procaine (6*R*)-6-(2-phenylacetamido)penicillanate monohydrate

$C_{13}H_{20}N_2O_2 \cdot C_{16}H_{18}N_2O_4S \cdot H_2O = 588.7$

CAS—54-35-3 (anhydrous); 6130-64-9 (monohydrate)

A white crystalline powder. M.p. 106° to 110°, with decomposition.

Soluble 1 in 200 of water, 1 in 30 of ethanol, and 1 in 60 of chloroform; very slightly soluble in ether.

Ultraviolet Spectrum. Aqueous acid—278 nm ($A_1^1 = 53$ b); aqueous alkali—280 nm ($A_1^1 = 256$ b); methanol—295 nm ($A_1^1 = 367$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1266, 1600, 1779, 1692, 1176, 1120 (KBr disk).

Dose. 300 to 600 mg daily, by deep intramuscular injection.

Procabazine*Antineoplastic*

Synonym. Ibenzmethyzin

N-Isopropyl- α -(2-methylhydrazino)-*p*-toluamide

$C_{12}H_{19}N_3O = 221.3$

CAS—671-16-9

**Procabazine Hydrochloride**

Proprietary Names. Matulane; Natulan.

$C_{12}H_{19}N_3O \cdot HCl = 257.8$

CAS—366-70-1

A white to pale yellow, crystalline powder. M.p. about 223°, with decomposition.

Freely **soluble** in water; sparingly soluble in ethanol; slightly soluble in chloroform; practically insoluble in ether; soluble in methanol. Solutions in water are unstable.

Dissociation Constant. pK_a 6.8.

Colour Tests. Liebermann's Test (100°)—blue (15 s); Nessler's Reagent (room temperature)—black; Palladium Chloride—black.

Thin-layer Chromatography. *System TA*—Rf 49; *system TB*—Rf 02; *system TC*—Rf 10. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. *System GA*—RI 1990.

Ultraviolet Spectrum. Aqueous acid—232 nm ($A_1^1 = 570$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1632, 1555, 1661, 1301, 861, 1176 (procarbazine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 177, 118, 45, 135, 90, 91, 221, 119.

Quantification. GAS CHROMATOGRAPHY-MASS SPECTROMETRY. In plasma: procarbazine and metabolites, sensitivity 10 ng/ml—R. M. Gorsen *et al.*, *J. Chromat.*, 1980, 221; *Biomed. Appl.*, 10, 309–318.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: sensitivity 10 ng, electrochemical detection—R. J. Rucki and S. A. Moros, *J. Chromat.*, 1980, 190, 359–365. In plasma: procarbazine metabolites, UV detection—D. A. Shiba and R. J. Weinkam, *J. Chromat.*, 1982, 229; *Biomed. Appl.*, 18, 397–407.

Disposition in the Body. Readily absorbed after oral administration; peak plasma concentrations are attained in 0.5 to 1 hour. Rapidly metabolised to active azo derivatives and by oxidation to *N*-isopropylterephthalamide. Up to about 75% of a dose is excreted in the urine with about 5% of a dose consisting of unchanged drug.

Dose. Initially the equivalent of 50 mg of procarbazine daily, increasing to 250 or 300 mg daily.

Prochlorperazine

Tranquilliser

Synonym. Prochlorpazine

Proprietary Names. Compazine; Stemetil (suppositories); Témentil. It is an ingredient of Eskatrol.

2-Chloro-10-[3-(4-methylpiperazin-1-yl)propyl]phenothiazine
 $C_{20}H_{24}ClN_3S$ = 373.9
 CAS—58-38-8

A clear, pale yellow, viscous liquid which is sensitive to light. Very slightly **soluble** in water; freely soluble in ethanol, chloroform, and ether.

Prochlorperazine Edisylate

Synonym. Prochlorperazine Ethanedisulphonate

Proprietary Name. Compazine

$C_{20}H_{24}ClN_3S_2 \cdot C_2H_6O_6S_2$ = 564.1

CAS—1257-78-9

A white to very light yellow, crystalline powder.

Soluble 1 in 2 of water and 1 in 1500 of ethanol; practically insoluble in chloroform and ether.

Prochlorperazine Maleate

Synonyms. Prochlorperazine Dihydrogen Maleate; Prochlorperazine Dimaleate.

Proprietary Names. Anti-Nausea; Compazine; Stemetil (tablets); Vertigon. It is an ingredient of Combid.

$C_{20}H_{24}ClN_3S_2 \cdot 2C_4H_4O_4$ = 606.1

CAS—84-02-6

A white or pale yellow, crystalline powder. M.p. 198° to 203°.

Practically **insoluble** in water, ethanol, and ether; slightly soluble in warm chloroform.

Prochlorperazine Mesylate

Synonyms. Prochlorperazine Dimethanesulphonate; Prochlorperazine Methanesulphonate.

Proprietary Name. Stemetil (injection and syrup)

$C_{20}H_{24}ClN_3S_2 \cdot 2CH_3SO_3H$ = 566.1

CAS—51888-09-6

A white powder. M.p. about 242°.

Soluble 1 in less than 0.5 of water and 1 in 40 of ethanol; slightly soluble in chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 8.1 (24°).

Partition Coefficient. Log *P* (octanol/pH 7.0), 2.4.

Colour Tests. Formaldehyde-Sulphuric Acid—red-violet; Forrester Reagent—red; FPN Reagent—red; Mandelin's Test—brown → violet; Marquis Test—violet.

Thin-layer Chromatography. System TA—Rf 49; system TB—Rf 33; system TC—Rf 37. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2954.

High Pressure Liquid Chromatography. System HA— k' 3.9.

Ultraviolet Spectrum. Aqueous acid—254 nm (A_1^1 = 875 a), 305 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 752, 1280, 1569, 1165, 1242, 1145 (KBr disk).

Mass Spectrum. Principal peaks at m/z 113, 70, 373, 141, 43, 72, 42, 127.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: detection limit about 200 pg/ml, electrochemical detection—M. G. Sankey *et al.*, *Br. J. clin. Pharmac.*, 1982, 13, 578–580.

RADIOIMMUNOASSAY. In plasma: detection limit 156 pg/ml—K. K. Midha *et al.*, *Ther. Drug Monit.*, 1983, 5, 117–121.

Disposition in the Body. Absorbed after oral administration but extensively metabolised.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 12.5 mg to 1 subject, a peak plasma concentration of about 0.0008 µg/ml was attained in 6 hours (M. G. Sankey *et al.*, *Br. J. clin. Pharmac.*, 1982, 13, 578–580).

TOXICITY.

Serum concentrations of 1.2 to 1.6 µg/ml were found in 4 cases of non-fatal overdose (S. L. Tompsett, *Acta pharmac. tox.*, 1968, 26, 298–302).

Dose. Usually 15 to 30 mg of prochlorperazine maleate daily, as an anti-emetic; 50 to 100 mg daily for the treatment of psychoses.

Procyclidine

Anticholinergic

1-Cyclohexyl-1-phenyl-3-(pyrrolidin-1-yl)propan-1-ol

$C_{19}H_{29}NO$ = 287.4

CAS—77-37-2

Crystals. M.p. 85° to 87°.

Procyclidine Hydrochloride

Proprietary Names. Arpicolin; Kemadrin(e); Osnervan; Procyclid.

$C_{19}H_{29}NO \cdot HCl$ = 323.9

CAS—1508-76-5

A white crystalline powder. M.p. 225° to 227°.

Soluble 1 in about 40 of water, 1 in 15 of ethanol, and 1 in 6 of chloroform; practically insoluble in ether.

Partition Coefficient. Log P (heptane), 1.7.

Colour Tests. Mandelin's Test—black; Marquis Test—violet; Sulphuric Acid—yellow.

Thin-layer Chromatography. System TA —Rf 48; system TB —Rf 63; system TC —Rf 31. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, violet-brown.)

Gas Chromatography. System GA —RI 2156; system GF —RI 2485.

High Pressure Liquid Chromatography. System HA — k' 2.0.

Ultraviolet Spectrum. Aqueous acid—251 nm, 257 nm (A_1^1 = 6.9 a), 263 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 700, 756, 746, 1128, 1075, 1175 (procyclidine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 84, 204, 205, 85, 42, 55, 105, 77.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: sensitivity 20 ng/ml, AFID—K. Dean *et al.*, *J. Chromat.*, 1980, 221; *Biomed. Appl.*, 10, 408–413. In blood: sensitivity 100 ng/ml, AFID—A. W. Missen *et al.*, *J. analyt. Toxicol.*, 1978, 2, 238–240.

Disposition in the Body. Absorbed after oral administration; bioavailability about 75%. Metabolised by hydroxylation of the benzyl or cyclohexyl rings.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 10 mg to 6 subjects, a mean peak plasma concentration of 0.12 µg/ml was reported; in 5 of the subjects the peak concentrations were attained in about 1 hour, whereas in the sixth subject the time to peak concentration was 8 hours (P. D. Whiteman *et al.*, *Eur. J. clin. Pharmac.*, 1985, 28, 73–78).

In 6 patients undergoing therapy with daily oral doses of 10 to 30 mg, mean steady-state blood concentrations of 0.15 to 0.63 µg/ml were reported (A. W. Missen *et al.*, *J. analyt. Toxicol.*, 1978, 2, 238–240).

TOXICITY.

In 2 fatalities involving procyclidine, postmortem tissue concentrations were: blood 4 and 4.4 µg/ml, liver 15 and 11 µg/g, urine 7 and 1.8 µg/ml; in the second case bexetropine and chlorpromazine were also detected (P. G. Ashton, *Bull. int. Ass. forens. Toxicol.*, 1980, 15(2), 9–11).

HALF-LIFE. Plasma half-life, 8 to 16 hours (mean 12).

VOLUME OF DISTRIBUTION. About 1 litre/kg.

CLEARANCE. Plasma clearance, about 1 ml/min/kg.

Dose. 7.5 to 30 mg of procyclidine hydrochloride daily; up to 60 mg daily has been given.

Profadol

Narcotic Analgesic

3-(1-Methyl-3-propylpyrrolidin-3-yl)phenol

$C_{14}H_{21}NO = 219.3$

CAS—428-37-5

Profadol Hydrochloride

$C_{14}H_{21}NO \cdot HCl = 255.8$

CAS—2324-94-9

A white solid. M.p. 145° to 146°.

Soluble in water and chloroform.

Colour Tests. Folin-Ciocalteu Reagent—blue; Liebermann's Test—black; Mandelin's Test—blue-green → green; Marquis Test—orange → red-brown.

Thin-layer Chromatography. System TA—Rf 42; system TB—Rf 08; system TC—Rf 06. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 1748.

Ultraviolet Spectrum. Aqueous acid—272 nm ($A_1^1 = 87$ b); aqueous alkali—237 nm, 290 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1575, 1590, 1234, 752, 702, 1267 (KBr disk).

Mass Spectrum. Principal peaks at m/z 57, 42, 44, 177, 58, 219, 133, 107.

Proflavine Hemisulphate

Disinfectant

Synonyms. Neutral Proflavine Sulphate; Proflavine.

3,6-Diaminoacridine sulphate dihydrate

$(C_{13}H_{11}N_3)_2 \cdot H_2SO_4 \cdot 2H_2O = 552.6$

CAS—92-62-6 (proflavine); 553-30-0 (sulphate, anhydrous)

An orange to red, hygroscopic, crystalline powder.

Soluble 1 in 300 of water, 1 in 1 of boiling water, and 1 in 35 of glycerol; very slightly soluble in ethanol; practically insoluble in chloroform and ether. A saturated solution in water is deep orange in colour and gives a green fluorescence when freely diluted.

Colour Tests. Mandelin's Test—green; Marquis Test—yellow → orange.

Thin-layer Chromatography. System TA—Rf 16.

Ultraviolet Spectrum. Ethanol—261 nm ($A_1^1 = 1091$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1605, 1625, 1125, 1160, 1218, 1263 (KBr disk).

Progesterone

Progestational Steroid

Synonyms. Luteal Hormone; Luteine; Pregnenedione; Progestin.

Proprietary Names. Biograviplan; Cyclogest; Gesterol; Gestone; Lutogyl; Progestasert; Progestilin; Progestogel; Progestosol; Proluton.

Pregn-4-ene-3,20-dione

$C_{21}H_{30}O_2 = 314.5$

CAS—57-83-0

Colourless crystals or a white or slightly yellowish-white, crystalline powder. There are two forms, one melts at 126° to 131° and the other, known as β -progesterone, at about 121°. Practically **insoluble** in water; soluble 1 in 8 of ethanol, 1 in less than 1 of chloroform, and 1 in 16 of ether.

Colour Tests. Naphthol-Sulphuric Acid—brown/yellow; Sulphuric Acid—yellow (green fluorescence under ultraviolet light).

Thin-layer Chromatography. System *TP*—Rf 81; system *TQ*—Rf 20; system *TR*—Rf 99; system *TS*—Rf 95.

Gas Chromatography. System *GA*—RI 2793.

Ultraviolet Spectrum. Dehydrated alcohol—240 nm ($A_1^1 = 540$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1662, 1614, 1700, 872, 1209, 1232 (KBr disk).

Mass Spectrum. Principal peaks at m/z 124, 43, 314, 79, 91, 229, 272, 105.

Dose. Up to 50 mg daily by intramuscular injection.

Proguanil

Antimalarial

Synonyms. Chloriguane; Chloroguanide; Proguanide.

1-(4-Chlorophenyl)-5-isopropylbiguanide

$C_{11}H_{16}ClN_5 = 253.7$

CAS—500-92-5

Colourless crystals. M.p. 130° to 131°.

Proguanil Hydrochloride

Synonym. Bigumalum

Proprietary Names. Paludrine; Paludrinol.

$C_{11}H_{16}ClN_5 \cdot HCl = 290.2$

CAS—637-32-1

A white crystalline powder. M.p. about 245°.

Soluble 1 in 110 of water and 1 in 40 of ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 2.3, 10.4 (22.5°).

Colour Test. To 10 ml of a saturated solution of proguanil hydrochloride add 1 drop of 10% copper sulphate solution and 2.5 ml of dilute ammonia solution and shake well; add 5 ml of toluene and shake again—toluene layer is violet-red.

Thin-layer Chromatography. System *TA*—Rf 03; system *TB*—Rf 00; system *TC*—Rf 01. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Methanol—259 nm ($A_1^1 = 886$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1534, 1635, 1492, 1575, 1600, 1170 (proguanil hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 43, 127, 195, 85, 44, 36, 152, 58.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: proguanil, cycloguanil and 4-chlorophenylbiguanide, detection limit 60 ng/ml, UV detection—R. R. Moody *et al.*, *J. Chromat.*, 1980, 182; *Biomed. Appl.*, 8, 359–367.

Disposition in the Body. Readily absorbed after oral administration; peak plasma concentrations are attained in about 3 hours. About 60% of a dose is excreted in the urine unchanged, together with about 30% as the active metabolite cycloguanil; 4-chlorophenylbiguanide is also a metabolite.

PROTEIN BINDING. In plasma, about 75%.

Dose. 100 to 300 mg of proguanil hydrochloride daily.

Prolintane

Central Stimulant

1-(α -Propylphenethyl)pyrrolidine

$C_{15}H_{23}N=217.4$

CAS—493-92-5

Prolintane Hydrochloride

Proprietary Names. Promotil. It is an ingredient of Villescon.

$C_{15}H_{23}N \cdot HCl=253.8$

CAS—1211-28-5

A white powder. M.p. about 133°.

Soluble in water, ethanol, and chloroform; practically insoluble in ether.

Colour Tests. Liebermann's Test—red-orange; Mandelin's Test—red; Marquis Test—orange \rightarrow brown.

Thin-layer Chromatography. System TA—Rf 50; system TB—Rf 66; system TC—Rf 32. (*Dragendorff spray*, positive; *acidified iodoplatinate solution*, positive; *Marquis reagent*, orange-brown; *acidified potassium permanganate solution*, positive.)

Gas Chromatography. System GA—RI 1634; system GB—RI 1675; system GC—RI 1849.

High Pressure Liquid Chromatography. System HA—k' 2.0; system HC—k' 1.26.

Ultraviolet Spectrum. Aqueous acid—252 nm, 258 nm ($A_1^1=8.6$ a), 264 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 776, 714, 752, 1501, 1141, 1020 (prolintane hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 126, 127, 174, 91, 70, 69, 55, 42.

Dose. 20 mg of prolintane hydrochloride daily.

Promazine

Tranquilliser

NN-Dimethyl-3-(phenothiazin-10-yl)propylamine

$C_{17}H_{20}N_2S=284.4$

CAS—58-40-2

An oily liquid.

Promazine Embonate

Synonym. Promazine Pamoate

Proprietary Names. Protactyl (suspension); Sparine (suspension).

$(C_{17}H_{20}N_2S)_2 \cdot C_{23}H_{16}O_6=957.2$

Promazine Hydrochloride

Synonym. Propazinum

Proprietary Names. Calmotal; Neurolegil; Prazine; Promabec; Promanyl; Protactyl (injection and tablets); Sparine (injection and tablets); Talofen.

$C_{17}H_{20}N_2S \cdot HCl=320.9$

CAS—53-60-1

A white or slightly yellow, slightly hygroscopic, crystalline powder. It is affected by air and light and traces of heavy metals. Decomposed solutions may be coloured pink, red, or blue. M.p. 172° to 182°.

Soluble 1 in 1 of water, 1 in 2 of ethanol, and 1 in 2 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 9.4 (25°).

Partition Coefficient. Log *P* (octanol/pH 7.4), 2.5.

Colour Tests. Formaldehyde-Sulphuric Acid—red; Forrester Reagent—red-brown; FPN Reagent—red-brown; Liebermann's Test—green-brown; Mandelin's Test—green \rightarrow violet; Marquis Test—violet.

Thin-layer Chromatography. System TA—Rf 44; system TB—Rf 41; system TC—Rf 30. (*Dragendorff spray*, positive; *FPN reagent*, pink; *acidified iodoplatinate solution*, positive; *Marquis reagent*, red; *ninhydrin spray*, positive.)

Gas Chromatography. System GA—RI 2316; system GF—RI 2745.

High Pressure Liquid Chromatography. System HA—k' 5.9.

Ultraviolet Spectrum. Aqueous acid—251 nm ($A_1^1=1055$ a), 302 nm; aqueous alkali—254 nm, 306 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 751, 1250, 1234, 1287, 770, 1162 (promazine hydrochloride, KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 58, 284, 86, 238, 198, 199, 85, 42.

Dose. Usually up to 400 mg of promazine hydrochloride daily; maximum of 1 g daily.

Promethazine

Antihistamine

Proprietary Name. Phenergan (cream)

1,1,1-Trimethyl-2-(phenothiazin-10-yl)ethylamine

$C_{17}H_{20}N_2S = 284.4$

CAS—60-87-7

A crystalline solid. M.p. about 60°.

Promethazine Hydrochloride

Synonyms. Diprazinum; Proazamine Chloride.

Proprietary Names. Atosil; Fellozine; Ganphen; Histantil; Phencen; Phenergan; Progan; Promine; Prothazine; Quadnite; Remsed; Sominex; V-Gan; ZiPan. It is an ingredient of Medised, Mepergan, Phensedyl, and Tixylis.

$C_{17}H_{20}N_2S \cdot HCl = 320.9$

CAS—58-33-3

A white or faintly yellow, crystalline powder, which is slowly oxidised on prolonged exposure to air, becoming blue in colour. M.p. about 222°, with decomposition.

Soluble 1 in 0.6 of water, 1 in 9 of ethanol, and 1 in 2 of chloroform; practically insoluble in ether.

Promethazine Theoclate

Synonym. Promethazine Chlorotheophyllinate

Proprietary Names. Avomine; Meth-Zine.

$C_{17}H_{20}N_2S \cdot C_7H_7ClN_4O_2 = 499.0$

CAS—17693-51-5

A white powder.

Very slightly **soluble** in water; soluble 1 in 70 of ethanol and 1 in 2.5 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 9.1 (25°).

Partition Coefficient. Log P (octanol/pH 7.4), 2.9.

Colour Tests. Formaldehyde-Sulphuric Acid—blue-violet; Forrest Reagent—red; FPN Reagent—orange; Mandelin's Test—green → violet; Marquis Test—violet.

Thin-layer Chromatography. System *TA*—Rf 50; system *TB*—Rf 37; system *TC*—Rf 35. (Dragendorff spray, positive; FPN reagent, positive; acidified iodoplatinate solution, positive; Marquis reagent, violet; ninhydrin spray, positive.)

Gas Chromatography. System *GA*—RI 2259; system *GC*—RI 2546; system *GF*—RI 2675.

High Pressure Liquid Chromatography. System *HA*— k' 5.0.

Ultraviolet Spectrum. Aqueous acid—249 nm ($A_1^1 = 1032$ a), 298 nm; aqueous alkali—254 nm, 305 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 758, 1229, 733, 1129, 1259, 1287 (promethazine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 72, 73, 284, 198, 213, 199, 180, 56; *N*-monodesmethylpromethazine 58, 213, 198, 180, 214, 57, 212, 270.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In blood: promethazine, *N*-monodesmethylpromethazine and promethazine sulphoxide, detection limit for promethazine 200 pg/ml, UV detection—G. Taylor and J. B. Houston, *J. Chromat.*, 1982, 230; *Biomed. Appl.*, 19, 194–198. In plasma or serum: detection limit 200 pg/ml, electrochemical detection—J. E. Wallace *et al.*, *Analyt. Chem.*, 1981, 53, 960–962. In postmortem samples: promethazine and metabolites, UV detection—W. J. Allender and A. W. Archer, *J. forens. Sci.*, 1984, 29, 515–526.

Disposition in the Body. Readily absorbed after oral administration but subject to extensive first-pass metabolism. About 2% of a dose is excreted in the urine unchanged. The major urinary metabolite is the sulfoxide; glucuronic acid conjugation also occurs. *N*-Monodesmethylpromethazine has been detected in plasma and urine.

THERAPEUTIC CONCENTRATION.

Following an oral dose of 25 mg to 10 subjects, a mean peak blood concentration of 0.005 µg/ml was attained in 2 hours; saliva concentrations averaged 0.008 µg/ml consistently from 1 to 6 hours after administration. After an intramuscular dose of 25 mg to the same subjects, mean peak concentrations of 0.022 µg/ml at 4 hours and 0.003 µg/ml at 2 hours were reported for blood and saliva, respectively (G. J. DiGregorio and E. Ruch, *J. pharm. Sci.*, 1980, 69, 1457-1459).

Following single oral doses of 25 mg to 7 subjects, peak blood concentrations of 0.002 to 0.018 µg/ml were attained in 1.5 to 3 hours (G. Taylor *et al.*, *Br. J. clin. Pharmacol.*, 1983, 15, 287-293).

TOXICITY. The estimated minimum lethal dose is 200 mg/kg.

In 2 fatalities involving the ingestion of promethazine, the following postmortem tissue concentrations were reported (µg/ml or µg/g):

	Promethazine	Promethazine sulphoxide	<i>N</i> -Monodesmethyl- promethazine
Blood	5.2, 2.4	3.1, 0.8	0.8, 1.2
Bile	82.6, 11.6	23.5, 27.0	14.5, 3.0
Liver	30.6, 23.2	8.4, 5.4	6.3, 16.2
Urine	6.0, 14.0	26.0, 42.0	1.0, 3.0

Other drugs were detected in both cases (W. J. Allender and A. W. Archer, *J. forens. Sci.*, 1984, 29, 515-526).

HALF-LIFE. Plasma half-life, 10 to 15 hours.

VOLUME OF DISTRIBUTION. About 13 litres/kg.

CLEARANCE. Plasma clearance, about 16 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 1.5.

PROTEIN BINDING. In plasma, about 75 to 93%.

Dose. 20 to 75 mg of promethazine hydrochloride daily.

Prometryne

Herbicide

Proprietary Name. Gesagard 50 WP

2,4-Bis(isopropylamino)-6-methylthio-1,3,5-triazine

$C_{10}H_{19}N_5S = 241.4$

CAS—7287-19-6

A white crystalline solid. M.p. 118° to 120°.

Practically **insoluble** in water; readily soluble in organic solvents.

Thin-layer Chromatography. System TA—Rf 76. (Dragendorff spray, positive.)

Gas Chromatography. System GA—RI 1853.

Infra-red Spectrum. Principal peaks at wavenumbers 1510, 1592, 1171, 1299, 809, 1217 (KBr disk).

Propamidine

Antibacterial/Antifungal

4,4'-Trimethylenedioxydibenzamidine

$C_{17}H_{20}N_4O_2 = 312.4$

CAS—104-32-5

Propamidine Isethionate

Proprietary Names. Brolene (eye drops); M & B Antiseptic Cream.

$C_{17}H_{20}N_4O_2 \cdot 2C_2H_5O_4S = 564.6$

CAS—140-63-6

A white, granular, hygroscopic powder. M.p. 235°.

Soluble 1 in 5 of water and 1 in 33 of ethanol; practically insoluble in organic solvents.

Thin-layer Chromatography. System TA—Rf 01; system TB—Rf 01; system TC—Rf 01. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Ethanol—267 nm ($A_1^1 = 1224$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1200, 1219, 1613, 1048, 1280, 1495 (propamidine isethionate, KBr disk).

Mass Spectrum. Principal peaks at m/z 41, 132, 102, 160, 96, 29, 27, 44.

Use. Propamidine isethionate is used in concentrations of 0.1 to 0.15%.

Propanidid

General Anaesthetic

Proprietary Name. Epontol

Propyl 4-diethylcarbamoylmethoxy-3-methoxyphenylacetate

$C_{18}H_{27}NO_5 = 337.4$

CAS—1421-14-3

A pale greenish-yellow, hygroscopic, viscous liquid. B.p. about 210°.

Very slightly **soluble** in water; miscible with ethanol, chloroform, and ether.

Colour Tests. Aromaticity (Method 2)—yellow/orange; Liebermann's Test—black.

Thin-layer Chromatography. *System TA*—Rf 66; *system TB*—Rf 20; *system TC*—Rf 70. (Dragendorff spray, positive.)

Gas Chromatography. *System GA*—RI 2433.

Ultraviolet Spectrum. Ethanol—280 nm ($A_1^1 = 82$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1258, 1508, 1637, 1142, 1724, 1220 (thin film).

Mass Spectrum. Principal peaks at m/z 114, 72, 43, 100, 29, 44, 337, 86.

Disposition in the Body. Rapidly metabolised by hydrolysis and demethylation to inactive metabolites which are excreted in the urine. About 90% of a dose is excreted in the urine in 2 hours and up to 6% is eliminated in the faeces.

THERAPEUTIC CONCENTRATION.

Following intravenous administration of 7 mg/kg to 10 subjects, a mean serum concentration of about 14 µg/ml was reported at 1 minute (A. Doenicke *et al.*, *Br. J. Anaesth.*, 1968, 40, 415–428).

HALF-LIFE. Plasma half-life, about 0.2 hour.

PROTEIN BINDING. In plasma, about 75%.

Dose. Usually 5 to 10 mg/kg intravenously.

Propanol

Solvent

Synonyms. Normal Propyl Alcohol; Primary Propyl Alcohol; Propyl Alcohol.

Proprietary Name. Satinazid

Propan-1-ol

$\text{CH}_3 \cdot \text{CH}_2 \cdot \text{CH}_2\text{OH} = 60.10$

CAS—71-23-8

A clear, colourless, inflammable liquid. Wt per ml about 0.804 g. B.p. 96° to 100°.

Miscible with water, ethanol, chloroform, and ether.

Colour Test. Potassium Dichromate (Method 2)—green.

Gas Chromatography. *System GA*—RI 571; *system GI*—retention time 5.5 min.

Mass Spectrum. Principal peaks at m/z 31, 59, 42, 60, 27, 29, 45, 41.

Propantheline Bromide

Anticholinergic

Proprietary Names. Banlin; Pantheline; Pro-Banthine; Propanthel.

Di - isopropylmethyl[2 - (xanthen - 9 - ylcarbonyloxy)ethyl] - ammonium bromide

$\text{C}_{23}\text{H}_{30}\text{BrNO}_3 = 448.4$

CAS—298-50-0 (propantheline); 50-34-0 (bromide)

A white or yellowish-white powder. M.p. 156° to 162°, with decomposition.

Very soluble in water, ethanol, and chloroform; practically insoluble in ether.

Note. The dust is irritant to mucous membranes.

Colour Tests. The following tests are performed on the nitrate (see page 128): Mandelin's Test—orange; Marquis Test—orange.

Thin-layer Chromatography. *System TA*—Rf 04. (Acidified iodoplatinate solution, positive.)

High Pressure Liquid Chromatography. *System HA*—k' 4.4.

Ultraviolet Spectrum. Aqueous acid—243 nm ($A_1^1 = 103$ a), 281 nm; aqueous alkali—249 nm, 282 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1255, 761, 1208, 1733, 745, 1158 (KBr disk).

Mass Spectrum. Principal peaks at m/z 86, 181, 43, 44, 41, 114, 42, 152 (propantheline).

Quantification. GAS CHROMATOGRAPHY-MASS SPECTROMETRY. In plasma or urine: sensitivity 5 ng/ml and 10 ng/ml respectively—G. C. Ford *et al.*, *Biomed. Mass Spectrom.*, 1977, 4, 94–97.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: sensitivity 2 ng/ml, UV detection—D. K. Moses *et al.*, *Br. J. clin. Pharmac.*, 1983, 16, 758–759.

Disposition in the Body. Poorly absorbed after oral administration due to decomposition in the small intestine. It undergoes extensive metabolism mainly by hydrolysis and glucuronide conjugation; aromatic hydroxylation also occurs. About 50 to 65% of an oral dose is excreted in the urine in 24 hours with less than 10% as unchanged drug. The major urinary metabolite is xanthanoic acid glucuronide conjugate; other metabolites include free xanthanoic acid, hydroxyxanthanoic acid, propantheline, and hydroxypropantheline.

THERAPEUTIC CONCENTRATION.

Following single oral doses of 30 mg and 60 mg to 6 subjects, peak plasma concentrations of 0.0 to 0.038 µg/ml (mean 0.024) and 0.033 to 0.162 µg/ml (mean 0.06), respectively, were attained in about 0.5 to 1 hour (C. W. Vose *et al.*, *Eur. J. drug Met. Pharmacokinet.*, 1980, 5, 29–34).

HALF-LIFE. Plasma half-life, 1 to 3 hours.

CLEARANCE. Plasma clearance, about 20 ml/min/kg.

Dose. Usually 75 mg daily; maximum of 120 mg daily.

Propicillin

Antibiotic

Synonym. α-Phenoxypropylpenicillin

(6R)-6-(2-Phenoxybutyramido)penicillanic acid

$C_{18}H_{22}N_2O_5S = 378.4$

CAS—551-27-9

Propicillin Potassium

Proprietary Names. Baycillin; Oricillin.

$C_{18}H_{21}KN_2O_5S = 416.5$

CAS—1245-44-9

A white, hygroscopic, finely crystalline powder.

Soluble 1 in 1.2 of water, 1 in 25 of ethanol, and 1 in 65 of dehydrated alcohol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 2.7 (25°).

Ultraviolet Spectrum. Propicillin potassium: water—269 nm ($A_1^1 = 27$ b), 276 nm ($A_1^1 = 21.5$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1600, 1757, 1669, 1224, 1314, 750 (propicillin potassium, KBr disk).

Dose. The equivalent of 0.5 to 1.5 g of propicillin daily.

Propiomazine

Antihistamine/Sedative

1-[10-(2-Dimethylaminopropyl)phenothiazin-2-yl]propan-1-one

$C_{20}H_{24}N_2OS = 340.5$

CAS—362-29-8

Propiomazine Hydrochloride

Proprietary Name. Largon

$C_{20}H_{24}N_2OS \cdot HCl = 376.9$

CAS—1240-15-9

A yellow powder.

Soluble 1 in less than 1 of water, 1 in 6 of ethanol, and 1 in 2 of chloroform; practically insoluble in ether.

Propiomazine Maleate

Synonym. Propiomazine Hydrogen Maleate

Proprietary Name. Serentin

$C_{20}H_{24}N_2OS \cdot C_4H_4O_4 = 456.6$

CAS—3568-23-8

A yellow microcrystalline powder. M.p. 160° to 161°.

Soluble 1 in 500 of water, 1 in 60 of ethanol, and 1 in 140 of dehydrated alcohol.

Dissociation Constant. pK_a 6.6.

Colour Tests. Formaldehyde–Sulphuric Acid—blue-violet; Forrest Reagent—red; FPN Reagent—pink-orange → red → fades; Liebermann's Test—violet; Mandelin's Test—violet; Marquis Test—red-violet.

Thin-layer Chromatography. System TA—Rf 55; system TB—Rf 34; system TC—Rf 42. (Location under ultraviolet light, pink fluorescence; Dragendorff spray, positive; FPN reagent, yellow; acidified iodoplatinate solution, positive; Marquis reagent, red.)

Gas Chromatography. System GA—RI 2738; system GF—RI 3225.

High Pressure Liquid Chromatography. System HA—k' 2.1.

Ultraviolet Spectrum. Aqueous acid—241 nm ($A_1^1 = 749$ a), 273 nm, 360 nm; aqueous alkali—243 nm, 283 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 754, 1653, 1221, 1186, 1575, 1316 (propiomazine hydrochloride, KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 72, 73, 340, 269, 197, 71, 70, 56.

Quantification. GAS CHROMATOGRAPHY. In plasma: propiomazine and *N*-monodesmethylpropiomazine, sensitivity 10 to 20 ng/ml, AFID—P. Hartvig *et al.*, *J. Chromat.*, 1980, 183; *Biomed. Appl.*, 9, 229–233.

Disposition in the Body. Slowly absorbed after oral administration; bioavailability about 33%. Metabolised by *N*-demethylation.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 50 mg to one subject, a peak serum concentration of about 0.05 µg/ml was attained in 2 to 3 hours. In several subjects, low concentrations (<0.01 µg/ml) of *N*-monodesmethylpropiomazine were also observed (P. Hartvig *et al.*, *Curr. ther. Res.*, 1981, 29, 351–362).

HALF-LIFE. Plasma half-life, 2 to 15 hours (mean 9).

VOLUME OF DISTRIBUTION. About 2 to 3 litres/kg.

CLEARANCE. Plasma clearance, 3 to 10 ml/min/kg (mean 5).

REFERENCE. P. Hartvig *et al.*, *Curr. ther. Res.*, 1981, 29, 351–362.

Dose. The equivalent of 50 to 100 mg of propiomazine daily, by mouth.

Propoxycaine

Local Anaesthetic

2-Diethylaminoethyl 4-amino-2-propoxybenzoate

$C_{16}H_{26}N_2O_3 = 294.4$

CAS—86-43-1

Propoxycaine Hydrochloride

$C_{16}H_{26}N_2O_3 \cdot HCl = 330.9$

CAS—550-83-4

A white crystalline powder which discolours on prolonged exposure to light and air. M.p. 146° to 151°.

Soluble 1 in 2 of water, 1 in 10 of ethanol, and 1 in 80 of ether; practically insoluble in chloroform.

Dissociation Constant. pK_a 8.6.

Colour Tests. Coniferyl Alcohol—orange; Diazotisation—red; Mandelin's Test—brown.

Thin-layer Chromatography. System TA—Rf 58; system TB—Rf 03; system TC—Rf 33; system TL—Rf 28. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2335.

High Pressure Liquid Chromatography. System HQ— k' 1.09.

Ultraviolet Spectrum. Aqueous acid—235 nm ($A_1^1 = 270$ b), 298 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1605, 1278, 1246, 1670, 1210, 1700 (KBr disk).

Mass Spectrum. Principal peaks at m/z 86, 99, 136, 30, 58, 178, 87, 71.

Use. Propoxycaine hydrochloride has been used as a 0.5% solution.

Propranolol

Beta-adrenoceptor Blocking Agent

(±)-1-Isopropylamino-3-(1-naphthoxy)propan-2-ol

$C_{16}H_{21}NO_2 = 259.3$

CAS—525-66-6; 13013-17-7 (±)

Crystals. M.p. 94° to 96°.

Propranolol Hydrochloride

Proprietary Names. Angilol; Apsolol; Avlocardyl; Bedranol; Berkolol; Beta-Neg; Cardinol; Dociton; Frekven; Inderal; Inderalici; Sloprolol; Tonum. It is an ingredient of Inderetic, Inderex, and Spiroprop.

$C_{16}H_{21}NO_2 \cdot HCl = 295.8$

CAS—318-98-9; 3506-09-0 (±)

A white powder. M.p. about 164°.

Soluble 1 in 20 of water and ethanol; slightly soluble in chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 9.5 (24°).

Partition Coefficient. Log *P* (octanol/pH 7.4), 1.2.

Colour Tests. Mandelin's Test—green; Marquis Test—green.

Thin-layer Chromatography. System TA—Rf 50; system TB—Rf 07; system TC—Rf 10. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2157.

High Pressure Liquid Chromatography. System HA—propranolol k' 1.3, 4-hydroxypropranolol k' 1.1.

Ultraviolet Spectrum. Aqueous acid—288 nm ($A_1^1 = 222$ a), 305 nm, 319 nm; methanol—290 nm ($A_1^1 = 240$ a), 306 nm ($A_1^1 = 143$ a), 319 nm ($A_1^1 = 86$ a). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1103, 1270, 772, 1580, 795, 1240 (propranolol hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 72, 56, 30, 43, 98, 115, 144, 41; 4-hydroxypropranolol 72, 30, 116, 56, 43, 160, 41, 158.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity <1 ng/ml, ECD—R. E. Kates and C. L. Jones, *J. pharm. Sci.*, 1977, 66, 1490–1492.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: propranolol and 4-hydroxypropranolol, sensitivity 1 ng/ml for propranolol, fluorescence detection—R. L. Nation *et al.*, *J. Chromat.*, 1978, 145; *Biomed. Appl.*, 2, 429–436. In urine: propranolol and six metabolites, fluorescence and UV detection—J. F. Pritchard *et al.*, *J. Chromat.*, 1979, 162; *Biomed. Appl.*, 4, 47–58.

RADIOIMMUNOASSAY. In plasma: sensitivity 600 pg/ml—G. P. Mould *et al.*, *Biopharm. Drug Disp.*, 1981, 2, 49–57.

Disposition in the Body. Rapidly and almost completely absorbed after oral administration, but undergoes extensive first-pass metabolism with considerable intersubject variation; bioavailability 10 to 50% (mean 30). Metabolic reactions include ring hydroxylation, *N*-demethylation, oxidative deamination, and conjugation. In 48 hours, about 10% of a dose is excreted in the urine as propranolol glucuronide and less than 4% as unchanged drug. Metabolites found in the urine, in free and conjugated forms, include naphthoxylactic acid (14 to 22% of the dose in 48 hours) and the active metabolite, 4-hydroxypropranolol and its glucuronide (5 to 8% of the dose); propranolol glycol, *N*-desisopropylpropranolol, and naphthoxyacetic acid each account for less than 2% of the dose and 4-hydroxypropranolol sulphate accounts for about 18% of the dose. After intravenous doses, a greater proportion of naphthoxylactic acid (up to 40% of the dose) is excreted in the urine and 4-hydroxypropranolol is not found in the urine. Less than 5% of a dose is eliminated in the faeces.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.05 to 1 µg/ml. However, there is considerable intersubject variation and a correlation between plasma concentration and therapeutic effect has not been established.

After a single oral dose of 80 mg administered to 6 subjects, the following mean peak concentrations of drug and metabolites were found in the plasma after 2 hours: propranolol 0.05 µg/ml, naphthoxylactic acid 0.53 µg/ml, 4-hydroxypropranolol 0.009 µg/ml, naphthoxyacetic acid 0.024 µg/ml, propranolol glycol 0.005 µg/ml (D. W. Schneck *et al.*, *Clin. Pharmac. Ther.*, 1980, 27, 744–755).

Oral doses of 80 mg, administered twice daily to 24 subjects, produced steady-state plasma concentrations of 0.06 to 0.29 µg/ml (mean 0.16) (M. J. Serlin *et al.*, *Clin. Pharmac. Ther.*, 1980, 27, 586–592).

Following oral administration of 160 mg twice a day to 12 subjects, mean steady-state plasma concentrations of 0.38 µg/ml of propranolol and 0.03 µg/ml of 4-hydroxypropranolol were reported (B. G. Charles *et al.*, *J. Pharm. Pharmac.*, 1982, 34, 403–404).

TOXICITY. Toxic effects have been associated with plasma concentrations greater than 2 µg/ml and fatalities with concentrations greater than 4 µg/ml.

In a case of suicide attributed to propranolol overdose, the following concentrations were found: blood 14 µg/ml, brain 67 µg/g, liver 171 µg/g, urine 0.9 µg/ml; alcohol was also present (J. Kristinsson and T. Johannesson, *Acta pharmac. tox.*, 1977, 41, 190–192).

In two further cases of suicide, blood concentrations were 9 and 4 µg/ml and liver concentrations were 140 and 170 µg/g (N. Piper and D. Smith, *Bull. int. Ass. forens. Toxicol.*, 1976, 12(1), 17–18).

In a fatality due to the ingestion of 9.6 g of propranolol, in which death occurred 8 hours after ingestion, the following postmortem tissue concentrations were reported: blood 20 µg/ml, brain 6 µg/g, kidney 26 µg/g, liver 10 µg/g, lung 69 µg/g (J. W. Jones *et al.*, *J. forens. Sci.*, 1982, 27, 213–216).

HALF-LIFE. Plasma half-life, 2 to 6 hours (dose-dependent elimination has been reported).

VOLUME OF DISTRIBUTION. About 4 litres/kg.

CLEARANCE. Plasma clearance, about 10 to 20 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 1.3.

PROTEIN BINDING. In plasma, about 90%.

NOTE. For a review of the clinical pharmacokinetics of propranolol see P. A. Routledge and D. G. Shand, *Clin. Pharmacokinet.*, 1979, 4, 73-90. See also B. M. Silber *et al.*, *J. pharm. Sci.*, 1983, 72, 725-732.

Dose. 30 to 400 mg of propranolol hydrochloride daily.

Propyl Hydroxybenzoate

Preservative

Synonyms. Propagin; Propyl Parahydroxybenzoate; Propylparaben.

Proprietary Names. Nipasol M. It is an ingredient of Nipasept and Nipastat.

Propyl 4-hydroxybenzoate

$C_{10}H_{12}O_3 = 180.2$

CAS—94-13-3

Colourless crystals or a white crystalline powder. M.p. 95° to 98°.

Soluble 1 in 2500 of cold water, 1 in 400 of boiling water, 1 in 3.5 of ethanol, 1 in 4 of chloroform, and 1 in 3 of ether.

Sodium Propyl Hydroxybenzoate

Synonyms. Sodium Propylparaben; Soluble Propyl Hydroxybenzoate.

Proprietary Name. Nipasol M Sodium

$C_{10}H_{11}NaO_3 = 202.2$

CAS—35285-69-9

A white, hygroscopic, crystalline powder.

Soluble 1 in 1 of water, 1 in 50 of ethanol, and 1 in 2 of ethanol (50%).

Dissociation Constant. pK_a 8.4 (22°).

Gas Chromatography. System GA—RI 1567.

Ultraviolet Spectrum. Aqueous acid—255 nm ($A_1^1 = 877$ b); aqueous alkali—296 nm ($A_1^1 = 1324$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1276, 1165, 1220, 1317, 1665, 1600 (KBr disk).

Propylhexedrine

Sympathomimetic/Anorectic

Proprietary Name. Benzedrex

(±)-2-Cyclohexyl-1,N-dimethylethylamine

$C_{10}H_{21}N = 155.3$

CAS—101-40-6; 3595-11-7 (±)

A clear colourless liquid which slowly volatilises at room temperature and absorbs carbon dioxide from the air. Wt per ml 0.853 to 0.861 g. B.p. about 204°.

Very slightly **soluble** in water; miscible with ethanol, chloroform, and ether.

Propylhexedrine Hydrochloride

Proprietary Name. Eventin(e)

$C_{10}H_{21}N \cdot HCl = 191.7$

CAS—1007-33-6; 6192-95-6 (±)

A crystalline solid. M.p. about 127°, with decomposition.

Soluble in water, ethanol, and chloroform; slightly soluble in ether.

Dissociation Constant. pK_a 10.7 (25°).

Thin-layer Chromatography. System TA—Rf 26. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 1169; system GB—RI 1186; system GC—RI 1500.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1058, 1015, 885, 913, 1153, 966 (propylhexedrine hydrochloride, Nujol mull).

Mass Spectrum. Principal peaks at m/z 58, 140, 67, 72, 83, 81, 155, 156.

Disposition in the Body. Norpropylhexedrine, cyclohexylacetoxime, and *cis/trans*-4-hydroxypropylhexedrine have been identified as urinary metabolites.

TOXICITY. The estimated minimum lethal dose for children up to 2 years of age is 200 mg.

In a fatality attributed to propylhexedrine ingestion, the following postmortem tissue concentrations were reported: blood 35 µg/ml, bile 20 µg/ml, brain 24 µg/g, kidney 30 µg/g, liver 36 µg/g, lung 50 µg/g, urine 60 µg/ml (L. Riddick and R. Reisch, *J. forens. Sci.*, 1981, 26, 834-839).

The following postmortem tissue concentrations were reported in 2 fatalities involving intravenous abuse: blood 1.8 and 2.7 µg/ml, kidney 1.5 and 9.5 µg/g, liver 2.8 and 11.8 µg/g, urine 12.6 µg/ml (first case) (W. Q. Sturmer *et al.*, *J. forens. Sci.*, 1974, 19, 572-574).

In a fatality attributed to acute intravenous propylhexedrine abuse, postmortem tissue concentrations were: blood 2 µg/ml, bile 9.4 µg/ml, kidney 4.0 µg/g, liver 7.4 µg/g, urine 69.5 µg/ml (V. J. M. DiMaio and J. C. Garriott, *J. forens. Sci.*, 1977, 22, 152-158).

Dose. Usually 75 to 100 mg of propylhexedrine hydrochloride daily.

Propyliodone*Contrast Medium**Proprietary Name.* Dionosil

Propyl 1,4-dihydro-3,5-di-iodo-4-oxo-1-pyridylacetate

 $C_{10}H_{11}I_2NO_3 = 447.0$

CAS—587-61-1

A white crystalline powder. M.p. 187° to 190°.

Practically **insoluble** in water; soluble 1 in 500 of ethanol and 1 in 150 of chloroform; soluble in acetone and ether.**Colour Test.** Iodine Test—positive.**Thin-layer Chromatography.** *System TA*—Rf 81. (*Acidified iodoplatinate solution*, positive.)**Gas Chromatography.** *System GA*—not eluted.**Ultraviolet Spectrum.** Dehydrated alcohol—239 nm ($A_1^1 = 320$ a), 281 nm ($A_1^1 = 260$ a).**Infra-red Spectrum.** Principal peaks at wavenumbers 1730, 1200, 1567, 1608, 751, 1227 (KBr disk).**Use.** Administered as a 50% aqueous suspension or as a 60% oily suspension.**Propylthiouracil***Antithyroid Agent**Proprietary Names.* Propycil; Propyl-Thyracil; Thyreostat II.

2,3-Dihydro-6-propyl-2-thioxopyrimidin-4(1H)-one

 $C_7H_{10}N_2OS = 170.2$

CAS—51-52-5

White or pale cream-coloured crystals or crystalline powder. M.p. 218° to 221°.

Soluble 1 in 700 of water, 1 in about 60 of ethanol, and 1 in 60 of acetone; slightly soluble in chloroform and ether; soluble in solutions of alkali hydroxides.**Dissociation Constant.** pK_a 8.3 (20°).**Ultraviolet Spectrum.** Aqueous acid—275 nm ($A_1^1 = 987$ b); aqueous alkali—260 nm ($A_1^1 = 703$ a).**Infra-red Spectrum.** Principal peaks at wavenumbers 1658, 1563, 1193, 1625, 1166, 1241 (KBr disk).**Quantification.** HIGH PRESSURE LIQUID CHROMATOGRAPHY. In blood: sensitivity 300 ng/ml, UV detection—C. Kim, *J. Chromat.*, 1983, 272; *Biomed. Appl.*, 23, 376–379.**RADIOIMMUNOASSAY.** In serum: sensitivity 2.5 ng—D. S. Cooper *et al.*, *J. clin. Endocr. Metab.*, 1981, 52, 204–213.**Disposition in the Body.** Rapidly and almost completely absorbed after oral administration; concentrated in the thyroid. Metabolised by conjugation with glucuronic acid and sulphate. Less than 10% of a dose is excreted in the urine as unchanged drug.**THERAPEUTIC CONCENTRATION.**Following a single oral dose of 400 mg to 17 subjects, serum concentrations of 1.6 to 7.5 µg/ml (mean 4.2) were reported at 1 hour (J. P. Kampmann and J. E. M. Hansen, *Br. J. clin. Pharmac.*, 1981, 12, 681–686).**HALF-LIFE.** Plasma half-life, about 1 to 2 hours, increased in renal failure.**VOLUME OF DISTRIBUTION.** About 0.4 litre/kg.**CLEARANCE.** Plasma clearance, about 4 ml/min/kg.**PROTEIN BINDING.** In plasma, about 80%.**NOTE.** For a review of the pharmacokinetics of antithyroid drugs, see J. P. Kampmann and J. E. M. Hansen, *Clin. Pharmacokinet.*, 1981, 6, 401–428.**Dose.** Initially 200 to 600 mg daily; maintenance, 50 to 200 mg daily.**Propyphenazone***Analgesic**Synonyms.* Isopropylantipyrine; Isopropylphenazone.

4-Isopropyl-1,5-dimethyl-2-phenyl-4-pyrazolin-3-one

 $C_{14}H_{18}N_2O = 230.3$

CAS—479-92-5

White crystals or white crystalline powder. M.p. 101° to 103°.

Soluble 1 in 400 of water; freely soluble in ethanol and chloroform; soluble in ether.**Colour Tests.** Ferric Chloride—orange; Liebermann's Test (100°)—blue (red with water).**Thin-layer Chromatography.** *System TA*—Rf 71; *system TD*—Rf 61; *system TE*—Rf 73; *system TF*—Rf 50. (*Acidified potassium permanganate solution*, positive.)**Gas Chromatography.** *System GA*—RI 1925; *system GF*—RI 2310.**High Pressure Liquid Chromatography.** *System HD*— k' 1.25; *system HW*— k' 11.0.**Ultraviolet Spectrum.** Aqueous acid—240 nm ($A_1^1 = 400$ a); aqueous alkali—245 nm ($A_1^1 = 385$ b), 265 nm. (See below)**Infra-red Spectrum.** Principal peaks at wavenumbers 1650, 1618, 1131, 1590, 1500, 750 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 215, 230, 56, 77, 216, 96, 41, 39.**Dose.** Propyphenazone has been given in doses of 0.3 to 1.5 g daily.

Proquamezine

Antispasmodic (Veterinary)

Synonyms. Aminopromazine; Tetrameprozine.

NNN' - Tetramethyl - 3 - (phenothiazin - 10 - yl)propane - 1,2 - diamine

$C_{19}H_{25}N_3S = 327.5$

CAS—58-37-7

Proquamezine Fumarate

Proprietary Name. Myspamol

$(C_{19}H_{25}N_3S)_2 \cdot C_4H_4O_4 = 771.0$

CAS—3688-62-8

A white powder. M.p. about 168°, with decomposition.

Soluble 1 in 11 of water, 1 in 200 of ethanol, and 1 in 20 of methanol; practically insoluble in ether.

Partition Coefficient. Log *P* (octanol), 4.8.

Colour Tests. Forrester Reagent—violet → red → orange; FPN Reagent—violet-red → red → orange; Mandelin's Test—orange → violet; Marquis Test—violet.

Thin-layer Chromatography. *System TA*—Rf 50; *system TB*—Rf 43; *system TC*—Rf 19. (*Acidified iodoplatinate solution*, positive.)

Gas Chromatography. *System GA*—RI 2434.

Ultraviolet Spectrum. Aqueous acid—248 nm ($A_1^1 = 965$ a), 297 nm (broad) ($A_1^1 = 106$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1584, 745, 660, 1278, 1190, 765 (proquamezine fumarate, KBr disk).

Mass Spectrum. Principal peaks at *m/z* 198, 58, 115, 70, 269, 199, 72, 71.

Prothionamide

Antituberculous Agent

Proprietary Names. Ektebin; Trevintix.

2-Propylpyridine-4-carbothioamide

$C_9H_{12}N_2S = 180.3$

CAS—14222-60-7

Yellow crystals or crystalline powder. M.p. 140° to 143°.

Practically **insoluble** in water; soluble 1 in 30 of ethanol, 1 in 200 of chloroform, 1 in 300 of ether, and 1 in 16 of methanol; soluble in acetone.

Colour Tests. Nessler's Reagent—brown-orange; Palladium Chloride—brown.

Thin-layer Chromatography. *System TA*—Rf 66; *system TB*—Rf 01; *system TC*—Rf 38. (*Acidified iodoplatinate solution*, positive.)

Gas Chromatography. *System GA*—RI 1816.

Ultraviolet Spectrum. Ethanol—291 nm ($A_1^1 = 390$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 828, 1590, 1284, 902, 1148, 710 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 152, 119, 165, 163, 180, 60, 179, 153.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma, serum or urine: detection limit 10 ng/ml, UV detection—P. J. Jenner and G. A. Ellard, *J. Chromat.*, 1981, 225; *Biomed. Appl.*, 14, 245–251.

Disposition in the Body. Readily absorbed after oral administration. Metabolised to the sulfoxide and excreted in the urine mainly as metabolites.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 500 mg to 10 subjects, mean peak plasma concentrations of 3 µg/ml of unchanged drug and 2.7 µg/ml of the sulfoxide were attained in 1 hour (J. Pütter, *Arzneimittel-Forsch.*, 1972, 22, 1027–1031).

Dose. Usually 0.5 to 1 g daily.

Prothipendyl

Tranquilliser

Synonym. Phrenotropin*NN* - Dimethyl - 3 - (pyrido[3,2 - *b*][1,4]benzothiazin - 10 - yl) - propylamine $C_{16}H_{19}N_3S = 285.4$ *CAS*—303-69-5**Prothipendyl Hydrochloride***Proprietary Name.* Dominal $C_{16}H_{19}N_3S \cdot HCl \cdot H_2O = 339.9$ *CAS*—1225-65-6 (anhydrous)

A crystalline powder. M.p. 108° to 112°.

Freely **soluble** in water and methanol; practically insoluble in ether.**Dissociation Constant.** pK_a 2.3 (25°).**Partition Coefficient.** Log *P* (octanol), 5.5.**Colour Test.** Marquis Test—orange.**Thin-layer Chromatography.** *System TA*—Rf 47; *system TB*—Rf 45; *system TC*—Rf 23. (*Dragendorff spray*, positive; *FPN reagent*, yellow; *acidified iodoplatinate solution*, positive; *Marquis reagent*, orange.)**Gas Chromatography.** *System GA*—RI 2339; *system GF*—RI 2800.**High Pressure Liquid Chromatography.** *System HA*— k' 4.4.**Ultraviolet Spectrum.** Aqueous acid—242 nm ($A_1^1 = 928$ a); aqueous alkali—250 nm ($A_1^1 = 909$ a), 320 nm ($A_1^1 = 163$ b).**Infra-red Spectrum.** Principal peaks at wavenumbers 757, 1295, 780, 1592, 1162, 1110 (prothipendyl hydrochloride, KBr disk).**Mass Spectrum.** Principal peaks at m/z 58, 285, 214, 200, 86, 227, 85, 213.**Dose.** The equivalent of up to 960 mg of prothipendyl daily.**Protokylol**

Sympathomimetic

Synonym. Protochylol1 - (3,4 - Dihydroxyphenyl) - 2 - (α - methyl - 3,4 - methylenedioxyphenethylamino)ethanol $C_{18}H_{21}NO_5 = 331.4$ *CAS*—136-70-9**Protokylol Hydrochloride***Proprietary Names.* Asmetil; Beres. $C_{18}H_{21}NO_5 \cdot HCl = 367.8$ *CAS*—136-69-6

A white crystalline powder. M.p. about 126°.

Soluble in water.**Colour Tests.** Ammoniacal Silver Nitrate—red-grey/brown; Ferric Chloride—green; Folin-Ciocalteu Reagent—blue; Liebermann's Test—black; Mandelin's Test—yellow → brown; Marquis Test—grey-green; Methanolic Potassium Hydroxide—orange → yellow; Nessler's Reagent—black; Potassium Dichromate—brown → red-brown (on warming).**Thin-layer Chromatography.** *System TA*—Rf 65; *system TB*—Rf 01; *system TC*—Rf 03. (*Acidified potassium permanganate solution*, positive.)**Gas Chromatography.** *System GA*—RI 1487.**High Pressure Liquid Chromatography.** *System HA*— k' 3.1 (tailing peak).**Ultraviolet Spectrum.** Aqueous acid—281 nm ($A_1^1 = 168$ b).**Infra-red Spectrum.** Principal peaks at wavenumbers 1492, 1250, 1271, 1227, 1036, 1128 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 178, 44, 163, 135, 77, 196, 176, 179.**Dose.** Protokylol hydrochloride has been given in doses of 8 to 16 mg daily.

Protoveratrine A*Antihypertensive**Proprietary Name.* Pro-AmidProtoverine 6,7-diacetate 3(*S*)-(2-hydroxy-2-methylbutyrate) 15(*R*)-(2-methylbutyrate) $C_{41}H_{63}NO_{14} = 793.5$ *CAS*—143-57-7An alkaloid obtained from white veratrum, *Veratrum album* (Liliaceae).

White crystals. M.p. 259° to 262°; or 302° to 304°, with decomposition.

Practically **insoluble** in water; soluble in hot ethanol and in chloroform.**Protoveratrine B***Synonym.* NeoprotoveratrineProtoverine 6,7-diacetate 3(*S*)-(2,3-dihydroxy-2-methylbutyrate) 15(*R*)-(2-methylbutyrate) $C_{41}H_{63}NO_{15} = 809.9$ *CAS*—124-97-0

An alkaloid obtained from white veratrum.

White crystals. M.p. 254° to 255°; or 285° to 290°, with decomposition.

Practically **insoluble** in water; soluble in hot ethanol and in chloroform.**Protoveratrine A and B***CAS*—8053-18-7

A white crystalline powder with a strong sternutatory action. M.p. 256° to 262°, with decomposition.

Practically **insoluble** in water; soluble in chloroform; very slightly soluble in ether. It is rapidly decomposed in alkaline and alcoholic solutions.**Thin-layer Chromatography.** Protoveratrine A: *system TA*—Rf 72. Protoveratrine B: *system TA*—Rf 70. (*Acidified iodoplatinate solution*, positive; *acidified potassium permanganate solution*, positive.)**Gas Chromatography.** *System GA*—protoveratrine A and B, RI 2465.**Infra-red Spectrum.** Principal peaks at wavenumbers 1742, 1200, 1182, 1240, 1150, 1055 (protoveratrine A and B, KCl disk).**Dose.** Protoveratrine A and B have been given in a dose of 1.6 to 6 mg daily.**Protriptyline***Antidepressant*3-(5*H*-Dibenzo[*a,d*]cyclohepten-5-yl)-*N*-methylpropylamine $C_{19}H_{21}N = 263.4$ *CAS*—438-60-8**Protriptyline Hydrochloride***Proprietary Names.* Concordin(e); Maximed; Triptil; Vivactil.*Note.* The name Vivactil is also applied to a vitamin/amino acid preparation. $C_{19}H_{21}N \cdot HCl = 299.8$ *CAS*—1225-55-4

A white to yellowish powder. M.p. about 168°.

Soluble 1 in 2 of water, 1 in 3.5 of ethanol, and 1 in 2.5 of chloroform; practically insoluble in ether.**Partition Coefficient.** Log *P* (octanol/pH 7.4), 1.2.**Colour Tests.** Mandelin's Test—violet-brown; Marquis Test—green; Sulphuric Acid—green.**Thin-layer Chromatography.** *System TA*—Rf 19; *system TB*—Rf 17; *system TC*—Rf 07. (*Acidified iodoplatinate solution*, positive.)**Gas Chromatography.** *System GA*—RI 2261; *system GF*—RI 2590.**High Pressure Liquid Chromatography.** *System HA*—*k'* 2.1; *system HF*—*k'* 3.60.**Ultraviolet Spectrum.** Methanolic acid—292 nm ($A_1^1 = 530$ a). No alkaline shift.**Infra-red Spectrum.** Principal peaks at wavenumbers 792, 750, 768, 1490, 730, 1595 (protriptyline hydrochloride, KBr disk).**Mass Spectrum.** Principal peaks at *m/z* 70, 44, 191, 192, 188, 59, 165, 71; 10,11-dihydro-10,11-dihydroxyprotriptyline 44, 70, 179, 178, 207, 280, 250, 236; 10-hydroxyprotriptyline 70, 44, 207, 178, 279, 249, —, —.

Quantification. GAS CHROMATOGRAPHY. In serum: protriptyline and other tricyclic antidepressants, detection limit 10 to 20 ng/ml, AFID—J. Kristinsson, *Acta pharmac. tox.*, 1981, 49, 390–398.

GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In plasma: protriptyline and other tricyclic antidepressants, sensitivity 10 ng/ml—J. T. Biggs *et al.*, *J. pharm. Sci.*, 1976, 65, 261–268.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 60 ng/ml, UV detection—L. P. Hackett and L. J. Dusi, *Clin. Toxicol.*, 1979, 15, 55–61.

Disposition in the Body. Slowly but well absorbed after oral administration; bioavailability about 75 to 90% (10 to 25% first-pass metabolism). Metabolised by oxidation to form the 10-hydroxy and 10,11-dihydro-10,11-dihydroxy derivatives and 5,10-dihydro-10-formylanthracen-5-ylpropylamine; glucuronic acid conjugation also occurs. About 50% of a dose is excreted in the urine in 16 days with only small amounts of unchanged drug; about 2% of a dose is eliminated in the faeces.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.07 to 0.25 µg/ml.

After a single oral dose of 30 mg to 8 subjects, peak plasma concentrations of 0.010 to 0.022 µg/ml (mean 0.014) were attained in 6 to 12 hours (V. E. Ziegler *et al.*, *Clin. Pharmac. Ther.*, 1978, 23, 580–584).

Following daily oral doses of 40 mg to 30 subjects, steady-state plasma concentrations of 0.11 to 0.38 µg/ml (mean 0.22) were reported (J. P. Moody *et al.*, *Eur. J. clin. Pharmac.*, 1977, 11, 51–56).

TOXICITY. Toxic effects are associated with plasma concentrations greater than 0.5 µg/ml; concentrations above 1 µg/ml may be lethal.

HALF-LIFE. Plasma half-life, during chronic dosing, about 3 to 8 days (mean 4).

VOLUME OF DISTRIBUTION. About 22 litres/kg.

CLEARANCE. Plasma clearance, 2 to 5 ml/min/kg.

PROTEIN BINDING. In plasma, about 92%.

NOTE. For a review of tricyclic antidepressants see G. Molnar and R. N. Gupta, *Biopharm. Drug Disp.*, 1980, 1, 283–305.

Dose. 15 to 60 mg of protriptyline hydrochloride daily.

Proxymetacaine

Local Anaesthetic

Synonym. Proparacaine

2-Diethylaminoethyl 3-amino-4-propoxybenzoate

C₁₆H₂₆N₂O₃ = 294.4

CAS—499-67-2

Proxymetacaine Hydrochloride

Proprietary Names. Alcaine; Kéracaine; Ophthaine; Ophthetic; Piloptic.

C₁₆H₂₆N₂O₃·HCl = 330.9

CAS—5875-06-9

A white or faintly buff-coloured crystalline powder. It discolours on heating or exposure to air and solutions exposed to air become yellow and then dark brown. M.p. 178° to 185°.

Soluble 1 in 30 of water and 1 in 50 of ethanol; practically insoluble in ether; soluble in methanol.

Colour Tests. Coniferyl Alcohol—orange; Diazotisation—red; Ninhydrin—yellow.

Thin-layer Chromatography. System TA—Rf 62; system TB—Rf 26; system TC—Rf 41; system TL—Rf 35. (Acidified iodoplatinate solution, positive; Van Urk reagent, yellow.)

Gas Chromatography. System GA—RI 2323.

High Pressure Liquid Chromatography. System HA—k' 2.1; system HQ—k' 1.38.

Ultraviolet Spectrum. Water—231 nm, 268 nm (A₁¹ = 326 b), 310 nm (A₁¹ = 182 a).

Infra-red Spectrum. Principal peaks at wavenumbers 1213, 1708, 1305, 1104, 1590, 1520 (proxymetacaine hydrochloride, KCl disk).

Mass Spectrum. Principal peaks at m/z 86, 99, 30, 87, 58, 71, 136, 100.

Use. Proxymetacaine hydrochloride is used as a 0.5% ophthalmic solution.

Proxiphylline

Xanthine Bronchodilator

Proprietary Names. Pantafillina; Spantin; Spasmolysin; Thean.

7-(2-Hydroxypropyl)theophylline

C₁₀H₁₄N₄O₃ = 238.2

CAS—603-00-9

A white crystalline powder. M.p. 134° to 136°.

Soluble 1 in 1.5 of water, 1 in 12 of ethanol, 1 in 6 of chloroform, and 1 in 500 of ether.

Colour Test. Amalic Acid Test—yellow/violet.

Thin-layer Chromatography. System TA—Rf 58; system TB—Rf 02; system TC—Rf 33. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 2103.

High Pressure Liquid Chromatography. System HA—k' 0.1.

Ultraviolet Spectrum. Aqueous acid—273 nm ($A_1^1 = 372$ a). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1656, 1690, 750, 1538, 763, 1282 (KBr disk).

Mass Spectrum. Principal peaks at m/z 194, 180, 109, 193, 238, 95, 137, 81.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 100 ng/ml, ECD—A. Arbin *et al.*, *Acta pharm. suec.*, 1976, 13, 235–240.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: detection limit 12 ng/ml, UV detection—K. Selvig and K. S. Bjerve, *Scand. J. clin. Lab. Invest.*, 1977, 37, 373–378.

Disposition in the Body. Rapidly and completely absorbed after oral administration. More than 95% of a dose is excreted in the urine in 96 hours with about 30% as unchanged drug, 58% as 1-methyl-7-(2-hydroxypropyl)xanthine, 10% as proxiphylline glucuronide, and 2% as 1-methyl-7-(2-hydroxypropyl)uric acid.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 400 mg given to 5 subjects, plasma concentrations of 7 to 13 µg/ml (mean 10) were attained in 1 hour. Oral dosing of 5 subjects with 400 mg three times a day for 5 days, produced peak plasma concentrations of 12 to 25 µg/ml (mean 18) on the 5th day (C. Graffner *et al.*, *Acta pharm. suec.*, 1973, 10, 425–434).

HALF-LIFE. Plasma half-life, 8 to 12 hours (mean 9).

VOLUME OF DISTRIBUTION. About 0.6 litre/kg.

CLEARANCE. Plasma clearance, about 0.8 ml/min/kg.

Dose. Usually 900 mg daily.

Pseudoephedrine

Sympathomimetic

Synonyms. *d*-ψ-Ephedrine; *d*-Isoephedrine.

Proprietary Name. It is an ingredient of Extil.

(1*S*,2*S*)-2-Methylamino-1-phenylpropan-1-ol

$C_{10}H_{15}NO = 165.2$

CAS—90-82-4

An alkaloid obtained from *Ephedra* spp. It is a stereoisomer of ephedrine. M.p. 118° to 119°.

Sparingly soluble in water; soluble in ethanol and ether.

Pseudoephedrine Hydrochloride

Proprietary Names. D-Feda; Eltor; Novafed; Robidrine; Sinufed; Sudafed; Sudelix. It is an ingredient of Actifed, Benafed, Benylin Decongestant, CoTylenol, Deconamine, Fedahist, Fedrazil, Intensin, Linctifed, Naldegescic, Paragesic, Rondec, Sancos Co, and Triocos.

$C_{10}H_{15}NO \cdot HCl = 201.7$

CAS—345-78-8

White crystals or powder. M.p. 182° to 186°. A solution in water is dextrorotatory.

Soluble 1 in 1.6 of water, 1 in 4 of ethanol, and 1 in 60 of chloroform; very slightly soluble in ether.

Pseudoephedrine Sulphate

Proprietary Names. Afrinol; Drixora Repetabs. It is an ingredient of Congesteze, Disophrol, Drixoral, and Halin.

$(C_{10}H_{15}NO)_2 \cdot H_2SO_4 = 428.5$

CAS—7460-12-0

A white crystalline powder. M.p. 174° to 179°. A solution in water is dextrorotatory.

Soluble in water.

Dissociation Constant. pK_a 9.8.

Thin-layer Chromatography. System TA—Rf 33; system TB—Rf 54; system TC—Rf 04. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 1354; system GB—RI 1399; system GC—RI 1543.

High Pressure Liquid Chromatography. System HA—pseudoephedrine k' 1.2, norpseudoephedrine k' 1.0; system HB— k' 5.90; system HC— k' 1.77.

Ultraviolet Spectrum. Aqueous acid—251 nm, 257 nm ($A_1^1 = 11.9$ a), 263 nm. No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 704, 1036, 764, 1005, 1210, 1595 (pseudoephedrine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 58, 77, 59, 56, 51, 42, 105, 91.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: pseudoephedrine and norpseudoephedrine, sensitivity 20 ng/ml for pseudoephedrine in plasma, ECD—L. Y. Lo *et al.*, *J. Chromat.*, 1981, 222; *Biomed. Appl.*, 11, 297–302. In serum: detection limit 20 ng/ml, ECD—S.-R. Sun and M. J. Leveque, *J. pharm. Sci.*, 1979, 68, 1567–1568.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In urine: pseudoephedrine and norpseudoephedrine, sensitivity 1.5 µg/ml for pseudoephedrine, UV detection—C. M. Lai *et al.*, *J. pharm. Sci.*, 1979, 68, 1243–1246.

RADIOIMMUNOASSAY. In plasma: sensitivity 0.2 to 2.5 ng/ml depending on the method—J. W. A. Findlay *et al.*, *J. pharm. Sci.*, 1981, 70, 624–631.

Disposition in the Body. Rapidly and completely absorbed after

oral administration. Up to about 90% of a dose is excreted unchanged in the urine in 24 hours with less than 1% as norpseudoephedrine (cathine) (pH-dependent).

THERAPEUTIC CONCENTRATION.

After a single oral dose of 180 mg to 3 subjects, peak plasma concentrations of 0.72 to 0.81 µg/ml were attained in 2 to 3 hours (R. G. Kuntzman *et al.*, *Clin. Pharmac. Ther.*, 1971, 12, 62–67).

Following oral administration of 60 mg 4 times a day to 17 subjects, maximum steady-state plasma concentrations of 0.41 to 0.79 µg/ml (mean 0.55) were reported about 1.5 hours after a dose (J. G. Perkins *et al.*, *Curr. ther. Res.*, 1980, 28, 650–668).

TOXICITY. Toxic effects have occurred after single doses of 60 mg.

The following postmortem tissue concentrations were reported in a fatality involving pseudoephedrine: blood 19 µg/ml, brain 22 µg/g, liver 33 µg/g, urine 105 µg/ml (*Registry of Human Toxicology*, American Academy of Forensic Sciences, 1978).

HALF-LIFE. Plasma half-life, 5 to 8 hours but may be increased when the urine is alkaline and decreased when it is acid.

VOLUME OF DISTRIBUTION. About 3 litres/kg.

Dose. Usually 180 to 240 mg of pseudoephedrine hydrochloride daily.

Pseudomorphine

Synonym. Oxydimorphine

2,2'-Bimorphine

$C_{34}H_{36}N_2O_6 \cdot 3H_2O = 622.7$

CAS—125-24-6 (anhydrous); 6472-73-7 (trihydrate)

White crystals. M.p. 327°, with decomposition.

Practically **insoluble** in water, ethanol, and ether; soluble in dilute hydrochloric acid, dilute acetic acid, and pyridine.

Colour Test. Marquis Test—green.

Thin-layer Chromatography. System TA—Rf 46; system TB—Rf 00; system TC—Rf 00. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2770.

Ultraviolet Spectrum. Aqueous acid—231 nm ($A_1^1 = 308$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1118, 1098, 1069, 1044, 1195, 1210 (KBr disk).

Mass Spectrum. Principal peaks at m/z 30, 44, 42, 568, 31, 58, 27, 81.

NOTE. Pseudomorphine may be found as an oxidation product of morphine in decomposed viscera.

Psilocin

Hallucinogen

Synonym. 4-Hydroxy-*NN*-dimethyltryptamine
3-(2-Dimethylaminoethyl)indol-4-ol
 $C_{12}H_{16}N_2O = 204.3$
CAS—520-53-6

An indole alkaloid obtained from the mushroom *Psilocybe mexicana* (Agaricaceae).

White crystals. M.p. 173° to 176°.

Soluble in ethanol and dilute acetic acid.

Colour Test. Marquis Test—green-brown.

Thin-layer Chromatography. System *TA*—Rf 39; system *TB*—Rf 05; system *TC*—Rf 09. (*Van Urk* reagent, faint blue.)

Gas Chromatography. System *GA*—RI 1980.

High Pressure Liquid Chromatography. System *HA*—k' 3.1 (tailing peak).

Ultraviolet Spectrum. Aqueous acid—266 nm, 283 nm, 292 nm; aqueous alkali—270 nm, 293 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 836, 1261, 1236, 1042, 1061, 733.

Mass Spectrum. Principal peaks at *m/z* 58, 204, 59, 42, 30, 146, 77, 44.

Disposition in the Body. Absorbed from the gastro-intestinal tract. It is a metabolite of psilocybin. An oral dose of several milligrams may produce hallucinations and related effects.

Psilocybin

Hallucinogen

Synonym. 4-Phosphoryloxy-*NN*-dimethyltryptamine
3-(2-Dimethylaminoethyl)indol-4-yl dihydrogen phosphate
 $C_{12}H_{17}N_2O_4P = 284.3$
CAS—520-52-5

The main indole alkaloid present in the mushroom *Psilocybe mexicana* (Agaricaceae). Psilocybin is also present in the mushrooms *Stropharia cubensis* and *Conocybe* spp.

White crystals. M.p. 185° to 195°, with decomposition.

Soluble in dilute acetic acid.

Colour Test. Marquis Test—orange.

Thin-layer Chromatography. System *TA*—Rf 05. (*Van Urk* reagent, grey-violet.)

Gas Chromatography. System *GA*—RI 2059.

Ultraviolet Spectrum. Aqueous acid—268 nm; aqueous alkali—269 nm, 282 nm, 292 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1105, 1045, 1062, 1183, 1160, 932 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 58, 42, 30, 51, 204, 146, 77, 44.

Disposition in the Body. Absorbed from the gastro-intestinal tract; hallucinogenic effects usually occur within 30 minutes of ingestion with a duration of effect of about 6 hours. It is rapidly dephosphorylated to psilocin which appears to be the psycho-active compound.

Putrescine

Putrefactive Base

Synonym. Tetramethylenediamine

Butane-1,4-diamine

$\text{NH}_2 \cdot [\text{CH}_2]_4 \cdot \text{NH}_2 = 88.15$

CAS—110-60-1

Crystals with a strong odour. M.p. 27° to 28°. B.p. 158° to 159°. Very **soluble** in water.

Colour Test. Ninhydrin—violet.

Thin-layer Chromatography. System TA—Rf 02. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 930.

Infra-red Spectrum. Principal peaks at wavenumbers 1118, 874, 1288, 923, 1026, 1036 (KBr disk).

Pyrantel

Anthelmintic

Synonym. Pirantel

1,4,5,6 - Tetrahydro - 1 - methyl - 2 - [(E) - 2 - (2 - thienyl) - vinyl]pyrimidine

$\text{C}_{11}\text{H}_{14}\text{N}_2\text{S} = 206.3$

CAS—15686-83-6

Crystals. M.p. 178° to 179°.

Pyrantel Embonate

Synonym. Pyrantel Pamoate

Proprietary Names. Antiminth; Combantrin; Helmex; Strongid-P (vet.).

$\text{C}_{11}\text{H}_{14}\text{N}_2\text{S} \cdot \text{C}_{23}\text{H}_{16}\text{O}_6 = 594.7$

CAS—22204-24-6

A yellow to tan-coloured crystalline powder.

Practically **insoluble** in water, ethanol, and methanol; soluble in dimethyl sulphoxide.

Pyrantel Tartrate

$\text{C}_{11}\text{H}_{14}\text{N}_2\text{S} \cdot \text{C}_4\text{H}_6\text{O}_6 = 356.4$

CAS—33401-94-4

A white to pale greenish-yellow, crystalline powder. M.p. 147° to 151°.

Soluble 1 in 5 of water and 1 in 9 of methanol; slightly soluble in chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 11.0 (20°).

Colour Tests. Liebermann's Test—black; Mandelin's Test—violet; Marquis Test—blue-violet; Sulphuric Acid—orange → violet.

Thin-layer Chromatography. System TA—Rf 06. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—not eluted.

Ultraviolet Spectrum. Methanolic acid—315 nm ($A_1^1 = 920$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1640, 1605, 1305, 1208, 1132, 1065 (pyrantel tartrate, KBr disk).

Mass Spectrum. Principal peaks at m/z 205, 42, 135, 173, 206, 123, 145, 45.

Dose. The equivalent of 10 to 20 mg/kg of pyrantel, as a single dose.

Pyrazinamide

Antituberculous Agent

Synonym. Pyrazinoic Acid Amide

Proprietary Names. Piraldina; Pyrafat; Tebrazid; Zinamide.

Pyrazine-2-carboxamide

$\text{C}_5\text{H}_5\text{N}_3\text{O} = 123.1$

CAS—98-96-4

A white crystalline powder. M.p. 188° to 191°.

Soluble 1 in 60 of water and 1 in 110 of ethanol; soluble in chloroform and ether.

Dissociation Constant. pK_a 0.5.

Colour Test. Nessler's Reagent—brown-orange.

Thin-layer Chromatography. System TA—Rf 63.

Gas Chromatography. System GA—RI 1250.

Ultraviolet Spectrum. Aqueous acid—269 nm ($A_1^1 = 659$ a), 312 nm. No alkaline shift. (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 1685, 1020, 1600, 1584, 1050, 1165 (KBr disk). (See below)

Quantification. GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In serum or urine: pyrazinamide, pyrazine-2-carboxylic acid and 5-hydroxypyrazine-2-carboxylic acid, sensitivity 10 ng/ml for pyrazinamide—J. Roboz *et al.*, *J. Chromat.*, 1978, 147, 337–347.

Disposition in the Body. Well absorbed after oral administration. Metabolised by hydrolysis to pyrazine-2-carboxylic acid and subsequent hydroxylation to 5-hydroxypyrazine-2-carboxylic acid. In 24 hours, about 30 to 40% of a dose is excreted in the urine as pyrazine-2-carboxylic acid and less than 4% as unchanged drug; the 5-hydroxy metabolite is also excreted in the urine.

**THERAPEUTIC CONCENTRATION.**

After an oral dose of 3 g to one subject, a peak serum concentration of 134 µg/ml was attained in 1 hour; the serum concentration of pyrazine-2-carboxylic acid was 20 to 30 µg/ml after the first hour and the concentration of 5-hydroxypyrazine-2-carboxylic acid ranged between 3 and 8 µg/ml over a period of 12 hours (J. Roboz *et al.*, *ibid.*).

HALF-LIFE. Plasma half-life, 4 to 10 hours.

PROTEIN BINDING. In plasma, about 50%.

Dose. 20 to 35 mg/kg to a maximum of 3 g daily.

Pyridostigmine Bromide*Anticholinesterase*

Proprietary Names. Mestinon; Regonol.

3-Dimethylcarbamoyloxy-1-methylpyridinium bromide

$C_9H_{13}BrN_2O_2 = 261.1$

CAS—155-97-5 (pyridostigmine); 101-26-8 (bromide)

A white, deliquescent, crystalline powder. M.p. 153° to 157°.

Soluble 1 in less than 1 of water, 1 in less than 1 of ethanol, and 1 in 1 of chloroform; practically insoluble in ether.

Thin-layer Chromatography. System TA—Rf 04. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 1515.

High Pressure Liquid Chromatography. System HA—k' 6.3 (tailing peak).

Ultraviolet Spectrum. Aqueous acid—270 nm ($A_1^1 = 186$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1728, 1156, 1249, 1500, 1630, 1010 (KBr disk).

Mass Spectrum. Principal peaks at m/z 72, 39, 42, 38, 94, 56, 51, 81.

Quantification. GAS CHROMATOGRAPHY. In plasma: detection limit 5 ng/ml, AFID—K. Chan *et al.*, *J. Chromat.*, 1976, 120, 349–358.

GAS CHROMATOGRAPHY-MASS SPECTROMETRY. In plasma: sensitivity 50 ng/ml—S. M. Aquilonius *et al.*, *Eur. J. clin. Pharmac.*, 1980, 18, 423–428.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In blood or urine: sensitivity 40 ng/ml—R. I. Ellin *et al.*, *J. Chromat.*, 1982, 228; *Biomed. Appl.*, 17, 235–244.

Disposition in the Body. Poorly and irregularly absorbed after oral administration and may undergo significant first-pass metabolism. Up to about 16% of an oral dose is excreted in the urine unchanged, together with small amounts of 3-hydroxy-*N*-methylpyridinium. After intravenous administration, up to about 90% is excreted in the urine unchanged.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.05 to 0.1 µg/ml.

After a single oral dose of 120 mg to 5 subjects, peak plasma concentrations of about 0.04 to 0.07 µg/ml were attained in 1 to 2 hours (S. M. Aquilonius *et al.*, *Eur. J. clin. Pharmac.*, 1980, 18, 423–428).

Following daily oral doses of 60 to 660 mg to 6 subjects, maximum steady-state plasma concentrations of 0.04 to 0.08 µg/ml were reported (T. N. Calvey and K. Chan, *Clin. Pharmac. Ther.*, 1977, 21, 187–193).

HALF-LIFE. Plasma half-life, 0.3 to 2 hours, increased in subjects with renal disease.

VOLUME OF DISTRIBUTION. About 1 litre/kg.

CLEARANCE. Plasma clearance, about 8 to 16 ml/min/kg.

Dose. Usually 0.3 to 1.2 g daily.

Pyridoxine

Vitamin

Synonyms. Adermine; Pyridoxol; Vitamin B₆.

3-Hydroxy-4,5-bis(hydroxymethyl)-2-methylpyridine

C₈H₁₁NO₃ = 169.2

CAS—65-23-6

Pyridoxine Hydrochloride

Proprietary Names. Bécilan; Benadon; Comploment; Dermo 6; Hexa-Betalin; Hexavibex; Hexobion; Paxadon; Pydiox; Pyroxin; Seibion. It is an ingredient of Ancoloxin, Apisate, Bendectin, Debendox, and Optimax.

C₈H₁₁NO₃·HCl = 205.6

CAS—58-56-0

A white crystalline powder, or crystals. M.p. 202° to 206°, with decomposition.

Soluble 1 in 5 of water and 1 in about 115 of ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 5.0 (—N=), 9.0 (—OH), (25°).

Colour Test. Mandelin's Test—blue → grey-green.

Thin-layer Chromatography. System TA—Rf 59. (Acidified potassium permanganate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—290 nm (A₁¹ = 523 a); phosphate buffer (pH 6.88)—254 nm (A₁¹ = 219 a), 324 nm (A₁¹ = 426 a).

Infra-red Spectrum. Principal peaks at wavenumbers 1277, 1212, 1015, 1540, 870, 1086 (pyridoxine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at *m/z* 151, 94, 122, 106, 51, 53, 149, 150.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: pyridoxine, pyridoxal and 4-pyridoxic acid, sensitivity 300 ng/ml for plasma, 500 ng/ml for urine, UV detection—W. J. O'Reilly *et al.*, *J. Chromat.*, 1980, 183; *Biomed. Appl.*, 9, 492–498.

Disposition in the Body. Absorbed from the gastro-intestinal tract and converted to the active form, pyridoxal phosphate. Excreted in the urine mainly as 4-pyridoxic acid.

PROTEIN BINDING. In plasma, pyridoxine not significantly bound, pyridoxal phosphate almost completely bound.

Dose. 20 to 200 mg of pyridoxine hydrochloride daily.

Pyrimethamine

Antimalarial

Proprietary Names. Daraprim; Erba-prelina. It is an ingredient of Fansidar, Maloprim, Supacox (vet.), and Whitsyn S (vet.).

5-(4-Chlorophenyl)-6-ethylpyrimidine-2,4-diamine

C₁₂H₁₃ClN₄ = 248.7

CAS—58-14-0

A white crystalline powder. M.p. 238° to 242°.

Practically **insoluble** in water; soluble 1 in 200 of ethanol and 1 in 125 of chloroform; soluble in warm dilute mineral acids.

Dissociation Constant. pK_a 7.0 (20°).

Thin-layer Chromatography. System TA—Rf 61; system TB—Rf 02; system TC—Rf 31. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2138.

High Pressure Liquid Chromatography. System HA—k' 1.0.

Ultraviolet Spectrum. Aqueous acid—272 nm (A₁¹ = 320 a); aqueous alkali—286 nm (A₁¹ = 381 b). (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 1628, 1575, 1640, 1075, 835, 805 (KBr disk).

Mass Spectrum. Principal peaks at m/z 247, 248, 249, 250, 219, 212, 106, 221.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: sensitivity 5 ng/ml, ECD—C. Midskov, *J. Chromat.*, 1984, 306; *Biomed. Appl.*, 31, 388–393.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 10 ng/ml, fluorescence detection—U. Timm and E. Weidekamm, *J. Chromat.*, 1982, 230; *Biomed. Appl.*, 19, 107–114.

Disposition in the Body. Well absorbed after oral administration, and very slowly excreted in the urine, about 20% of a dose being excreted in 7 days.

THERAPEUTIC CONCENTRATION.

A single oral dose of 50 mg given to 5 subjects produced a peak plasma concentration of 0.21 to 0.43 $\mu\text{g/ml}$ (mean 0.34) in 2 to 4 hours, followed by a slow decline over several days (L. Donno *et al.*, *Curr. ther. Res.*, 1980, 27, 346–355).

TOXICITY. Children have died following ingestion of 0.4 to 1 g.

HALF-LIFE. Plasma half-life, about 4 days.

Dose. Up to 75 mg daily.

Pyridithium Bromide

Trypanocide (Veterinary)

Synonym. Pyritidium Bromide

3-Amino-8-(2-amino-1,6-dimethylpyrimidin-4-ylamino)-6-(4-aminophenyl)-5-methylphenanthridinium dibromide

$\text{C}_{26}\text{H}_{27}\text{Br}_2\text{N}_7 = 597.4$

CAS—3616-05-5 (pyridithium); 14222-46-9 (bromide)

A brick-red to reddish-purple, hygroscopic powder.

Soluble 1 in 40 of water and 1 in 1900 of ethanol.

Thin-layer Chromatography. System TA—Rf 01. (Location under ultraviolet light, yellow fluorescence; acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—256 nm ($A_1^1 = 425$ a), 313 nm ($A_1^1 = 813$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1615, 1642, 1515, 1250, 1562, 1298 (KBr disk).

Pyrrobutamine

Antihistamine

1-[4-(4-Chlorophenyl)-3-phenylbut-2-enyl]pyrrolidine

$\text{C}_{20}\text{H}_{22}\text{ClN} = 311.9$

CAS—91-82-7

An oily liquid. On standing gives crystals. M.p. 48° to 49°.

Pyrrobutamine Phosphate

Proprietary Name. It is an ingredient of Co-Pyronil.

$\text{C}_{20}\text{H}_{22}\text{ClN} \cdot 2\text{H}_3\text{PO}_4 = 507.8$

CAS—135-31-9

A white crystalline powder. M.p. 127° to 131°.

Soluble in water; soluble 1 in 20 of ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 8.8 (25°).

Colour Tests. Liebermann's Test—brown; Mandelin's Test—violet; Marquis Test—grey-violet.

Thin-layer Chromatography. System *TA*—Rf 54; system *TB*—Rf 55; system *TC*—Rf 37. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, grey.)

Gas Chromatography. System *GA*—RI 2419; system *GF*—RI 2815.

High Pressure Liquid Chromatography. System *HA*— k' 2.8.

Infra-red Spectrum. Principal peaks at wavenumbers 995, 1018, 1087, 772, 1492, 820 (pyrrobutamine phosphate, KBr disk).

Mass Spectrum. Principal peaks at m/z 205, 240, 91, 84, 125, 242, 206, 186.

Dose. 30 to 90 mg of pyrrobutamine phosphate daily.

Quinalbarbitone

Barbiturate

Synonyms. Meballymal; Secobarbital.

Proprietary Name. Seconal

5-Allyl-5-(1-methylbutyl)barbituric acid

$C_{12}H_{18}N_2O_3 = 238.3$

CAS—76-73-3

A white amorphous or crystalline powder. M.p. 100°. Very slightly soluble in water; freely soluble in ethanol and ether; soluble in chloroform.

Quinalbarbitone Sodium

Synonyms. Meballymalnatrium; Secobarbital Sodium; Secobarbitone Sodium.

Proprietary Names. Immenoctal; Immenox; Proquinal; Quinbar; Secogen; Seconal Sodium; Seral. It is an ingredient of Tuinal.

$C_{12}H_{17}N_2NaO_3 = 260.3$

CAS—309-43-3

A white hygroscopic powder.

Soluble 1 in 3 of water and 1 in 5 of ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 7.9 (20°).

Colour Tests. Koppanyi-Zwikker Test—violet; Mercurous Nitrate—black; Vanillin Reagent—brown-red/violet.

Thin-layer Chromatography. System *TD*—Rf 55; system *TE*—Rf 44; system *TF*—Rf 68; system *TH*—Rf 78. (Mercuric chloride-diphenylcarbazone reagent, positive; mercurous nitrate spray, black; acidified potassium permanganate solution, yellow-brown; Zwikker's reagent, pink.)

Gas Chromatography. System *GA*—quinalbarbitone RI 1791, 3'-hydroxyquinalbarbitone RI 1965; system *GF*—RI 2510.

High Pressure Liquid Chromatography. System *HG*— k' 16.28; system *HH*— k' 11.47.

Ultraviolet Spectrum. Borax buffer 0.05M (pH 9.2)—239 nm ($A_1^1 = 393$ a); M sodium hydroxide (pH 13)—254 nm ($A_1^1 = 330$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1559, 1648, 1690, 1298, 1270, 925 (quinalbarbitone sodium, KBr disk).

Mass Spectrum. Principal peaks at m/z 167, 168, 41, 43, 97, 124, 39, 55; 5-(2,3-dihydroxypropyl)quinalbarbitone 171, 43, 143, 41, 128, 55, 141, 159; 3'-hydroxyquinalbarbitone 41, 45, 43, 168, 39, 70, 69, 167; 3'-ketoquinalbarbitone 43, 69, 168, 41, 85, 167, 86, 169.

Quantification. See also under Amylobarbitone.

GAS CHROMATOGRAPHY. In plasma or urine: sensitivity 200 ng/ml in plasma, FID—J. L. Valentine *et al.*, *Analyt. Lett. (Part B)*, 1982, 15, 343–361.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: detection limit 20 ng/ml, UV detection—H. L. Levine *et al.*, *J. pharm. Sci.*, 1982, 71, 1281–1283.

Disposition in the Body. About 90% of a dose is absorbed after oral administration. The major metabolic reactions are hydroxylation of both side-chains at the C_5 -position with further

oxidation of the ω -position on the butyl side-chain. Less than 5% of an oral dose is excreted unchanged in the urine. Two diastereoisomeric forms of the following metabolites have been found in the urine, each metabolite accounting for about 4% of the dose in 24 hours: 5-allyl-5-(3-hydroxy-1-methylbutyl)-barbituric acid (3'-hydroxyquinalbarbitone), 5-allyl-5-(3-carboxy-1-methylpropyl)barbituric acid, and 5-(2,3-dihydroxypropyl)quinalbarbitone; an additional metabolite, 5-allyl-5-(1-methyl-3-oxobutyl)barbituric acid (3'-ketoquinalbarbitone), accounts for about 3% of the dose in 96 hours. A total of about 45% of the dose is excreted in the urine over a period of 108 hours.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 2 to 10 $\mu\text{g/ml}$.

After an oral dose of 3.3 mg/kg to 6 subjects, peak blood concentrations of 2.0 to 2.2 $\mu\text{g/ml}$ (mean 2.1) were attained in about 3 hours (J. M. Clifford *et al.*, *Clin. Pharmac. Ther.*, 1974, 16, 376-389).

TOXICITY. The estimated minimum lethal dose is 2 g. Toxic effects are usually associated with blood concentrations greater than about 8 $\mu\text{g/ml}$. In 276 reported fatalities attributed to quinalbarbitone, blood concentrations ranged from 4 to 132 $\mu\text{g/ml}$ (mean 30).

The following postmortem tissue distribution was reported in 5 fatalities: blood 35 to 123 $\mu\text{g/ml}$ (mean 66), brain 109 $\mu\text{g/g}$ (1 case), kidney 67 to 270 $\mu\text{g/g}$ (mean 152, 3 cases), liver 25 to 605 $\mu\text{g/g}$ (mean 271, 4 cases), spleen 42 $\mu\text{g/g}$ (1 case), urine 12 to 182 $\mu\text{g/ml}$ (mean 72, 3 cases) (C. J. Rehling, *Poison Residues in Human Tissues*, in *Progress in Chemical Toxicology*, Vol. 3, A. Stolman (Ed.), New York, Academic Press Inc., 1967, p. 371).

The following postmortem tissue concentrations ($\mu\text{g/ml}$ or $\mu\text{g/g}$) were reported in 3 fatalities due to quinalbarbitone:

	Quinalbarbitone	3'-Hydroxyquinalbarbitone
Blood	12, 9, 13	0, —, 2
Bile	—, 42, 79	—, —, 0
Left Kidney	37, 25, 25	3, —, 17
Right Kidney	69, 24, 28	4, —, 16
Liver	77, 51, 44	4, —, 25
Urine	6, 3, 32	0, —, 33

(A. E. Robinson and R. D. McDowall, *J. Pharm. Pharmacol.*, 1979, 31, 357-365).

HALF-LIFE. Plasma half-life, 19 to 34 hours (mean 25).

VOLUME OF DISTRIBUTION. About 1.5 litres/kg.

CLEARANCE. Plasma clearance, about 0.8 ml/min/kg.

SALIVA. Plasma: saliva ratio, about 3.3.

PROTEIN BINDING. In plasma, about 70%.

Dose. 50 to 200 mg daily.

Quinethazone

Diuretic

Synonym. Chinethazonum

Proprietary Names. Aquamox; Hydromox.

7-Chloro-2-ethyl-1,2,3,4-tetrahydro-4-oxoquinazoline-6-sulphonamide

$\text{C}_{10}\text{H}_{12}\text{ClN}_3\text{O}_3\text{S}$ = 289.7

CAS—73-49-4

A white to yellowish-white, crystalline powder. M.p. 245° to 252°.

Very slightly soluble in water; slightly soluble in ethanol; freely soluble in solutions of alkali hydroxides and carbonates.

Dissociation Constant. pK_a 9.3, 10.7.

Colour Test. Koppanyi-Zwicker Test—violet.

Thin-layer Chromatography. System TA—Rf 75; system TD—Rf 04; system TE—Rf 41; system TF—Rf 21. (Location under ultraviolet light, blue fluorescence; acidified iodoplatinate solution, positive.)

High Pressure Liquid Chromatography. System HN— k' 0.67.

Ultraviolet Spectrum. Ethanol—234 nm (A_1^1 = 1532 a), 278 nm, 345 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1600, 1650, 1160, 960, 1510, 1040 (KBr disk).

Mass Spectrum. Principal peaks at m/z 260, 262, 180, 287, 261, 145, 286, 124.

Dose. 50 to 200 mg daily.

Quinidine

Anti-arrhythmic

Synonyms. Chinidinum; Quinidina.

(8*R*,9*S*)-6'-Methoxycinchonan-9-ol dihydrate

$\text{C}_{20}\text{H}_{24}\text{N}_2\text{O}_2 \cdot 2\text{H}_2\text{O}$ = 360.5

CAS—56-54-2 (anhydrous); 63717-04-4 (dihydrate)

A dextrorotatory stereoisomer of quinine, obtained from the bark of species of *Cinchona* (Rubiaceae). Commercial samples may contain 20 to 30% of hydroquinidine.

A white amorphous powder or acicular crystals.

Soluble 1 in 2000 of water and 1 in 70 of ether. The anhydrous alkaloid is soluble 1 in 1.6 of chloroform.

Quinidine Bisulphate

Proprietary Names. Biquin; Kilitard; Kinidin Durules; Quinidurile.

$C_{20}H_{24}N_2O_2 \cdot H_2SO_4 = 422.5$

CAS—747-45-5

Colourless crystals.

Soluble 1 in 8 of water and 1 in 3 of ethanol; practically insoluble in ether.

Quinidine Gluconate

Proprietary Names. Duraquin; Quinaglute; Quinate.

$C_{20}H_{24}N_2O_2 \cdot C_6H_{12}O_7 = 520.6$

CAS—7054-25-3

A white powder. M.p. 175° to 177°.

Freely **soluble** in water; slightly soluble in ethanol.

Quinidine Polygalacturonate

Proprietary Names. Cardioquin; Galactokin.

$C_{20}H_{24}N_2O_2 \cdot (C_6H_{10}O_7)_x \cdot xH_2O$

CAS—27555-34-6 (anhydrous); 65484-56-2 (hydrate)

An amorphous powder. M.p. 180°, with decomposition.

The anhydrous product is sparingly **soluble** in water; practically insoluble in ethanol, chloroform, ether, and methanol.

Quinidine Sulphate

Proprietary Names. Cin-Quin; Kinidine; Quinicardine; Quinidex; Quinidoxin; Quinora; Systodin.

$(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O = 782.9$

CAS—50-54-4 (anhydrous); 6591-63-5 (dihydrate)

White acicular crystals or fine white powder, darkening on exposure to light. M.p. about 207°, with decomposition.

Soluble 1 in 80 of water, 1 in 10 of ethanol, and 1 in 15 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 4.2, 8.8 (20°).

Colour Tests. Sulphuric Acid—yellow (fluoresces under ultraviolet light); Thalleioquin Test—green.

Thin-layer Chromatography. *System TA*—Rf 51; *system TB*—Rf 03; *system TC*—Rf 11. (Location under ultraviolet light, blue fluorescence; *Dragendorff* spray, positive; *acidified iodoplatinate solution*, positive.)

Gas Chromatography. *System GA*—RI 2798.

High Pressure Liquid Chromatography. *System HA*—k' 2.1.

Ultraviolet Spectrum. Aqueous acid—250 nm ($A_1^1 = 959$ a), 317 nm, 345 nm; aqueous alkali—280 nm, 330 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1258, 1514, 1619, 1040, 860, 820 (KBr disk).

Mass Spectrum. Principal peaks at m/z 136, 81, 322, 188, 55, 42, 41, 172.

Quantification. GAS CHROMATOGRAPHY. In serum: quinidine and other anti-arrhythmic agents, AFID—K. M. Kessler *et al.*, *Clin. Chem.*, 1982, 28, 1187–1190.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: quinidine and other anti-arrhythmic agents, sensitivity 500 ng/ml, UV detection—R. R. Bridges and T. A. Jennison, *J. analyt. Toxicol.*, 1983, 7, 65–68. In plasma: quinidine, hydroquinidine, and 2 quinidine metabolites, sensitivity 50 ng/ml for quinidine, fluorescence detection—L. K. Pershing *et al.*, *J. analyt. Toxicol.*, 1982, 6, 153–156. In plasma or urine: quinidine, hydroquinidine and quinidine metabolites, detection limit 10 ng/ml for quinidine, fluorescence and UV detection—T. W. Guentert *et al.*, *J. Chromat.*, 1980, 183; *Biomed. Appl.*, 9, 514–518.

Disposition in the Body. Readily absorbed after oral administration; bioavailability about 70 to 80% but there is considerable intersubject variation. Extensively metabolised, mainly by hydroxylation. The major metabolites, 3-hydroxyquinidine and

quinidin-2'-one appear to be pharmacologically active. Hydroquinidine which may occur in quinidine as an impurity, at concentrations of up to about 30%, has similar pharmacological activity to quinidine. About 10 to 30% of a dose is excreted in the urine as unchanged drug in 48 hours and the remainder is mostly excreted in the urine as metabolites; *O*-desmethylquinidine accounts for about 2% of a dose; quinidine-10,11-dihydrodiol and an *N*-oxide metabolite have been detected in plasma and urine. The proportion of unchanged drug is dependent on the urinary pH, being decreased if the urine is alkaline.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 2 to 6 µg/ml; there is, however, considerable intersubject variation. Concentrations appear to be higher in subjects with congestive heart failure.

After single oral doses of 4.5 mg/kg of quinidine sulphate to 10 subjects, peak plasma concentrations of 0.9 to 1.8 µg/ml (mean 1.2) were attained in about 50 minutes (T. W. Guentert *et al.*, *J. Pharmacokinet. Biopharm.*, 1979, 7, 315–330).

Following daily oral doses of 8 to 19 mg/kg (mean 12) to 5 subjects, steady-state serum concentrations of 0.5 to 2.5 µg/ml (mean 1.8) of quinidine, 0.38 to 0.94 µg/ml (mean 0.55) of 3-hydroxyquinidine, and 0.02 to 0.12 µg/ml (mean 0.07) of quinidin-2'-one, were reported; following daily oral doses of 8.6 to 13.3 mg/kg (mean 10.7) to 8 subjects with mild renal dysfunction, steady-state serum-quinidine concentrations ranged from 1.4 to 3.6 µg/ml (mean 2.3) (D. E. Drayer *et al.*, *Clin. Pharmac. Ther.*, 1978, 24, 31–39).

TOXICITY. Plasma concentrations greater than 6 µg/ml are progressively associated with toxicity, and concentrations of about 15 µg/ml may cause toxic reactions in about 50% of patients; concentrations in excess of about 30 µg/ml may be lethal.

The following postmortem tissue concentrations were reported in one fatality: blood 75 µg/ml, brain 11 µg/g, kidney 89 µg/g, liver 145 µg/g, spleen 136 µg/g, urine 52 µg/ml; 3-hydroxyquinidine, and lactone conjugates of quinidine and 3-hydroxyquinidine were also detected (J. G. Leferink *et al.*, *J. analyt. Toxicol.*, 1977, 1, 62–65).

In a fatality involving the ingestion of about 5 g of a sustained-release preparation by a 2-year-old child, the following postmortem tissue concentrations were reported: blood 45 µg/ml, kidney 180 µg/g, liver 220 µg/g; death occurred 28 hours after ingestion (A. J. McBay and R. F. Turk, *Bull. int. Ass. forens. Toxicol.*, 1972, 8(4), 2–3).

HALF-LIFE. Plasma half-life, about 4 to 12 hours (mean 7).

VOLUME OF DISTRIBUTION. About 2 to 3 litres/kg, decreased in subjects with congestive heart failure.

CLEARANCE. Plasma clearance, about 4 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 1.0.

PROTEIN BINDING. In plasma, quinidine about 75 to 90%, 3-hydroxyquinidine about 70%, and quinidin-2'-one about 55%.

NOTE. For a review of the pharmacokinetics of quinidine see H. R. Ochs *et al.*, *Clin. Pharmacokinet.*, 1980, 5, 150–168.

Dose. Usually 0.6 to 1.6 g of quinidine sulphate daily.

Quinine

Antimalarial

Synonym. Chininum

(8*S*,9*R*)-6'-Methoxycinchonan-9-ol trihydrate

$C_{20}H_{24}N_2O_2 \cdot 3H_2O = 378.5$

CAS—130-95-0 (anhydrous)

The chief alkaloid of various species of *Cinchona* (Rubiaceae). It is a laevorotatory stereoisomer of quinidine.

A white, slightly efflorescent, flaky, granular or microcrystalline powder. M.p. about 173°.

Very slightly **soluble** in water; soluble 1 in 1 of ethanol (90%), 1 in 3 of chloroform, and 1 in 4 of ether saturated with water.

Quinine Bisulphate

Synonyms. Neutral Quinine Sulphate; Quinine Acid Sulphate.

Proprietary Names. Biquin; Biquinate; Dentojel; Myoquin; Quinbisan.

$C_{20}H_{24}N_2O_2 \cdot H_2SO_4 \cdot 7H_2O = 548.6$

CAS—549-56-4 (anhydrous)

Colourless crystals or white crystalline powder. It effloresces in dry air and becomes yellow when exposed to light.

Soluble 1 in 8 of water, 1 in 50 of ethanol, and 1 in 625 of chloroform.

Quinine Dihydrobromide

Synonyms. Neutral Quinine Hydrobromide; Quinine Acid Hydrobromide.

$C_{20}H_{24}N_2O_2 \cdot 2HBr \cdot 3H_2O = 540.3$

CAS—549-47-3 (anhydrous)

Yellowish or white crystals or powder.

Soluble 1 in 7 of water; soluble in ethanol; practically insoluble in ether.

Quinine Dihydrochloride

Synonyms. Neutral Quinine Hydrochloride; Quinine Acid Hydrochloride.

$C_{20}H_{24}N_2O_2 \cdot 2HCl = 397.3$

CAS—60-93-5

A white powder.

Soluble 1 in 0.5 of water, 1 in 14 of ethanol, and 1 in 7 of chloroform; practically insoluble in ether.

Quinine Ethyl Carbonate

Synonym. Euquinina

$C_{22}H_{28}N_2O_4 = 396.5$

CAS—83-75-0

White masses of silky crystals which darken on exposure to light. M.p. 91° to 95°.

Very slightly **soluble** in water; soluble 1 in 2 of ethanol, 1 in 1 of chloroform, and 1 in 10 of ether.

Quinine Hydrobromide

Synonym. Basic Quinine Hydrobromide

Proprietary Name. Coquelusédal Quinine

$C_{20}H_{24}N_2O_2 \cdot HBr \cdot 2H_2O = 441.4$

CAS—549-49-5 (anhydrous)

White, silky, efflorescent crystals which darken on exposure to light.

Soluble 1 in about 55 of water, 1 in 0.7 of ethanol, and 1 in 1 of chloroform, the solution in chloroform being turbid due to separation of water.

Quinine Hydrochloride

Synonym. Basic Quinine Hydrochloride

Proprietary Name. Kinin

$C_{20}H_{24}N_2O_2 \cdot HCl \cdot 2H_2O = 396.9$

CAS—130-89-2 (anhydrous); 6119-47-7 (dihydrate)

Colourless, fine, silky, acicular crystals which effloresce in dry air and gradually become yellowish on exposure to light.

Soluble 1 in 23 of water, 1 in 0.9 of ethanol, and 1 in 2 of chloroform to give a turbid solution; very slightly soluble in ether.

Quinine Salicylate

$C_{20}H_{24}N_2O_2 \cdot C_7H_6O_3 \cdot H_2O = 480.6$

CAS—750-90-3 (anhydrous)

White silky crystals or a crystalline powder; it becomes pink on storage.

Very slightly **soluble** in water; soluble 1 in 24 of ethanol and 1 in 25 of chloroform.

Quinine Sulphate

Synonym. Basic Quinine Sulphate

Proprietary Names. Adquin; Kinine; Quinamm; Quinate; Quine; Quinite; Quinocet; Quinsan.

$(C_{20}H_{24}N_2O_2)_2 \cdot H_2SO_4 \cdot 2H_2O = 782.9$

CAS—804-63-7 (anhydrous); 6119-70-6 (dihydrate)

Colourless acicular crystals or a white crystalline powder, becoming brown on exposure to light.

Soluble 1 in about 810 of water and 1 in about 95 of ethanol; slightly soluble in chloroform and ether; readily soluble in a 2:1 mixture of chloroform and dehydrated alcohol.

Dissociation Constant. pK_a 4.1, 8.5 (20°).

Colour Tests. Sulphuric Acid—yellow (fluoresces under ultraviolet light); Thalleioquin Test—green.

Thin-layer Chromatography. System *TA*—Rf 51; system *TB*—Rf 03; system *TC*—Rf 11. (Location under ultraviolet light, blue fluorescence; *Dragendorff spray*, positive; *acidified iodoplatinate solution*, positive.)

Gas Chromatography. System *GA*—RI 2798.

High Pressure Liquid Chromatography. System *HA*— k' 2.4; system *HS*— k' 2.02.

Ultraviolet Spectrum. Aqueous acid—250 nm ($A_1^1 = 959$ a), 317 nm, 346 nm; aqueous alkali—280 nm, 330 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1235, 1215, 1510, 1619, 1030, 1105 (KBr disk).

Mass Spectrum. Principal peaks at m/z 136, 137, 81, 42, 41, 189, 55, 117.

Quantification. SPECTROFLUORIMETRY. In plasma or urine—A. P. Hall *et al.*, *Clin. Pharmac. Ther.*, 1973, 14, 580–585.

GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In urine: sensitivity 50 pg—R. L. Furner *et al.*, *J. analyt. Toxicol.*, 1981, 5, 275–278.

Disposition in the Body. Readily absorbed after oral administration but more slowly absorbed after intramuscular or subcutaneous doses. Hydroquinine may occur in quinine as an impurity at concentrations up to about 10%. Metabolised by oxidation to hydroxylated metabolites, mainly the 2-hydroxyquinoline and 6-hydroxyquinoline derivatives, 3-hydroxyquinine, and the corresponding dihydro compounds; quinine-10,11-epoxide and quinine-10,11-dihydrodiol have also been detected in urine. Up to about 20% of a single dose is excreted in the urine in 24 hours with less than 5% as unchanged drug. Less than 5% of a dose is eliminated in the faeces. The urinary excretion of quinine is increased when the urine is acid; quinine is excreted to some extent in the bile.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 3 to 7 $\mu\text{g/ml}$. Malarial infection inhibits hepatic metabolism and thus plasma concentrations resulting from a given dose will vary according to the severity of the infection.

Oral doses of 540 mg, given 8-hourly for 3 days to 11 subjects, resulted in a mean peak plasma concentration of 4 $\mu\text{g/ml}$ after 72 hours (A. P. Hall *et al.*, *Clin. Pharmac. Ther.*, 1973, 14, 580–585).

Oral doses of 650 mg, given 8-hourly to 15 subjects, resulted in a mean steady-state plasma concentration of 11 $\mu\text{g/ml}$ during the first 5 days; thereafter the concentration declined slowly to about 8 $\mu\text{g/ml}$ after 14 days (M. H. Brooks *et al.*, *Clin. Pharmac. Ther.*, 1969, 10, 85–91).

TOXICITY. The estimated minimum lethal dose is 8 g. Blood concentrations greater than about 10 $\mu\text{g/ml}$ may cause toxic effects and can be lethal.

Fatal quinine poisoning occurred in three young females, and the following postmortem concentrations ($\mu\text{g/ml}$ or $\mu\text{g/g}$) were reported: blood —, 11, —; kidney 300, 96, 410; liver 1500, 39, 150; spleen 600, 87, —; urine —, —, 860 (G. W. Walker, personal communication, 1964).

In a fatality involving the ingestion of 32.5 g of quinine sulphate, postmortem brain and liver concentrations of 292 and 3000 $\mu\text{g/g}$, respectively, were reported (S. Andrtauskas *et al.*, *Bull. int. Ass. forens. Toxicol.*, 1974, 10(3), 7–8).

HALF-LIFE. Plasma half-life, 4 to 15 hours (mean 9); it appears to increase during malarial infection.

VOLUME OF DISTRIBUTION. About 2 litres/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 0.93 in normal subjects. In malarial subjects, the plasma concentration rises but this does not seem to be accompanied by a rise in the amount taken up by erythrocytes; under these conditions there may be twice as much in the plasma as in the erythrocytes.

PROTEIN BINDING. In plasma, 70 to 90%.

Dose. 2 g of quinine sulphate or other salt, daily, for 14 days.

Quinuronium Sulphate

Antiprotozoal (Veterinary)

Synonym. Quinolyl Urea

Proprietary Names. Ludobal; Pirevan V.

6,6'-Ureylenebis(1-methylquinolinium) bis(methyl sulphate)

$\text{C}_{23}\text{H}_{26}\text{N}_4\text{O}_9\text{S}_2 = 566.6$

CAS—135-14-8

A creamy-white to yellow, crystalline powder. M.p. 235°, with decomposition.

Very **soluble** in water; very slightly soluble in organic solvents. On heating, aqueous solutions darken and some decomposition may occur.

Colour Test. Aromaticity (Method 2)—yellow/orange.

Thin-layer Chromatography. *System TA*—Rf 00. (*Acidified iodoplatinate solution*, positive.)

Ultraviolet Spectrum. Aqueous acid—274 nm ($A_1^1 = 1527$ a), 323 nm, 359 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1210, 1248, 1276, 1572, 1025, 1525 (KBr disk).

Racemorphan

Narcotic Analgesic

(±)-9a-Methylmorphinan-3-ol

$C_{17}H_{23}NO = 257.4$

CAS—297-90-5

A white powder. M.p. 251° to 253°.

Soluble in dilute acetic acid.

Thin-layer Chromatography. *System TA*—Rf 35; *system TB*—Rf 13; *system TC*—Rf 07. (*Dragendorff spray*, positive; *acidified iodoplatinate solution*, positive.)

Gas Chromatography. *System GA*—RI 2230.

Ultraviolet Spectrum. Aqueous acid—279 nm ($A_1^1 = 79$ a); aqueous alkali—240 nm ($A_1^1 = 339$ a), 299 nm ($A_1^1 = 119$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1242, 1280, 1580, 1495, 1505, 760 (KBr disk).

Mass Spectrum. Principal peaks at m/z 257, 59, 150, 256, 31, 157, 42, 200.

Racephedrine

Sympathomimetic

Synonyms. *dl*-Ephedrine; Racemic Ephedrine.

Proprietary Name. It is an ingredient of Riddofan.

(±)-2-Methylamino-1-phenylpropan-1-ol

$C_{10}H_{15}NO = 165.2$

CAS—90-81-3

Crystals. M.p. 79°.

Soluble in water, ethanol, chloroform, and ether.

Racephedrine Hydrochloride

Proprietary Names. Efetonina; Ephetonin.

$C_{10}H_{15}NO \cdot HCl = 201.7$

CAS—134-71-4

Fine, white, crystals or powder. M.p. 187° to 188°.

Soluble 1 in about 4 of water and 1 in about 25 of ethanol; practically insoluble in ether.

For analytical data see under Ephedrine.

Dose. 50 to 200 mg of racephedrine hydrochloride daily.

Rafoxanide

Anthelmintic (Veterinary)

Proprietary Names. Flukanide. It is an ingredient of Ranizole.

3'-Chloro-4'-(4-chlorophenoxy)-3,5-di-iodosalicylanilide

$C_{16}H_{11}Cl_2I_2NO_3 = 626.0$

CAS—22662-39-1

A greyish-white to brown powder. M.p. about 175°.

Practically **insoluble** in water; soluble 1 in 25 of acetone, 1 in 40 of chloroform, 1 in 35 of ethyl acetate, and 1 in 200 of methanol.

Colour Test. Iodine Test—positive.

Thin-layer Chromatography. *System TA*—Rf 89. (*Acidified potassium permanganate solution*, positive.)

Gas Chromatography. *System GA*—not eluted.

Ultraviolet Spectrum. Methanolic acid—280 nm ($A_1^1 = 243$ b), 335 nm ($A_1^1 = 149$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1215, 1562, 1592, 1257, 1087, 1275 (KBr disk).

Ranitidine

Histamine H₂-Receptor Antagonist

NN - Dimethyl - 5 - [2 - (1 - methylamino - 2 - nitrovinylamino) - ethylthiomethyl]furfurylamine

$C_{13}H_{22}N_4O_3S = 314.4$

CAS—66357-35-5

Ranitidine Hydrochloride

Proprietary Name. Zantac

$C_{13}H_{22}N_4O_3S \cdot HCl = 350.9$

CAS—71130-06-8

A yellowish-grey powder. M.p. about 130°.

Freely **soluble** in water.

Dissociation Constant. pK_a 2.3, 8.2.

High Pressure Liquid Chromatography. *System HA*— k' 2.3.

Ultraviolet Spectrum. Water—313 nm ($A_1^1 = 499$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1220, 1620, 1192, 1570, 1590, 1260 (ranitidine hydrochloride, KBr disk).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: sensitivity 5 ng/ml for ranitidine, 15 ng/ml for desmethylranitidine, UV detection—G. W. Mihaly *et al.*, *J.*

pharm. Sci., 1980, 69, 1155–1157. In urine: ranitidine and metabolites, UV detection—P. F. Carey *et al.*, *J. Chromat.*, 1981, 225; *Biomed. Appl.*, 14, 161–168.

RADIOIMMUNOASSAY. In biological fluids: sensitivity 2 ng/ml—W. N. Jenner *et al.*, *Life Sci.*, 1981, 28, 1323–1329.

Disposition in the Body. Readily absorbed after oral administration; bioavailability about 50%, but there is considerable intersubject variation. It is metabolised by *N*-oxidation, *S*-oxidation, and demethylation, but is excreted mainly as unchanged drug. After oral administration, about 30 to 70% is excreted unchanged in the urine in 24 hours (dose-dependent), together with small amounts of the metabolites; after an intravenous dose, about 70 to 80% is excreted unchanged in the urine in 24 hours.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 150 mg to 5 subjects, peak plasma concentrations of 0.24 to 0.63 µg/ml (mean 0.5) were reported; plasma concentrations initially peaked at 0.5 to 1.5 hours but a second peak at 3 hours was reported in 4 subjects (A. M. van Hecken *et al.*, *Br. J. clin. Pharmac.*, 1982, 14, 195–200).

Following oral administration of 150 mg twice daily to 10 subjects, maximum steady-state plasma concentrations of 0.31 to 0.82 µg/ml (mean 0.6) were reported at 0.5 to 2 hours compared with peak concentrations of 0.21 to 0.54 µg/ml (mean 0.37), 1 to 3 hours after a single 150-mg dose given to the same subjects (M. L. McFadyen *et al.*, *Eur. J. clin. Pharmac.*, 1983, 24, 441–447).

HALF-LIFE. Plasma half-life, about 2 to 3 hours, increased in elderly subjects, and in renal impairment.

VOLUME OF DISTRIBUTION. 1 to 2 litres/kg.

CLEARANCE. Plasma clearance, about 10 ml/min/kg.

PROTEIN BINDING. In plasma, about 15%.

NOTE. For a review of ranitidine pharmacokinetics see C. J. C. Roberts, *Clin. Pharmacokinet.*, 1984, 9, 211–221.

Dose. The equivalent of 150 to 900 mg of ranitidine daily.

Rescinnamine

Antihypertensive

Proprietary Names. Cinnasil; Moderil.

Methyl 18-*O*-(3,4,5-trimethoxycinnamoyl)reserpate

$C_{35}H_{42}N_2O_9 = 634.7$

CAS—24815-24-5

An alkaloid obtained from the roots of certain species of *Rauwolfia* (Apocynaceae), mainly *R. serpentina* and *R. vomitoria*, or by synthesis.

A white or pale buff to cream-coloured, crystalline powder. It slowly darkens on exposure to light but more rapidly when in solution. M.p. about 226°.

Practically **insoluble** in water; soluble in ethanol, acetic acid, and chloroform.

Colour Tests. Mandelin's Test—brown; Marquis Test—grey-green.

Thin-layer Chromatography. System TA—Rf 73; system TB—Rf 01; system TC—Rf 75. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 2180.

High Pressure Liquid Chromatography. System HA—*k'* 0.6.

Ultraviolet Spectrum. Aqueous acid—299 nm; aqueous alkali—306 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1266, 1147, 1124, 1165, 1233, 1715 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 221, 199, 200, 186, 395, 251, 77, 214.

Dose. 0.25 to 1 mg daily.

Reserpine

Antihypertensive

Proprietary Names. Lemiserp; Neo-Serp; Rau-Sed; Resercent; Reserfia; Reserpanca; Reserpoid; Sandril; Sedaraupin; Serpasil; Serpate; Vio-Serpine. It is an ingredient of Abicol, Diupres, Hydropres, Metatensin, Naquival, Regroton, Renese-R, Salutensin, and Seominal.

Methyl 18-*O*-(3,4,5-trimethoxybenzoyl)reserpate

$C_{33}H_{40}N_2O_9 = 608.7$

CAS—50-55-5

An alkaloid obtained from the roots of certain species of *Rauwolfia* (Apocynaceae), mainly *R. serpentina* and *R. vomitoria*, or by synthesis.

Fine, white or pale buff to slightly yellow-coloured crystals or crystalline powder. It darkens slowly on exposure to light, but more rapidly when in solution. M.p. about 270°, with decomposition.

Practically **insoluble** in water and ether; soluble 1 in 2000 of ethanol and 1 in 6 of chloroform; freely soluble in acetic acid.

Dissociation Constant. pK_a 6.6 (25°).

Colour Tests. Mandelin's Test—green; Marquis Test—grey-green → brown.

Thin-layer Chromatography. System TA—Rf 69; system TB—Rf 02; system TC—Rf 74. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—not eluted.

Ultraviolet Spectrum. Ethanol—267 nm ($A_1^1 = 272$ a), 295 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1220, 1120, 1700, 1240, 1720, 1265 (KBr disk).

Mass Spectrum. Principal peaks at m/z 608, 606, 195, 609, 395, 397, 212, 396.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 300 pg/ml, fluorescence detection—R. F. Suckow *et al.*, *J. liq. Chromat.*, 1983, 6, 1111–1122.

THIN-LAYER CHROMATOGRAPHY. In plasma: sensitivity 50 pg/ml—S. L. Tripp *et al.*, *Life Sci.*, 1975, 16, 1167–1177.

Disposition in the Body. Readily but somewhat erratically absorbed after oral administration. Rapidly and extensively metabolised by hydrolysis and *O*-demethylation; the major metabolites are trimethoxybenzoic acid and methyl reserpate, together with reserpine acid, syringomethyl reserpate, and syringic acid; metabolites may be conjugated with glucuronic acid or sulphate. About 6% of an oral dose is excreted in the urine in 24 hours and about 8% in the first 4 days, mainly as trimethoxybenzoic acid; less than 3% of a dose is excreted in the urine unchanged. About 60% of the dose is eliminated in the faeces in 4 days, mainly as unchanged drug.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 1 mg to 2 subjects, peak plasma concentrations of 0.0004 to 0.0006 $\mu\text{g/ml}$ were attained in 2 to 3 hours (S. L. Tripp *et al.*, *ibid.*).

TOXICITY. High dosage may occasionally cause a parkinsonian-like syndrome and severe depression; several cases of accidental poisoning have been reported in children but fatalities are unlikely.

HALF-LIFE. Plasma half-life, extremely variable and may be up to 11 days.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 1.1.

PROTEIN BINDING. In plasma, about 40%.

Dose. Usually 250 to 500 μg daily, for hypertension. Doses of 0.1 to 1 mg or more daily have been given as a sedative.

Resorcinol*Dermatological Agent*

Synonyms. *m*-Dihydroxybenzene; Dioxybenzolum; Resorcin.

Proprietary Names. Castel-Minus; Egosol R. It is an ingredient of Acnil, Acnomel, and Eskamel.

Benzene-1,3-diol

$C_6H_6O_2 = 110.1$

CAS—108-46-3

Colourless or slightly pinkish-grey, acicular crystals or crystalline powder. It becomes red on exposure to air and light. M.p. 109° to 112°; it sublimes on further heating.

Soluble 1 in less than 1 of water and 1 in 1 of ethanol; slightly soluble in chloroform; freely soluble in ether.

Resorcinol Monoacetate

Synonyms. 3-Acetoxyphenol; Resorcin Acetate.

Proprietary Name. Euresol

$C_8H_8O_3 = 152.1$

CAS—102-29-4

A pale yellow or amber, viscous liquid. Sp. gr. 1.203 to 1.207. B.p. about 283°, with decomposition.

Sparingly **soluble** in water; soluble in ethanol and most organic solvents.

Dissociation Constant. pK_a 9.5, 10.1 (20°).

Colour Test. Liebermann's Test—violet.

Gas Chromatography. System GA—RI 1258.

Ultraviolet Spectrum. Aqueous acid—273 nm ($A_1^1 = 172$ a); aqueous alkali—290 nm ($A_1^1 = 315$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1149, 1603, 774, 962, 1164, 1289 (KBr disk).

Mass Spectrum. Principal peaks at m/z 110, 82, 39, 81, 53, 69, 55, 111.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: sensitivity 500 ng/ml, UV detection—D. Yeung *et al.*, *J. Chromat.*, 1981, 224; *Biomed. Appl.*, 13, 513–518.

Disposition in the Body. Resorcinol may be absorbed through the skin or from ulcerated surfaces.

TOXICITY. The estimated minimum lethal dose is 2 g and the maximum permissible atmospheric concentration is 10 ppm. The systemic effects of resorcinol are similar to those of phenol but convulsions may be more frequent.

Use. Topically in concentrations of 2 to 5%.

Riboflavin*Vitamin*

Synonyms. Lactoflavin; Riboflavin; Vitamin B₂; Vitamin G.

Proprietary Names. Bflavin(e). It is an ingredient of Apisate.

3,10 - Dihydro - 7,8 - dimethyl - 10 - (D - ribo - 2,3,4,5 - tetra - hydroxypentyl)benzopteridine-2,4-dione

$C_{17}H_{20}N_4O_6 = 376.4$

CAS—83-88-5

A yellow or orange-yellow, crystalline powder. M.p. about 280°, with decomposition. Solutions deteriorate on exposure to light.

Soluble 1 in 3000 to 1 in 20 000 of water, the variation in solubility being due to the variation in the internal crystalline structure; practically insoluble in ethanol, acetone, chloroform, and ether; very soluble in dilute solutions of alkali hydroxides.

Dissociation Constant. pK_a 1.9, 10.2 (20°).

Colour Test. Dissolve 1 mg in 100 ml of water—the solution is green-yellow when viewed by transmitted light and shows an intense yellow-green fluorescence which disappears on adding mineral acids, alkalis, and reducing agents such as sodium dithionite.

Ultraviolet Spectrum. Aqueous acid—267 nm ($A_1^1 = 820$ a); aqueous alkali—270 nm, 356 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1544, 1575, 1641, 1715, 1235, 1070 (KBr disk).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In urine: sensitivity 50 ng/ml, fluorescence detection—M. D. Smith, *J. Chromat.*, 1980, 182; *Biomed. Appl.*, 8, 285–291.

Disposition in the Body. Readily absorbed after oral administration. Widely distributed throughout the body but little is stored, and amounts in excess of the body's requirements are excreted in the urine. Metabolised by phosphorylation to flavine mononucleotide (FMN) and then to flavine adenine dinucleotide (FAD). The recommended daily intake is up to 500 µg/kg. Endogenous plasma concentrations are usually less than 0.1 µg/ml.

HALF-LIFE. Plasma half-life, about 1 hour.

PROTEIN BINDING. In plasma, about 60%.

Dose. 2 to 10 mg daily.

Rifampicin*Antituberculous Agent**Synonym.* Rifaldazine; Rifampin; Rifamycin AMP.*Proprietary Names.* Rifa; Rifadin(e); Rimactan(e); Rofact. It is an ingredient of Rifinah and Rimactazid.

3-(4-Methylpiperazin-1-yliminomethyl)rifamycin SV

 $C_{43}H_{58}N_4O_{12} = 823.0$ *CAS*—13292-46-1

A brick-red to reddish-brown, crystalline powder. M.p. about 185°, with decomposition.

Slightly **soluble** in water, ethanol, and ether; freely soluble in chloroform; soluble in ethyl acetate and methanol.**Dissociation Constant.** pK_a 1.7, 7.9.**Colour Test.** Mandelin's Test—orange-brown.**Thin-layer Chromatography.** *System TA*—Rf 79. (Visible red-brown spot; *acidified potassium permanganate solution*, positive.)**Ultraviolet Spectrum.** Aqueous acid—231 nm ($A_1^1 = 320$ a), 263 nm, 336 nm ($A_1^1 = 250$ a).**Infra-red Spectrum.** Principal peaks at wavenumbers 1250, 1567, 976, 1098, 1064, 1650 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 43, 45, 60, 58, 95, 99, 398, 206.**Quantification.** HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma, urine or saliva: rifampicin and metabolites, sensitivity 100 ng/ml, UV detection—J. B. Lecaillon *et al.*, *J. Chromat.*, 1978, 145; *Biomed. Appl.*, 2, 319–324. In serum: rifampicin and desacetyl rifampicin, detection limits 17 ng/ml and 10 ng/ml, respectively—M. Guillaumont *et al.*, *J. Chromat.*, 1982, 232; *Biomed. Appl.*, 21, 369–376.**Disposition in the Body.** Readily absorbed after oral administration; peak plasma concentrations are attained in about 2 hours after a single dose. Widely distributed in the tissues and fluids and undergoes enterohepatic circulation. Metabolised to desacetyl rifampicin, which is active; excreted in the urine and bile.**HALF-LIFE.** Plasma half-life, about 2 to 6 hours (dose-dependent), decreased during chronic dosing; prolonged in subjects with liver disease.**VOLUME OF DISTRIBUTION.** About 1 litre/kg.**PROTEIN BINDING.** In plasma, about 80%.**NOTE.** For a review of the pharmacokinetics of rifampicin see G. Acocella, *Clin. Pharmacokinet.*, 1978, 3, 108–127.**Dose.** Usually 600 mg daily.**Rifamycin SV***Antibiotic**Synonym.* Rifomycin SV $C_{37}H_{47}NO_{12} = 697.8$ *CAS*—6998-60-3Rifamycin SV is a semi-synthetic antibiotic derived from rifamycin B, a substance produced during growth of certain strains of *Streptomyces mediterranei*.

Dark yellow crystals.

Practically **insoluble** in water; very soluble in ethanol; soluble in acetone, chloroform, ether, ethyl acetate, and methanol.**Rifamycin Sodium***Synonym.* Rifamycin SV Sodium*Proprietary Name.* Rifocin(e) $C_{37}H_{46}NNaO_{12} = 719.8$ *CAS*—15105-92-7

A brick-red, fine or slightly granular powder.

Soluble in water and chloroform; freely soluble in dehydrated alcohol and methanol; practically insoluble in ether.**Colour Test.** Mandelin's Test—yellow-brown.**Thin-layer Chromatography.** *System TA*—Rf 84. (Visible orange spot.)**Ultraviolet Spectrum.** Ethanol—315 nm ($A_1^1 = 420$ b).**Dose.** 0.5 to 1 g of rifamycin sodium daily, by intramuscular injection.**Rimantadine***Antiviral**Synonym.* α -Methyl-1-adamantanemethylamine1-(Tricyclo[3.3.1.1^{3,7}]dec-1-yl)ethylamine $C_{12}H_{21}N = 179.3$ *CAS*—13392-28-4**Rimantadine Hydrochloride** $C_{12}H_{21}N \cdot HCl = 215.8$ *CAS*—1501-84-4

A white crystalline powder. M.p. above 300°.

Soluble 1 in 17 of water, 1 in 20 of ethanol, and 1 in 6 of chloroform.**Colour Test.** Ninhydrin—pink-violet.**Thin-layer Chromatography.** *System TA*—Rf 37; *system TB*—Rf 50; *system TC*—Rf 11. (*Acidified iodoplatinate solution*, strong reaction.)**Gas Chromatography.** *System GA*—RI 1388.**Infra-red Spectrum.** Principal peaks at wavenumbers 1538, 1600, 1266, 1277, 1160, 1117 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 44, 43, 79, 93, 41, 135, 91, 81.**Dose.** 300 to 400 mg of rimantadine hydrochloride daily.**Rimiterol***Sympathomimetic**erythro*-3,4-Dihydroxy- α -(2-piperidyl)benzyl alcohol $C_{12}H_{17}NO_3 = 223.3$ *CAS*—32953-89-2

Crystals. M.p. 203° to 204°.

Rimiterol Hydrobromide*Proprietary Name.* Pulmadil $C_{12}H_{17}NO_3 \cdot HBr = 304.2$ *CAS*—31842-61-2

A white or pale grey, crystalline powder. M.p. about 220°, with decomposition.

Soluble 1 in 10 of water and 1 in 20 of methanol.**Dissociation Constant.** pK_a 8.7, 10.3 (25°).**Colour Tests.** Ammoniacal Silver Nitrate—red/brown; Ferric Chloride—green; Liebermann's Test—black; Marquis Test—brown→black; Methanolic Potassium Hydroxide—orange-pink; Nessler's Reagent—black; Palladium Chloride—orange; Potassium Dichromate—green→brown; Sulphuric Acid—yellow.**Ultraviolet Spectrum.** Aqueous acid—280 nm ($A_1^1 = 131$ a).**Infra-red Spectrum.** Principal peaks at wavenumbers 1020, 1230, 1290, 1210, 1530, 1605 (rimiterol hydrobromide, KCl disk).**Disposition in the Body.** Rapidly absorbed from the lungs, but most of an inhaled dose is swallowed; readily absorbed from the gastro-intestinal tract. It is subject not only to extensive first-pass metabolism by sulphate and glucuronide conjugation, but also to metabolism by catechol-O-methyltransferase (COMT) forming 3-O-methylrimiterol. It also appears to be metabolised by COMT in the lungs. After intrabronchial administration, about 70% of a dose is excreted in the urine in 24 hours, mainly as free and conjugated 3-O-methylrimiterol, together with some free and conjugated rimiterol. A proportion of a dose is excreted in the bile. After oral or aerosol administration, less than 50% of a dose is excreted in the urine, mainly as conjugates of rimiterol.**HALF-LIFE.** Plasma half-life, about 3 minutes after intravenous administration.**Dose.** 200 to 600 µg of rimiterol hydrobromide, by aerosol inhalation; maximum of 8 doses daily.**Ritodrine***Sympathomimetic**erythro*-2-(4-Hydroxyphenethylamino)-1-(4-hydroxyphenyl)propan-1-ol $C_{17}H_{21}NO_3 = 287.4$ *CAS*—26652-09-5

M.p. 88° to 90°.

Ritodrine Hydrochloride*Proprietary Names.* Pre-Par; Utopar; Yutopar. $C_{17}H_{21}NO_3 \cdot HCl = 323.8$ *CAS*—23239-51-2

A white crystalline powder. M.p. 193° to 195°, with decomposition.

Soluble in chloroform and dilute acetic acid.**Colour Tests.** Folin-Ciocalteu Reagent—blue; Liebermann's Test—black; Mandelin's Test—green; Marquis Test—yellow-brown.**Thin-layer Chromatography.** *System TA*—Rf 73. (Acidified iodoplatinate solution, positive.)**Gas Chromatography.** *System GA*—not eluted.**Ultraviolet Spectrum.** Aqueous acid—274 nm ($A_1^1 = 98$ a). (See below)**Infra-red Spectrum.** Principal peaks at wavenumbers 1510, 1209, 1256, 1610, 833, 1170 (KBr disk). (See below)**Mass Spectrum.** Principal peaks at m/z 121, 164, 77, 57, 56, 165, 162, 122.**Quantification.** HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: sensitivity 2 ng/ml, electrochemical detection—L. S. Lin *et al.*, *J. pharm. Sci.*, 1984, 73, 131–133.**RADIOIMMUNOASSAY.** In plasma or serum: sensitivity 300 pg/ml—R. Gandar *et al.*, *Eur. J. clin. Pharmac.*, 1980, 17, 117–122.

Disposition in the Body. Readily absorbed after oral administration but subject to considerable first-pass metabolism; bioavailability about 30%. About 70 to 90% of an oral dose is excreted in the urine in 24 hours, mainly as sulphate and glucuronide conjugates with about 5% of the dose as unchanged drug.

THERAPEUTIC CONCENTRATION.

Following oral and intramuscular administration of 10 mg to 4 subjects, mean peak serum concentrations of 0.01 µg/ml and 0.02 µg/ml were attained in 20 to 40 minutes and 10 minutes, respectively (R. Gandar *et al.*, *ibid.*).

HALF-LIFE. Plasma half-life, about 1 to 2 hours; a longer elimination half-life of about 15 to 20 hours has also been reported.

PROTEIN BINDING. In plasma, about 32%.

NOTE. For a review of ritodrine see B. W. Finklestein, *Drug Intell. & clin. Pharm.*, 1981, 15, 425-433.

Dose. 50 to 350 µg/min of ritodrine hydrochloride by intravenous infusion; up to 120 mg daily, by mouth.

Rolitettracycline

Antibiotic

Synonyms. PMT; Pyrrolidinomethyltetracycline.

Proprietary Names. Reverin; Tetralidina; Transcycline.

*N*²-(Pyrrolidin-1-ylmethyl)tetracycline

$C_{27}H_{33}N_3O_8 = 527.6$

CAS—751-97-3

A light yellow crystalline powder. M.p. about 163°.

Soluble 1 in 1.1 of water and 1 in 200 of ethanol; soluble in acetone; very slightly soluble in ether.

Rolitettracycline Nitrate

$C_{27}H_{33}N_3O_8 \cdot HNO_3 \cdot 1\frac{1}{2}H_2O = 617.6$

CAS—20685-78-3 (anhydrous); 26657-13-6 (sesquihydrate)

A yellow crystalline powder.

Soluble 1 in 40 of water.

Dissociation Constant. pK_a 7.4.

Colour Tests. Benedict's Reagent—red; Formaldehyde-Sulphuric Acid—green-yellow (→ yellow-brown); Mandelin's Test—violet → red → orange; Marquis Test—orange; Sulphuric Acid—violet.

Thin-layer Chromatography. System TA—Rf 05, streaking. (Location under ultraviolet light, orange fluorescence; *acidified potassium permanganate solution*, positive.)

Ultraviolet Spectrum. Aqueous acid—272 nm ($A_1^1 = 325$ a), 357 nm; aqueous alkali—248 nm ($A_1^1 = 261$ b), 268 nm ($A_1^1 = 266$ b).

Dose. Up to 700 mg daily, given parenterally.

Rotenone

Pesticide

(-)-1,2,12,12a-Tetrahydro-2-isopropenyl-8,9-dimethoxy-6aH-furo[2,3-b][1]benzopyran-6-one
 $C_{23}H_{22}O_6 = 394.4$
 CAS—83-79-4

Rotenone is the principal active insecticidal constituent of derris, the dried rhizome and roots of *Derris elliptica*, *D. malaccensis* (Leguminosae) and other species of *Derris*, and of lonchocarpus, the dried root of *Lonchocarpus utilis*, *L. urucu* and other species of *Lonchocarpus* (Leguminosae). Colourless to brownish crystals, or a white to brownish-white, crystalline powder; it decomposes on exposure to light and air. M.p. about 163°. A dimorphic form melts at 181°. Practically **insoluble** in water; soluble 1 in 300 of ethanol, 1 in 12 of acetone, 1 in 3 of chloroform, and 1 in 200 of ether.

Colour Tests. Antimony Pentachloride—brown; Liebermann's Test—black; Sulphuric Acid—orange.

Gas Chromatography. System GA—RI 3242.

Ultraviolet Spectrum. Aqueous acid—235 nm ($A_1^1 = 480$ b), 292 nm ($A_1^1 = 550$ b).

Saccharin

Sweetening Agent

Synonyms. Benzosulphimide; Garantose; Gluside; Sacarina; Saccarina; Zaharina.

1,2-Benzisothiazolin-3-one 1,1-dioxide

$C_7H_5NO_3S = 183.2$

CAS—81-07-2

White crystals or crystalline powder. M.p. 226° to 230°.

Soluble 1 in 290 of water, 1 in 30 of ethanol, and 1 in 12 of acetone; slightly soluble in chloroform and ether; readily soluble in dilute ammonia solution and in solutions of alkali hydroxides and, with the evolution of carbon dioxide, in solutions of alkali bicarbonates and carbonates.

Saccharin Calcium

Synonym. Calcium Benzosulphimide

$C_{14}H_8CaN_2O_6S_2 \cdot 3\frac{1}{2}H_2O = 467.5$

CAS—6485-34-3 (anhydrous); 6381-91-5 (hydrate)

White crystals or crystalline powder.

Soluble 1 in about 2.5 of water and 1 in about 5 of ethanol.

Saccharin Sodium

Synonyms. Saccharoidum Natricum; Sodium Benzosulphimide; Soluble Gluside; Soluble Saccharin.

$C_7H_4NNaO_3S \cdot 2H_2O = 241.2$

CAS—128-44-9 (anhydrous); 6155-57-3 (dihydrate)

White efflorescent crystals or a white crystalline powder.

Soluble 1 in 1.5 of water and 1 in 50 of ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 1.6 (20°).

Colour Tests. Koppanyi-Zwicker Test—violet; Mercurous Nitrate—black.

Thin-layer Chromatography. System TD—Rf 01; system TE—Rf 07; system TF—Rf 01.

Gas Chromatography. System GA—RI 1819.

Ultraviolet Spectrum. Aqueous alkali—235 nm ($A_1^1 = 351$ b), 268 nm ($A_1^1 = 82$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1260, 1154, 1646, 750, 678, 1120 (saccharin sodium, KBr disk).

Mass Spectrum. Principal peaks at m/z 183, 76, 90, 50, 91, 120, 106, 92.

Quantification. GAS CHROMATOGRAPHY. In urine: detection limit 10 ng/ml, ECD—P. Hartvig *et al.*, *J. Chromat.*, 1978, 151, 232–236.

GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In plasma or urine: sensitivity 50 ng/ml—C. Pantarotto *et al.*, *J. pharm. Sci.*, 1981, 70, 871–874.

Disposition in the Body. Rapidly absorbed after oral administration; peak plasma concentrations are attained in 0.5 to 1 hour. About 60% of a dose is excreted in the urine unchanged in 6 hours and 80% in 24 hours.

HALF-LIFE. Plasma half-life, about 5 to 9 hours in regular saccharin users.

Salbutamol

Sympathomimetic

Synonym. Albuterol

Proprietary Names. Asmaven (inhaler); Broncovaleas; Cobutolin (inhaler); Proventil (inhaler); Salbulin (inhaler); Sultanol (aerosol); Ventolin(e) (inhaler). It is an ingredient of Ventide.

2-*tert*-Butylamino-1-(4-hydroxy-3-hydroxymethylphenyl)-ethanol

$C_{13}H_{21}NO_3 = 239.3$

CAS—18559-94-9

A white crystalline powder. M.p. about 156°.

Soluble 1 in 70 of water and 1 in 25 of ethanol; slightly soluble in ether.

Salbutamol Sulphate

Proprietary Names. Asmaven (tablets); Cobutolin (tablets); Proventil (tablets); Salbulin (tablets and syrup); Sultanol; Ventolin(e).

$C_{13}H_{21}NO_3 \cdot \frac{1}{2}H_2SO_4 = 288.4$

CAS—51022-70-9

A white powder.

Soluble 1 in 4 of water; slightly soluble in ethanol, chloroform, and ether.

Dissociation Constant. pK_a 9.3, 10.3.

Colour Tests. Liebermann's Test—black; Mandelin's Test—blue rim → brown rim; Marquis Test—yellow; Sulphuric Acid—yellow.

Thin-layer Chromatography. System TA—Rf 46; system TB—Rf 01; system TC—Rf 01. (Acidified potassium permanganate solution, positive.)

High Pressure Liquid Chromatography. System HA— k' 1.0.

Ultraviolet Spectrum. Aqueous acid—276 nm ($A_1^1 = 71$ a); aqueous alkali—245 nm ($A_1^1 = 510$ a), 295 nm ($A_1^1 = 133$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1075, 1038, 1263, 1228, 1213, 822 (KBr disk).

Mass Spectrum. Principal peaks at m/z 30, 86, 57, 41, 77, 135, 29, 206.

Quantification. GAS CHROMATOGRAPHY (CAPILLARY COLUMN)—MASS SPECTROMETRY. In serum: detection limit 1 ng/ml—J. G. Leferink *et al.*, *J. Chromat.*, 1982, 229; *Biomed. Appl.*, 18, 217–221.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: detection limit 500 pg/ml, electrochemical detection—B. Oosterhuis and C. J. van Boxtel, *J. Chromat.*, 1982, 232; *Biomed. Appl.*, 21, 327–334.

Disposition in the Body. Rapidly absorbed after oral administration and after inhalation. About 60 to 90% of a dose is excreted in the urine in 24 hours, of which approximately 50% is unchanged salbutamol and 50% is the 4'-O-sulphate of salbutamol. Up to about 12% is eliminated in the faeces.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 8 mg given to 3 subjects, peak plasma concentrations of 0.096 to 0.117 $\mu\text{g/ml}$ were attained in 1 to 3 hours. An inhaled dose of 0.04 to 0.1 mg given to 6 subjects produced peak plasma concentrations of 0.0006 to 0.0014 $\mu\text{g/ml}$ in 3 to 5 hours. The ratio of salbutamol to an unidentified metabolite in the plasma was found to be 1:4 (S. R. Walker *et al.*, *Clin. Pharmac. Ther.*, 1972, 13, 861–867).

TOXICITY. Hypokalaemia has been reported after overdosage; recovery has occurred after the ingestion of up to 240 mg.

HALF-LIFE. Plasma half-life, 2 to 7 hours.

PROTEIN BINDING. In plasma, not significantly bound.

Dose. Usually the equivalent of 6 to 16 mg of salbutamol daily.

Salicylamide

Analgesic

Proprietary Names. Amid-Sal; Salamide; Salizell. It is an ingredient of Anodyne, Coriforte, and Delimon.

2-Hydroxybenzamide

$C_7H_7NO_2 = 137.1$

CAS—65-45-2

A white crystalline powder. M.p. 139° to 142°.

Soluble 1 in 500 of water, 1 in 15 of ethanol, 1 in 100 of chloroform, and 1 in 35 of ether; soluble in solutions of alkalis.

Dissociation Constant. pK_a 8.2 (37°).

Colour Tests. Ferric Chloride—blue-violet (after hydrolysis); McNally's Test—orange; Nessler's Reagent—brown-orange (weak).

Thin-layer Chromatography. System TD—Rf 38; system TE—Rf 46; system TF—Rf 55. (Location under ultraviolet light, violet fluorescence; ferric chloride solution, violet; acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 1455.

High Pressure Liquid Chromatography. System HD— k' 0.4; system HW— k' 2.5.

Ultraviolet Spectrum. Aqueous acid—235 nm ($A_1^1 = 572$ a), 298 nm; aqueous alkali—241 nm ($A_1^1 = 547$ a), 328 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1250, 752, 758, 1670, 1626, 1587 (Nujol mull).

Mass Spectrum. Principal peaks at m/z 120, 92, 137, 65, 121, 39, 64, 53.

Quantification. SPECTROFLUORIMETRY. In blood, serum or urine: sensitivity 100 ng/ml—S. A. Varesch *et al.*, *J. pharm. Sci.*, 1971, 60, 1092–1095.

GAS CHROMATOGRAPHY. In plasma, saliva or urine: sensitivity 1 µg/ml in plasma and saliva, 5 µg/ml in urine, AFID—A. G. de Boer *et al.*, *J. Chromat.*, 1979, 162; *Biomed. Appl.*, 4, 457–460.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: limit of detection 500 pg, fluorescence detection—S. R. Gautam *et al.*, *Analyt. Lett. (Part B)*, 1981, 14, 577–582. In serum, saliva or urine: salicylamide and metabolites, sensitivity 1 to 2 µg/ml, UV detection—M. E. Morris and G. Levy, *J. pharm. Sci.*, 1983, 72, 612–617.

Disposition in the Body. Readily absorbed after oral administration but undergoes significant first-pass metabolism; widely distributed throughout the body. It is rapidly excreted in the urine mainly as the sulphate and glucuronide conjugates together with small amounts of gentisamide glucuronide and traces of gentisamide and gentisamide sulphate; only traces are excreted unchanged.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 1.3 g given to 5 subjects, mean peak plasma concentrations of about 2 µg/ml of free salicylamide and about 18 µg/ml of total (free + conjugated) salicylamide were attained in 0.3 and 2 hours respectively; following similar doses of a solution of sodium salicylamide, peak plasma concentrations were higher and were attained more rapidly (L. Fleckenstein *et al.*, *Clin. Pharmac. Ther.*, 1976, 19, 451–458).

Following a single oral dose of 1.5 g of sodium salicylamide given as an aqueous solution to 5 subjects, peak plasma concentrations of 21.8 to 44.6 µg/ml (mean 31) of salicylamide were attained in 5 to 10 minutes (A. G. de Boer *et al.*, *Biopharm. Drug Disp.*, 1983, 4, 321–330).

HALF-LIFE. Derived from urinary excretion data, about 1 hour.

Dose. Salicylamide has been given in doses of 1.5 to 10 g daily.

Salicylic Acid

Dermatological Agent/Analgesic

Proprietary Names. Egocappol; Fomac; Keralyt; Saligel; Xseb. It is an ingredient of Aserbine, Cuplex, Dithrolan, Duofilm, Malatex, Monphytol, Pragmatar, Psorin, Salactol, and Stie-Lasan.

2-Hydroxybenzoic acid

$C_7H_6O_3 = 138.1$

CAS—69-72-7

Colourless, feathery crystals or a white crystalline powder. M.p. 158° to 161°.

Soluble 1 in about 550 of water, 1 in about 4 of ethanol, 1 in 45 of chloroform, and 1 in 3 of ether.

Choline Salicylate

Synonym. (2-Hydroxyethyl)trimethylammonium Salicylate

Proprietary Names. Arthropan; Syrap. It is an ingredient of Audax, Bonjela, and Teejel.

$C_{12}H_{19}NO_4 = 241.3$

CAS—2016-36-6

A white, crystalline, very hygroscopic powder. M.p. about 50°.

Very **soluble** in water, ethanol, and acetone; practically insoluble in ether.

Sodium Salicylate

Synonym. Sodium 2-Hydroxybenzoate

Proprietary Names. Ancosal; Ensalate; Entérosalicyl; Entrosalyl (Standard); Rhumax. It is an ingredient of Bronchotone.

$C_7H_5NaO_3 = 160.1$

CAS—54-21-7

Colourless crystals, crystalline flakes, or white or faintly pink powder.

Soluble 1 in 1 of water and 1 in 11 of ethanol; practically insoluble in chloroform and ether. Concentrated aqueous solutions are liable to deposit crystals of the hexahydrate on standing.

Dissociation Constant. pK_a 3.0, 13.4 (25°).

Colour Tests. Ferric Chloride—blue-violet; Folin-Ciocalteu Reagent—blue; McNally's Test—red.

Thin-layer Chromatography. *System TD*—salicylic acid Rf 07, salicyluric acid Rf 00; *system TE*—salicylic acid Rf 11, salicyluric acid Rf 00; *system TF*—salicylic acid Rf 25, salicyluric acid Rf 00. (Location under ultraviolet light, violet fluorescence; *ferric chloride solution*, violet; *acidified potassium permanganate solution*, positive.)

Gas Chromatography. *System GA*—RI 1308.

High Pressure Liquid Chromatography. *System HD*—salicylic acid k' 0.7, choline salicylate k' 0.7; *system HW*—salicylic acid k' 4.6, choline salicylate k' 4.8.

Ultraviolet Spectrum. Aqueous acid—236 nm ($A_1^1 = 647a$), 303 nm; aqueous alkali—298 nm ($A_1^1 = 259a$). Choline salicylate: methanol—298 nm ($A_1^1 = 170b$). (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 758, 1657, 1288, 1210, 1250, 1150 (salicylic acid, KBr disk); 1587, 1724, 1176, 1515, 699, 1041 (choline salicylate).

Mass Spectrum. Principal peaks at m/z 120, 92, 138, 64, 39, 63, 121, 65; salicylic acid 121, 120, 69, 92, 195, 39, 93, 45.

Quantification. See under Aspirin.

Disposition in the Body. Rapidly absorbed and distributed throughout the body. Metabolised by conjugation with glucuronic acid and glycine to give salicyluric acid, salicyl *O*-glucuronide, and salicyl ester glucuronide; hydroxylation to gentisic acid, gentisuric acid, and dihydroxy and trihydroxy derivatives also occurs. Excreted in the urine as unchanged drug and metabolites. Salicylic acid is the major metabolite of aspirin, methyl salicylate, and salsalate.

THERAPEUTIC CONCENTRATION.

Following daily oral doses of 9 mg/kg of sodium salicylate to 20 female and 20 male subjects, mean peak plasma concentrations of 57 and 58 $\mu\text{g/ml}$ were attained in 0.9 and 0.5 hours respectively (S. L. Miasiewicz *et al.*, *Clin. Pharmac. Ther.*, 1982, 31, 30–37).

After daily oral doses of choline salicylate, equivalent to 3.8 g of aspirin, a mean steady-state serum concentration of 166 $\mu\text{g/ml}$ was reported (P. D. Hansten and W. L. Hayton, *J. clin. Pharmac.*, 1980, 20, 326–331).

TOXICITY. The estimated minimum lethal dose is 15 g. Plasma concentrations greater than 300 $\mu\text{g/ml}$ are likely to produce toxic effects and concentrations greater than 500 $\mu\text{g/ml}$ are associated with moderate to severe intoxication.

HALF-LIFE. Plasma half-life, dose-dependent (2 to 4 hours after salicylate doses of less than 3 g, increasing to about 19 hours after large doses).

VOLUME OF DISTRIBUTION. About 0.1 to 0.2 litre/kg (dose-dependent).

PROTEIN BINDING. In plasma, about 50 to 90% (dose-dependent, about 90% bound at concentrations below 100 $\mu\text{g/ml}$, decreasing to 50% at concentrations above 400 $\mu\text{g/ml}$).

NOTE. For a review of the pharmacokinetics of salicylates see M. Mandelli and G. Tognoni, *Clin. Pharmacokinet.*, 1980, 5, 424–440.

Uses. Salicylic acid is applied topically in concentrations ranging from 1 to 50%. Sodium salicylate has been given by mouth in doses of up to 10 g daily.

Salinazid

Antituberculous Agent

Synonyms. *o*-Hydroxybenzal Isonicotinyl Hydrazone; INSH; SAH; Salizid.

2'-Salicylideneisonicotinohydrazide

$\text{C}_{13}\text{H}_{11}\text{N}_3\text{O}_2 = 241.2$

CAS—495-84-1

A pale cream-coloured powder.

Very slightly **soluble** in water; soluble in dilute acids and alkalis.

Colour Tests. Aromaticity (Method 2)—yellow/orange; Ferric Chloride—yellow-brown; Folin-Ciocalteu Reagent—blue; Liebermann's Test—orange; Mandelin's Test—brown; Marquis Test—yellow; Nessler's Reagent (100°)—black; Sulphuric Acid—yellow.

Thin-layer Chromatography. System TA—Rf 84; system TB—Rf 01; system TC—Rf 20. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—257 nm ($A_1^1 = 697$ a), 327 nm (broad); aqueous alkali—264 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1290, 1680, 1565, 1270, 687, 772 (KBr disk).

Mass Spectrum. Principal peaks at m/z 106, 123, 78, 51, 119, 79, 77, 107.

Dose. Salinazid was formerly given in doses of 0.2 to 3 g daily.

Salol

Sunscreen Agent

Proprietary Name. Sola-Stick

Phenyl salicylate

 $C_{13}H_{10}O_3 = 214.2$

CAS—118-55-8

Colourless acicular crystals, or white crystalline powder. M.p. 42° to 44°.

Soluble 1 in 7000 of water, 1 in 9 of ethanol, and 1 in 0.3 of chloroform and of ether.

Gas Chromatography. *System GA*—RI 1685.

High Pressure Liquid Chromatography. *System HD*—k' 15.6.

Ultraviolet Spectrum. Ethanol—242 nm ($A_1^1 = 664$ a), 310 nm ($A_1^1 = 248$ a).

Use. Topically in concentrations of 5 to 10%.

Salsalate

Analgesic

Synonyms. Salicyl Salicylate; Salicylosalicylic Acid; Salsal; Sasapyrine.

Proprietary Names. Arcylate; Disalcid.

O-(2-Hydroxybenzoyl)salicylic acid

 $C_{14}H_{10}O_5 = 258.2$

CAS—552-94-3

Colourless crystals or white crystalline powder. M.p. about 145°. Practically **insoluble** in water but gradually hydrolysed to 2 molecules of salicylic acid; soluble in ethanol and ether.

Dissociation Constant. pK_a 3.5, 9.8 (25°).

Thin-layer Chromatography. *System TG*—Rf 23. (*Chromic acid solution*, brown.)

Gas Chromatography. *System GD*—retention time of methyl derivative 0.4 and 0.6 relative to n - $C_{16}H_{34}$.

High Pressure Liquid Chromatography. *System HD*—k' 3.6; *system HV*—retention time 0.69 relative to meclofenamic acid.

Ultraviolet Spectrum. Aqueous acid—310 nm; aqueous alkali—341 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1690, 1205, 1170, 1310, 1620, 1270 (KBr disk).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: sensitivity 1 µg/ml for salsalate and salicylic acid, UV detection—L. I. Harrison *et al.*, *J. pharm. Sci.*, 1980, 69, 1268–1271.

Disposition in the Body. Rapidly absorbed after oral administration and extensively hydrolysed to salicylic acid. Less than 1% of a dose is excreted in the urine as unchanged salsalate in 24 hours, and the remainder is excreted in the urine by the normal metabolic route for salicylic acid.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 1 g of salsalate to 12 subjects, a mean peak plasma concentration of 21 µg/ml of salsalate was attained in 1.5 hours and peak plasma-salicylic acid concentrations of 38 to 77 µg/ml (mean 54) were reported at 2 to 4 hours (L. I. Harrison *et al.*, *J. clin. Pharmac.*, 1981, 21, 401–404).

HALF-LIFE. Plasma half-life, about 1 hour.

Dose. Up to 4 g daily.

Santonin

Anthelmintic

Synonym. Santolactone

(3*S*,3*aS*,5*aS*,9*bS*) - 3*a*,5,5*a*,9*b* - Tetrahydro - 3,5*a*,9 - trimethylnaphtho[1,2-*b*]furan-2,8(3*H*,4*H*)-dione

 $C_{15}H_{18}O_3 = 246.3$

CAS—481-06-1

A crystalline lactone obtained from the dried unexpanded flowerheads of *Artemisia cina* and other species of *Artemisia* (Compositae).

Colourless crystals, or white crystalline powder, becoming yellow on exposure to light. M.p. about 173°.

Practically **insoluble** in water; soluble 1 in 50 of ethanol and 1 in 3 of chloroform; slightly soluble in ether.

Thin-layer Chromatography. *System TD*—Rf 64; *system TE*—Rf 75; *system TF*—Rf 50. (*Acidified iodoplatinate solution*, positive; *acidified potassium permanganate solution*, positive.)

Gas Chromatography. *System GA*—RI 2174.

Ultraviolet Spectrum. Methanol—239 nm ($A_1^1 = 493$ a).

Mass Spectrum. Principal peaks at m/z 41, 173, 91, 135, 77, 55, 44, 69.

Dose. Santonin was formerly given in doses of 60 to 200 mg daily for 3 days.

Secbutobarbitone

Barbiturate

Synonyms. Butabarbital; Secbutobarbital.

Proprietary Names. Neo-Barb. It is an ingredient of Quibron Plus.

5-*sec*-Butyl-5-ethylbarbituric acid

 $C_{10}H_{16}N_2O_3 = 212.2$

CAS—125-40-6

A fine, white, microcrystalline powder. M.p. 165° to 168°.

Soluble 1 in 1400 of water, 1 in 12 of ethanol, 1 in 30 of chloroform, and 1 in 30 of ether.

Secbutobarbitone Sodium

Synonyms. Butabarbital Sodium; Butabarbitalone Sodium (distinguish from Butobarbitone); Secumalnatrium; Sodium Butabarbital.

Proprietary Names. Buticaps; Butisol Sodium.

$C_{10}H_{15}N_2NaO_3 = 234.2$

CAS—143-81-7

A white powder.

Soluble 1 in 2 of water and 1 in 7 of ethanol; very slightly soluble in chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 8.0 (20°).

Partition Coefficient. Log P (octanol/pH 7.4), 1.3.

Colour Tests. Koppanyi-Zwicker Test—violet; Mercurous Nitrate—black; Vanillin Reagent—orange/violet.

Thin-layer Chromatography. System *TD*—Rf 50; system *TE*—Rf 41; system *TF*—Rf 63; system *TH*—Rf 69. (Mercurous nitrate spray, black.)

Gas Chromatography. System *GA*—secbutobarbitone RI 1662, 2'-hydroxysecbutobarbitone RI 1928.

High Pressure Liquid Chromatography. System *HG*— k' 4.89; system *HH*— k' 3.32.

Ultraviolet Spectrum. Borax buffer 0.05M (pH 9.2)—239 nm ($A_1^1 = 428$ a); M sodium hydroxide (pH 13)—254 nm ($A_1^1 = 354$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1675, 1760, 1317, 1303, 1230, 853 (KBr disk).

Mass Spectrum. Principal peaks at m/z 141, 156, 41, 57, 39, 98, 157, 47.

Quantification. See under Amylobarbitone.

Disposition in the Body. Well absorbed after oral administration. Rapidly metabolised by ω - and $(\omega-1)$ -oxidation of the methylpropyl side-chain. About 40 to 60% of a dose is slowly excreted in the urine, 5 to 9% as unchanged drug, 30% as 5-(2-carboxy-1-methylethyl)-5-ethylbarbituric acid, 3% as 2'-hydroxysecbutobarbitone, and 1% as 2'-oxosecbutobarbitone; greater amounts of unchanged drug may be excreted after excessive doses.

TOXICITY. The estimated minimum lethal dose is 2 g. Blood concentrations greater than about 10 $\mu\text{g/ml}$ are likely to cause toxic reactions, and concentrations greater than 30 $\mu\text{g/ml}$ may be fatal.

Following oral administration of 600 mg, given in 3 doses over a period of 3 hours to 5 subjects, peak blood concentrations of 7.6 to 16.9 $\mu\text{g/ml}$ (mean 12.3) were reported, 0.5 hour after the third dose. Tests 2 hours after the first dose indicated depression of the central nervous system in all subjects (K. D. Parker *et al.*, *Clin. Toxicol.*, 1970, 3, 131-145).

In 4 fatalities attributed to secbutobarbitone overdose, blood concentrations of 30 to 88 $\mu\text{g/ml}$ (mean 58) and liver concentrations of 51 to 250 $\mu\text{g/g}$ (mean 112) were reported (R. C. Baselt and R. H. Cravey, *J. analyt. Toxicol.*, 1977, 1, 81-102).

HALF-LIFE. Plasma half-life, 34 to 42 hours.

PROTEIN BINDING. In plasma, about 26%.

Dose. Usually 45 to 120 mg daily.

Selegiline

Antiparkinsonian

Synonyms. Synonyms used in the literature are confusing and include (–)-Deprenil, L-Deprenil, Deprenyl, (–)-Deprenyl, L-Deprenyl, L-Deprenaline, and E-250. It is the (–)-isomer which is active.

(–)-(R)-N, α -Dimethyl-N-(prop-2-ynyl)phenethylamine

$C_{13}H_{17}N = 187.3$

CAS—14611-51-9

An oil.

Selegiline Hydrochloride

Proprietary Name. Eldepryl

$C_{13}H_{17}N\cdot\text{HCl} = 223.7$

CAS—14611-52-0

A white crystalline solid.

Thin-layer Chromatography. System *TA*—Rf 74; system *TB*—Rf 57; system *TC*—Rf 69. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, orange.)

Gas Chromatography. System *GA*—selegiline RI 1436, amphetamine RI 1123, methylamphetamine RI 1176.

Ultraviolet Spectrum. Aqueous acid—252 nm, 258 nm ($A_1^1 = 9.1$ b), 264 nm; aqueous alkali—259 nm, 269 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 704, 765, 740, 1492, 1092, 981 (selegiline hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 96, 56, 42, 91, 97, 39, 65, 58; amphetamine 44, 91, 40, 42, 65, 45, 39, 43; methylamphetamine 58, 91, 59, 134, 65, 56, 42, 57.

Quantification. See under Amphetamine and Methylamphetamine.

Disposition in the Body. Rapidly absorbed after oral administration and distributed to the tissues. Selegiline is almost completely metabolised to form methylamphetamine and amphetamine. About 50% of a dose is excreted in the urine in 24 hours and 75% in 72 hours; excreted mainly as methylamphetamine with lesser amounts of amphetamine. The excretion of metabolites is increased in acid urine. About 15% of a dose is eliminated in the faeces in 72 hours.

HALF-LIFE. Derived from urinary excretion data (total radioactivity), about 39 hours.

Dose. 5 to 10 mg of selegiline hydrochloride daily.

Serotonin

Synonyms. Enteramine; 5-HT; 5-Hydroxytryptamine.

3-(2-Aminoethyl)-1H-indol-5-ol

$C_{10}H_{12}N_2O = 176.2$

CAS—50-67-9

White crystals.

Soluble in water.

Dissociation Constant. pK_a 9.1, 9.8.

Colour Test. Marquis Test—brown (slow).

Thin-layer Chromatography. System TA—Rf 25. (Acidified potassium permanganate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—276 nm; aqueous alkali—274 nm, 323 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1195, 1225, 1582, 1627, 720, 1105 (serotonin oxalate, KBr disk).

Disposition in the Body. Widely distributed in the body, arising from the hydroxylation and subsequent decarboxylation of tryptophan. It is metabolised chiefly by oxidative deamination to 5-hydroxyindol-3-ylacetic acid; *N*-methylation of the side-chain may also occur.

Simazine

Herbicide

Proprietary Names. Gesatop; Herbazin 50; Simadex SC; Simflow; Weedex S2 G. It is an ingredient of Pathclear.

2-Chloro-4,6-bis(ethylamino)-1,3,5-triazine

$C_7H_{12}ClN_5 = 201.7$

CAS—122-34-9

A white crystalline powder. M.p. 224° to 227°.

Practically **insoluble** in water; very slightly soluble in chloroform and ether.

Thin-layer Chromatography. System TA—Rf 73.

Gas Chromatography. System GA—RI 1690; system GK—retention time 0.79 relative to caffeine.

Ultraviolet Spectrum. Ethanol—262 nm ($A_1^1 = 162$ b). (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 1553, 1621, 1289, 797, 1103, 1129 (KBr disk).

Mass Spectrum. Principal peaks at m/z 201, 44, 186, 68, 173, 96, 158, 203.

Sodium Cromoglycate

Anti-allergic

Synonyms. Cromolyn Sodium; Disodium Cromoglycate.

Proprietary Names. Colimune; Frenal; Intal; Lomudal; Lomusol; Nalcrom; Opticrom; Rynacrom.

Disodium 4,4'-dioxo-5,5'-(2-hydroxytrimethylenedioxy)di(4H-chromene-2-carboxylate)

$C_{23}H_{14}Na_2O_{11} = 512.3$

CAS—16110-51-3 (cromoglycic acid); 15826-37-6 (disodium salt)

A white, hygroscopic, crystalline powder. M.p. 241° to 242° , with decomposition.

Soluble 1 in 20 of water; practically insoluble in ethanol and chloroform.

Dissociation Constant. Cromoglycic acid: pK_a 2.5 (20°).

Colour Tests. Copper Sulphate (Method 2)—blue (1 to 2 min); Mandelin's Test—red; Marquis Test—yellow; Methanolic Potassium Hydroxide—yellow; Sulphuric Acid—yellow.

Thin-layer Chromatography. Cromoglycic acid: system TD—Rf 00; system TE—Rf 00; system TF—Rf 00.

Ultraviolet Spectrum. Phosphate buffer (pH 7.4)—238 nm ($A_1^1 = 600$ b), 326 nm ($A_1^1 = 164$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1635, 1305, 1264, 805, 1069, 1047 (KBr disk).

Mass Spectrum. Principal peaks at m/z 44, 206, 162, 108, 51, 207, 201, 178 (cromoglycic acid).

Quantification. SPECTROFLUORIMETRY. In plasma: sensitivity 100 ng/ml—G. F. Moss *et al.*, *Toxic. appl. Pharmac.*, 1971, 20, 147–156.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In urine: sensitivity 50 ng/ml, UV detection—J. J. Gardner, *J. Chromat.*, 1984, 305; *Biomed. Appl.*, 30, 228–232.

POLAROGRAPHY. In urine: limit of detection 500 ng/ml—A. G. Fogg and N. Fayad, *Analytica chim. Acta*, 1978, 102, 205–210.

Disposition in the Body. Poorly absorbed after oral or subcutaneous administration. After inhalation most of a dose is swallowed with less than 10% reaching the lungs, from where it is rapidly absorbed; the amount absorbed after inhalation is dependent on particle size, smaller particles being absorbed better than large ones. It does not appear to be metabolised. Up to about 3% of an inhaled dose is excreted unchanged in the urine in 24 hours and up to about 87% is eliminated unchanged in the faeces in 3 days. After oral administration less than 1% is excreted in the urine, and after an intravenous dose about 50% is excreted in the urine and 50% is eliminated in the faeces.

THERAPEUTIC CONCENTRATION.

Following inhalation of a ^{14}C -labelled 20-mg dose by 12 asthmatic subjects, peak plasma concentrations of 0.006 to 0.012 $\mu g/ml$ (mean 0.009) were attained in 15 minutes (S. R. Walker *et al.*, *J. Pharm. Pharmac.*, 1972, 24, 525–531).

After inhalation of a single 60-mg dose by 3 subjects, peak plasma concentrations of about 0.2 to 0.3 $\mu g/ml$ were reported in 10 to 15 minutes (G. F. Moss *et al.*, *Toxic. appl. Pharmac.*, 1971, 20, 147–156).

HALF-LIFE. Plasma half-life, about 1 to 1.5 hours.

CLEARANCE. Plasma clearance, about 8 ml/min/kg.

PROTEIN BINDING. In plasma, about 60 to 70%.

Dose. 20 mg inhaled as a dry powder 4 times daily; 800 mg daily, by mouth.

Solanidine

Alkaloid

Synonym. Solatubine

$C_{27}H_{43}NO = 397.6$

CAS—80-78-4

An alkaloid present in various species of *Solanum* (Solanaceae). It is the aglycone of solanine.

A white crystalline powder. M.p. 218° to 219°, with decomposition.

Practically **insoluble** in water and ether; slightly soluble in ethanol; freely soluble in chloroform; soluble in dilute acids.

Colour Tests. Mandelin's Test—orange → violet → blue; Marquis Test—violet.

Thin-layer Chromatography. *System TA*—Rf 68.

Quantification. RADIOIMMUNOASSAY. In plasma: sensitivity 200 pg/ml—J. A. Matthew *et al.*, *Food Chem. Toxicol.*, 1983, 21, 637–640.

Solanine

Alkaloid

Synonym. Solatunine

$C_{45}H_{73}NO_{15} = 868.1$

CAS—20562-02-1

A glycoalkaloid present in various species of *Solanum*, particularly *S. tuberosum* (Solanaceae).

A white crystalline powder which decomposes at about 285°.

Practically **insoluble** in water, chloroform, and ether; soluble in hot ethanol, dilute acids, and amyl alcohol.

Colour Tests. Mandelin's Test—orange → violet → blue; Marquis Test—yellow → violet.

Thin-layer Chromatography. *System TA*—Rf 52. (*Marquis reagent*, positive.)

Sorbic Acid

Preservative

Proprietary Name. Sorbistat

(*E,E*)-Hexa-2,4-dienoic acid

$C_6H_8O_2 = 112.1$

CAS—110-44-1; 22500-92-1

A white or creamy-white crystalline powder. M.p. 132° to 137°.

Soluble 1 in 700 of water, 1 in 10 of ethanol, 1 in 16 of chloroform, 1 in 20 of ether, and 1 in 8 of methanol.

Caution. Sorbic acid is irritant to the eyes and possibly also to the skin.

Potassium Sorbate

Proprietary Name. Sorbistat-K

$C_6H_7KO_2 = 150.2$

CAS—590-00-1; 24634-61-5

White or creamy-white crystals or powder. M.p. about 270°, with decomposition.

Soluble 1 in less than 1 of water and 1 in 70 of ethanol; very slightly soluble in acetone, chloroform, and ether; soluble in propylene glycol.

Dissociation Constant. pK_a 4.8.

Ultraviolet Spectrum. Aqueous acid—264 nm ($A_1^1 = 2343$ a); aqueous alkali—254 nm ($A_1^1 = 2211$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1550, 1005, 1616, 1602, 1647, 882 (potassium sorbate, KBr disk).

Use. In concentrations of 0.1 to 0.2%.

Sotalol

Beta-adrenoceptor Blocking Agent

4'-(1-Hydroxy-2-isopropylaminoethyl)methanesulphonanilide

$C_{12}H_{20}N_2O_3S = 272.4$

CAS—3930-20-9

Sotalol Hydrochloride

Proprietary Names. Beta-Cardone; Sotacor; Sotalex. It is an ingredient of Sotazide and Tolerzide.

$C_{12}H_{20}N_2O_3S \cdot HCl = 308.8$

CAS—959-24-0

An off-white to pale cream crystalline powder. M.p. 206° to 207°, with decomposition.

Freely **soluble** in water; sparingly soluble in chloroform.

Dissociation Constant. pK_a 8.3, 9.8.

Colour Tests. Liebermann's Test (100°)—brown; Mercurous Nitrate—black.

Thin-layer Chromatography. *System TA*—Rf 53; *system TB*—Rf 01; *system TC*—Rf 03.

Gas Chromatography. *System GA*—RI 2413.

High Pressure Liquid Chromatography. *System HA*— k' 1.2.

Ultraviolet Spectrum. Aqueous acid—269 nm ($A_1^1 = 16$ a); aqueous alkali—249 nm ($A_1^1 = 552$ b). (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 1160, 992, 785, 1512, 1230, 1585 (sotalol hydrochloride, KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 72, 30, 43, 122, 73, 41, 106, 121.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: detection limit 20 ng/ml, fluorescence detection—M. A. Lefebvre *et al.*, *J. pharm. Sci.*, 1980, 69, 1216–1217.

Disposition in the Body. Almost completely absorbed after oral administration; bioavailability about 90%. It is excreted almost entirely in the urine as unchanged drug, 50 to 80% of a dose being excreted in 24 hours. Less than 10% is eliminated in the faeces.

THERAPEUTIC CONCENTRATION.

A single oral dose of 160 mg given to 8 subjects produced peak plasma concentrations of 1.1 to 1.4 µg/ml in about 3 hours (M. Anttila *et al.*, *Acta pharmac. tox.*, 1976, 39, 118–128).

Following daily oral doses of 400 mg for 5 days to 5 subjects, a mean plasma concentration of 6 µg/ml was reported 3 hours after the last dose (D. G. McDevitt and R. G. Shanks, *Br. J. clin. Pharmac.*, 1977, 4, 153–156).

TOXICITY.

A man ingested about 3 g of sotalol and subsequently died; the following postmortem concentrations were reported: blood 40 µg/ml, brain

0.59 µg/g, heart 42.7 µg/g, kidney 116 µg/g, liver 88 µg/g, lung 59.7 µg/g, urine 416 µg/ml (M. Montagna and A. Groppi, *Arch. Tox.*, 1980, 43, 221–226).

HALF-LIFE. Plasma half-life, 10 to 17 hours, increased in renal insufficiency and in elderly subjects.

VOLUME OF DISTRIBUTION. About 1 to 2 litres/kg.

CLEARANCE. Plasma clearance, about 1 to 2 ml/min/kg.

PROTEIN BINDING. In plasma, not significantly bound.

Dose. Usually 120 to 600 mg of sotalol hydrochloride daily.

Sparteine

Oxytocic

Synonyms. Lupinidine; (–)-Sparteine; *l*-Sparteine.

Dodecahydro - 7,14 - methano - 2*H*,6*H* - dipyrido[1,2 - *a*:1',2' - *e*][1,5]diazocine

$C_{15}H_{26}N_2 = 234.4$

CAS—90-39-1

A dibasic alkaloid obtained from scoparium, the dried tops of broom, *Sarothamnus scoparius* (= *Cytisus scoparius*) (Leguminosae).

A viscous oily liquid.

Soluble 1 in 325 of water; very soluble in ethanol, chloroform, and ether.

Sparteine Sulphate

Proprietary Name. Depasan

$C_{15}H_{26}N_2 \cdot H_2SO_4 \cdot 5H_2O = 422.5$

CAS—299-39-8 (anhydrous); 6160-12-9 (pentahydrate)

Colourless crystals or white crystalline granules or powder which decompose at 136°.

Soluble 1 in 2 of water and 1 in 5 of ethanol; practically insoluble in chloroform and ether.

Thin-layer Chromatography. System TA—Rf 05; system TB—Rf 67; system TC—Rf 03. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 1801.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1118, 1070, 1045, 980, 962, 1015 (sparteine sulphate, KBr disk).

Mass Spectrum. Principal peaks at *m/z* 98, 137, 97, 136, 41, 193, 84, 110.

Quantification. GAS CHROMATOGRAPHY. In urine: sparteine and metabolites, sensitivity 50 ng/ml, FID—M. Eichelbaum *et al.*, *Eur. J. clin. Pharmac.*, 1979, 16, 183–187. In plasma: sparteine and metabolites, sensitivity 30 ng/ml, FID—*idem.*, 189–194.

Disposition in the Body. Metabolised by *N*-oxidation followed by rearrangement to 2- and 5-dehydrosparteine. About 5% of the population are non-metabolisers (greater than 90% of a dose excreted in the urine unchanged in 24 hours). In metabolisers, about 55% of a dose is excreted in the urine in 24 hours, about 30% of the dose as unchanged drug, 7% as 5-dehydrosparteine, and 18% as 2-dehydrosparteine.

HALF-LIFE. Plasma half-life, about 3 hours in metabolisers, and 7 hours in non-metabolisers.

Dose. Sparteine sulphate has been given intramuscularly in a dose of 150 mg.

Spiramycin

Antibiotic

Proprietary Names. Rovamycin(e); Selectomycin.

A mixture of basic antimicrobial substances produced by the growth of *Streptomyces ambofaciens* and consisting of Spiramycin I, $C_{45}H_{78}N_2O_{15}$ = 887.1 (about 63%), Spiramycin II, $C_{47}H_{80}N_2O_{16}$ = 929.2 (about 24%), and Spiramycin III, $C_{48}H_{82}N_2O_{16}$ = 943.2 (about 13%).

Note. The stated molecular formulae for the spiramycins may vary.

CAS—8025-81-8

A white or slightly yellowish amorphous powder.

Soluble 1 in 50 of water; very soluble in ethanol and chloroform.**Dissociation Constant.** pK_a 8.0.**Colour Tests.** Mandelin's Test—orange-brown; Marquis Test—orange.**Thin-layer Chromatography.** System TA—Rf 42. (Acidified potassium permanganate solution, positive.)**Ultraviolet Spectrum.** Aqueous acid—233 nm (A_1^1 = 160 b). No alkaline shift.**Infra-red Spectrum.** Principal peaks at wavenumbers 1052, 1163, 1122, 994, 1016, 1730 (KBr disk).**Dose.** 2 to 4 g daily.**Spirolactone**

Diuretic

Synonyms. Espironolactona; Spirolactone.

Proprietary Names. Aldactone; Aldopur; Altex; Diatensec; Laractone; Sincomen; Spioretic; Spiro; Spiroctan; Spirolang; Spirolone; Spirotone. It is an ingredient of Aldactide, Lasilactone, and Spiroprop.

Note. The name Aldactone is also used in some countries as a proprietary name for canrenoate potassium.

7 α -Acetylthio-3-oxo-17 α -pregn-4-ene-21,17 β -carbolactone $C_{24}H_{32}O_4S$ = 416.6**CAS**—52-01-7

A white to light tan powder. M.p. 198° to 207°.

Practically **insoluble** in water; soluble 1 in 80 of ethanol, 1 in 3 of chloroform, and 1 in 100 of ether.**Colour Tests.** Palladium Chloride—brown; Sulphuric Acid—orange → yellow-green (yellow-green fluorescence under ultra-violet light).**Thin-layer Chromatography.** System TD—Rf 66; system TE—Rf 79; system TF—Rf 51.**Gas Chromatography.** System GA—RI 3280.**Ultraviolet Spectrum.** Aqueous acid—242 nm (A_1^1 = 464 a); aqueous alkali—247 nm (A_1^1 = 405 a).**Infra-red Spectrum.** Principal peaks at wavenumbers 1773, 1676, 1170, 1127, 1115, 1185 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 341, 43, 340, 374, 267, 107, 55, 342.**Quantification.** GAS CHROMATOGRAPHY. In urine: canrenone, detection limit 20 ng, FID—T. Fehér *et al.*, *J. Chromat.*, 1976, 123, 460–462.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: canrenone, sensitivity 5 ng/ml, UV detection—E. Besenfelder and R. Ende, *J. High Resolut. Chromat., Chromat. Commun.*, 1981, 4, 419–421. In serum or urine: canrenone, detection limit 5 ng/ml in serum, UV detection—G. B. Neurath and D. Ambrosius, *J. Chromat.*, 1979, 163; *Biomed. Appl.*, 5, 230–235.

NOTE. Plasma-canrenone concentrations are apparently overestimated when determined by spectrofluorimetry in comparison to HPLC methods (U. Abshagen *et al.*, *Eur. J. clin. Pharmac.*, 1979, 16, 255–262).

Disposition in the Body. Rapidly but incompletely absorbed after oral administration; subject to extensive first-pass metabolism and enterohepatic circulation. The metabolism of spironolactone is very complex and there are a large number of metabolites; the initial step appears to be the formation of a thiol intermediate which is subsequently hydrolysed to canrenone, and which may also be methylated to thiomethylspironolactone. The transformation is rapid and spironolactone cannot be measured in the plasma. Canrenone, which is an active metabolite, is in enzymatic equilibrium with canrenoic acid, which may be conjugated with glucuronic acid; canrenone may also be hydroxylated to 15 α -hydroxycanrenone. Other active sulphur-containing metabolites are thought to be formed from hydroxylation and sulphoxidation of thiomethylspironolactone. About 25 to 55% of a dose is excreted in the urine in 6 days and up to 40% may be eliminated in the faeces. About 11% of a dose is excreted in the urine as canrenone, canrenoic acid and its glucuronide conjugate, and about 6% as the 6 β -hydroxysulphoxide metabolite; the 6 β -hydroxysulphone derivative has also been detected in the urine.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 100 mg to 20 subjects, a mean peak serum-canrenone concentration of 0.13 μ g/ml was attained in 2.5 to 3 hours;

after daily oral doses of 100 mg to 20 subjects, the mean maximum steady-state serum concentration was reported to be 0.20 µg/ml (U. Abshagen *et al.*, *Eur. J. clin. Pharmac.*, 1979, 16, 255–262).

HALF-LIFE. Plasma half-life, canrenone 13 to 24 hours (mean 18).

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, canrenone 1.85.

PROTEIN BINDING. In plasma, canrenone, about 98%.

NOTE. For a review of spironolactone see A. Karim, *Drug Met. Rev.*, 1978, 8, 151–188.

Dose. 100 to 400 mg daily.

Stanolone

Anabolic Steroid

Synonyms. Androstanolone; Dihydrotestosterone.

Proprietary Name. Anabolex

17β-Hydroxy-5α-androstan-3-one

C₁₉H₃₀O₂ = 290.4

CAS—521-18-6

A white crystalline powder. M.p. 178° to 183°.

Practically **insoluble** in water; soluble 1 in 20 of ethanol and 1 in 70 of ether.

Thin-layer Chromatography. System TP—Rf 78; system TQ—Rf 11; system TR—Rf 90; system TS—Rf 72.

Infra-red Spectrum. Principal peaks at wavenumbers 1698, 1046, 1277, 1027, 1064, 1079 (KBr disk).

Dose. Stanolone has been given sublingually or sublabially in doses of 50 to 75 mg daily.

Stanozolol

Anabolic Steroid

Synonyms. Androstanazole; Methylstanazole; Stanazolol.

Proprietary Names. Stromba; Winstrol.

17α-Methyl-2'H-5α-androst-2-eno[3,2-c]pyrazol-17β-ol

C₂₁H₃₂N₂O = 328.5

CAS—10418-03-8

A white crystalline powder. It exists as needles, m.p. 155° or prisms, m.p. about 235°.

Practically **insoluble** in water; soluble 1 in about 40 of ethanol, 1 in about 75 of chloroform, and 1 in 370 of ether; soluble in dimethylformamide.

Colour Tests. Mandelin's Test—brown; Marquis Test—orange-yellow.

Thin-layer Chromatography. System TA—Rf 78. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Methanolic acid—230 nm (A₁¹ = 200 b).

Infra-red Spectrum. Principal peaks at wavenumbers 1096, 950, 1068, 982, 1175, 1125 (KCl disk).

Quantification. GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In urine: detection limit 2 ng/ml—O. Lantto *et al.*, *J. Steroid Biochem.*, 1981, 14, 721–727.

Dose. 5 to 10 mg daily.

Stilbazium Iodide

Anthelmintic

1-Ethyl-2,6-bis[4-(pyrrolidin-1-yl)styryl]pyridinium iodide

$C_{31}H_{36}IN_3 = 577.6$

CAS—3784-99-4

M.p. about 282°.

Soluble in ethanol and dilute acetic acid.

Thin-layer Chromatography. System TA—Rf 10. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—264 nm ($A_1^1 = 274$ b), 355 nm ($A_1^1 = 310$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1175, 1538, 1582, 1510, 1307, 1274 (KBr disk).

Dose. Stilbazium iodide has been given in doses of 10 mg/kg once or twice daily for up to 3 days.

Stilboestrol

Oestrogen

Synonyms. Diethylstilbestrol; Stilbol.

Proprietary Names. Cyren-A; Desma; Dicorvin; Distilbene; Stibilium.

(*E*)- $\alpha\beta$ -Diethylstilbene-4, 4'-diol

$C_{18}H_{20}O_2 = 268.4$

CAS—56-53-1

A white crystalline powder. M.p. 169° to 175°.

Practically **insoluble** in water; soluble 1 in 5 of ethanol, 1 in 200 of chloroform, and 1 in 3 of ether; soluble in acetone and methanol.

Caution. Stilboestrol is a powerful oestrogen. Contact with the skin or inhalation should be avoided.

Stilboestrol Diphosphate

Synonyms. Diethylstilbestrol Diphosphate; Fosfestrol; Phosphoestrolum.

Proprietary Name. Stilphostrol (tablets)

Note. Fosfestrol Sodium (the tetra-sodium salt of stilboestrol diphosphate) is available under the proprietary names Honvan, Honvol, ST-52, and Stilphostrol (injection).

$C_{18}H_{22}O_8P_2 = 428.3$

CAS—522-40-7

An off-white crystalline powder which decomposes at about 205°.

Sparingly **soluble** in water; soluble in ethanol and dilute alkalis.

Stilboestrol Dipropionate

Proprietary Name. Stilbocream

$C_{24}H_{28}O_4 = 380.5$

CAS—130-80-3

Colourless crystals or white crystalline powder. M.p. 104° to 108°.

Slightly **soluble** in water and dilute mineral acids; soluble 1 in 100 of ethanol (90%) and 1 in 6 of ether; freely soluble in acetone and chloroform.

Colour Tests. Antimony Pentachloride—red; Naphthol-Sulphuric Acid—yellow/orange; Sulphuric Acid—orange.

Dissolve about 0.5 mg in 0.2 ml of *acetic acid*, add 1 ml of *phosphoric acid*, and heat on a water-bath for 3 minutes—yellow, disappearing on dilution with 3 ml of *acetic acid*. (This test distinguishes stilboestrol from dienestrol, which produces a violet colour.)

Thin-layer Chromatography. System TP—Rf 65, streaking may occur; system TQ—Rf 10, streaking may occur; system TR—Rf 18, streaking may occur; system TS—Rf 03.

Gas Chromatography. System GA—RI 2298.

Ultraviolet Spectrum. Ethanol—241 nm ($A_1^1 = 600$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1205, 1176, 833, 1250, 1512, 1610 (KBr disk).

Mass Spectrum. Principal peaks at m/z 107, 145, 268, 238, 121, 133, 159, 224.

Quantification. GAS CHROMATOGRAPHY. In blood, plasma, serum, bile or tissues: FID—K. A. Kohrman and J. MacGee, *J. Ass. off. analyt. Chem.*, 1977, 60, 5–8.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma, urine or tissues: UV detection—G. D. Newport *et al.*, *J. liq. Chromat.*, 1980, 3, 1053–1070.

Dose. 0.1 to 2 mg daily; doses of 15 mg daily may be given.

Streptomycin

Antibiotic

Synonym. Estreptomicina

4-*O*-[2-*O*-(2-deoxy-2-methylamino- α -L-glucopyranosyl)-5-deoxy-3-*C*-formyl- α -L-lyxofuranosyl]-*NN'*-diamidino-D-streptamine

$C_{21}H_{39}N_7O_{12}$ = 581.6

CAS—57-92-1

An antimicrobial organic base produced by the growth of certain strains of *Streptomyces griseus*, or by any other means.

Caution. Streptomycin may cause severe dermatitis in sensitised persons.

Streptomycin Sulphate

Proprietary Names. Solvo-strept S; Strycin. It is an ingredient of Streptotriad.

$(C_{21}H_{39}N_7O_{12})_2 \cdot 3H_2SO_4$ = 1457

CAS—3810-74-0

A white hygroscopic powder.

Very **soluble** in water; practically insoluble in ethanol, chloroform, and ether.

Colour Tests. Benedict's Reagent—orange-brown.

Boil a small quantity of streptomycin sulphate with M sodium hydroxide, add a slight excess of *hydrochloric acid* and a few drops of *ferric chloride solution*—violet.

Thin-layer Chromatography. System TA—Rf 00. (Acidified potassium permanganate solution, positive.)

Disposition in the Body. Poorly and irregularly absorbed from the gastro-intestinal tract. Rapidly absorbed after intramuscular administration and widely distributed throughout the body. About 30 to 90% of a parenteral dose is excreted unchanged in the urine in 24 hours.

HALF-LIFE. Plasma half-life, about 2 to 4 hours, increased in neonates, in elderly subjects, and in renal impairment.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 1.9.

PROTEIN BINDING. In plasma, about 20 to 30%.

Dose. The equivalent of 0.5 to 1 g of streptomycin daily, by intramuscular injection.

Strophanthin-K

Cardiac Glycoside

Synonyms. Estrofantina; Kombé Strophanthin; K-Strophanthin; Strophanthoside-K.

Proprietary Names. Kombetin; Myokombin; Strofofan; Trauphantin.

A mixture of glycosides from strophanthus, the dried ripe seeds of *Strophanthus kombe* (Apocynaceae), adjusted by admixture with a suitable diluent such as lactose so as to possess 40% of the activity of anhydrous ouabain.

CAS—11005-63-3

A white or yellowish-white powder containing microscopic crystals.

Soluble in water and ethanol; very slightly soluble in chloroform; practically insoluble in ether.

Colour Tests. Antimony Pentachloride—orange → red.

Dissolve in a cold mixture of *sulphuric acid* and water (4:1)—green, immediately (distinction from ouabain).

Infra-red Spectrum. Principal peaks at wavenumbers 1071, 1035, 1733, 1140, 1165, 1640 (KBr disk).

Dose. Strophanthin-K has been given intravenously in doses of 125 to 500 μ g daily.

Strychnine

Alkaloid

Synonym. Estricnina

Proprietary Name. It is an ingredient of Neuro Phosphates.

Strychnidin-10-one

$C_{21}H_{22}N_2O_2$ = 334.4

CAS—57-24-9

An alkaloid obtained from *nux vomica* and the seeds of other species of *Strychnos*.

Translucent colourless crystals or white crystalline powder. M.p. about 268°.

Very slightly **soluble** in water; soluble 1 in 250 of ethanol and 1 in 6 of chloroform; practically insoluble in ether.

Strychnine Hydrochloride

Proprietary Name. It is an ingredient of Aneurone.

$C_{21}H_{22}N_2O_2 \cdot HCl \cdot 2H_2O$ = 406.9

CAS—1421-86-9 (anhydrous); 6101-04-8 (dihydrate)

Colourless crystals or white crystalline powder.

Soluble 1 in 40 of water and 1 in 85 of ethanol; practically insoluble in ether.

Strychnine Nitrate

$C_{21}H_{22}N_2O_2 \cdot HNO_3 = 397.4$

CAS—66-32-0

Colourless glistening crystals.

Soluble 1 in 50 of water, 1 in 150 of ethanol, and 1 in 110 of chloroform; practically insoluble in ether.

Strychnine Sulphate

$(C_{21}H_{22}N_2O_2)_2 \cdot H_2SO_4 \cdot 5H_2O = 857.0$

CAS—60-41-3 (anhydrous); 60491-10-3 (pentahydrate)

Colourless crystals or white crystalline powder. It is efflorescent in dry air. Melts when anhydrous at about 200°, with decomposition.

Soluble 1 in 50 of water and 1 in 135 of ethanol; slightly soluble in chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 2.3, 8.0 (25°).

Colour Test. Mandelin's Test—violet.

Thin-layer Chromatography. System TA—Rf 26; system TB—Rf 08; system TC—Rf 19. (Dragendorff spray, positive; acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 3119.

High Pressure Liquid Chromatography. System HA— k' 13.0 (tailing peak); system HS— k' 2.43.

Ultraviolet Spectrum. Aqueous acid—254 nm ($A_1^1 = 373$ a); aqueous alkali—255 nm, 278 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1664, 764, 1050, 1110, 1282, 775 (KBr disk).

Mass Spectrum. Principal peaks at m/z 334, 335, 162, 120, 107, 144, 143, 130.

Quantification. GAS CHROMATOGRAPHY. In postmortem tissues: FID—J. S. Oliver *et al.*, *Medicine, Sci. Law*, 1979, 19, 134–137.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: sensitivity 625 ng/ml, UV detection—L. Alliot *et al.*, *J. Chromat.*, 1982, 232; *Biomed. Appl.*, 21, 440–442.

Disposition in the Body. Readily absorbed after oral or parenteral administration and rapidly oxidised. It is taken up to some extent by the red blood cells. About 20% of a dose is excreted unchanged in the urine.

TOXICITY. The minimum lethal dose is about 15 to 30 mg for children and 50 to 100 mg for adults, although with adequate treatment recovery may occur after the ingestion of 250 mg or more.

From a review of nine fatalities due to strychnine poisoning, the following postmortem tissue concentrations were reported: blood 0 to 61 µg/g (mean 25, 5 cases), brain 0.47, 4.2, 5 µg/g (3 cases), kidney 0.07 to 90 µg/g (mean 36, 6 cases), liver 0 to 209 µg/g (mean 95.5, 8 cases), spinal cord 0.1, 1.8, 1.9 µg/g (3 cases), urine 1, 2.5, 7.7 µg/g (3 cases) (J. S. Oliver *et al.*, *Medicine, Sci. Law*, 1979, 19, 134–137).

Dose. Strychnine has been given, as a bitter and analeptic, in doses of 2 to 8 mg, usually as its salts.

Styramate

Muscle Relaxant

Proprietary Name. Sinaxar

β -Hydroxyphenethyl carbamate

$C_9H_{11}NO_3 = 181.2$

CAS—94-35-9

A crystalline powder. M.p. 108° to 110°.

Sparingly **soluble** in water; soluble in ethanol, chloroform, and ether.

Thin-layer Chromatography. System TA—Rf 62; system TB—Rf 01; system TC—Rf 20; system TD—Rf 13; system TE—Rf 53; system TF—Rf 39. (Furfuraldehyde reagent, positive; Van Urk reagent, positive.)

Gas Chromatography. System GA—RI 1667.

Ultraviolet Spectrum. Aqueous acid—251 nm, 257 nm ($A_1^1 = 11$ b), 263 nm. (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 1660, 1059, 1630, 750, 699, 1115 (KBr disk).

Mass Spectrum. Principal peaks at m/z 107, 120, 79, 75, 77, 44, 91, 45.

Dose. Usually 0.8 to 1.6 g daily.

Succinylsulphathiazole

Sulphonamide

Synonyms. Succinylsulphathiazole; Sulfasuccithiazole.

Proprietary Names. SS Thiazole; Sulfasuxidine; Thiacyl.

4'-(Thiazol-2-ylsulphamoyl)succinilic acid monohydrate

$C_{13}H_{13}N_3O_5S_2 \cdot H_2O = 373.4$

CAS—116-43-8 (anhydrous)

White or yellowish-white crystals or powder which darken on exposure to light. M.p. about 190°, with decomposition.

Soluble 1 in 5000 of water, 1 in 200 of ethanol, and 1 in 150 of acetone; practically insoluble in chloroform and ether; soluble in aqueous solutions of alkali hydroxides and carbonates.

Dissociation Constant. pK_a 4.5.

Colour Tests. Copper Sulphate (Method 1)—green (→ violet); Koppanyi-Zwicker Test—red-violet; Mercurous Nitrate—black.

Thin-layer Chromatography. System TD—Rf 00; system TE—Rf 00; system TF—Rf 00; system TT—Rf 02; system TU—Rf 01; system TV—Rf 01.

High Pressure Liquid Chromatography. System HU— k' 16.8.

Ultraviolet Spectrum. Aqueous acid—258 nm ($A_1^1 = 570$ a), 281 nm; aqueous alkali—257 nm ($A_1^1 = 651$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1143, 1585, 1091, 840, 1529, 1667 (Nujol mull).

Mass Spectrum. Principal peaks at m/z 92, 156, 65, 191, 108, 55, 45, 174.

Disposition in the Body. Only about 5% of a dose is absorbed after oral administration and blood concentrations are therefore very low compared to other sulphonamides, usually less than 40 $\mu\text{g/ml}$. It is slowly hydrolysed to sulphathiazole in the gastrointestinal tract. Considerable amounts of sulphathiazole are eliminated in the faeces.

Dose. Usually 10 to 20 g daily.

Sulfadoxine

Sulphonamide

Synonyms. Sulfadimoxinum; Sulfomethoxine; Sulforthomidine; Sulphadoxine; Sulphomethoxine; Sulphorthodimethoxine.

Proprietary Names. Fanaril; Fanasil; Fanasulf; Fanzil; Fontasul. It is an ingredient of Borgal (vet.), Fansidar, and Trivetin (vet.).

N^1 -(5,6-Dimethoxypyrimidin-4-yl)sulphanilamide

$C_{12}H_{14}N_4O_4S = 310.3$

CAS—2447-57-6

A white or creamy-white crystalline powder. M.p. 197° to 200°. Very slightly **soluble** in water; slightly soluble in ethanol and in methanol; practically insoluble in ether.

Colour Tests. Coniferyl Alcohol—orange; Copper Sulphate (Method 1)—green; Mercurous Nitrate—black; Nitrous Acid—yellow.

Thin-layer Chromatography. *System TA*—Rf 67; *system TD*—Rf 37; *system TE*—Rf 08; *system TF*—Rf 51.

High Pressure Liquid Chromatography. *System HU*—*k'* 4.4.

Ultraviolet Spectrum. Aqueous acid—264 nm; aqueous alkali—272 nm ($A_1^1 = 762$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1583, 1161, 1596, 1315, 1091, 1305 (KBr disk).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. The method referred to under Sulphamethoxazole may be used.

Disposition in the Body. Sulfadoxine is a long-acting sulphonamide which is readily absorbed after oral administration. The main metabolic reaction is *N*⁴-acetylation together with glucuronidation. High concentrations of sulfadoxine are attained in the blood in about 4 hours with about 5% as the acetyl derivative and 2% as the glucuronide. It is excreted very slowly in the urine, about 8% of a dose being excreted in 24 hours and 30% in 7 days. The excreted material consists of 30 to 60% acetyl derivative and 30 to 60% unchanged sulfadoxine of which up to 40% may be conjugated with glucuronic acid and up to 10% with sulphate.

THERAPEUTIC CONCENTRATION.

Blood concentrations of 130 to 200 µg/ml were attained by 31 patients receiving 1.5 to 2 g weekly (V. Haegi, *Schweiz. med. Wschr.*, 1966, 96, 1308, per *Int. pharm. Abstr.*, 1967, 4, 93).

HALF-LIFE. Plasma half-life, about 4 to 8 days.

PROTEIN BINDING. In plasma, about 90%.

Dose. Initially 2 g, followed by 1 to 1.5 g weekly.

Sulfamerazine

Sulphonamide

Synonyms. Sulfamethyldiazine; Sulfamethylpyrimidine; Sulphamerazine.

Proprietary Names. It is an ingredient of Sulphatriad and Trinamide (vet.).

*N*¹-(4-Methylpyrimidin-2-yl)sulphanilamide

$C_{11}H_{12}N_4O_2S = 264.3$

CAS—127-79-7

A white or faintly yellowish-white crystalline powder which slowly darkens on exposure to light. M.p. 234° to 239°, with decomposition.

Soluble 1 in 6250 of water, 1 in 550 of ethanol, and 1 in 60 of acetone; slightly soluble in chloroform; very slightly soluble in ether; soluble in dilute mineral acids and in solutions of alkali hydroxides and carbonates.

Sulfamerazine Sodium

Synonyms. Soluble Sulphamerazine; Sulphamerazine Sodium.

$C_{11}H_{11}N_4NaO_2S = 286.3$

CAS—127-58-2

A white or yellowish-white powder. It slowly darkens on exposure to light; on exposure to moist air it absorbs carbon dioxide and becomes less soluble in water.

Soluble 1 in 3.5 of water; slightly soluble in ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 7.1 (20°).

Partition Coefficient. Log *P* (octanol/pH 7.5), −0.1.

Colour Tests. Coniferyl Alcohol—orange; Copper Sulphate (Method 1)—green → brown; Koppányi-Zwicker Test—pink; Mercurous Nitrate—black.

Thin-layer Chromatography. *System TA*—Rf 65; *system TD*—Rf 23; *system TE*—Rf 08; *system TF*—Rf 41; *system TT*—Rf 33; *system TU*—Rf 18; *system TV*—Rf 07.

Gas Chromatography. *System GJ*—retention time of methyl derivative 0.69 relative to griseofulvin.

High Pressure Liquid Chromatography. *System HU*—*k'* 8.1.

Ultraviolet Spectrum. Aqueous acid—242 nm ($A_1^1 = 596$ a), 304 nm; aqueous alkali—242 nm ($A_1^1 = 820$ b), 255 nm ($A_1^1 = 828$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1149, 1590, 1560, 1316, 1088, 1618 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 199, 200, 92, 65, 108, 39, 66, 201.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: sulfamerazine and acetylsulfamerazine, detection limit 300 ng/ml, UV detection—T. B. Vree *et al.*, *Biopharm. Drug Disp.*, 1983, 4, 271–291.

Disposition in the Body. Rapidly absorbed after oral administration. It penetrates into the cerebrospinal fluid to produce concentrations about one-half of those in blood. Metabolised by *N*⁴-acetylation, the extent of which is genetically determined; in slow acetylators about 15% of the sulfamerazine in the blood is in the form of the acetyl derivative compared with 35% in rapid acetylators. About 60% of a dose is excreted in the urine in 48 hours; approximately half of the excreted material is in the form of the acetyl derivative.

TOXICITY. Serious toxic effects, sometimes fatal, have occurred in young children, after therapeutic doses.

HALF-LIFE. Plasma half-life, 9 to 14 hours in rapid acetylators and about 24 hours in slow acetylators.

VOLUME OF DISTRIBUTION. About 0.4 litre/kg.

PROTEIN BINDING. In plasma, about 80 to 90%.

Dose. 4 g daily.

Sulfametopyrazine

Sulphonamide

Synonyms. Sulfalene; Sulfamethoxyypyrazine; Sulfapyrazin Methoxyne; Sulphalene.

Proprietary Names. Kelfizine W; Longum.

*N*¹-(3-Methoxyypyrazin-2-yl)sulphanilamide

$C_{11}H_{12}N_4O_3S = 280.3$

CAS—152-47-6

A white or yellowish-white crystalline powder. M.p. 175° to 178°.

Practically **insoluble** in water; slightly soluble in ethanol and chloroform; freely soluble in acetone and in dilute mineral acids and solutions of alkali hydroxides.

Dissociation Constant. pK_a 7.0.

Colour Tests. Coniferyl Alcohol—orange; Copper Sulphate (Method 1)—green; Mercurous Nitrate—black; Nitrous Acid—yellow.

Thin-layer Chromatography. *System TA*—Rf 67; *system TD*—Rf 40; *system TE*—Rf 08; *system TF*—Rf 50. (*Van Urk reagent*, positive.)

Infra-red Spectrum. Principal peaks at wavenumbers 1145, 1315, 1162, 1601, 1642, 1085 (KBr disk).

Disposition in the Body. Sulfametopyrazine is a long-acting sulphonamide and is readily absorbed after oral administration. It is acetylated in the body, 5 to 10% of the sulfametopyrazine in the blood being in the form of the *N*⁴-acetyl derivative which is inactive. It is slowly excreted in the urine, about 70% of the excreted material being the acetyl derivative and about 14 to 20% being unchanged drug.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 500 mg to 3 subjects, peak plasma concentrations of 25 to 33 µg/ml (mean 29) were attained in 2 to 4 hours (R. L. Herting *et al.*, *Antimicrob. Ag. Chemother.*, 1964, 554–561).

Maximum steady-state plasma concentrations of 51 to 69 µg/ml (mean 58) were reported on the seventh day after 6 subjects had received an initial dose of 600 mg followed by 200 mg daily (D. S. Reeves *et al.*, *J. antimicrob. Chemother.*, 1980, 6, 647–656).

HALF-LIFE. Plasma half-life, 2 to 4 days.

VOLUME OF DISTRIBUTION. About 0.2 to 0.3 litre/kg.

PROTEIN BINDING. In plasma, 65 to 80%.

Dose. 2 g once a week.

Sulfaquinoxaline

Coccidiostat (Veterinary)

Synonyms. Sulfabenzpyrazine; Sulphaquinoxaline.

Proprietary Names. It is an ingredient of Pancoxin, Saquadil, Supacox, and Whitsyn S.

*N*¹-(Quinoxalin-2-yl)sulphanilamide

$C_{14}H_{12}N_4O_2S = 300.3$

CAS—59-40-5

A yellow powder. M.p. about 250°, with decomposition.

Practically **insoluble** in water and ether; very slightly soluble in ethanol and chloroform; soluble in dilute solutions of mineral acids and in solutions of alkalis.

Dissociation Constant. pK_a 5.5 (20°).

Colour Test. Copper Sulphate (Method 1)—green.

Thin-layer Chromatography. *System TA*—Rf 71.

High Pressure Liquid Chromatography. *System HU*—*k'* 4.8.

Ultraviolet Spectrum. Aqueous acid—248 nm ($A_1^1 = 648$ b), 263 nm ($A_1^1 = 540$ b), 348 nm ($A_1^1 = 263$ b); aqueous alkali—252 nm ($A_1^1 = 1085$ a), 357 nm ($A_1^1 = 265$ b).

Sulforidazine

Tranquilliser

Synonym. Sulphoridazine

Proprietary Name. Inofal

10-[2-(1-Methyl-2-piperidyl)ethyl]-2-methylsulphonylphenothiazine

$C_{21}H_{26}N_2O_2S_2 = 402.6$

CAS—14759-06-9

Crystals. M.p. 121° to 123°.

Ultraviolet Spectrum. Aqueous acid—265 nm ($A_1^1 = 700$ b), 311 nm ($A_1^1 = 75$ b); aqueous alkali—266 nm ($A_1^1 = 659$ b).

Quantification. See under Thioridazine.

Disposition in the Body. Sulforidazine is an active metabolite of mesoridazine and thioridazine.

Dose. Sulforidazine has been given in doses of 150 to 300 mg daily.

Sulindac

Analgesic

Proprietary Names. Arthrocline; Clinoril; Imbaral.

(Z)-[5-Fluoro-2-methyl-1-(4-methylsulphonylbenzylidene)-inden-3-yl]acetic acid

$C_{20}H_{17}FO_3S = 356.4$

CAS—38194-50-2

A yellow crystalline powder. M.p. about 182° to 185°.

Practically **insoluble** in water; slightly soluble in ethanol, chloroform, and methanol.

Colour Tests. Liebermann's Test—brown; Mandelin's Test—orange; Marquis Test—green (slow); Sulphuric Acid—brown.

Thin-layer Chromatography. System TD—Rf 14; system TE—Rf 01; system TF—Rf 10; system TG—Rf 13. (Chromic acid solution, white; Ludy Tenger reagent, orange-brown.)

Gas Chromatography. System GA—RI 2690, 2750, and 2820; system GD—retention time of methyl derivative 0.49 relative to $n\text{-C}_{16}\text{H}_{34}$.

High Pressure Liquid Chromatography. System HD— k' 1.25; system HV—retention time 0.78 relative to meclofenamic acid.

Ultraviolet Spectrum. Methanolic acid—284 nm ($A_1^1 = 420$ a), 327 nm ($A_1^1 = 373$ a); aqueous alkali—280 nm ($A_1^1 = 442$ b), 327 nm ($A_1^1 = 364$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1704, 1006, 1018, 1160, 1270, 1603 (KBr disk).

Mass Spectrum. Principal peaks at m/z 341, 233, 356, 246, 247, 248, 234, 281.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: sulindac and its sulphide and sulphone metabolites, sensitivity 100 ng/ml in plasma, UV detection—B. N. Swanson and V. K. Boppana, *J. Chromat.*, 1981, 225; *Biomed. Appl.*, 14, 123–130. In plasma, urine, bile, or gastric fluid: sulindac and its sulphide and sulphone metabolites, sensitivity 250 ng/ml for plasma, UV detection—D. G. Musson *et al.*, *J. pharm Sci.*, 1984, 73, 1270–1273.

Disposition in the Body. Readily absorbed after oral administration. It is metabolised by oxidation to the sulphone and by reduction to the sulphide which is thought to be responsible for most of the pharmacological activity. A total of about 36% of a dose is excreted in the urine in 24 hours and about 75% in 4 days. In four days, about 30% of a dose is excreted as the sulphone and its conjugate, and 20% as unchanged drug and its conjugate; no significant amount of the sulphide or its conjugate is found in the urine. Sulindac and its metabolites are excreted in the bile

and undergo extensive enterohepatic circulation. Up to about 25% of a dose is eliminated in the faeces in 4 days, with less than 2% as unchanged drug.

THERAPEUTIC CONCENTRATION.

A single dose of 200 mg to 14 subjects produced a mean peak plasma concentration of about 4 µg/ml after 1 hour; mean peak plasma concentrations for the sulphide and sulphone were about 3 and about 2 µg/ml, respectively, after 2 hours (D. F. Duggan *et al.*, *Clin. Pharmac. Ther.*, 1977, 21, 326–335).

Following daily oral doses of 200 mg, twice a day to 12 subjects, mean maximum steady-state plasma concentrations were: sulindac 5.0 µg/ml, sulphide 6.9 µg/ml, sulphone 2.6 µg/ml; a diurnal variation in plasma concentrations was reported with lower concentrations being attained after the evening dose. After oral administration of 400 mg once daily to 12 subjects, maximum steady-state plasma concentrations were: sulindac 8.7 µg/ml, sulphide 8.8 µg/ml, sulphone 3.9 µg/ml (B. N. Swanson *et al.*, *Clin. Pharmac. Ther.*, 1982, 32, 397–403).

HALF-LIFE. Plasma half-life, sulindac about 7 hours, sulphide metabolite about 16 to 18 hours.

PROTEIN BINDING. In plasma, sulindac, sulphone, and sulphide, about 95%.

NOTE. For a review of the pharmacokinetics of sulindac see R. N. Brogden *et al.*, *Drugs*, 1978, 16, 97–114.

Dose. 200 to 400 mg daily.

Sulphacetamide

Sulphonamide

Synonyms. Acetosulfaminum; Sulfacetamide.

Proprietary Name. It is an ingredient of Sultrin.

N-Sulphanilylacetylacetamide

$C_8H_{10}N_2O_3S = 214.2$

CAS—144-80-9

A white or yellowish-white crystalline powder. M.p. 181° to 184°.

Soluble 1 in 150 of water, 1 in 15 of ethanol, and 1 in 7 of acetone; very slightly soluble in chloroform; slightly soluble in ether.

Sulphacetamide Sodium

Synonyms. Soluble Sulphacetamide; Sulfacetamide Sodium; Sulfacylum Natrium.

Proprietary Names. Acetopt; Albucid; Antebor; Bleph-10; Cetamide; Optamide; Optosulfex; Sebizon; Sodium Sulamyd; Sulf-10; Sulphacalyre. It is an ingredient of Ocusol.

$C_8H_9N_2NaO_3S \cdot H_2O = 254.2$

CAS—127-56-0 (anhydrous); 6209-17-2 (monohydrate)

White or yellowish-white crystals or crystalline powder. It slowly darkens on exposure to light; on exposure to moist air it absorbs carbon dioxide and becomes less soluble.

Soluble 1 in 1.5 of water; slightly soluble in ethanol; sparingly soluble in acetone; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 1.8, 5.4.

Colour Tests. Coniferyl Alcohol—orange; Copper Sulphate (Method 1)—blue; Koppanyi-Zwicker Test—blue-violet.

Thin-layer Chromatography. System TA—Rf 70; system TD—Rf 17; system TE—Rf 05; system TF—Rf 42; system TT—Rf 53; system TU—Rf 37; system TV—Rf 04. (Mercuric chloride–diphenylcarbazone reagent, blue; acidified potassium permanganate solution, positive; Van Urk reagent, yellow.)

Gas Chromatography. System GJ—retention time of methyl derivative 0.16 relative to griseofulvin.

High Pressure Liquid Chromatography. System HU—k' 7.7.

Ultraviolet Spectrum. Aqueous acid—271 nm ($A_1^1 = 260$ a); aqueous alkali—256 nm ($A_1^1 = 750$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1145, 1264, 1552, 1090, 825, 1600 (sulphacetamide sodium, KBr disk).

Mass Spectrum. Principal peaks at m/z 172, 92, 156, 65, 108, 39, 44, 41.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. The method referred to under Sulphamethoxazole may be used.

Disposition in the Body. After oral administration sulphacetamide is readily absorbed and rapidly excreted in the urine, mainly as unchanged drug. However, it is usually only used topically in the treatment of eye infections; absorption into the blood may occur after application to the eye if the conjunctiva is inflamed.

HALF-LIFE. Plasma half-life, 7 to 14 hours.

PROTEIN BINDING. In plasma, 15 to 18%.

Use. Sulphacetamide sodium is used as a 10 to 30% ophthalmic solution.

Sulphachlorpyridazine

Sulphonamide

Synonym. Sulfachlorpyridazine

Proprietary Names. Nefrosul; Sonilyn.

N^1 -(6-Chloropyridazin-3-yl)sulphanilamide

$C_{10}H_9ClN_4O_2S = 284.7$

CAS—80-32-0

A yellowish crystalline powder.

Soluble in bicarbonate solutions.

Colour Tests. Coniferyl Alcohol—orange; Copper Sulphate (Method 1)—green; Koppányi–Zwicker Test—pink; Mercurous Nitrate—black; Nitrous Acid—yellow.

Thin-layer Chromatography. System TA—Rf 70. (Van Urk reagent, positive.)

High Pressure Liquid Chromatography. System HU—k' 3.3.

Ultraviolet Spectrum. Aqueous acid—256 nm; aqueous alkali—257 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1124, 1220, 1087, 1208, 963, 1618 (KBr disk).

Disposition in the Body. Readily absorbed after oral administration and rapidly excreted in the urine.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 500 mg to 10 subjects, peak plasma concentrations of 39.7 to 85.5 $\mu\text{g/ml}$ (mean 59.6) were attained in about 1 hour (E. L. Marino *et al.*, *Int. J. clin. Pharmac. Ther. Toxicol.*, 1980, 18, 10–14).

HALF-LIFE. Plasma half-life, about 3 to 4 hours.

VOLUME OF DISTRIBUTION. About 0.1 litre/kg.

CLEARANCE. Plasma clearance, about 0.5 ml/min/kg.

PROTEIN BINDING. In plasma, about 94 to 99%.

REFERENCE. E. L. Marino *et al.*, *ibid.*

Dose. Sulphachlorpyridazine has been given in an initial dose of 4 g, followed by 2 to 4 g daily.

Sulphadiazine

Sulphonamide

Synonyms. Solfadiazina; Solfapirimidina; Sulfadiazine. It is an ingredient of Co-tetroxazine and Co-trimazine.

Proprietary Names. Adiazine; Diazyl Dulcet; S-Diazine. It is an ingredient of Streptotriad, Sulphatriad, Tibirox, Triglobe, and Trinamide (vet.).

N^1 -(Pyrimidin-2-yl)sulphanilamide

$C_{10}H_{10}N_4O_2S = 250.3$

CAS—68-35-9

White, yellowish-white, or pinkish-white crystals or powder, slowly darkening on exposure to light. M.p. about 255°, with decomposition.

Practically **insoluble** in water, chloroform, and ether; very slightly soluble in ethanol; soluble 1 in 300 of acetone; soluble in dilute mineral acids and in solutions of alkali hydroxides and carbonates.

Sulphadiazine Sodium

Synonyms. Soluble Sulphadiazine; Sulfadiazine Sodium.

$C_{10}H_9N_4NaO_2S = 272.3$

CAS—547-32-0

A white or yellowish-white powder. It slowly darkens on exposure to light; on exposure to moist air it absorbs carbon dioxide with the liberation of sulphadiazine and becomes incompletely soluble in water.

Soluble 1 in 2 of water; slightly soluble in ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 6.5 (25°).

Partition Coefficient. Log P (octanol/pH 7.5), -1.3 .

Colour Tests. Coniferyl Alcohol—orange; Copper Sulphate (Method 1)—violet-brown; Koppanyi-Zwicker Test—violet-pink; Mercurous Nitrate—black.

Thin-layer Chromatography. *System TA*—Rf 64; *system TD*—Rf 22; *system TE*—Rf 04; *system TF*—Rf 39; *system TT*—Rf 24; *system TU*—Rf 22; *system TV*—Rf 03.

Gas Chromatography. *System GJ*—retention time of the methyl derivative of sulphadiazine 0.66 and of N^4 -acetylsulphadiazine 1.69, both relative to griseofulvin.

High Pressure Liquid Chromatography. *System HU*— k' 8.7.

Ultraviolet Spectrum. Aqueous acid—242 nm ($A_1^1 = 587$ a); aqueous alkali—240 nm ($A_1^1 = 867$ a), 254 nm ($A_1^1 = 868$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1580, 1159, 1494, 682, 940, 797 (KBr disk).

Mass Spectrum. Principal peaks at m/z 186, 185, 92, 65, 108, 39, 93, 187.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: sulphadiazine and acetyl derivative, sensitivity 1 ng, ECD—A. Bye and G. Land, *J. Chromat.*, 1977, 139, 181–185.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: detection limit 400 ng/ml for sulphadiazine in plasma, 5 and

7 µg/ml for sulphadiazine and the acetyl derivative, respectively, in urine, UV detection—D. Westerlund and A. Wijkström, *J. pharm. Sci.*, 1982, 71, 1142–1145.

Disposition in the Body. Readily absorbed after oral administration. It is acetylated in the body and up to 15% of the sulphadiazine in the blood is in the form of the inactive N^4 -acetyl derivative. About 50% of a dose is excreted in the urine in 24 hours; up to about 40% of the excreted material is the acetyl derivative and up to about 50% is unchanged drug. Excretion is influenced by the pH of the urine, the rate being increased when the urine is alkaline.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 820 mg to 5 subjects, peak serum concentrations of sulphadiazine plus metabolites of 19 to 40 µg/ml (mean 33) were attained in 4 hours (T. Bergan *et al.*, *Clin. Pharmac. Ther.*, 1977, 22, 211–224).

HALF-LIFE. Plasma half-life, 6 to 17 hours.

VOLUME OF DISTRIBUTION. About 0.3 litre/kg.

CLEARANCE. Plasma clearance, about 0.3 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 0.93.

PROTEIN BINDING. In plasma, about 50%.

Dose. An initial dose of 2 to 4 g, followed by 1 g every 4 to 6 hours.

Sulphadimethoxine

Sulphonamide

Synonym. Sulfadimethoxine

Proprietary Names. Crozinal; Ipersulfa; Madribon; Risulpir; Sulfabon; Sulfaduran.

N^1 -(2,6-Dimethoxypyrimidin-4-yl)sulphanilamide

$C_{12}H_{14}N_4O_4S = 310.3$

CAS—122-11-2

A white or creamy-white crystalline powder. M.p. 198° to 204°. Very slightly **soluble** in water; soluble 1 in 200 of ethanol, 1 in 800 of chloroform, and 1 in 2000 of ether; soluble in dilute mineral acids and in solutions of alkali hydroxides and carbonates.

Dissociation Constant. pK_a 5.9 (25°).

Colour Tests. Coniferyl Alcohol—orange; Copper Sulphate (Method 1)—green; Koppanyi-Zwicker Test—violet-pink; Mercurous Nitrate—black.

Thin-layer Chromatography. System *TA*—Rf 65; system *TD*—Rf 31; system *TE*—Rf 10; system *TF*—Rf 51; system *TT*—Rf 85; system *TU*—Rf 52; system *TV*—Rf 34.

Ultraviolet Spectrum. Aqueous acid—275 nm ($A_1^1 = 449$ a); aqueous alkali—269 nm ($A_1^1 = 845$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1590, 1147, 1090, 1314, 685, 1066 (KBr disk).

Mass Spectrum. Principal peaks at m/z 246, 92, 65, 245, 108, 247, 39, 260.

Disposition in the Body. Sulphadimethoxine is a long-acting sulphonamide which is readily absorbed after oral administration. After a single dose, peak blood concentrations are attained in about 4 to 6 hours. It is acetylated in the body and about 10% of the sulphadimethoxine in the blood is present as the inactive N^4 -acetyl derivative, and about 5% as the N^1 -glucuronide. About 50% of a dose is excreted in the urine in 48 hours, about 20% of the excreted material being the acetyl derivative, about 5% unchanged drug, and 60 to 80% the N^1 -glucuronide. Both unchanged drug and the N^1 -glucuronide are excreted in the bile.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 50 to 100 $\mu\text{g/ml}$.

Following an oral dose of 2 g, peak blood concentrations of 120 to 180 $\mu\text{g/ml}$ were attained (H. Seneca, *J. Am. med. Ass.*, 1966, 198, 975–980).

HALF-LIFE. Plasma half-life, 20 to 40 hours.

VOLUME OF DISTRIBUTION. About 0.1 to 0.2 litre/kg.

PROTEIN BINDING. In plasma, 90 to 99%.

Dose. An initial dose of 1 or 2 g, followed by 0.5 to 1 g daily.

Sulphadimidine

Sulphonamide

Synonyms. Sulfadimérazine; Sulfadimezinum; Sulfadimidine; Sulfamethazine; Sulphadimethylpyrimidine; Sulphamethazine.

Note. Sulfadimethylpyrimidine has been used as a synonym for sulphasomidine. Care should be taken to avoid confusion between the two compounds, which are isomeric.

Proprietary Names. Diazil; S-Dimidine. It is an ingredient of Streptotriad.

N^1 -(4,6-Dimethylpyrimidin-2-yl)sulphanilamide

$C_{12}H_{14}N_4O_2S = 278.3$

CAS—57-68-1

White or yellowish-white crystals or powder which darken and decompose on exposure to light. M.p. 197° to 200°.

Very slightly **soluble** in water; soluble 1 in 120 of ethanol, 1 in 30 of acetone, 1 in 600 of chloroform, and 1 in 2500 of ether; soluble in dilute mineral acids and in aqueous solutions of alkali hydroxides and carbonates.

Sulphadimidine Sodium

Synonyms. Soluble Sulphadimethylpyrimidine; Soluble Sulphadimidine; Soluble Sulphamethazine.

Proprietary Name. Sulphamezathine

$C_{12}H_{13}N_4NaO_2S = 300.3$

CAS—1981-58-4

White or creamy-white hygroscopic crystals or powder. It slowly discolours and decomposes on exposure to light; on exposure to air it absorbs carbon dioxide and becomes less soluble in water.

Soluble 1 in 2.5 of water and 1 in 60 of ethanol.

Dissociation Constant. pK_a 7.4 (25°).

Partition Coefficient. Log P (octanol), 0.3.

Colour Tests. Coniferyl Alcohol—orange; Copper Sulphate (Method 1)—green → brown; Koppanyi-Zwicker Test—violet-pink; Mercurous Nitrate—black; Nitrous Acid—yellow.

Thin-layer Chromatography. System *TA*—Rf 62; system *TD*—Rf 23; system *TE*—Rf 13; system *TF*—Rf 45; system *TT*—Rf 50; system *TU*—Rf 27; system *TV*—Rf 62. (Mercuric chloride-diphenylcarbazone reagent, blue; acidified potassium permanganate solution, positive; Van Urk reagent, yellow.)

Gas Chromatography. System *GJ*—retention time of methyl derivative 0.71 relative to griseofulvin.

High Pressure Liquid Chromatography. System *HU*— k' 7.1.

Ultraviolet Spectrum. Aqueous acid—243 nm ($A_1^1 = 541$ a), 301 nm; aqueous alkali—242 nm ($A_1^1 = 760$ a), 258 nm ($A_1^1 = 783$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1145, 1595, 1304, 1635, 682, 1090 (KCl disk).

Mass Spectrum. Principal peaks at m/z 214, 213, 92, 65, 215, 108, 39, 42.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or blood: sulphadimidine and acetyl metabolite, sensitivity 6 $\mu\text{g/ml}$, UV detection—R. Whelpton *et al.*, *Clin. Chem.*, 1981, 27, 1911–1914.

Disposition in the Body. Readily absorbed after oral administration. It is acetylated in the body, the degree of acetylation being dependent on the acetylator status of the subject. In rapid

acetylators, 60 to 90% of the sulphadimidine in the blood is present as the *N*⁴-acetyl derivative whereas, in slow acetylators, the proportion is only about 16 to 37%. About 50% of a dose is excreted in the urine in 48 hours. Of the excreted material, up to about 15% is unchanged drug and up to about 95% may be the acetyl derivative.

THERAPEUTIC CONCENTRATION. In plasma, free sulphadimidine, usually in the range 50 to 100 µg/ml.

Following a single oral dose of 1.5 g to 8 slow acetylators, plasma-sulphadimidine concentrations of 64.0 to 88.4 µg/ml (mean 80.7) were attained in 3 to 4 hours; after a similar dose to 8 rapid acetylators, peak plasma concentrations ranged from 38.8 to 64.1 µg/ml (mean 45.7) at 3 hours (U. M. Woolhouse and L. C. Atu-Taylor, *Clin. Pharmac. Ther.*, 1982, 31, 377–383).

HALF-LIFE. Derived from urinary excretion data, 1 to 5 hours for rapid acetylators and 3 to 11 hours (mean 6) for slow acetylators.

VOLUME OF DISTRIBUTION. About 0.6 litre/kg.

PROTEIN BINDING. In plasma, 60 to 90%.

Dose. An initial dose of up to 3 g, followed by 0.5 to 1.5 g every 6 hours.

Sulphaethidole

Sulphonamide

Synonyms. Aethazolum; Ethazol; SETD; Sulfaethidole; Sulphaethylthiadiazole.

Proprietary Name. Sulfa-Perlongit

*N*¹-(5-Ethyl-1,3,4-thiadiazol-2-yl)sulphanilamide

C₁₀H₁₂N₄O₂S₂ = 284.4

CAS—94-19-9

A white or yellowish-white crystalline powder. M.p. 186° to 190°.

Very slightly **soluble** in water; soluble 1 in 75 of ethanol, 1 in 13 of acetone, 1 in 1300 of chloroform, and 1 in 1700 of ether; freely soluble in solutions of alkali hydroxides.

Dissociation Constant. pK_a 5.6.

Colour Tests. Coniferyl Alcohol—orange; Copper Sulphate (Method 1)—green; Koppányi-Zwicker Test—violet; Mercurous Nitrate—black; Nitrous Acid—yellow.

Thin-layer Chromatography. System TA—Rf 67; system TD—Rf 14; system TE—Rf 08; system TF—Rf 35.

Infra-red Spectrum. Principal peaks at wavenumbers 1086, 1298, 1538, 1149, 689, 917.

Mass Spectrum. Principal peaks at *m/z* 92, 284, 156, 108, 65, 106, 93, 220.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. The method referred to under Sulphamethoxazole may be used.

Disposition in the Body. Readily absorbed after oral administration and only slightly acetylated in the body. More than 75% of a dose is excreted in the urine in 48 hours as unchanged drug.

THERAPEUTIC CONCENTRATION.

Following oral administration of 3.9 g to 6 subjects, peak blood concentrations of 138 to 275 µg/ml (mean 227) were attained in about 2 hours (A. E. Nicholson *et al.*, *J. Am. pharm. Ass.*, 1960, 49, 40–44).

HALF-LIFE. Plasma half-life, about 10 to 12 hours.

VOLUME OF DISTRIBUTION. About 0.1 litre/kg.

PROTEIN BINDING. In plasma, 96 to 99%.

Dose. Sulphaethidole has been given in sustained-release form in a dose of up to 3.9 g.

Sulphafurazole

Sulphonamide

Synonyms. Sulfafurazolum; Sulfisoxazole.**Proprietary Names.** Chemovag; Gantrisin (tablets); Koro-Sulf; Novosoxazole; SK-Soxazole; Sosol; Soxa; Sulfagan; Sulfazole; Sulfizin; Urizole; Urogan; Velmatrol. It is an ingredient of Azo Gantrisin.***N*¹-(3,4-Dimethylisoxazol-5-yl)sulphanilamide****C₁₁H₁₃N₃O₃S = 267.3****CAS—127-69-5**

A white or yellowish-white crystalline powder. M.p. 194° to 199°.

Soluble 1 in 7700 of water, 1 in 50 of ethanol, 1 in 1000 of chloroform, and 1 in 800 of ether; freely soluble in acetone; soluble in methanol.**Acetyl Sulphafurazole****Synonym.** Sulfisoxazole Acetyl**Proprietary Names.** Gantrisin (suspension and syrup); Lipo-Gantrisin.**Note.** Acetyl sulphafurazole [*N*-(3,4-dimethylisoxazol-5-yl)-*N*-sulphanilyl-acetamide] should be distinguished from the *N*⁴-acetyl derivative formed from sulphafurazole by acetylation in the body.**C₁₃H₁₅N₃O₄S = 309.3****CAS—80-74-0**

A white to slightly yellow crystalline powder. M.p. 192° to 195°.

Practically **insoluble** in water; soluble 1 in about 180 of ethanol, 1 in 35 of chloroform, 1 in about 1100 of ether, and 1 in about 200 of methanol.**Sulphafurazole Diethanolamine****Synonyms.** Sulfisoxazole Diolamine; Sulphafurazole Diolamine.**Proprietary Name.** Gantrisin (injection)**C₁₁H₁₃N₃O₃S·C₄H₁₁NO₂ = 372.4****CAS—4299-60-9**

A white, fine, crystalline powder. M.p. 119° to 124°.

Soluble 1 in 2 of water, 1 in 16 of ethanol, 1 in 1000 of chloroform, and 1 in 4 of methanol; practically insoluble in ether.**Dissociation Constant.** p*K*_a 5.0 (20°).**Partition Coefficient.** Log *P* (octanol/pH 7.5), −0.9.**Colour Tests.** Coniferyl Alcohol—orange; Copper Sulphate (Method 1)—brown; Koppanyi-Zwicker Test—blue-violet; Mercurous Nitrate—black; Nitrous Acid—orange.**Thin-layer Chromatography.** *System TA*—Rf 65; *system TD*—Rf 25; *system TE*—Rf 08; *system TF*—Rf 52; *system TT*—Rf 74; *system TU*—Rf 48; *system TV*—Rf 04. Wavelength

**Quantification.** HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: sulphafurazole and acetylsulphafurazole, sensitivity 50 ng/ml, UV detection—D. Jung and S. Øie, *Clin. Chem.*, 1980, 26, 51–54.**Disposition in the Body.** Rapidly absorbed after oral administration. It is acetylated in the body, about 30% of the sulphafurazole in the blood being in the form of the inactive *N*⁴-acetyl derivative. It is rapidly excreted in the urine, almost the entire dose being excreted within 48 hours, with up to about 60% as unchanged drug and up to about 30% as the acetyl derivative. Excretion is influenced by the pH of the urine, the rate being increased when the urine is alkaline.**THERAPEUTIC CONCENTRATION.**After a single oral dose of 2 g to 7 subjects, peak plasma concentrations of sulphafurazole of 127 to 210 µg/ml (mean 169) were attained in 1 to 4 hours (S. A. Kaplan *et al.*, *J. pharm. Sci.*, 1972, 61, 773–778).**HALF-LIFE.** Plasma half-life, 4 to 7 hours.**VOLUME OF DISTRIBUTION.** About 0.1 to 0.2 litre/kg.**CLEARANCE.** Plasma clearance, about 0.3 ml/min/kg.**PROTEIN BINDING.** In plasma, 85 to 95%.**Dose.** An initial dose of 2 to 4 g, followed by 1 to 2 g every 4 to 6 hours.**Sulphaguanidine**

Sulphonamide

Synonyms. Sulfaguanidine; Sulfamidinum; Sulginum.**Proprietary Names.** Ganidan; Resulfon; S-Guanidine. It is an ingredient of Guanimycin.***N*¹-Amidinosulphanilamide monohydrate****C₇H₁₀N₄O₂S·H₂O = 232.3****CAS—57-67-0 (anhydrous); 6190-55-2 (monohydrate)**

White crystals or powder, slowly darkening on exposure to light. M.p. 188° to 193°.

Soluble 1 in 1000 of water and 1 in 250 of ethanol; practically insoluble in ether; readily soluble in dilute mineral acids.

Partition Coefficient. Log *P* (octanol), −1.2.

Colour Tests. Coniferyl Alcohol—orange; Copper Sulphate (Method 1)—blue; Koppányi–Zwicker Test—violet (transient).

Thin-layer Chromatography. *System TA*—Rf 65; *system TD*—Rf 01; *system TE*—Rf 25; *system TF*—Rf 06; *system TT*—Rf 21; *system TU*—Rf 90; *system TV*—Rf 48.

Gas Chromatography. *System GA*—not eluted.

Ultraviolet Spectrum. Aqueous acid—264 nm ($A_1^1 = 115$ a), 271 nm ($A_1^1 = 107$ c); aqueous alkali—259 nm ($A_1^1 = 758$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1620, 1129, 1230, 1537, 1075, 1176 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 92, 65, 108, 214, 156, 39, 109, 43.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 10 ng/ml, UV detection—R. L. Suber and G. T. Edds, *J. liq. Chromat.*, 1980, 3, 257–268.

Disposition in the Body. Absorption is variable after oral administration. It is rapidly excreted in the urine, about 30% of the excreted material being in the form of the inactive *N*⁴-acetyl derivative. Large amounts are also eliminated in the faeces.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 15 to 40 µg/ml.

PROTEIN BINDING. In plasma, about 8%.

Dose. Sulphaguanidine has been given in doses of 9 g daily for 3 days.

Sulphamethizole

Sulphonamide

Synonyms. Sulfamethizole; Sulfamethylthiadiazole.

Proprietary Names. Microsul; Proklar-M; Rufol; S-Methizole; Thiosulfil; Urolex; Urolucosil; Uroz. It is an ingredient of Azotrex.

*N*¹-(5-Methyl-1,3,4-thiadiazol-2-yl)sulphanilamide

$C_9H_{10}N_4O_2S_2 = 270.3$

CAS—144-82-1

Colourless crystals or white or creamy-white crystalline powder. M.p. 208° to 212°.

Soluble 1 in 2000 of water, 1 in 25 of ethanol, 1 in 13 to 1 in 15 of acetone, and 1 in 1900 of chloroform and ether; soluble in solutions of alkali hydroxides and in dilute mineral acids.

Dissociation Constant. pK_a 5.5 (25°).

Partition Coefficient. Log *P* (octanol/pH 7.5), −1.1.

Colour Tests. Coniferyl Alcohol—orange; Copper Sulphate (Method 1)—green; Koppányi–Zwicker Test—red-violet; Mercurous Nitrate—black; Nitrous Acid—yellow.

Thin-layer Chromatography. *System TA*—Rf 65; *system TD*—Rf 12; *system TE*—Rf 04; *system TF*—Rf 23; *system TT*—Rf 46; *system TU*—Rf 36; *system TV*—Rf 02. (Mercuric chloride–diphenylcarbazone reagent, blue; acidified potassium permanganate solution, positive; Van Urk reagent, yellow.)

Gas Chromatography. *System GJ*—retention time of methyl derivative 0.98 relative to griseofulvin.

Ultraviolet Spectrum. Aqueous acid—268 nm ($A_1^1 = 542$ a); aqueous alkali—260 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1549, 1134, 699, 1084, 1152, 1600 (KBr disk). (See below)

Mass Spectrum. Principal peaks at *m/z* 92, 270, 65, 156, 108, 106, 93, 59.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. The method referred to under Sulphamethoxazole may be used.

Disposition in the Body. Readily absorbed after oral administration and only slightly acetylated in the body. It is rapidly excreted in the urine, up to 90% of a dose being excreted within 24 hours, mainly as unchanged drug.

THERAPEUTIC CONCENTRATION.

Following oral administration of 0.5 g of sulphamethizole to 5 subjects, a mean peak blood concentration of 20 µg/ml was attained in about 2 hours (G. L. Mattock and I. J. McGilveray, *J. pharm. Sci.*, 1972, 61, 746–749).

HALF-LIFE. Plasma half-life, 1 to 2 hours.

VOLUME OF DISTRIBUTION. About 0.3 litre/kg.

CLEARANCE. Blood clearance, about 3 ml/min/kg.

PROTEIN BINDING. In plasma, about 90%.

Dose. 1 to 4 g daily.

Sulphamethoxazole

Sulphonamide

Synonyms. Sulfamethoxazole; Sulfisomezole. It is an ingredient of Co-trimoxazole.

Proprietary Names. Gantanol. It is an ingredient of Azo Gantanol, Bactrim, Chemotrim, Comox, Cotrimox, Eusaprim, Fectrim, Laratrim, Septra, Septrin, and Sulfotrimin.

*N*¹-(5-Methylisoxazol-3-yl)sulphanilamide

C₁₀H₁₁N₃O₃S = 253.3

CAS—723-46-6

A white or yellowish-white crystalline powder. M.p. 168° to 172°.

Very slightly **soluble** in water; soluble 1 in 50 of ethanol and 1 in 3 of acetone; practically insoluble in chloroform and ether; soluble in solutions of alkali hydroxides.

Dissociation Constant. pK_a 5.6 (25°).

Colour Tests. Coniferyl Alcohol—orange; Copper Sulphate (Method 1)—green; Koppanyi-Zwicker Test—blue-violet; Mercurous Nitrate—black; Nitrous Acid—yellow.

Thin-layer Chromatography. System TA—Rf 65; system TD—Rf 26; system TE—Rf 05; system TF—Rf 54; system TT—Rf 88; system TU—Rf 33; system TV—Rf 02. (Mercuric chloride-diphenylcarbazone reagent, blue; acidified potassium permanganate solution, positive; Van Urk reagent, yellow.)

Gas Chromatography. System GJ—retention time of the methyl derivative of sulphamethoxazole 0.40 and of *N*⁴-acetylsulphamethoxazole 0.91, both relative to griseofulvin.

High Pressure Liquid Chromatography. System HU—sulphamethoxazole k' 4.8, *N*⁴-acetylsulphamethoxazole k' 4.9.

Ultraviolet Spectrum. Aqueous acid—265 nm (A₁¹ = 175 a); aqueous alkali—256 nm (A₁¹ = 673 a).

Infra-red Spectrum. Principal peaks at wavenumbers 1145, 1160, 1599, 1621, 685, 1306 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 156, 92, 108, 65, 140, 253, 157, 43.

Quantification. COLORIMETRY. In plasma—P. Heizmann and P. Haefelfinger, *Experientia*, 1981, 37, 806–807.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum or urine: detection limit 500 ng/ml, UV detection—T. B. Vree *et al.*, *J. Chromat.*, 1978, 146; *Biomed. Appl.*, 3, 103–112.

Disposition in the Body. Readily absorbed after oral administration. It is metabolised mainly by acetylation with the formation of the *N*¹-acetyl and *N*⁴-acetyl derivatives; about 15% of the

sulphamethoxazole in the blood is present as acetylated metabolites. Excreted in the urine mostly as the *N*⁴-acetyl derivative and unchanged sulphamethoxazole together with some glucuronide conjugates. Urinary excretion is variable and is dependent on the pH of the urine, the proportion of unchanged drug excreted being increased when the urine is alkaline. Up to about 25% of the dose is excreted unchanged when the urine is acid, rising to 40% or more in alkaline urine. The amount of the *N*⁴-acetyl derivative excreted may be 30 to 70% of the dose. Sulphamethoxazole is frequently administered together with trimethoprim but this does not affect its metabolism.

THERAPEUTIC CONCENTRATION.

After a single oral dose containing 800 mg of sulphamethoxazole and 160 mg of trimethoprim given to 8 subjects, peak serum concentrations of 28 to 45 µg/ml (mean 39) of sulphamethoxazole were attained in 2 to 4 hours. Peak concentrations of trimethoprim of 0.9 to 1.5 µg/ml (mean 1.3) were attained in 1 to 2 hours (W. A. Craig and C. M. Kunin, *Ann. intern. Med.*, 1973, 78, 491-497).

Oral dosing of 5 subjects with 800 mg of sulphamethoxazole and 160 mg of trimethoprim twice daily, produced minimum steady-state plasma concentrations of about 55 µg/ml of sulphamethoxazole and 1.7 µg/ml of trimethoprim, on the ninth day (P. Kremers *et al.*, *J. clin. Pharmacol.*, 1974, 14, 112-117).

TOXICITY. Plasma concentrations greater than 400 µg/ml may be associated with toxic effects.

HALF-LIFE. Plasma half-life, 9 to 12 hours.

VOLUME OF DISTRIBUTION. About 0.2 litre/kg.

CLEARANCE. Plasma clearance, about 0.2 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 1.35.

SALIVA. Plasma: saliva ratio, about 14.

PROTEIN BINDING. In plasma, 60 to 70%.

NOTE. For a review of the clinical pharmacokinetics of sulphamethoxazole and trimethoprim see R. B. Patel and P. G. Welling, *Clin. Pharmacokinet.*, 1980, 5, 405-423.

Dose. Usually 2 g initially, followed by 1 g twice daily; maximum of 3 g daily.

Sulphamethoxydiazine

Sulphonamide

Synonyms. Sulfameter; Sulfamethoxydiazine; Sulfametin; Sulfametorinum; Sulphamethoxydin.

Proprietary Names. Bayrena; Durenat; Kirocid; Sullā.

*N*¹-(5-Methoxypyrimidin-2-yl)sulphanilamide

C₁₁H₁₂N₄O₃S = 280.3

CAS—651-06-9

A white or yellowish-white crystalline powder. M.p. 209° to 213°.

Practically **insoluble** in water; slightly soluble in ethanol; sparingly soluble in acetone; freely soluble in aqueous solutions of alkali hydroxides and carbonates.

Dissociation Constant. pK_a 7.0.

Colour Tests. Coniferyl Alcohol—orange; Copper Sulphate (Method 1)—violet-brown; Koppanyi-Zwicker Test—pink; Mercurous Nitrate—black; Nitrous Acid—yellow.

Thin-layer Chromatography. System TA—Rf 60; system TD—Rf 24; system TE—Rf 12; system TF—Rf 43; system TT—Rf 55; system TU—Rf 17; system TV—Rf 15.

Gas Chromatography. System GJ—retention time of methyl derivative 1.38 relative to griseofulvin.

High Pressure Liquid Chromatography. System HU—k' 8.2.

Ultraviolet Spectrum. Aqueous alkali—245 nm (A₁¹ = 920 a).

Infra-red Spectrum. Principal peaks at wavenumbers 1153, 1597, 1140, 1284, 1090, 925 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 216, 215, 92, 65, 108, 54, 125, 39.

Disposition in the Body. Sulphamethoxydiazine is a long-acting sulphonamide which is readily absorbed after oral administration. It is acetylated in the body, about 10% being present in the blood as the inactive *N*⁴-acetyl derivative. It is excreted slowly in the urine, 20 to 40% of a dose being excreted in 24 hours and about 70% in 3 days. About 50% of the excreted material is unchanged drug, about 25% is the acetyl derivative, and about 20% is a glucuronide conjugate.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 1 g to 4 subjects, peak serum concentrations of 62 to 90 µg/ml (mean 80) were attained in about 6 to 8 hours; following a single oral dose of 2 g to a further 4 subjects, peak serum concentrations of 113 to 148 µg/ml (mean 134) were reported at 6 to 8 hours; mean peak serum concentrations of 86 µg/ml and 166 µg/ml respectively were reported following daily oral doses of 0.5 and 1 g for 3 days (W. H. Chew *et al.*, *Clin. Pharmac. Ther.*, 1965, 6, 307-315).

HALF-LIFE. Plasma half-life, 29 to 59 hours (mean 37).

VOLUME OF DISTRIBUTION. About 0.3 litre/kg.

PROTEIN BINDING. In plasma, about 80%.

Dose. An initial dose of 1 or 1.5 g, followed by 500 mg daily.

Sulphamethoxypyridazine*Sulphonamide*

Synonym. Sulfamethoxypyridazine

Proprietary Names. Lederkyn; Microcid; Midicel.

***N*¹-(6-Methoxypyridazin-3-yl)sulphanilamide**

$C_{11}H_{12}N_4O_3S = 280.3$

CAS—80-35-3

A white or yellowish-white crystalline powder which slowly darkens on exposure to light. M.p. 180° to 183°.

Very slightly **soluble** in water; sparingly soluble in ethanol; soluble 1 in 25 of acetone and 1 in 400 of chloroform; practically insoluble in ether; freely soluble in dilute mineral acids and solutions of alkali hydroxides.

Acetyl Sulphamethoxypyridazine

Note. Acetyl sulphamethoxypyridazine [*N*-(6-methoxypyridazin-3-yl)-*N*-sulphanilylacetamide] should be distinguished from the *N*⁴-acetyl derivative formed from sulphamethoxypyridazine by acetylation in the body.

$C_{13}H_{14}N_4O_4S = 322.3$

CAS—3568-43-2

Crystals. M.p. 186° to 187°, with decomposition.

Very **soluble** in water.

Dissociation Constant. pK_a 7.2 (20°).

Colour Tests. Coniferyl Alcohol—orange; Copper Sulphate (Method 1)—green-brown; Koppanyi-Zwicker Test—red-violet; Mercurous Nitrate—black; Nitrous Acid—yellow.

Thin-layer Chromatography. *System TA*—Rf 65; *system TD*—Rf 19; *system TE*—Rf 11; *system TF*—Rf 39; *system TT*—Rf 53; *system TU*—Rf 26; *system TV*—Rf 50.

Gas Chromatography. *System GJ*—retention time of methyl derivative 0.93 relative to griseofulvin.

High Pressure Liquid Chromatography. *System HU*— k' 7.5.

Ultraviolet Spectrum. Aqueous acid—316 nm ($A_1^1 = 163$ b); aqueous alkali—250 nm ($A_1^1 = 712$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1159, 1599, 1130, 1305, 1630, 1088 (KBr disk).

Mass Spectrum. Principal peaks at m/z 215, 92, 216, 65, 108, 53, 69, 39.

Quantification. **HIGH PRESSURE LIQUID CHROMATOGRAPHY.** The method referred to under Sulphamethoxazole may be used.

Disposition in the Body. Sulphamethoxypyridazine is a long-acting sulphonamide which is readily absorbed after oral administration and may be detected in blood for up to 7 days after discontinuation of treatment. It is acetylated in the body and 10 to 15% of the sulphamethoxypyridazine in the blood is present as the inactive *N*⁴-acetyl derivative. About 45% of a dose is excreted in the urine in 48 hours, with 40 to 70% of the excreted material as the acetyl derivative, about 20% as unchanged drug, and about 13% as glucuronide conjugates. Excretion is influenced by the pH of the urine, the rate being increased when the urine is alkaline.

THERAPEUTIC CONCENTRATION.

Blood concentrations of 110 to 180 µg/ml were attained in 5 hours following an oral dose of 4 g (H. Seneca, *J. Am. med. Ass.*, 1966, 198, 975-980).

HALF-LIFE. Plasma half-life, 1 to 3 days.

VOLUME OF DISTRIBUTION. About 0.2 litre/kg.

DISTRIBUTION IN BLOOD. Small amounts are taken up by the erythrocytes.

PROTEIN BINDING. In plasma, 80 to 90%.

Dose. An initial dose of 1 to 2 g, followed by 500 mg daily.

Sulphamoxole

Sulphonamide

Synonyms. SDMO; Sulfamoxole; Sulphadimethyloxazole. It is an ingredient of Co-trifamole.

Proprietary Names. Justamil; Sulfuno. It is an ingredient of Co-Fram and Supristol.

*N*¹-(4,5-Dimethyloxazol-2-yl)sulphanilamide

$C_{11}H_{13}N_3O_3S = 267.3$

CAS—729-99-7

A white crystalline powder. M.p. about 193°. Slightly **soluble** in water.

Dissociation Constant. pK_a 7.4.

Partition Coefficient. Log *P* (chloroform/pH 7.4), −0.3.

Colour Tests. Coniferyl Alcohol—orange; Copper Sulphate (Method 1)—green-brown; Mercurous Nitrate—black; Nitrous Acid—yellow.

Thin-layer Chromatography. System TA—Rf 67. (*Van Urk reagent*, positive.)

Gas Chromatography. System GA—not eluted; system GJ—retention time of methyl derivative 0.40 relative to griseofulvin.

High Pressure Liquid Chromatography. System HU—*k'* 12.6.

Ultraviolet Spectrum. Aqueous acid—249 nm ($A_1^1 = 375$ b); aqueous alkali—250 nm ($A_1^1 = 685$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1605, 1626, 1127, 1145, 1276, 1094 (KBr disk).

Disposition in the Body. Rapidly absorbed after oral administration. About 65 to 71% of a dose is excreted in the urine, mainly as unchanged drug, the *N*⁴-acetyl conjugate, and sulphanilamide.

THERAPEUTIC CONCENTRATION.

Following single oral doses of 1, 2, and 4 g to 4 subjects, peak serum concentrations of 73.5 to 94.8 (mean 88), 138 to 182 (mean 157), and 215 to 290 µg/ml (mean 241), respectively, were attained in about 2 hours (C. G. vom Bruck *et al.*, *Arzneimittel-Forsch.*, 1960, 10, 621–626).

Following oral administration of 400 mg twice a day to 10 subjects (in combination with trimethoprim 80 mg), a mean maximum steady-state plasma concentration of 75 µg/ml and a mean trough concentration of 42 µg/ml were reported (I. D. Watson *et al.*, *Br. J. clin. Pharmac.*, 1982, 14, 437–443).

HALF-LIFE. Plasma half-life, 4 to 11 hours.

VOLUME OF DISTRIBUTION. About 0.1 litre/kg.

DISTRIBUTION IN BLOOD. Plasma; whole blood ratio, about 1.8.

PROTEIN BINDING. In plasma, about 25%.

Dose. 2 g daily for 1 or 2 days, followed by 1 g daily.

Sulphanilamide

Sulphonamide

Synonyms. Solfammide; Streptocidum; Sulfaminum; Sulfanilamide.

Proprietary Names. Exoseptoplix; Streptosil; Sulfonamid-Spuman; Tablamide. It is an ingredient of Rhinamid.

4-Aminobenzenesulphonamide

$C_6H_8N_2O_2S = 172.2$

CAS—63-74-1

A white crystalline powder. On heating the dry powder it becomes violet-blue and eventually aniline and ammonia are produced. M.p. about 165°.

Soluble 1 in 170 of water, 1 in 30 of ethanol, and 1 in 4 of acetone; practically insoluble in chloroform and ether; soluble in hydrochloric acid and solutions of alkali hydroxides.

Dissociation Constant. pK_a 10.4 (20°).

Partition Coefficient. Log *P* (octanol/pH 7.5), −0.9.

Colour Tests. Coniferyl Alcohol—orange; Copper Sulphate (Method 1)—blue; Koppanyi-Zwicker Test—blue-violet; Mercurous Nitrate—black.

Thin-layer Chromatography. System TA—Rf 67; system TD—Rf 13; system TE—Rf 52; system TF—Rf 46; system TT—Rf 61; system TU—Rf 96; system TV—Rf 66. (*Mercuric chloride-diphenylcarbazone reagent*, blue; *acidified potassium permanganate solution*, positive; *Van Urk reagent*, yellow.)

Gas Chromatography. System GA—RI 2166.

High Pressure Liquid Chromatography. System HU—sulphanilamide *k'* 8.9, *N*⁴-acetylsulphanilamide *k'* 9.6.

Ultraviolet Spectrum. Aqueous acid—262 nm ($A_1^1 = 106$ a), 269 nm ($A_1^1 = 85$ a); aqueous alkali—250 nm ($A_1^1 = 932$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1149, 1603, 1316, 1637, 1099, 1294 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 172, 92, 156, 65, 108, 173, 39, 174.

Dose. Sulphanilamide has been given in an initial dose of 3 g, followed by 1 to 1.5 g every 4 hours.

Sulphaphenazole*Sulphonamide**Synonyms.* Sulfaphenazole; Sulphaphenylpyrazol.*Proprietary Names.* Fenazolo; Orisul; Sulforal.*N*¹-(1-Phenylpyrazol-5-yl)sulphanilamideC₁₅H₁₄N₄O₂S = 314.4

CAS—526-08-9

A white crystalline powder. When heated, the powder becomes brown; when further heated, it produces yellow fumes and an odour of sulphur dioxide. M.p. 179° to 183°.

Very slightly **soluble** in water, ethanol, chloroform, and ether; soluble in acetone, mineral acids, and solutions of alkali hydroxides.

Dissociation Constant. pK_a 6.5.

Partition Coefficient. Log *P* (octanol/pH 7.5), 0.1.

Colour Tests. Coniferyl Alcohol—orange; Copper Sulphate (Method 1)—blue; Koppanyi–Zwicker Test—blue-violet; Mercurous Nitrate—black; Nitrous Acid—yellow.

Thin-layer Chromatography. *System TA*—Rf 69; *system TD*—Rf 29; *system TE*—Rf 09; *system TF*—Rf 51; *system TT*—Rf 89; *system TU*—Rf 70; *system TV*—Rf 13.

Gas Chromatography. *System GJ*—retention time of methyl derivative 1.71 relative to griseofulvin.

Ultraviolet Spectrum. Aqueous alkali—249 nm (*A*₁¹ = 700 b).

Infra-red Spectrum. Principal peaks at wavenumbers 1148, 1507, 1313, 1592, 675, 1630 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 156, 158, 92, 77, 157, 314, 108, 65.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. The method referred to under Sulphamethoxazole may be used.

Disposition in the Body. Readily absorbed after oral administration. It is acetylated in the body and slowly excreted in the urine, about 70 to 80% of a dose being excreted in 72 hours, 30% as the acetyl derivative.

HALF-LIFE. Plasma half-life, 8 to 12 hours.

PROTEIN BINDING. In plasma, about 90 to 99%.

Dose. 2 to 3 g daily for 2 days, followed by 1 g daily.

Sulphapyridine*Sulphonamide**Synonym.* Sulfapyridine*Proprietary Names.* Dagenan; M & B 693. It is an ingredient of Trinamide (vet.).*N*¹-(2-Pyridyl)sulphanilamideC₁₁H₁₁N₃O₂S = 249.3

CAS—144-83-2

A white or yellowish-white crystalline powder or granules. It slowly darkens on exposure to light. M.p. 190° to 193°.

Soluble 1 in 3500 of water, 1 in about 440 of ethanol, and 1 in 65 of acetone; practically insoluble in chloroform and ether; soluble in dilute mineral acids and aqueous solutions of alkali hydroxides.

Sulphapyridine Sodium

Synonym. Soluble Sulphapyridine

$C_{11}H_{10}N_3NaO_2S = 271.3$ (or with $1H_2O = 289.3$)

CAS—127-57-1 (anhydrous); 6101-41-3 (monohydrate)

A white or yellowish-white crystalline powder. On exposure to air, it slowly absorbs carbon dioxide with the liberation of sulphapyridine and becomes incompletely soluble in water.

Soluble 1 in 3 of water and 1 in 10 of ethanol.

Dissociation Constant. pK_a 8.4 (25°).

Partition Coefficient. Log P (octanol/pH 7.5), 0.9.

Colour Tests. Coniferyl Alcohol—orange; Copper Sulphate (Method 1)—green → brown-green; Koppanyi-Zwicker Test—pink; Mercurous Nitrate—black; Nitrous Acid—yellow.

Thin-layer Chromatography. *System TA*—Rf 67; *system TD*—Rf 16; *system TE*—Rf 24; *system TF*—Rf 42; *system TT*—Rf 47; *system TU*—Rf 43; *system TV*—Rf 73.

Gas Chromatography. *System GJ*—retention time of methyl derivative 0.47 relative to griseofulvin.

High Pressure Liquid Chromatography. *System HU*— k' 3.8.

Ultraviolet Spectrum. Aqueous acid—240 nm ($A_1^1 = 392$ a); aqueous alkali—247 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1585, 1264, 1127, 1078, 1639, 950 (KBr disk).

Mass Spectrum. Principal peaks at m/z 184, 92, 185, 65, 39, 108, 66, 186.

Quantification. COLORIMETRY. In serum, saliva or plasma: sensitivity 1.5 $\mu\text{g/ml}$ for sulphapyridine or the acetyl metabolite—T. R. Bates and H. J. Pieniaszek, *Analyt. Lett. (Part B)*, 1978, 11, 709–720.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sulphapyridine and metabolites, detection limit 1 $\mu\text{g/ml}$, UV detection—C. Fischer and U. Klotz, *J. Chromat.*, 1978, 146; *Biomed. Appl.*, 3, 157–162. In plasma, saliva or urine: comparison with GC, detection limits 50 ng for HPLC (fluorescence detection), 10 ng for GC (ECD)—M. E. Sharp *et al.*, *Can. J. pharm. Sci.*, 1980, 15, 35–38.

Disposition in the Body. Irregularly absorbed after oral administration. It is acetylated in the body, about 30 to 70% of the sulphapyridine in the blood being present as the inactive N^4 -acetyl derivative; the extent of acetylation is genetically determined. The rate of excretion appears to be irregular but about 25% of a dose may be excreted in the urine as the acetyl derivative and about 20% as unchanged drug in 60 hours. Other metabolites include the 5-hydroxy derivative and its glucuronide conjugate.

Sulphapyridine is a metabolite of sulphasalazine.

THERAPEUTIC CONCENTRATION.

After an oral dose of 2.5 g given to 5 subjects, peak serum concentrations of sulphapyridine plus metabolites of about 35 to 60 $\mu\text{g/ml}$ were attained in 3 to 5 hours (H. Schröder and D. E. S. Campbell, *Clin. Pharmac. Ther.*, 1972, 13, 539–551).

TOXICITY. Toxic effects are associated with plasma concentrations greater than 50 $\mu\text{g/ml}$.

HALF-LIFE. Plasma half-life, about 6 hours in rapid acetylators, increased in slow acetylators to about 13 hours.

VOLUME OF DISTRIBUTION. About 0.4 litre/kg.

SALIVA. Plasma: saliva ratio, about 1.8.

PROTEIN BINDING. In plasma, about 40 to 60%.

Dose. Initially 3 or 4 g daily, followed by 0.5 to 1 g daily.

Sulphasalazine

Sulphonamide

Synonyms. Salazosulphapyridine; Salicylazosulphapyridine; Sulfasalazine.

Proprietary Names. Azulfidine; Colo-Pleon; Salazopyrin(e); Salisulf; SAS-500.

4-Hydroxy-4'-(2-pyridylsulphamoyl)azobenzene-3-carboxylic acid

$C_{18}H_{14}N_4O_5S = 398.4$

CAS—599-79-1

A fine bright yellow to brownish-yellow powder. M.p. about 255°, with decomposition.

Practically **insoluble** in water, chloroform, and ether; soluble 1 in 2900 of ethanol; soluble in aqueous solutions of alkali hydroxides.

Dissociation Constant. pK_a 0.6, 2.4, 9.7, 11.8.

Colour Tests. Copper Sulphate (Method 1)—orange-brown; Palladium Chloride—black.

Thin-layer Chromatography. *System TA*—Rf 66; *system TD*—Rf 00; *system TE*—Rf 00; *system TF*—Rf 00. (Visible orange spot.)

Infra-red Spectrum. Principal peaks at wavenumbers 1078, 1123, 772, 1634, 1175, 1672 (Nujol mull).

Mass Spectrum. Principal peaks at m/z 169, 92, 289, 65, 290, 39, 333, 184.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sulphapyridine, acetylsulphapyridine, 5-aminosalicylic acid, and 5-acetamidosalicylic acid, sensitivity 500 ng/ml, UV and fluorescence detection—P. N. Shaw *et al.*, *J. Chromat.*, 1983, 274; *Biomed. Appl.*, 25, 393–397. In plasma or urine: 5-aminosalicylic acid and 5-acetamidosalicylic acid, sensitivity 20 ng/ml, fluorescence detection—C. Fischer *et al.*, *J. Chromat.*,

1981, 225; *Biomed. Appl.*, 14, 498–503. In bile: 5-aminosalicylic acid and 5-acetamidosalicylic acid, fluorescence detection—C. Fischer *et al.*, *Br. J. clin. Pharmacol.*, 1983, 15, 273–274.

Disposition in the Body. Partially and irregularly absorbed after oral administration. The absorbed material is not metabolised but is excreted unchanged in the urine and accounts for up to about 10% of the dose. The greater part of the dose passes unchanged into the colon where it is metabolised by bacteria to sulphapyridine and 5-aminosalicylic acid, which is thought to be the active moiety. The sulphapyridine so formed is absorbed, and metabolised by *N*⁴-acetylation, ring hydroxylation, and glucuronidation. The degree of acetylation is dependent on the acetylator status of the subject. About 60% of the dose is excreted in the urine as free and acetylated sulphapyridine and their glucuronides, and about 25% of the dose is eliminated as sulphapyridine in the faeces. The 5-aminosalicylic acid is partially absorbed and metabolised by *N*-acetylation; about 30% is excreted in the urine as unchanged drug and 5-acetamidosalicylic acid, and most of the remainder is eliminated unchanged in the faeces.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 2 g to 8 subjects, peak plasma concentrations of 7 to 32 µg/ml (mean 17) of sulphasalazine were attained in about 3 hours; peak plasma concentrations of sulphapyridine averaged about 20 µg/ml (E. M. Ryde and J. J. Lima, *Curr. ther. Res.*, 1981, 29, 728–737).

Following daily oral doses of 3 g to 6 subjects, minimum steady-state plasma concentrations of 0.04 to 0.34 µg/ml of 5-aminosalicylic acid and 0.2 to 1.4 µg/ml of 5-acetamidosalicylic acid were reported (C. Fischer *et al.*, *J. Chromat.*, 1981, 225; *Biomed. Appl.*, 14, 498–503).

After daily oral doses of 4 g to 9 subjects, steady-state serum concentrations of 37 to 92 µg/ml (median 50) for total sulphapyridine and its metabolites, 4.7 to 45 µg/ml (median 12) for sulphasalazine, and less than 2 µg/ml for 5-aminosalicylic acid metabolites were reported on the 5th day (H. Schröder and D. E. S. Campbell, *Clin. Pharmacol. Ther.*, 1972, 13, 539–551).

TOXICITY. Toxic effects are associated with plasma concentrations of sulphapyridine greater than 50 µg/ml.

HALF-LIFE. Plasma half-life, sulphasalazine, 6 to 17 hours (mean 10).

NOTE. For a review of the pharmacokinetics of sulphasalazine see K. M. Das and R. Dubin, *Clin. Pharmacokinet.*, 1976, 1, 406–425.

Dose. Initially 4 to 8 g daily; maintenance, 1.5 to 2 g daily.

Sulphasomidine

Sulphonamide

Synonyms. Sulfa-isodimérazine; Sulfaisodimidine; Sulfasomidine; Sulfisomidine.

Note. Sulfadimethylpyrimidine has been used as a synonym for sulphasomidine and is sometimes used as a synonym for sulphadimidine. Care should be taken to avoid confusion between the two compounds, which are isomeric.

Proprietary Names. Elcosine; Elkosin(e); Pepsilphen.

*N*¹-(2,6-Dimethylpyrimidin-4-yl)sulphanilamide

C₁₂H₁₄N₄O₂S = 278.3

CAS—515-64-0

A white or creamy-white finely crystalline powder which slowly darkens on exposure to light. M.p. 244° to 246°.

Slightly **soluble** in water and ethanol; very slightly soluble in chloroform and ether; readily soluble in dilute mineral acids and solutions of alkali hydroxides.

Dissociation Constant. pK_a 7.5 (27°).

Colour Tests. Coniferyl Alcohol—orange; Copper Sulphate (Method 1)—green; Koppanyi-Zwicker Test—blue-violet (transient); Mercurous Nitrate—black; Nitrous Acid—yellow.

Thin-layer Chromatography. System TA—Rf 64; system TD—Rf 05; system TE—Rf 05; system TF—Rf 16; system TT—Rf 11; system TU—Rf 49; system TV—Rf 20.

Ultraviolet Spectrum. Aqueous acid—262 nm; aqueous alkali—262 nm (A₁¹ = 764 b); methanol—272 nm (A₁¹ = 745 a).

Infra-red Spectrum. Principal peaks at wavenumbers 1125, 1260, 1138, 1595, 1650, 1070 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 214, 92, 65, 213, 108, 42, 215, 39.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. The method referred to under Sulphamethoxazole may be used.

Disposition in the Body. Absorbed after oral administration. It is acetylated in the body to only a small extent, about 10 to 25% of the material in the blood being in the form of the inactive *N*⁴-acetyl derivative. It is rapidly excreted in the urine, about 87% of the dose being excreted within 48 hours as unchanged drug together with about 6% as the acetyl derivative.

HALF-LIFE. Plasma half-life, 6 to 8 hours.

PROTEIN BINDING. In plasma, 40 to 90% (dose-dependent).

Dose. Sulphasomidine has been given in an initial dose of 2 to 4 g, followed by 6 g daily.

Sulphathiazole*Sulphonamide*

Synonyms. Norsulfazolum; Sulfanilamidothiazolum; Sulfathiazole; Sulfonazolum.

Proprietary Names. Cibazol; Sulfamul; Thiazamide. It is an ingredient of Streptotriad, Sulphatriad, and Sultrin.

*N*¹-(Thiazol-2-yl)sulphanilamide

$C_9H_9N_3O_2S_2 = 255.3$

CAS—72-14-0

A white crystalline powder which slowly darkens on exposure to light. M.p. 200° to 203°.

Soluble 1 in 2500 of water and 1 in 120 of ethanol; practically insoluble in chloroform and ether; soluble in dilute mineral acids and solutions of alkali hydroxides and carbonates.

Sulphathiazole Sodium

Synonym. Soluble Sulphathiazole

Proprietary Name. It is an ingredient of Tylasul Soluble (vet.).

$C_9H_8N_3NaO_2S_2 \cdot 5H_2O = 367.4$

CAS—144-74-1 (anhydrous); 6791-71-5 (pentahydrate)

A white or yellowish-white microcrystalline powder. It slowly darkens on exposure to light; on exposure to moist air it absorbs carbon dioxide and becomes incompletely soluble in water.

Soluble 1 in 3 of water and 1 in 20 of ethanol.

Dissociation Constant. pK_a 7.1 (25°).

Partition Coefficient. Log *P* (octanol/pH 7.5), −0.4.

Colour Tests. Coniferyl Alcohol—orange; Copper Sulphate (Method 1)—violet-brown; Koppanyi-Zwicker Test—red-violet; Mercurous Nitrate—black; Nitrous Acid—yellow.

Thin-layer Chromatography. *System TA*—Rf 66; *system TD*—Rf 09; *system TE*—Rf 09; *system TF*—Rf 20; *system TT*—Rf 53; *system TU*—Rf 40; *system TV*—Rf 05. (Mercuric chloride-diphenylcarbazone reagent, blue; acidified potassium permanganate solution, positive; Van Urk reagent, yellow.)

Gas Chromatography. *System GA*—not eluted; *system GJ*—retention time of methyl derivative 0.49 relative to griseofulvin.

High Pressure Liquid Chromatography. *System HU*—*k'* 13.4.

Ultraviolet Spectrum. Aqueous acid—280 nm ($A_1^1 = 498$ a); aqueous alkali—256 nm ($A_1^1 = 716$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1130, 1527, 929, 1274, 1082, 1592 (Nujol mull).

Mass Spectrum. Principal peaks at *m/z* 92, 156, 65, 108, 191, 45, 39, 55.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: sensitivity, 250 ng/ml in plasma, 2.5 µg/ml in urine, UV detection—A. Sioufi *et al.*, *J. Chromat.*, 1980, 221; *Biomed. Appl.*, 10, 419–424.

Disposition in the Body. Readily absorbed after oral administration and acetylated in the body, about 20% of the sulphathiazole in the blood being in the form of the inactive *N*⁴-acetyl derivative. It is rapidly excreted in the urine, about 60 to 90% of a dose being excreted in 24 hours; about 20% of the excreted material is the acetyl derivative.

Sulphathiazole is a metabolite of phthalylsulphathiazole and succinylsulphathiazole.

HALF-LIFE. Plasma half-life, about 4 hours.

PROTEIN BINDING. In plasma, 55 to 80%.

Dose. An initial dose of 2 to 3 g, followed by 1 g every 4 to 6 hours.

Sulphaurea*Sulphonamide*

Synonyms. Sulfacarbamide; Sulfanilcarbamide; Sulphacarbamide; Sulphanilylurea; Urosulphanum.

Proprietary Names. Euvernil. It is an ingredient of Uromide.

Sulphanilylurea monohydrate

$C_7H_9N_3O_3S \cdot H_2O = 233.2$

CAS—547-44-4 (anhydrous); 6101-35-5 (monohydrate)

A white crystalline powder. M.p. 125° to 127°.

Soluble 1 in 430 of water; slightly soluble in ethanol; practically insoluble in chloroform and ether; soluble in acetone, dilute mineral acids, and solutions of alkali hydroxides.

Colour Tests. Copper Sulphate (Method 1)—blue; Koppanyi-Zwicker Test—violet; Palladium Chloride—black.

Thin-layer Chromatography. *System TA*—Rf 76; *system TB*—Rf 00; *system TC*—Rf 01.

Ultraviolet Spectrum. Aqueous acid—266 nm ($A_1^1 = 188$ b), 272 nm; aqueous alkali—255 nm. (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 1694, 1149, 1587, 1086, 1612, 684.

Disposition in the Body. Readily absorbed after oral administration. It is rapidly excreted in the urine, most of a single dose being eliminated in 12 hours. About 10 to 15% of the material in the urine is the inactive *N*⁴-acetyl metabolite and the remainder is unchanged drug.

HALF-LIFE. Plasma half-life, about 2.5 hours.

Dose. 3 g daily.

Sulphinpyrazone

Uricosuric

Synonyms. Sulfinpyrazone; Sulphoxyphenylpyrazolidine.

Proprietary Names. Anturan(e); Enturen; Zynol.

1,2-Diphenyl-4-(2-phenylsulphinylethyl)pyrazolidine-3,5-dione

$C_{23}H_{20}N_2O_3S = 404.5$

CAS—57-96-5

A white powder. M.p. 131° to 135°.

Practically **insoluble** in water; soluble 1 in 40 of ethanol, 1 in about 10 of acetone, 1 in 2 of chloroform, and 1 in 750 of ether.

Dissociation Constant. pK_a 2.8 (22°).

Partition Coefficient. Log *P* (octanol), 2.3.

Colour Tests. Copper Sulphate (Method 1)—blue; Koppanyi-Zwikker Test—violet (transient); Liebermann's Test—orange; Nitrous Acid—yellow.

Thin-layer Chromatography. *System TD*—Rf 04; *system TE*—Rf 16; *system TF*—Rf 04.

Gas Chromatography. *System GA*—RI 2253.

Ultraviolet Spectrum. Aqueous acid—237 nm ($A_1^1 = 436$ a); aqueous alkali—260 nm ($A_1^1 = 559$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1716, 1305, 750, 688, 1750, 1595 (KBr disk).

Mass Spectrum. Principal peaks at m/z 77, 278, 105, 78, 51, 279, 252, 130.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: sulphinpyrazone and its *p*-hydroxy and sulphone metabolites, detection limit for sulphinpyrazone 100 ng/ml using AFID or 10 ng/ml using ECD—P. Jakobsen and A. Kirstein Pedersen, *J. Chromat.*, 1979, 163; *Biomed. Appl.*, 5, 259–269.

GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In plasma or urine: sulphide and *p*-hydroxysulphide metabolites, detection limit 5 ng/ml for sulphide and 30 ng/ml for *p*-hydroxysulphide—P. Jakobsen and A. Kirstein Pedersen, *J. Pharm. Pharmac.*, 1981, 33, 89–92.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: sulphinpyrazone and its *p*-hydroxy and sulphone metabolites, sensitivity 50 ng/ml for sulphinpyrazone, UV detection—T. D. Bjornsson *et al.*, *J. Chromat.*, 1980, 181; *Biomed. Appl.*, 7, 417–425. In plasma: sulphinpyrazone and metabolites, sensitivity 30 ng/ml, UV detection—B.-S. Kuo *et al.*, *Arzneimittel-Forsch.*, 1984, 34, 548–550.

Disposition in the Body. Readily absorbed after oral administration. It is metabolised by reduction to the sulphide which is active and is the predominant circulating metabolite, reaching a concentration about 25% of that of sulphinpyrazone. It is also oxidised to the sulphone (active) and there are several hydroxy metabolites. All metabolites are excreted in the urine as the *C*-glucuronides, only a small proportion being excreted in *O*-glucuronidated or unconjugated form. Up to 50% of a dose is excreted in the urine as unchanged drug or its glucuronide.

About 80% of a single dose is recovered within the first 24 hours and more than 95% within 4 days (85% from urine and 10% from faeces).

THERAPEUTIC CONCENTRATION.

Following single oral doses of 200 mg to 6 subjects, peak plasma concentrations of 6.0 to 17.0 µg/ml (mean 13) of sulphinpyrazone were attained in 1 to 4 hours; peak plasma concentrations of the metabolites attained in about 4, 4, and 11 hours, respectively, were: sulphone 0.2 to 1.1 µg/ml, *p*-hydroxysulphinpyrazone 0.1 to 0.48 µg/ml, sulphide 0.6 to 8.9 µg/ml (C. Mahony *et al.*, *Clin. Pharmac. Ther.*, 1983, 33, 491–497).

Following oral administration of 200 mg four times a day to 6 subjects, mean maximum steady-state plasma concentrations were: sulphinpyrazone 20.7 µg/ml about 2 hours after a dose, sulphide 13.9 µg/ml about 7 hours after a dose, sulphone 3.4 µg/ml 2 hours after a dose (B. Rosenkranz *et al.*, *Eur. J. clin. Pharmac.*, 1983, 24, 231–235).

Daily oral doses of 600 to 800 mg to 8 diabetics, treated for 2.5 years or more, produced sulphinpyrazone plasma concentrations of 2.5 to 13.2 µg/ml (mean 7) before the first morning dose of 200 mg and 9.1 to 23.2 µg/ml (mean 16) 2 hours later. The corresponding sulphide plasma concentrations were 1.0 to 6.0 µg/ml (mean 2.8) and 1.5 to 8.6 µg/ml (mean 4.3) (A. Kirstein-Pedersen *et al.*, *Br. J. clin. Pharmac.*, 1981, 11, 597–603).

HALF-LIFE. Plasma half-life, about 3 to 5 hours, sulphide metabolite about 14 to 21 hours.

VOLUME OF DISTRIBUTION. About 0.06 litre/kg.

CLEARANCE. Plasma clearance, about 0.3 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 1.8.

PROTEIN BINDING. In plasma, about 98%.

NOTE. For a review of the pharmacokinetics of sulphinpyrazone see A. Kirstein-Pedersen *et al.*, *Clin. Pharmacokinetics*, 1982, 7, 42–56.

Dose. 100 to 800 mg daily.

Sulpiride

Tranquilliser

Proprietary Names. Championyl; Dogmatil; Dolmatil; Equilid; Sursumid.

N-(1-Ethylpyrrolidin-2-ylmethyl)-2-methoxy-5-sulphamoylbenzamide

$C_{15}H_{23}N_3O_4S = 341.4$

CAS—15676-16-1

A white crystalline powder. M.p. 175° to 182°, with decomposition.

Soluble 1 in about 2200 of water, 1 in 100 of ethanol, 1 in about 220 of chloroform, 1 in about 2600 of ether, and 1 in 50 of methanol.

Dissociation Constant. pK_a 8.9.

Thin-layer Chromatography. *System TA*—Rf 38.

Ultraviolet Spectrum. Aqueous acid—292 nm ($A_1^1 = 70$ a). No alkaline shift.

Mass Spectrum. Principal peaks at m/z 98, 70, 214, 111, 134, 341, 199, 326.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum, cerebrospinal fluid or urine: detection limits 10 ng/ml in serum or CSF, 200 ng/ml in urine, fluorescence detection—G. Alfreðsson *et al.*, *J. Chromat.*, 1979, 164; *Biomed. Appl.*, 6, 187–193.

RADIOIMMUNOASSAY. In serum: sensitivity 100 pg—A. Mizuchi *et al.*, *Archs int. Pharmacodyn. Thér.*, 1981, 254, 317–326.

Disposition in the Body. Slowly and incompletely absorbed after oral administration. About 70% of an intravenous dose is excreted as unchanged drug in the urine in 36 hours; up to about 20% of an oral dose is excreted in the urine as unchanged drug.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 200 mg given to 10 subjects, peak plasma concentrations of 0.18 to 0.32 µg/ml (mean 0.24) were attained in 3 to 4 hours (F. R. Sugnaux *et al.*, *Eur. J. drug Met. Pharmacokinetics*, 1983, 8, 189–200).

Following oral administration of 50 mg, three times a day to 14 subjects, steady-state plasma concentrations of 0.03 to 0.6 µg/ml (mean 0.18) were reported, 4 to 7 hours after the final dose (J. K. Salminen *et al.*, *Curr. ther. Res.*, 1980, 27, 109–115).

HALF-LIFE. Plasma half-life, after intravenous administration 4 to 13 hours; after oral administration variously reported as 6 to 15 hours (mean 10) and 13 to 41 hours (mean 25).

VOLUME OF DISTRIBUTION. About 2 to 3 litres/kg.

CLEARANCE. Plasma clearance, about 6 ml/min/kg.

Dose. For psychoses, 0.4 to 2.4 g daily.

Sulthiame

Anticonvulsant

Synonym. Sultiame

Proprietary Name. Ospolot

4-(Tetrahydro-2*H*-1,2-thiazin-2-yl)benzenesulphonamide SS-dioxide

$C_{10}H_{14}N_2O_4S_2 = 290.4$

CAS—61-56-3

A white crystalline powder. M.p. 185° to 188°.

Soluble 1 in 2000 of water, 1 in 350 of ethanol, 1 in 700 of chloroform, and 1 in 500 of ether; readily soluble in alkaline solutions.

Dissociation Constant. pK_a 10.0.

Colour Tests. Copper Sulphate (Method 1)—blue; Koppanyi-Zwikker Test—violet-blue.

Thin-layer Chromatography. *System TD*—Rf 23; *system TE*—Rf 53; *system TF*—Rf 43.

High Pressure Liquid Chromatography. *System HE*— k' 1.57.

Ultraviolet Spectrum. Methanol—246 nm ($A_1^1 = 390$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1138, 1158, 1172, 1293, 889, 1192 (KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 290, 184, 185, 104, 77, 168, 291, 198.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: UV detection—D. J. Berry *et al.*, *J. Chromat.*, 1979, 171, 363–370. In plasma: sensitivity 150 ng/ml, UV detection—T. Sadanaga *et al.*, *Chem. pharm. Bull.*, 1981, 29, 872–874.

Disposition in the Body. Readily but variably absorbed after oral administration. During long-term therapy 17 to 70% (mean 32) of the daily dose is excreted in 24 hours, of which about 60% is unchanged drug and the remainder is an inactive metabolite. Up to 15% of a dose may be eliminated in the faeces.

THERAPEUTIC CONCENTRATION.

Following daily oral doses of 3 to 14.5 mg/kg to 36 subjects, serum concentrations ranged from 0.5 to 12.5 μg/ml; peak concentrations were attained 1 to 5 hours after a dose (O. V. Olesen, *Acta pharmac. tox.*, 1968, 26, 22–28).

TOXICITY. Recovery has occurred after the ingestion of 4 to 5 g. Blood concentrations of 12 to 26 μg/ml have been reported in fatalities.

Dose. 200 to 600 mg daily.

Suprofen

Analgesic

Synonym. Sutoprofen

Proprietary Name. Suprol

2-[4-(2-Thenoyl)phenyl]propionic acid

$C_{14}H_{12}O_3S = 260.3$

CAS—40828-46-4

A white to slightly yellowish powder. M.p. 120° to 125°.

Soluble 1 in 5 of ethanol, 1 to 3 of acetone, 1 in about 4 of chloroform, and 1 in about 20 of ether.

Dissociation Constant. pK_a 3.9.

Ultraviolet Spectrum. Isopropyl alcohol—265 nm ($A_1^1 = 550$ b), 291 nm ($A_1^1 = 550$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1590, 1220, 1722, 1050, 1308, 743 (KBr disk).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 100 ng/ml, UV detection—K. B. Alton and J. E. Patrick, *J. pharm. Sci.*, 1978, 67, 985–987.

Disposition in the Body. Rapidly and well absorbed after oral administration. About 72% of a dose is excreted in the urine in 6 hours, mainly as dihydrosuprofen glucuronide.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 200 mg to 6 subjects, peak plasma concentrations of 4.5 to 28.9 μg/ml (mean 17.5) were attained in 0.25 to 2 hours (H. W. Zulliger and A. Fassolt, *Arzneimittel-Forsch.*, 1983, 33, 1322–1326).

HALF-LIFE. Plasma half-life, about 2 hours.

PROTEIN BINDING. In plasma, about 99.5%.

Dose. 600 to 800 mg daily.

Suxamethonium Chloride

Muscle Relaxant

Synonyms. Choline Chloride Succinate; Succinylcholine Chloride; Succinylcholine Chloride.

Proprietary Names. Anectine; Celocurin; Lysthenon; Midarine; Myotenis; Pantolax; Quelicin; Scoline; Succinyl-Asta; Sucos-trin; Sux-Cert.

2,2'-Succinylidiodibis(ethyltrimethylammonium) dichloride dihydrate

$C_{14}H_{30}Cl_2N_2O_4 \cdot 2H_2O = 397.3$

CAS—306-40-1 (suxamethonium); 71-27-2 (chloride, anhydrous); 6101-15-1 (chloride, dihydrate)

A white, hygroscopic, crystalline powder. M.p. about 160°.

Soluble 1 in 1 of water and 1 in 350 of ethanol; practically insoluble in chloroform and ether; soluble in methanol.

Suxamethonium Bromide

Synonyms. Choline Bromide Succinate; Succinylcholine Bromide.

Proprietary Name. Brevdil M

$C_{14}H_{30}Br_2N_2O_4 \cdot 2H_2O = 486.2$

CAS—55-94-7

A white or creamy-white powder. M.p. about 225°.

Soluble 1 in 0.3 of water and 1 in 5 of ethanol; practically insoluble in chloroform and ether.

Suxamethonium Iodide

Synonym. Dithylinum

Proprietary Name. Celocurine

$C_{14}H_{30}I_2N_2O_4 = 544.2$

CAS—541-19-5

A white, slightly hygroscopic, crystalline powder. M.p. about 250°.

Freely **soluble** in water; very slightly soluble in ethanol; practically insoluble in ether.

Thin-layer Chromatography. *System TA*—Rf 01; *system TN*—Rf 35; *system TO*—Rf 10. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—not eluted.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1724, 1148, 1308, 961, 952, 1612 (KBr disk).

Disposition in the Body. Slowly and incompletely absorbed after oral administration; absorbed after intramuscular administration but generally given by the intravenous route. Rapidly distributed into the extracellular fluids throughout the body. Suxamethonium is rapidly hydrolysed in plasma and body tissues to succinylmonocholine (weak activity) and choline. Succinylmonocholine is then slowly hydrolysed to succinic acid and choline. Less than 3% of a dose is excreted unchanged in the urine.

HALF-LIFE. Plasma half-life, about 3 minutes.

Dose. Usually 20 to 100 mg of suxamethonium chloride, intravenously.

Suxethonium Bromide

Muscle Relaxant

Proprietary Name. Brevidil E

2,2'-Succinyldioxybis(diethylammonium) dibromide

$C_{16}H_{34}Br_2N_4O_4 = 478.3$

CAS—111-00-2

A slightly hygroscopic, white or slightly cream, crystalline powder. M.p. 158°.

Readily **soluble** in water, yielding weakly acidic solutions.

Thin-layer Chromatography. System TA—Rf 01; system TN—Rf 40; system TO—Rf 23. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1740, 1163, 1638, 1270, 962, 1012 (KBr disk).

Disposition in the Body. After intravenous administration it is rapidly hydrolysed in plasma and body tissues to succinic acid and choline.

Dose. 1.5 to 1.9 mg/kg intravenously.

Syrosingopine

Antihypertensive

Synonym. Methyl Carbethoxysyringoyl Reserpate

Proprietary Names. Neoreserpan; Raunova.

Methyl 18-O-(4-ethoxycarbonyloxy-3,5-dimethoxybenzoyl)-reserpate

$C_{35}H_{42}N_2O_{11} = 666.7$

CAS—84-36-6

A white or slightly yellowish crystalline powder. M.p. 220° to 225°.

Practically **insoluble** in water; freely soluble in chloroform and acetic acid; slightly soluble in ether.

Colour Tests. Mandelin's Test—green-brown; Marquis Test—brown.

Thin-layer Chromatography. System TA—Rf 78. (Acidified potassium permanganate solution, positive.)

Ultraviolet Spectrum. Ethanol—258 nm ($A_1^1 = 242$ a), 298 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1209, 1130, 1247, 1180, 1770, 1727 (KBr disk).

Mass Spectrum. Principal peaks at m/z 181, 395, 198, 251, 397, 396, 199, 666.

Dose. 0.5 to 3 mg daily.

Tacrine*Anticholinesterase/Central Stimulant**Synonym.* Tetrahydroaminacrine

1,2,3,4-Tetrahydroacridin-9-ylamine

 $C_{13}H_{14}N_2 = 198.3$ *CAS*—321-64-2

M.p. 183° to 184°.

Tacrine Hydrochloride*Proprietary Name.* THA $C_{13}H_{14}N_2 \cdot HCl = 234.7$ *CAS*—1684-40-8

A pale yellow crystalline powder. M.p. 283° to 284°.

Readily **soluble** in water.**Thin-layer Chromatography.** *System TA*—Rf 43; *system TB*—Rf 05; *system TC*—Rf 04. (*Acidified iodoplatinate solution*, positive.)**Gas Chromatography.** *System GA*—RI 2165.**High Pressure Liquid Chromatography.** *System HA*— k' 1.6.**Ultraviolet Spectrum.** Aqueous acid—240 nm ($A_1^1 = 2032$ a), 323 nm, 336 nm; aqueous alkali—237 nm, 317 nm.**Infra-red Spectrum.** Principal peaks at wavenumbers 1650, 1590, 765, 1496, 774, 1176 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 198, 197, 170, 199, 182, 169, 77, 183.**Dose.** Tacrine hydrochloride has been given in doses of 10 to 60 mg, intravenously.**Talbutal***Barbiturate**Proprietary Name.* Lotusat5-Allyl-5-*sec*-butylbarbituric acid $C_{11}H_{16}N_2O_3 = 224.3$ *CAS*—115-44-6

A white crystalline powder. It occurs in 2 polymorphic forms with m.p. about 108° and 111°.

Soluble 1 in 500 of water, 1 in 1 of ethanol, 1 in 2 of chloroform, and 1 in 40 of ether.**Dissociation Constant.** pK_a 7.9 (20°).**Partition Coefficient.** Log P (octanol/pH 7.4), 1.3.**Colour Tests.** Koppanyi-Zwikker Test—violet; Mercurous Nitrate—black; Vanillin Reagent—brown-orange/violet.**Thin-layer Chromatography.** *System TD*—Rf 53; *system TE*—Rf 41; *system TF*—Rf 67; *system TH*—Rf 71.**Gas Chromatography.** *System GA*—RI 1701.**High Pressure Liquid Chromatography.** *System HG*— k' 7.25; *system HH*— k' 4.67.**Ultraviolet Spectrum.** Borax buffer 0.05M (pH 9.2)—239 nm ($A_1^1 = 415$ a); M sodium hydroxide (pH 13)—255 nm ($A_1^1 = 313$ b).**Infra-red Spectrum.** Principal peaks at wavenumbers 1703, 1728, 1752, 1315, 1211, 829 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 167, 168, 41, 97, 124, 39, 57, 53.

Disposition in the Body.

TOXICITY. The estimated minimum lethal dose is 2 g.

In one fatality involving talbutal, a blood concentration of 13 µg/ml and a liver concentration of 305 µg/g was reported (R. C. Baselt and R. H. Cravey, *J. analyt. Toxicol.*, 1977, 1, 81–102).

Dose. 60 to 150 mg daily.

Temazepam*Hypnotic*

Synonym. 3-Hydroxydiazepam

Proprietary Names. Euhypnos; Levanxol; Maeva; Normison; Restoril.

7-Chloro-1,3-dihydro-3-hydroxy-1-methyl-5-phenyl-2H-1,4-benzodiazepin-2-one

$C_{16}H_{13}ClN_2O_2 = 300.7$

CAS—846-50-4

A white crystalline powder. M.p. 156° to 159°.

Practically **insoluble** in water; soluble 1 in 10 of ethanol and 1 in 10 of chloroform.

Dissociation Constant. pK_a 1.6.

Colour Test. Formaldehyde–Sulphuric Acid—orange.

Thin-layer Chromatography. *System TA*—Rf 53; *system TB*—Rf 08; *system TC*—Rf 59; *system TD*—Rf 51; *system TE*—Rf 63; *system TF*—Rf 47. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; acidified potassium permanganate solution, positive.)

Gas Chromatography. *System GA*—temazepam RI 2633, oxazepam RI 2336; *system GG*—temazepam RI 3125, oxazepam RI 2803.

High Pressure Liquid Chromatography. *System HI*—temazepam k' 5.68, oxazepam k' 4.62; *system HK*—temazepam k' 0.60, oxazepam k' 0.73.

Ultraviolet Spectrum. Aqueous acid—237 nm ($A_1^1 = 980$ b), 284 nm ($A_1^1 = 283$ b), 358 nm ($A_1^1 = 68$ b); aqueous alkali—231 nm, 313 nm; methanol—230 nm ($A_1^1 = 1090$ a), 314 nm ($A_1^1 = 76$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1687, 1670, 1112, 1603, 705, 1150 (KBr disk).

Mass Spectrum. Principal peaks at m/z 271, 273, 300, 272, 256, 77, 255, 257; oxazepam 257, 77, 268, 239, 205, 267, 233, 259.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 5 ng/ml, ECD—M. Divoll and D. J. Greenblatt, *J. Chromat.*, 1981, 222; *Biomed. Appl.*, 11, 125–128.

Disposition in the Body. Rapidly absorbed after oral administration. Metabolised principally by glucuronic acid conjugation; demethylation to oxazepam occurs to a small extent. About 80% of a dose is excreted in the urine, mostly as conjugates; less than 2% of a dose is excreted as unchanged drug. About 12% of a dose is eliminated in the faeces.

Temazepam is a metabolite of several benzodiazepines, including diazepam, ketazolam, and medazepam.

**THERAPEUTIC CONCENTRATION.**

After a single oral dose of 30 mg given to 14 subjects, peak plasma concentrations of 0.29 to 0.75 µg/ml (mean 0.5) were attained in about 2 hours (M. Divoll *et al.*, *J. pharm. Sci.*, 1981, 70, 1104–1107).

Following daily oral doses of 20 mg to 10 subjects for 6 days, trough steady-state serum concentrations of 0.017 to 0.132 µg/ml (mean 0.05) were reported (H. R. Ochs *et al.*, *J. clin. Pharmacol.*, 1984, 24, 58–64).

HALF-LIFE. Plasma half-life, about 3 to 38 hours (mean 10); there is considerable intersubject variation, and sex differences have been reported.

VOLUME OF DISTRIBUTION. About 1 litre/kg.

CLEARANCE. Plasma clearance, about 1 to 2 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 1.9.

PROTEIN BINDING. In plasma, about 97%.

NOTE. For a review of the pharmacokinetics of temazepam see R. C. Heel *et al.*, *Drugs*, 1981, 21, 321–340.

Dose. 10 to 60 mg.

Terbutaline

Sympathomimetic

2-*tert*-Butylamino-1-(3,5-dihydroxyphenyl)ethanol

$C_{12}H_{19}NO_3 = 225.3$

CAS—23031-25-6

Crystals. M.p. 119° to 122°.

Terbutaline Sulphate

Proprietary Names. Brethine; Bricanyl; Feevone; Terbasmin.

$C_{12}H_{19}NO_3 \cdot \frac{1}{2}H_2SO_4 = 274.3$

CAS—23031-32-5

A white to greyish-white crystalline powder. M.p. about 255°.

Soluble 1 in 4 of water; slightly soluble in ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 8.7, 10.0, 11.0 (20°).

Colour Tests. *p*-Dimethylaminobenzaldehyde—orange/violet; Folin-Ciocalteu Reagent—blue; Liebermann's Test—black; Mandelin's Test—grey-green; Marquis Test—yellow; Potassium Dichromate (Method 1)—brown (slow).

Thin-layer Chromatography. System TA—Rf 47; system TB—Rf 01; system TC—Rf 01. (Acidified potassium permanganate solution, strong reaction.)

High Pressure Liquid Chromatography. System HA— k' 0.9.

Ultraviolet Spectrum. Aqueous acid—276nm ($A_1^1 = 85$ a); aqueous alkali—297 nm ($A_1^1 = 150$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1210, 1231, 1155, 1069, 1610, 1042 (terbutaline sulphate, KBr disk).

Mass Spectrum. Principal peaks at m/z 30, 86, 57, 41, 29, 39, 192, 42.

Quantification. GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In plasma: unconjugated terbutaline, detection limit 100 pg/ml—S.-E. Jacobsson *et al.*, *Biomed. Mass Spectrom.*, 1980, 7, 265–268. In plasma or urine: unconjugated and total terbutaline, detection limit 300 pg/ml—R. A. Clare *et al.*, *Biomed. Mass Spectrom.*, 1979, 6, 31–37. In postmortem tissues: unconjugated terbutaline, detection limit 1.5 ng/g—J. G. Leferink *et al.*, *J. analyt. Toxicol.*, 1978, 2, 86–88.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity about 1 ng/ml, electrochemical detection—S. Bergquist and L.-E. Edholm, *J. liq. Chromat.*, 1983, 6, 559–574.

Disposition in the Body. Incompletely absorbed after oral administration. Extensive first-pass metabolism occurs in the liver and gut wall to produce the sulphate conjugate (the main metabolite) but some glucuronic acid conjugation also occurs. Less than 15% of an oral dose is present as free drug in the plasma. It is excreted in the urine as unchanged drug and the inactive conjugates, the concentration of each being dependent upon the route of administration. After oral administration, up to about 50% of a dose is excreted in the urine, predominantly as the sulphate conjugate, with up to 10% as unchanged drug. Up to about 60% of a dose is eliminated in the faeces, mainly in unchanged form. After intravenous or subcutaneous administration, more than 80% of a dose is excreted in the urine, with up to about 60% as unchanged drug and only about 2 to 3% is eliminated in the faeces.

THERAPEUTIC CONCENTRATION.

After single oral doses of 5 mg to 8 subjects, peak serum concentrations of 0.002 to 0.005 $\mu\text{g/ml}$ (mean 0.003) were attained in 2 to 4 hours. In 3 subjects there were 2 peaks, the first occurred in 1 to 2 hours and the second in 3 to 4 hours. After single subcutaneous doses of 0.5 mg to the same subjects, peak serum concentrations of 0.005 to 0.011 $\mu\text{g/ml}$ (mean 0.007) were attained in 0.2 to 0.6 hour (J. G. Leferink *et al.*, *Arzneimittel-Forsch.*, 1982, 32, 159–164).

TOXICITY.

A female subject took several tablets of terbutaline during a severe night attack of asthma and died the next morning. The following postmortem tissue concentrations were reported: serum 0.014 $\mu\text{g/ml}$, heart 0.036 $\mu\text{g/g}$, kidney 0.054 $\mu\text{g/g}$, liver 0.055 $\mu\text{g/g}$, lung 0.026 $\mu\text{g/g}$, muscle 0.063 $\mu\text{g/g}$ (J. G. Leferink *et al.*, *J. analyt. Toxicol.*, 1978, 2, 86–88).

HALF-LIFE. Plasma half-life, about 3 to 4 hours.

VOLUME OF DISTRIBUTION. About 1 litre/kg.

CLEARANCE. Plasma clearance, about 4 ml/min/kg.

PROTEIN BINDING. In plasma, about 15 to 25%.

Dose. 10 to 15 mg of terbutaline sulphate daily.

Terbutryne

Herbicide

Proprietary Names. Clarosan; Prebane. It is an ingredient of Opogard.

2-*tert*-Butylamino-4-ethylamino-6-methylthio-1,3,5-triazine

$C_{10}H_{19}N_5S = 241.4$

CAS—886-50-0

A white crystalline powder. M.p. 104° to 105°.

Practically **insoluble** in water; readily soluble in chloroform, ether, and methanol.

Thin-layer Chromatography. System TA—Rf 77. (Dragendorff spray, positive.)

Gas Chromatography. System GA—RI 1940; system GK—retention time 0.99 relative to caffeine.

Infra-red Spectrum. Principal peaks at wavenumbers 1520, 1587, 1215, 806, 1266, 1133 (KBr disk).

Testosterone

Androgen

Proprietary Names. Andronaq; Hydrotest; Malogen; Oretion; Percutacrine Androgénique Forte; Testoral Sublings.

Note. Testoral is also used as a proprietary name for Fluoxymesterone.

17 β -Hydroxyandrost-4-en-3-one

C₁₉H₂₈O₂ = 288.4

CAS—58-22-0

White or creamy-white crystals or crystalline powder. M.p. 152° to 157°.

Practically **insoluble** in water; soluble 1 in 6 of dehydrated alcohol, 1 in 2 of chloroform, and 1 in 100 of ether.

Testosterone Cypionate

Synonym. Testosterone Cyclopentylpropionate

Proprietary Names. Andronate; Ciclostero; Jectatest-LA.

C₂₇H₄₀O₃ = 412.6

CAS—58-20-8

A white or creamy-white crystalline powder. M.p. 98° to 104°.

Practically **insoluble** in water; freely soluble in ethanol, chloroform, and ether.

Testosterone Enanthate

Synonyms. Testosterone Heptanoate; Testosterone Oenanthate.

Proprietary Names. Androtardyl; Delatestryl; Malogen LA; Malogex; Primoteston-Depot; Testate; Testone LA; Testostroval-PA; Testoviron-Depot.

C₂₆H₄₀O₃ = 400.6

CAS—315-37-7

A white or creamy-white crystalline powder. M.p. 34° to 39°.

Practically **insoluble** in water; soluble 1 in 0.3 of ethanol, chloroform, and ether.

Testosterone Isocaproate

Synonym. Testosterone Isohexanoate

Proprietary Names. It is an ingredient of Mixogen (injection) and Sustanon.

C₂₅H₃₈O₃ = 386.6

CAS—15262-86-9

White to creamy-white crystals or crystalline powder. M.p. about 80°.

Practically **insoluble** in water; very soluble in ethanol and chloroform.

Testosterone Phenylpropionate

Proprietary Names. It is an ingredient of Mixogen (injection) and Sustanon.

C₂₈H₃₆O₃ = 420.6

CAS—1255-49-8

A white crystalline powder. M.p. 114° to 117°.

Practically **insoluble** in water; soluble 1 in 40 of ethanol.

Testosterone Propionate

Proprietary Names. Stérandryl; Testoviron (injection); Viormone. It is an ingredient of Mixogen (injection), Plex-Hormone (injection), and Sustanon.

C₂₂H₃₂O₃ = 344.5

CAS—57-85-2

Colourless or yellowish-white crystals or a white or creamy-white crystalline powder. M.p. 118° to 123°.

Practically **insoluble** in water; soluble 1 in 6 of ethanol and 1 in 4 of acetone; very soluble in chloroform; freely soluble in ether.

Colour Tests. Naphthol—Sulphuric Acid—yellow/green, brown dichroism; Sulphuric Acid—no initial colour (green fluorescence under ultraviolet light).

Thin-layer Chromatography. Testosterone: system TP—Rf 60; system TQ—Rf 07; system TR—Rf 90; system TS—Rf 63. Testosterone phenylpropionate: system TP—Rf 86; system TQ—Rf 28; system TR—Rf 99; system TS—Rf 98. Testosterone propionate: system TP—Rf 78; system TQ—Rf 12; system TR—Rf 99; system TS—Rf 98.

Gas Chromatography. System GA—RI 2620.

Ultraviolet Spectrum. Dehydrated alcohol—240 nm (A₁¹ = 560 a).

Infra-red Spectrum. Principal peaks at wavenumbers 1660, 871, 1615, 1057, 1236, 1066 (KBr disk).

Quantification. RADIOIMMUNOASSAY. In plasma or other biological fluids: sensitivity 8 pg—C. S. Corker and D. W. Davidson, *J. Steroid Biochem.*, 1978, 9, 373–374.

ENZYME IMMUNOASSAY. In plasma or saliva: detection limit 4 pg—A. Turkes *et al.*, *Steroids*, 1979, 33, 347–359.

Disposition in the Body. Testosterone is the androgenic hormone formed in the testes. In man, it is metabolised to 5 α -androstane-3 α ,17 β -diol, androsterone, etiocholanolone, and 5 α -androstene-3,17-dione. In the horse, the major metabolites are 5 α -androstane-3 β ,17 α -diol, which is excreted in the urine as the glucuronide conjugate, and the 17 β -epimer which is excreted in the urine as the sulphate conjugate.

Dose. 10 to 30 mg daily, sublingually; 200 to 600 mg by implantation.

Tetrabenazine

Tranquilliser

Synonym. TBZ

Proprietary Name. Nitoman

1,3,4,6,7,11b - Hexahydro - 3 - isobutyl - 9,10 - dimethoxy - 2H - benzo[a]quinolizin-2-one

 $C_{19}H_{27}NO_3 = 317.4$

CAS—58-46-8

A white crystalline powder. M.p. 126° to 131°.

Soluble in hot water, ethanol, and chloroform.**Colour Tests.** Liebermann's Test—black; Mandelin's Test—brown; Marquis Test—yellow.**Thin-layer Chromatography.** System TA—Rf 69; system TB—Rf 41; system TC—Rf 78. (Acidified iodoplatinate solution, positive.)**Ultraviolet Spectrum.** Aqueous acid—282 nm ($A_1^1 = 108$ a). No alkaline shift.**Infra-red Spectrum.** Principal peaks at wavenumbers 1694, 1260, 1520, 1155, 1140, 1222 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 191, 261, 274, 260, 316, 192, 190, 176.**Quantification.** HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: tetrabenazine and 2-hydroxy metabolite, detection limits 100 pg/ml and 1 ng/ml, respectively, fluorescence detection—M. S. Roberts *et al.*, *J. Chromat.*, 1981, 226; *Biomed. Appl.*, 15, 175–182.**Disposition in the Body.** Absorbed after oral administration. It is extensively metabolised and excreted in the urine as free and conjugated metabolites; nine metabolites have been identified in the urine. 2-Hydroxytetrabenazine is an active metabolite.**THERAPEUTIC CONCENTRATION.**Following a single oral dose of 50 mg to 1 subject, peak plasma concentrations of about 0.015 μ g/ml of tetrabenazine and 0.085 μ g/ml of the 2-hydroxy metabolite were attained in 1 hour and 2 hours, respectively (M. S. Roberts *et al.*, *ibid.*).**Dose.** 75 to 200 mg daily.**Tetrachloroethane**

Solvent

Synonym. Acetylene Tetrachloride

1,1,2,2-Tetrachloroethane

 $CHCl_2 \cdot CHCl_2 = 167.8$

CAS—79-34-5

A clear, colourless, heavy, non-inflammable, mobile liquid. Wt per ml 1.590 to 1.595 g. B.p. 142° to 147°. Refractive index, at 25°, 1.4918.

Soluble 1 in 400 of water; miscible with ethanol, chloroform, and ether.**Gas Chromatography.** System GA—RI 910; system GI—retention time 24.9 min.**Disposition in the Body.** Absorbed from the gastro-intestinal tract, lungs, and through the skin.**TOXICITY.** Tetrachloroethane is probably the most toxic of the chlorinated hydrocarbons. The estimated lethal dose is 3 ml.**Tetrachloroethylene**

Anthelmintic/Solvent

Synonym. Perchloroethylene

Proprietary Name. Perklone

 $CCl_2:CCl_2 = 165.8$

CAS—127-18-4

A colourless, heavy, non-inflammable, mobile liquid. Wt per ml 1.620 to 1.626 g. F.p. -22°. B.p. 118° to 122°.

Tetrachloroethylene (B.P.) contains thymol 0.01% w/w as a preservative.

Practically **insoluble** in water; soluble in ethanol; miscible with chloroform and ether.**Colour Test.** Tetrachloroethylene may be distinguished from carbon tetrachloride and chloroform by the following test: to 5 ml in a stoppered cylinder add 5 ml of bromine solution and shake vigorously at intervals of 15 minutes for 1 hour—bromine colour fades and there is a white turbidity in the lower layer.**Gas Chromatography.** System GA—RI 789; system GI—retention time 24.3 min.

Mass Spectrum. Principal peaks at m/z 166, 164, 129, 131, 168, 94, 133, 96.

Quantification. GAS CHROMATOGRAPHY. In blood or tissues: ECD—B. Levine *et al.*, *J. forens. Sci.*, 1981, 26, 206–209.

GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In blood or tissues—T. Lukaszewski, *Clin. Toxicol.*, 1979, 15, 411–415.

Disposition in the Body. Slightly absorbed from the gastrointestinal tract and through the skin; well absorbed from the lungs. It has an affinity for lipid-rich tissues from which it is slowly released. About 25% of an inhaled dose is excreted unchanged in expired air in 40 hours and this is thought to be the major route of excretion; small amounts are eliminated through the skin. Less than about 3% of a dose is metabolised and excreted in the urine, partly as trichloroacetic acid, in 3 days.

TOXICITY. The maximum permissible atmospheric concentration is 100 ppm. Exposure to air concentrations of more than 1000 ppm may cause unconsciousness within a short time.

Exposure to a concentration of 194 ppm of tetrachloroethylene for 3 hours produced peak blood concentrations of about 2 to 3 µg/ml (mean 2.6) in 6 subjects, at the end of the exposure period (R. D. Stewart *et al.*, *Archs envir. Hlth*, 1961, 2, 516–522).

A 53-year-old man was found dead after exposure to tetrachloroethylene vapour. The following postmortem concentrations were reported: blood 4.5 µg/ml, brain 69 µg/g, kidney 71 µg/g, liver 240 µg/g, and lung 30 µg/g (B. Levine *et al.*, *J. forens. Sci.*, 1981, 26, 206–209).

In a case of fatal exposure to tetrachloroethylene vapour, a 33-year-old man had the following postmortem concentrations: blood 44 µg/ml, brain 360 µg/g, and lung 3 µg/g (T. Lukaszewski, *Clin. Toxicol.*, 1979, 15, 411–415).

HALF-LIFE. About 72 hours.

Dose. Usually 0.1 ml/kg, to a maximum of 5 ml, as a single dose.

Tetracycline

Antibiotic

Proprietary Names. Tetracycline and Tetracycline Hydrochloride are ingredients of many proprietary preparations—see *Martindale, The Extra Pharmacopoeia*, 28th Edn.

A hydrated form of (4S,4aS,5aS,6S,12aS)-4-dimethylamino-1,4,4a,5,5a,6,11,12a-octahydro-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxonaphthacene-2-carboxamide

$C_{22}H_{24}N_2O_8 = 444.4$

CAS—60-54-8 (anhydrous); 6416-04-2 (trihydrate)

A yellow, crystalline, amphoteric powder which darkens in moist air on exposure to strong sunlight.

Soluble 1 in 2500 of water and 1 in 50 of ethanol; practically insoluble in chloroform and ether; freely soluble in dilute acids and, with decomposition, in solutions of alkali hydroxides.

Tetracycline Hydrochloride

$C_{22}H_{24}N_2O_8 \cdot HCl = 480.9$

CAS—64-75-5

A yellow, hygroscopic, crystalline, amphoteric powder which darkens in moist air on exposure to strong sunlight. M.p. about 214°, with decomposition.

Soluble 1 in 10 of water and 1 in 100 of ethanol; practically insoluble in chloroform and ether; soluble in methanol and in aqueous solutions of alkali hydroxides and carbonates. Solutions in water become turbid on standing owing to hydrolysis and precipitation of tetracycline.

Dissociation Constant. pK_a 3.3, 7.7, 9.7 (25°).

Partition Coefficient. Log P (octanol/pH 7.4), -1.4 .

Colour Tests. Benedict's Reagent—red; Formaldehyde-Sulphuric Acid—green-yellow → yellow-brown; Liebermann's Test—black; Mandelin's Test—violet → red → orange; Marquis Test—orange; Sulphuric Acid—violet.

Thin-layer Chromatography. System TA—Rf 05, streaking. (Location under ultraviolet light, orange fluorescence; acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 1950.

Ultraviolet Spectrum. Aqueous acid—270 nm ($A_1^1 = 417$ a), 356 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1612, 1580, 1660, 1226, 1248, 1530 (tetracycline hydrochloride, KCl disk). (See below)

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: sensitivity 100 ng/ml, UV detection—J. Hermansson, *J. Chromat.*, 1982, 232; *Biomed. Appl.*, 21, 385–393.

RADIOIMMUNOASSAY. In plasma or urine: detection limit about 20 ng/ml—B. A. Faraj and F. M. Ali, *J. Pharmac. exp. Ther.*, 1981, 217, 10–14.

Disposition in the Body. Irregularly and incompletely absorbed after oral administration; widely distributed throughout the body. Up to about 60% of an intravenous dose and 20 to 50% of an oral dose is excreted in the urine unchanged in 48 hours. Excreted in the bile and undergoes some enterohepatic circulation.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 1 to 5 µg/ml.

HALF-LIFE. Plasma half-life, about 9 hours.

VOLUME OF DISTRIBUTION. About 1.3 litres/kg.

CLEARANCE. Plasma clearance, about 2 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 0.97.

PROTEIN BINDING. In plasma, 25 to 65%.

Dose. 1 to 2 g daily.

Tetrahydrozoline

Sympathomimetic

Synonym. Tetryzoline

2-(1,2,3,4-Tetrahydro-1-naphthyl)-2-imidazoline

$C_{13}H_{16}N_2 = 200.3$

CAS—84-22-0

A white crystalline powder.

Soluble in water and chloroform.

Tetrahydrozoline Hydrochloride

Proprietary Names. Murine Plus; Tyzine; Visine; Yxin.

$C_{13}H_{16}N_2 \cdot HCl = 236.7$

CAS—522-48-5

A white crystalline powder. M.p. about 256°, with decomposition.

Soluble 1 in 3.5 of water and 1 in 7.5 of ethanol; very slightly soluble in chloroform; practically insoluble in ether.

Colour Tests. Aromaticity (Method 2)—colourless/yellow; Liebermann's Test—brown-orange.

Thin-layer Chromatography. *System TA*—Rf 13; *system TB*—Rf 07; *system TC*—Rf 02. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 1833.

Ultraviolet Spectrum. Aqueous acid—265 nm ($A_1^1 = 21$ a), 272 nm. No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1600, 742, 1293, 1250, 763, 1500 (tetrahydrozoline hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 200, 185, 199, 171, 44, 84, 71, 131.

Use. Tetrahydrozoline hydrochloride is used as a 0.1% nasal solution.

Tetramisole

Anthelmintic

(±)-2,3,5,6-Tetrahydro-6-phenylimidazo[2,1-*b*]thiazole

$C_{11}H_{12}N_2S = 204.3$

CAS—5036-02-2

Crystals. M.p. 87° to 89°.

Practically **insoluble** in water; soluble in chloroform.

Tetramisole Hydrochloride

Proprietary Name. Nilverm (pig wormer)

$C_{11}H_{12}N_2S \cdot HCl = 240.8$

CAS—5086-74-8

A white to pale cream-coloured crystalline powder. M.p. 264° to 265°.

Soluble 1 in 5 of water, 1 in 50 of ethanol, 1 in 3000 of chloroform, and 1 in 10 of methanol; very slightly soluble in ether.

For analytical data see under Levamisole.

Dose. 2.5 to 5 mg/kg of tetramisole hydrochloride as a single dose.

Tetrazepam*Muscle Relaxant/Tranquilliser**Proprietary Name.* Myolastan

7-Chloro-5-(cyclohex-1-enyl)-1,3-dihydro-1-methyl-2H-1,4-benzodiazepin-2-one

 $C_{16}H_{17}ClN_2O = 288.8$

CAS—10379-14-3

Yellow-brown crystals. M.p. 144°.

Colour Test. Formaldehyde-Sulphuric Acid—orange.**Ultraviolet Spectrum.** Aqueous acid—239 nm ($A_1^1 = 940$ b), 284 nm, 345 nm; aqueous alkali—305 nm ($A_1^1 = 84$ b).**Infra-red Spectrum.** Principal peaks at wavenumbers 1678, 1602, 825, 1132, 1310, 800 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 253, 288, 287, 289, 225, 259, 254, 41.**Quantification.** HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: detection limit 100 pg/ml for tetrazepam and 500 pg/ml for desmethyltetrazepam, UV detection—M. G. Baumgärtner *et al.*, *Arzneimittel-Forsch.*, 1984, 34, 724–729.**Disposition in the Body.** Rapidly absorbed after oral administration. Extensively metabolised by *N*-demethylation and hydroxylation. Urinary metabolites include 3-hydroxytetrazepam, 3-hydroxydesmethyltetrazepam, 3'-hydroxytetrazepam, and 3'-hydroxydesmethyltetrazepam.**THERAPEUTIC CONCENTRATION.**

Following a single oral dose of 50 mg to 12 subjects, peak serum

concentrations of 0.49 to 0.63 µg/ml (mean 0.57) of tetrazepam and 0.005 to 0.008 µg/ml of desmethyltetrazepam were attained in about 2 hours and 4 hours respectively (M. G. Baumgärtner *et al.*, *ibid.*).**HALF-LIFE.** Plasma half-life, 10 to 25 hours (mean 15).**REFERENCE.** M. G. Baumgärtner *et al.*, *ibid.***Dose.** 25 to 150 mg daily.**Thalidomide***Hypnotic/Immunosuppressant*

2-Phthalimidoglutarimide

 $C_{13}H_{10}N_2O_4 = 258.2$

CAS—50-35-1

A white crystalline powder. M.p. 269° to 271°.

Slightly **soluble** in water and ethanol; practically insoluble in chloroform and ether.**Ultraviolet Spectrum.** Aqueous acid—240 nm ($A_1^1 = 385$ b), 300 nm ($A_1^1 = 94$ b).**Infra-red Spectrum.** Principal peaks at wavenumbers 1681, 727, 1205, 1250, 1316, 1110 (Nujol mull).**Mass Spectrum.** Principal peaks at m/z 76, 173, 104, 111, 148, 50, 169, 130.**Quantification.** ULTRAVIOLET SPECTROPHOTOMETRY. In blood, plasma or urine—J. N. Green and B. C. Benson, *J. Pharm. Pharmac.*, 1961, 13, 117T–121T.**Disposition in the Body.** Absorbed from the gastro-intestinal tract. Thalidomide is hydrolysed in the body, forming mainly 2-(*o*-carboxybenzamido)glutarimide, although many other hydrolysis products are also detectable.**TOXICITY.** Thalidomide has a low acute toxicity; in 2 cases of reported overdose there was no evidence of respiratory or cardiac depression. Thalidomide has teratogenic effects when administered to women early in pregnancy.**Dose.** 50 to 400 mg daily, in the treatment of lepra reactions.**Thebacon***Narcotic Analgesic**Synonyms.* Acetylhydrocodone; Acetyldihydrocodeinone; Dihydrocodeinone Enol Acetate.(–)-(5*R*)-4,5-Epoxy-3-methoxy-9a-methylmorphin-6-en-6-yl acetate $C_{20}H_{23}NO_4 = 341.4$

CAS—466-90-0

A white powder. M.p. 154°.

Practically **insoluble** in water; soluble in ethanol, chloroform, and ether.

Thebacon Hydrochloride

Proprietary Name. Acedicon

 $C_{20}H_{23}NO_4 \cdot HCl = 377.9$

CAS—20236-82-2

White crystals. M.p. 132° to 135°, with decomposition.

Soluble in water.

Colour Test. Marquis Test—yellow → violet.**Thin-layer Chromatography.** System TA—Rf 45; system TB—Rf 19; system TC—Rf 34. (Acidified iodoplatinate solution, positive.)**Gas Chromatography.** System GA—RI 2533.**High Pressure Liquid Chromatography.** System HA—k' 3.7 (tailing peak); system HC—k' 0.85.**Ultraviolet Spectrum.** Aqueous acid—281 nm ($A_1^1 = 41$ b).**Infra-red Spectrum.** Principal peaks at wavenumbers 1208, 1138, 1744, 1500, 905, 1194 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 341, 298, 43, 44, 55, 284, 242.**Dose.** Usually 10 mg of thebacon hydrochloride daily.**Thebaine**

Alkaloid

Synonym. Paramorphine

3,6-Dimethoxy-4,5-epoxy-9a-methylmorphin-6,8-diene

 $C_{19}H_{21}NO_3 = 311.4$

CAS—115-37-7

An alkaloid present in opium.

A white powder. M.p. 193°.

Soluble 1 in 1500 of water, 1 in 10 of ethanol, 1 in 13 of chloroform, and 1 in 200 of ether.**Dissociation Constant.** pK_a 8.2 (20°).**Partition Coefficient.** Log P (octanol/pH 7.5), 0.3.**Colour Tests.** Mandelin's Test—orange-brown; Marquis Test—red → orange.**Thin-layer Chromatography.** System TA—Rf 45; system TB—Rf 23; system TC—Rf 37. (Dragendorff spray, positive; FPN reagent, faint brown; acidified iodoplatinate solution, positive; Marquis reagent, yellow.)**Gas Chromatography.** System GA—RI 2517.**High Pressure Liquid Chromatography.** System HA—k' 4.6 (tailing peak); system HC—k' 0.94; system HS—k' 0.79.**Ultraviolet Spectrum.** Aqueous acid—284 nm ($A_1^1 = 253$ a). No alkaline shift.**Infra-red Spectrum.** Principal peaks at wavenumbers 1234, 1605, 1144, 1270, 1030, 910 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 311, 255, 42, 44, 296, 310, 312, 174.

Thenalidine

Antihistamine

Synonyms. Thenophenopiperidine; Thenopiperidine.*N*-(1-Methyl-4-piperidyl)-*N*-(2-thenyl)aniline $C_{17}H_{22}N_2S = 286.4$

CAS—86-12-4

M.p. 95° to 97°.

Practically **insoluble** in water; soluble in chloroform.**Thenalidine Tartrate** $C_{17}H_{22}N_2S \cdot C_4H_6O_6 = 436.5$

CAS—16509-35-6

A white crystalline powder. M.p. 170° to 172°.

Soluble in water.**Colour Tests.** Mandelin's Test—orange → brown; Marquis Test—grey-violet.**Thin-layer Chromatography.** *System TA*—Rf 50; *system TB*—Rf 38; *system TC*—Rf 44. (*Acidified iodoplatinate solution*, positive.)**Gas Chromatography.** *System GA*—RI 2318.**High Pressure Liquid Chromatography.** *System HA*—k' 3.5.**Ultraviolet Spectrum.** Aqueous acid—234 nm ($A_1^1 = 280$ b).**Infra-red Spectrum.** Principal peaks at wavenumbers 1505, 748, 1600, 693, 1279, 755 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 97, 70, 99, 43, 98, 44, 42, 188.**Dose.** Thenalidine tartrate has been given in doses of 100 to 150 mg daily.**Thenium Closylate**

Anthelmintic (Veterinary)

Dimethyl(2- phenoxyethyl)(2- thenyl)ammonium 4- chlorobenzenesulphonate

 $C_{21}H_{24}ClNO_4S_2 = 454.0$

CAS—16776-64-0 (thenium); 4304-40-9 (closylate)

A white crystalline powder. M.p. 156° to 162°.

Soluble 1 in 200 of water, 1 in 25 of ethanol, and 1 in 35 of chloroform.**Colour Tests.** Mandelin's Test—green; Marquis Test—violet.**Thin-layer Chromatography.** *System TA*—Rf 02. (*Acidified iodoplatinate solution*, positive.)**Ultraviolet Spectrum.** Aqueous acid—268 nm ($A_1^1 = 45$ b), 275 nm ($A_1^1 = 36$ b).**Infra-red Spectrum.** Principal peaks at wavenumbers 1210, 1174, 1042, 1135, 760, 1010 (KBr disk).**Thenyldiamine**

Antihistamine

NN-Dimethyl-*N'*-(2-pyridyl)-*N'*-(3-thenyl)ethylenediamine $C_{14}H_{19}N_3S = 261.4$

CAS—91-79-2

A liquid.

Practically **insoluble** in water; soluble in chloroform.**Thenyldiamine Hydrochloride***Proprietary Names.* It is an ingredient of Bronchilator, Franol Plus, and Hayphryn. $C_{14}H_{19}N_3S \cdot HCl = 297.8$

CAS—958-93-0

A white crystalline powder. M.p. 167° to 171°.

Soluble 1 in 5 of water, 1 in 5 of ethanol, and 1 in 5 of chloroform; practically insoluble in ether.**Dissociation Constant.** pK_a 3.9, 8.9 (25°).**Colour Tests.** Mandelin's Test—green; Marquis Test—black-violet.**Thin-layer Chromatography.** *System TA*—Rf 53; *system TB*—Rf 42; *system TC*—Rf 25. (*Dragendorff spray*, positive; *acidified iodoplatinate solution*, positive; *Marquis reagent*, violet.)**Gas Chromatography.** *System GA*—RI 1999; *system GB*—RI 2034; *system GC*—RI 2300; *system GF*—RI 2340.**High Pressure Liquid Chromatography.** *System HA*—k' 4.0.

Ultraviolet Spectrum. Aqueous acid—239 nm ($A_1^1 = 703$ a), 315 nm; aqueous alkali—246 nm, 310 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1597, 766, 1242, 976, 1159, 1311.

Mass Spectrum. Principal peaks at m/z 58, 97, 72, 71, 203, 191, 190, 42.

Dose. Theophylline hydrochloride has been given in doses of up to 90 mg daily.

Theobromine

Xanthine Derivative

Synonyms. 3,7-Dimethylxanthine; Santheose.

Proprietary Names. It is an ingredient of Seominal.

3,7-Dihydro-3,7-dimethylpurine-2,6(1*H*)-dione

$C_7H_8N_4O_2 = 180.2$

CAS—83-67-0

An alkaloid contained in the seeds of *Theobroma cacao* (Sterculiaceae).

A white microcrystalline powder which sublimes at about 290°.

Soluble 1 in 2000 of water, 1 in 2500 of ethanol, and 1 in 6000 of chloroform; practically insoluble in ether; freely soluble in dilute mineral acids and aqueous solutions of alkali hydroxides.

Dissociation Constant. $pK_a < 1$, 10.0 (25°).

Partition Coefficient. Log P (octanol), -0.8 .

Colour Test. Amalic Acid Test—yellow/violet.

Thin-layer Chromatography. System *TA*—Rf 53; system *TB*—Rf 01; system *TC*—Rf 31; system *TG*—Rf 47. (Ludy Tenger reagent, orange.)

High Pressure Liquid Chromatography. System *HA*— k' 0.1.

Ultraviolet Spectrum. Aqueous acid—272 nm ($A_1^1 = 563$ a); aqueous alkali—274 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1690, 1665, 1221, 1550, 1595, 680 (KBr disk).

Mass Spectrum. Principal peaks at m/z 180, 55, 67, 109, 82, 42, 137, 70; 3-methylxanthine 166, 68, 95, 41, 53, 123, —, —; 7-methylxanthine 166, 68, 123, 53, 42, 41, 95, —.

Disposition in the Body. Well absorbed after oral administration. It is metabolised by demethylation, mainly to 7-methylxanthine, together with some 3-methylxanthine. The 7-methylxanthine is further oxidised to 7-methyluric acid. About 90% of a dose is excreted in the urine in 48 hours, of which about 40% is 7-methylxanthine, 20% is 3-methylxanthine, 11% is 7-methyluric acid.

acid, and 15% is unchanged drug. An additional metabolite, 6-amino-5-(*N*-methylformylamino)-1-methyluracil, accounts for about 7% of a dose.

Theobromine is a metabolite of caffeine.

HALF-LIFE. Plasma half-life, 5 to 11 hours (mean 8) after a single dose, increased on chronic administration.

VOLUME OF DISTRIBUTION. About 0.5 to 1 litre/kg.

CLEARANCE. Plasma clearance, about 0.8 ml/min/kg.

SALIVA. Plasma: saliva ratio, about 1.0.

Dose. 300 to 600 mg.

Theophylline

Xanthine Bronchodilator

Synonyms. Anhydrous Theophylline, 1,3-Dimethylxanthine; Teofilina.

Proprietary Names. Accurbron; Aerolate; Asthmophylline; Bronkodyl; Elixicon; Elixophyllin; LaBID; Lasma; Nuelin (tablets); Physpan; Pro-vent; Slo-Phyllin; Somophyllin-T; Sustaire; Theobid; Theoclear; Theocontin; Theo-Dur; Theograd; Theolair; Theolixir; Theon-300; Theophyl; Theospan; Theo-vent; Uniphyllin Unicontin. It is an ingredient of Franol, Franyl, Labophylline, Phylbrox, Quibron, Tancolin, Taumasthman, and Tedral.

3,7-Dihydro-1,3-dimethylpurine-2,6(1*H*)-dione

$C_7H_8N_4O_2 = 180.2$

CAS—58-55-9

A white crystalline powder. M.p. 270° to 274°.

Soluble 1 in 120 of water, 1 in 80 of ethanol, and 1 in about 200 of chloroform; very slightly soluble in ether; freely soluble in dilute acids, ammonia and alkali hydroxide solutions.

Aminophylline

Synonyms. Euphyllinum; Metaphyllin; Theophyllaminum; Theophylline and Ethylenediamine; Theophylline Ethylenediamine Compound.

Proprietary Names. Aminodur; Aminophyl; Androphyllin; Cardophyllin; Carine; Corophyllin; Euphyllin; Inophylline (injection); Lixaminol; Minilix; Phyllocontin; Phyllotemp; Somophyllin. It is an ingredient of Amesec, and Theodrox.

A stable mixture containing 78 to 84% of anhydrous theophylline and 13 to 14% of ethylenediamine with a variable quantity of water.

Its composition approximately corresponds to the formula $(C_7H_8N_4O_2)_2 \cdot C_2H_4(NH_2)_2 \cdot 2H_2O = 456.5$

CAS—317-34-0 (anhydrous)

White or slightly yellowish granules or powder.

Soluble 1 in 5 of water at 25°, but the addition of ethylenediamine or ammonia solution may be necessary to give complete solution. Practically insoluble in ethanol and ether.

Choline Theophyllinate

Synonyms. Oxtriphylline; Theophylline Choline.

Proprietary Names. Cholelodyl; Euspirax; Sabidal.

$C_{12}H_{21}N_5O_3 = 283.3$

CAS—4499-40-5

A white crystalline powder. M.p. 185° to 192°.

Soluble 1 in less than 1 of water and 1 in 10 of ethanol; very slightly soluble in chloroform and ether.

Theophylline Hydrate

Synonym. Theophylline Monohydrate

Proprietary Names. It is an ingredient of Asmapax and Franol Expect.

$C_7H_8N_4O_2 \cdot H_2O = 198.2$

CAS—5967-84-0

A white crystalline powder. M.p. about 272°, after drying.

Soluble 1 in 120 of water and 1 in 80 of ethanol; very slightly soluble in ether; soluble in solutions of alkali hydroxides.

Theophylline Monoethanolamine

Synonym. Theophylline Olamine

Proprietary Names. Inophylline (tablets); Monotheamin.

An equimolecular compound of anhydrous theophylline and monoethanolamine.

$C_7H_8N_4O_2 \cdot C_2H_7NO = 241.2$

CAS—573-41-1

A white crystalline powder.

Soluble 1 in 20 of water.

Theophylline Sodium Glycinate

Synonym. Theophylline Sodium Aminoacetate

Proprietary Names. Acet-Am (liquid); Nuelin (liquid); Synophyllate; Theocyne.

An equilibrium mixture of theophylline sodium ($C_7H_7N_4NaO_2 = 202.1$) and glycine ($C_2H_5NO_2 = 75.07$) in approximately equimolecular proportions, buffered with an additional mole of glycine.

CAS—8000-10-0

A white crystalline powder.

Soluble 1 in 6 of water; very slightly soluble in ethanol; practically insoluble in chloroform.

Dissociation Constant. $pK_a < 1, 8.6 (25^\circ)$.

Partition Coefficient. Log *P* (octanol), 0.0.

Colour Tests. Amalic Acid Test—yellow/violet; Folin-Ciocalteu Reagent—blue.

Thin-layer Chromatography. *System TA*—Rf 75; *system TB*—Rf 01; *system TC*—Rf 30; *system TG*—Rf 33. (Ludy Tenger reagent, orange.)

Gas Chromatography. *System GA*—RI 1999; *system GF*—RI 2745.

High Pressure Liquid Chromatography. *System HA*—*k'* 0.1.

Ultraviolet Spectrum. Aqueous acid—270 nm ($A_1^1 = 536$ a); aqueous alkali—275 nm ($A_1^1 = 650$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1670, 1717, 1567, 745, 980, 1190 (KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 180, 95, 68, 41, 53, 181, 96, 40; 3-methylxanthine 166, 68, 95, 41, 53, 123, —, —.

Quantification. GAS CHROMATOGRAPHY. In serum: sensitivity 2.5 µg/ml, FID—H. A. Schwertner, *Clin. Chem.*, 1979, 25, 212–214.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or saliva: sensitivity 500 ng/ml, UV detection—K. T. Muir *et al.*, *J. Chromat.*, 1982, 231; *Biomed. Appl.*, 20, 73–82. In serum: UV detection—S. J. Soldin and J. G. Hill, *Clin. Biochem.*, 1977, 10, 74–77. In urine: theophylline and major metabolites, UV detection—K. T. Muir *et al.*, *J. Chromat.*, 1980, 221; *Biomed. Appl.*, 10, 85–95.

FLUOROIMMUNOASSAY. In serum—T. M. Li *et al.*, *Clin. Chem.*, 1981, 27, 22–26.

Disposition in the Body. Readily absorbed after oral administration of aminophylline; less rapidly absorbed when given as theophylline; irregularly absorbed after rectal administration. Rapidly and widely distributed throughout the tissues. Metabolised by *N*-demethylation to form 3-methylxanthine (which is active but less potent than theophylline), 1,3-dimethyluric acid, and 1-methyluric acid. In adults, about 13% of a dose is excreted in the urine in 24 hours as unchanged drug, with about 15% as 3-methylxanthine, 35 to 50% as 1,3-dimethyluric acid, and about 20% as 1-methyluric acid. In premature neonates, most of a dose is excreted as unchanged drug with up to 10% as caffeine. Theophylline is a metabolite of caffeine.

THERAPEUTIC CONCENTRATION. There is considerable intersubject variation in serum-theophylline concentrations; therapeutic effect has been correlated with concentrations of 10 to 15 µg/ml. 3-Methylxanthine accumulates in the serum to concentrations of about 25% of those of theophylline. Diurnal variations in plasma concentrations have been reported with higher concentrations in the morning.

After oral doses of 200 to 300 mg of aminophylline every 6 hours to 83 subjects, trough serum-theophylline concentrations of 2.9 to 32.6 µg/ml (mean about 13) were reported (J. W. Jenne *et al.*, *Clin. Pharmac. Ther.*, 1972, 13, 349–360).

Following a single oral dose of 5 mg/kg of an elixir containing theophylline, administered to 12 subjects, peak serum concentrations of 11.0 to 16.8 µg/ml (mean 13.9) were attained in 0.5 to 2 hours (R. L. Manfredi and E. S. Vessell, *Clin. Pharmac. Ther.*, 1981, 29, 224–229).

Following single oral doses of 250 mg and 500 mg of theophylline to 8 subjects, peak plasma concentrations of 5.0 to 12.1 µg/ml (mean 8.0) and 10.7 to 20.5 µg/ml (mean 15), respectively, were attained in 0.5 to 3 hours (V. Rovei *et al.*, *Br. J. clin. Pharmac.*, 1982, 14, 769–778).

Following daily oral doses of 6.9 to 18.2 mg/kg of aminophylline to 14 subjects, trough steady-state serum concentrations of 6.6 to 15 µg/ml (mean 11) were reported in the morning, in comparison with trough serum concentrations of 5.0 to 13 µg/ml (mean 9.6) in the afternoon (L. J. Lesko *et al.*, *J. pharm. Sci.*, 1980, 69, 358–359).

TOXICITY. The estimated minimum lethal dose after intravenous administration is 0.1 g; fatalities have occurred after oral doses of 8.4 mg/kg in a child and after 25 to 100 mg/kg of aminophylline given as a suppository. Recovery has been reported after ingestion of choline theophyllinate equivalent to 12.8 g of theophylline. Toxic effects are usually associated with plasma concentrations greater than 30 µg/ml and fatalities with concentrations above 50 µg/ml; premature neonates appear to be relatively resistant to theophylline poisoning.

In a review of nine cases of theophylline poisoning, plasma concentrations on admission to hospital ranged from 24.5 to 120 µg/ml. Convulsions followed by death occurred in three of these cases, the amounts of drug taken being 11.5 g (intravenously over 36 hours), 10.5 g (oral) and 11.2 g (oral); the respective plasma concentrations were 66, 85, and 120 µg/ml (M. Helliwell and D. Berry, *Br. med. J.*, 1979, 2, 1114).

In a fatality due to the ingestion of theophylline, the following postmortem tissue concentrations were reported: blood 250 µg/ml, bile 275 µg/ml, brain 231 µg/g, kidney 212 µg/g, liver 200 µg/g (C. L. Winek *et al.*, *Forens. Sci. Int.*, 1980, 15, 233–236).

The following postmortem concentrations were reported in a fatality due to theophylline overdose: blood 63 µg/ml, brain 120 µg/g, liver 275 µg/g; death occurred 23 hours after the subject was discovered comatose (M. R. Loveland, *Bull. int. Ass. forens. Toxicol.*, 1974, 10(1), 16).

HALF-LIFE. Plasma half-life, 3 to 13 hours in normal subjects (mean 7) but decreased in smokers and in children, and increased in premature neonates and in certain disease states such as hepatic disease, heart failure, and chronic obstructive pulmonary disease. The half-life may also be affected by the amount of dietary methylxanthines ingested.

VOLUME OF DISTRIBUTION. About 0.5 litre/kg.

CLEARANCE. Plasma clearance, about 0.5 to 2 ml/min/kg in normal subjects.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 1.2.

SALIVA. Plasma: saliva ratio, about 2, but there is considerable intersubject variation.

PROTEIN BINDING. In plasma, about 40% (temperature and pH-dependent); decreased in neonates and in subjects with hepatic cirrhosis.

NOTE. For reviews of the clinical pharmacokinetics of theophylline see R. I. Ogilvie, *Clin. Pharmacokinetics*, 1978, 3, 267–293 and T. J. Haley, *Drug Met. Rev.*, 1983, 14, 295–335).

Dose. 0.18 to 1 g daily.

Thiabendazole

Anthelmintic

Proprietary Names. Equizole (vet.); Mintezol; Thiprazole (vet.). It is an ingredient of Ranizole (vet.).

2-(Thiazol-4-yl)-1*H*-benzimidazole

$C_{10}H_7N_3S = 201.3$

CAS—148-79-8

A white or cream-coloured powder. M.p. 296° to 303°. Practically **insoluble** in water; soluble 1 in 150 of ethanol, 1 in 300 of chloroform, and 1 in 2000 of ether; soluble in dilute mineral acids.

Thin-layer Chromatography. System TA—Rf 67; system TB—Rf 07; system TC—Rf 54. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2040; system GK—retention time 1.18 relative to caffeine.

Ultraviolet Spectrum. Aqueous acid—243 nm, 302 nm ($A_1^1 = 1230$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 740, 1306, 902, 1095, 1279, 1231 (KBr disk).

Mass Spectrum. Principal peaks at m/z 201, 174, 63, 202, 64, 65, 175, 90.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: thiabendazole and 5-hydroxythiabendazole, detection limit 100 ng/ml and 400 ng/ml, respectively, fluorescence detection—M. T. Watts *et al.*, *J. Chromat.*, 1982, 230; *Biomed. Appl.*, 19, 79–86.

Disposition in the Body. Readily absorbed after oral administration; peak plasma concentrations are attained in 1 to 2 hours. Metabolised to the 5-hydroxy derivative and excreted in the urine as conjugates. About 90% of a dose is excreted in the urine in 48 hours and 5% is eliminated in the faeces. Less than 1% of a dose is excreted in the urine unchanged.

HALF-LIFE. Plasma half-life, about 1 hour.

Dose. Usually 25 mg/kg twice daily, to a maximum daily dose of 3 g.

Thiacetazone

Antituberculous Agent/Antileprotic

Synonyms. Amithiozone; Tebezozum; Thioacetazone.

4-Acetamidobenzaldehyde thiosemicarbazone

$C_{10}H_{12}N_4OS = 236.3$

CAS—104-06-3

Pale yellow crystals or crystalline powder. M.p. 225° to 230°, with decomposition.

Very slightly **soluble** in water; soluble 1 in 500 of ethanol and 1 in 100 of propylene glycol; practically insoluble in chloroform and ether.

Colour Tests. Nessler's Reagent (100°)—black; Palladium Chloride—orange.

Thin-layer Chromatography. System TA—Rf 78. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2038.

Ultraviolet Spectrum. Ethanol—328 nm ($A_1^1 = 1870$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1515, 1603, 1580, 1661, 1250, 1305 (KBr disk).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: detection limit 3 ng/ml, UV detection—P. J. Jenner, *J. Chromat.*, 1983, 276; *Biomed. Appl.*, 27, 463–470.

Disposition in the Body. Slowly absorbed after oral administration. Most of a dose is metabolised and excreted in the urine; about 20% of a dose is excreted in the urine unchanged.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 4 mg/kg to 10 subjects, peak serum concentrations of 1.3 to 4.0 $\mu\text{g/ml}$ (mean 3.1) were attained in about 5 hours (P. K. Sen *et al.*, *J. Indian med. Ass.*, 1973, 61, 306–308).

HALF-LIFE. About 8 to 12 hours.

Dose. Up to 150 mg daily.

Thialbarbitone*Synonym.* Thialbarbital

5-Allyl-5-(cyclohex-2-enyl)-2-thiobarbituric acid

 $C_{13}H_{16}N_2O_2S = 264.3$

CAS—467-36-7

Crystals. M.p. 148° to 150°.

Sparingly **soluble** in water; readily soluble in most organic solvents.**Thialbarbitone Sodium***Synonyms.* Natrium Cyclohexenylallylthiobarbituricum; Thiohexally-malnatium. $C_{13}H_{15}N_2NaO_2S = 286.3$

CAS—3546-29-0

A pale yellow hygroscopic powder. M.p. 130° to 132°.

Very **soluble** in water and ethanol; slightly soluble in chloroform; practically insoluble in ether.**Colour Tests.** Palladium Chloride—orange-yellow; Vanillin Reagent—brown-orange/violet (transient).**Thin-layer Chromatography.** *System TD*—Rf 77; *system TE*—Rf 44; *system TF*—Rf 74; *system TH*—Rf 75. (Mercurous nitrate spray, black; acidified potassium permanganate solution, yellow-brown; Zwikker's reagent, green.)**Gas Chromatography.** *System GA*—RI 2116.**Ultraviolet Spectrum.** Borax buffer 0.05M (pH 9.2)—256 nm, 307 nm ($A_1^1 = 1236$ b); M sodium hydroxide (pH 13)—306 nm ($A_1^1 = 1271$ b).**Infra-red Spectrum.** Principal peaks at wavenumbers 1685, 1610, 1300, 1130, 1270, 1000 (thialbarbitone sodium, KBr disk).**Mass Spectrum.** Principal peaks at m/z 81, 223, 79, 41, 80, 157, 185, 77.**Dose.** Thialbarbitone sodium has been given in doses of 0.2 to 1 g intravenously.*Barbiturate***Thiambutosine***Synonym.* DPT*Proprietary Name.* Ciba-1906

1-(4-Butoxyphenyl)-3-(4-dimethylaminophenyl)thiourea

 $C_{19}H_{25}N_3OS = 343.5$

CAS—500-89-0

A white or creamy-white crystalline powder. M.p. 123° to 127°. Practically **insoluble** in water; soluble 1 in 1.5 of chloroform and 1 in 300 of ether; soluble in acetone.**Thin-layer Chromatography.** *System TA*—Rf 76; *system TB*—Rf 06; *system TC*—Rf 77.**Gas Chromatography.** *System GA*—RI 1715.**Ultraviolet Spectrum.** Ethanol—270 nm ($A_1^1 = 720$ a).**Infra-red Spectrum.** Principal peaks at wavenumbers 1234, 720, 1307, 1499, 813, 1093.**Mass Spectrum.** Principal peaks at m/z 151, 109, 136, 178, 177, 29, 207, 135.**Disposition in the Body.** Poorly absorbed after oral administration; aqueous suspensions are slowly and possibly incompletely absorbed after intramuscular injection. About 10% of a dose is metabolised to water-soluble compounds and rapidly excreted in the urine; about 75% of a dose is eliminated unchanged in the faeces.**Dose.** 1 to 3 g daily.**Thiamine***Vitamin**Synonyms.* Aneurine; Vitamin B₁.

3-(4-Amino-2-methylpyrimidin-5-ylmethyl)-5-(2-hydroxyethyl)-4-methylthiazolium chloride

 $C_{12}H_{17}ClN_4OS = 300.8$

CAS—59-43-8

**Thiamine Hydrochloride***Synonym.* Aneurine Chloride Hydrochloride*Proprietary Names.* Benerva; Betabion; Betalin S; Betamin; Beta-Sol; Betaxin; Bévitine; Bewon; Invite B₁; Megamin. It is an ingredient of Aneurone, Apisate and Effico. $C_{12}H_{17}ClN_4OS.HCl = 337.3$

CAS—67-03-8

Colourless crystals or white crystalline powder. M.p. about 248°, with decomposition.

Soluble 1 in 1 of water and 1 in 100 of ethanol; practically insoluble in dehydrated alcohol and ether; soluble in methanol.

Thiamine Mononitrate

Synonyms. Aneurine Mononitrate; Thiamine Nitrate; Vitamin B₁ Mononitrate.

Proprietary Name. B₁-Vicostat

$C_{12}H_{17}N_5O_4S = 327.4$

CAS—532-43-4

White crystals or crystalline powder. M.p. about 193°, with decomposition.

Soluble 1 in 44 of water; slightly soluble in ethanol and chloroform.

Dissociation Constant. pK_a 4.8 (20°).

Colour Test. Dissolve about 5 mg of thiamine hydrochloride in a mixture of 1 ml of lead acetate solution and 1 ml of 10% sodium hydroxide solution—yellow; after heating on a steam-bath—brown; on standing—a black precipitate of lead sulphide.

Thin-layer Chromatography. *System TA*—Rf 01. (Acidified iodoplatinate solution, positive.)

High Pressure Liquid Chromatography. *System HA*— k' 2.0.

Ultraviolet Spectrum. Aqueous acid—246 nm ($A_1^1 = 450$ a); aqueous alkali—232 nm ($A_1^1 = 566$ b), 336 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1660, 1618, 1048, 1237, 1595, 1228 (thiamine hydrochloride, KBr disk).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: detection limit 150 pg/ml, fluorescence detection—W. Weber and H. Kewitz, *Eur. J. clin. Pharmac.*, 1985, 28, 213–219.

Disposition in the Body. Well absorbed from the gastro-intestinal tract and widely distributed throughout the body. It is converted in the body to thiamine pyrophosphate. Thiamine is not stored to any appreciable extent in the body and amounts in excess of the body's requirements are excreted in the urine unchanged or as metabolites. About 1 mg of thiamine is metabolised in the body daily.

Endogenous blood concentrations are about 0.010 to 0.015 µg/ml and concentrations of thiamine pyrophosphate in erythrocytes are usually 0.03 to 0.11 µg/ml.

Endogenous plasma concentrations in 91 subjects ranged from 0.002 to 0.013 µg/ml (median 0.004) (W. Weber and H. Kewitz, *ibid.*).

Dose. 10 to 100 mg daily.

Thiamylal

Barbiturate

5-Allyl-5-(1-methylbutyl)-2-thiobarbituric acid

$C_{12}H_{18}N_2O_2S = 254.3$

CAS—77-27-0

Crystals. M.p. 132° to 133°.

Sodium Thiamylal

Proprietary Name. Surital

$C_{12}H_{17}N_2NaO_2S = 276.3$

CAS—337-47-3

Thiamylal sodium for injection is a mixture of sodium thiamylal with anhydrous sodium carbonate. It is a pale yellow hygroscopic powder.

Soluble in water.

Dissociation Constant. pK_a 7.5.

Gas Chromatography. *System GA*—RI 1899.

Ultraviolet Spectrum. Aqueous acid—238 nm, 287 nm; aqueous alkali—305 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1668, 1541, 1731, 1170, 1318, 1291 (KBr disk).

Mass Spectrum. Principal peaks at m/z 43, 41, 184, 168, 167, 97, 55, 53.

Dose. Initially 3 to 6 ml of a 2.5% solution of sodium thiamylal intravenously.

Thiazinamium Methylsulphate

Antihistamine

Synonym. Methylpromethazinium Methylsulphuric

Proprietary Name. Multergan

Trimethyl[1-methyl-2-(phenothiazin-10-yl)ethyl]ammonium methylsulphate

$C_{19}H_{26}N_2O_4S_2 = 410.5$

CAS—2338-21-8 (thiazinamium); 58-34-4 (methylsulphate)

A white crystalline powder which discolours on exposure to light. M.p. 206° to 210°, with decomposition.

Soluble 1 in 10 of water; very soluble in ethanol; practically insoluble in ether.

Colour Tests. Formaldehyde-Sulphuric Acid—brown-violet; Forrester Reagent—red; FPN Reagent—red; Liebermann's Test—red.

Thin-layer Chromatography. *System TA*—Rf 02. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—251 nm ($A_1^1 = 450$ b), 299 nm. (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 1224, 1010, 1059, 764, 743, 1036.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: sensitivity 20 ng/ml, AFID—J. H. G. Jonkman *et al.*, *J. Pharm. Pharmac.*, 1975, 27, 849–854.

Disposition in the Body. Incompletely absorbed after oral administration and undergoes considerable first-pass metabolism to thiazinamium sulphoxide; well absorbed after intramuscular administration. About 40% of a parenteral dose is excreted in the urine unchanged in 8 hours, together with 9% of the dose as the sulphoxide.

THERAPEUTIC CONCENTRATION.

Following single oral doses equivalent to 300 mg and 900 mg of thiazinamium to 10 subjects, peak plasma concentrations of 0.03 to 0.13 µg/ml (mean 0.07) and 0.06 to 0.36 µg/ml (mean 0.17) were attained in about 2.4 hours and 5 hours, respectively (J. H. G. Jonkman *et al.*, *Clin. Pharmac. Ther.*, 1977, 21, 457–463).

Dose. 0.6 to 1.2 g daily.

Thiethylperazine

Anti-emetic

2 - Ethylthio - 10 - [3 - (4 - methylpiperazin - 1 - yl)propyl]-phenothiazine

$C_{22}H_{29}N_3S_2 = 399.6$

CAS—1420-55-9

Crystals. M.p. 62° to 64°. Practically **insoluble** in water.

Thiethylperazine Malate

Proprietary Name. Torecan (injection)

$C_{22}H_{29}N_3S_2 \cdot 2C_4H_6O_5 = 667.8$

CAS—52239-63-1

A white to faintly yellow crystalline powder. M.p. 139°.

Soluble 1 in 40 of water, 1 in 90 of ethanol, 1 in 525 of chloroform, and 1 in 3400 of ether.

Thiethylperazine Maleate

Proprietary Name. Torecan (suppositories and tablets)

$C_{22}H_{29}N_3S_2 \cdot 2C_4H_4O_4 = 631.8$

CAS—1179-69-7

A yellowish granular powder. M.p. about 183°, with decomposition.

Soluble 1 in 1700 of water and 1 in 530 of ethanol; practically insoluble in chloroform and ether.

Colour Tests. Formaldehyde-Sulphuric Acid—green; Forrest Reagent—blue; FPN Reagent—blue; Mandelin's Test—violet; Marquis Test—red → green.

Thin-layer Chromatography. System TA—Rf 51; system TB—Rf 30; system TC—Rf 41. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 3247.

High Pressure Liquid Chromatography. System HA—k' 3.8.

Ultraviolet Spectrum. Aqueous acid—255 nm ($A_1^1 = 857$ b), 309 nm ($A_1^1 = 98$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1563, 864, 1613, 1212, 1105, 1067 (KBr disk).

Mass Spectrum. Principal peaks at m/z 70, 113, 141, 399, 43, 26, 72, 42.

Dose. Usually 20 to 30 mg of thiethylperazine maleate daily.

Thiocarlide

Antituberculous Agent

Synonym. Tiocarlide

Proprietary Name. Isoxyl

1,3-Bis(4-isopentyloxyphenyl)thiourea

$C_{23}H_{32}N_2O_2S = 400.6$

CAS—910-86-1

A white crystalline powder. M.p. 134° to 145°.

Practically **insoluble** in water; soluble in ethanol and chloroform.

Colour Tests. Liebermann's Test—green; Mandelin's Test—green → yellow.

Thin-layer Chromatography. System TA—Rf 80; system TB—Rf 07; system TC—Rf 78. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2005.

Infra-red Spectrum. Principal peaks at wavenumbers 1228, 1499, 1534, 823, 1163, 1285 (KBr disk).

Mass Spectrum. Principal peaks at m/z 109, 151, 43, 41, 221, 179, 29, 108.

Dose. 6 g daily.

Thioguanine

Antineoplastic

Synonyms. 6-TG; 6-Thioguanine.*Proprietary Name.* Lanvis2-Aminopurine-6(1*H*)-thione $C_5H_5N_5S = 167.2$ *CAS*—154-42-7 (anhydrous); 5580-03-0 (hemihydrate)

A pale yellow crystalline powder.

Practically **insoluble** in water, ethanol, and chloroform; freely soluble in dilute solutions of alkali hydroxides.**Ultraviolet Spectrum.** Aqueous acid—258 nm ($A_1^1 = 490$ b), 348 nm ($A_1^1 = 1240$ a); aqueous alkali—320 nm ($A_1^1 = 1015$ b).**Infra-red Spectrum.** Principal peaks at wavenumbers 1625, 1668, 1257, 1539, 1231, 971 (KBr disk).**Quantification.** SPECTROFLUORIMETRY. In plasma: sensitivity 5 ng/ml—T. Dooley and J. L. Maddocks, *Br. J. clin. Pharmacol.*, 1980, 9, 77–82.**HIGH PRESSURE LIQUID CHROMATOGRAPHY.** In plasma or urine: sensitivity 200 ng/ml, UV detection—H. Breithaupt and G. Goebel, *J. chromatogr. Sci.*, 1981, 19, 496–499. In plasma: thioguanine and metabolites, sensitivity about 130 ng/ml, UV detection—P. A. Andrews *et al.*, *J. Chromat.*, 1982, 227; *Biomed. Appl.*, 16, 83–91.**Disposition in the Body.** Incompletely and variably absorbed after oral administration. Rapidly activated by intracellular conversion to thioguanic acid. Inactivated by methylation to aminomethylthiopurine and by deamination to thioxanthine. About 40% of an oral dose is excreted in the urine as metabolites in 24 hours; only traces of thioguanine have been detected.**Dose.** Initially 2 to 2.5 mg/kg daily.**Soluble** 1 in 1.5 of water; partly soluble in ethanol; practically insoluble in ether.**Dissociation Constant.** pK_a 7.6 (20°).**Colour Tests.** Koppanyi-Zwicker Test—violet; Palladium Chloride—orange; Vanillin Reagent—brown-red/violet.**Thin-layer Chromatography.** *System TD*—Rf 77; *system TE*—Rf 49; *system TF*—Rf 74; *system TH*—Rf 80. (Mercuric chloride-diphenylcarbazone reagent, positive; mercurous nitrate spray, black; acidified potassium permanganate solution, yellow-brown; Zwicker's reagent, green.)**Gas Chromatography.** *System GA*—RI 1859; *system GF*—RI 2600.**Ultraviolet Spectrum.** Borax buffer 0.05*M* (pH 9.2)—255 nm, 304 nm ($A_1^1 = 1138$ b); M sodium hydroxide (pH 13)—303 nm ($A_1^1 = 1170$ b).**Infra-red Spectrum.** Principal peaks at wavenumbers 1670, 1540, 1300, 1170, 1735, 1220 (KBr disk).**Thiopentone**

Barbiturate

Synonyms. Penthiobarbital; Thiomebumal; Thiopental.

5-Ethyl-5-(1-methylbutyl)-2-thiobarbituric acid

 $C_{11}H_{18}N_2O_2S = 242.3$ *CAS*—76-75-5**Thiopentone Sodium***Synonyms.* Soluble Thiopentone; Thiopental Sodium.*Proprietary Names.* Farmotal; Intraval Sodium; Nesdonal; Pentothal; Trapanal. $C_{11}H_{17}N_2NaO_2S = 264.3$ *CAS*—71-73-8

A white to yellowish-white to pale green, hygroscopic powder. It usually contains anhydrous sodium carbonate in the proportion of 6 parts to each 100 parts of thiopentone sodium.

Mass Spectrum. Principal peaks at m/z 172, 157, 173, 43, 41, 55, 69, 71.

Quantification. See also under Amylobarbitone.

GAS CHROMATOGRAPHY. In plasma: sensitivity 25 ng/ml, AFID—D. Jung *et al.*, *Clin. Chem.*, 1981, 27, 113–115.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: detection limit 200 ng/ml, UV detection—C. Salvadori *et al.*, *Ther. Drug Monit.*, 1981, 3, 171–176. In blood or tissues: sensitivity 1 µg/ml, UV detection—B. Levine *et al.*, *J. analyt. Toxicol.*, 1983, 7, 207–208.

Disposition in the Body. About 10% of a dose is concentrated in the brain within 1 minute of an intravenous injection and it is then rapidly distributed throughout the body, eventually accumulating in body fat; about 50% of a dose accumulates in this way after 30 to 90 minutes. The very short action of thiopentone is due to the brief α -phase half-life and the redistribution of the drug from the brain to other fatty tissues. Metabolic reactions include ω -hydroxylation, further oxidation and, to a lesser extent, desulphuration to pentobarbitone. Less than 1% of a dose is excreted in the urine as unchanged drug. 5-(3-Carboxy-1-methylpropyl)-5-ethyl-2-thiobarbituric acid has been reported to be a urinary metabolite.

THERAPEUTIC CONCENTRATION.

Plasma concentrations of 4.2 to 134 µg/ml (mean 28) were reported in 22 patients after intravenous injections (K. E. Becker, *Anesthesiology*, 1976, 45, 656–660).

TOXICITY. The estimated minimum lethal dose is 1 g. Numerous fatalities have occurred due to accidental or intentional overdosage, and blood concentrations from 6 to 392 µg/ml have been reported in fatalities.

The following postmortem tissue distribution was reported in one suicide case: blood 6 µg/ml, brain 24 µg/g, heart 22 µg/g, kidney 31 µg/g, and liver 63 µg/g (A. M. Bruce *et al.*, *Forens. Sci.*, 1977, 9, 205–207).

In a fatality due to intravenous self-administration of thiopentone, the following postmortem tissue concentrations were reported: blood 285 µg/ml, brain 414 µg/g, kidney 195 µg/g, liver 440 µg/g (E. Reed and J. R. Monforte, *Bull. int. Ass. forens. Toxicol.*, 1973, 9 (3&4), 12).

HALF-LIFE. Plasma half-life, 4 to 20 hours (mean 9), increased after high doses (25 mg/min), up to 60 hours.

VOLUME OF DISTRIBUTION. 0.5 to 4 litres/kg.

CLEARANCE. Plasma clearance, 1 to 4 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 1.0.

PROTEIN BINDING. In plasma, about 75 to 90%.

Dose. 100 to 150 mg of thiopentone sodium intravenously, repeated if necessary.

Practically insoluble in water; soluble in chloroform and ether.

Thiopropazate Hydrochloride

Proprietary Names. Dartal; Dartalan.

$C_{23}H_{28}ClN_3O_2S \cdot 2HCl = 518.9$

CAS—146-28-1

A white or pale yellow crystalline powder. M.p. 228° to 232°.

Soluble 1 in 4 of water, 1 in 130 of ethanol, and 1 in 65 of chloroform; practically insoluble in ether.

Caution. Thiopropazate hydrochloride may cause severe dermatitis in sensitised persons.

Dissociation Constant. pK_a 7.3 (24°).

Colour Tests. Formaldehyde–Sulphuric Acid—red-violet; Forest Reagent—red; FPN Reagent—red; Liebermann's Test—green-brown; Mandelin's Test—violet; Marquis Test—violet.

Thin-layer Chromatography. System *TA*—Rf 61; system *TB*—Rf 35; system *TC*—Rf 53. (Dragendorff's spray, positive; FPN reagent, pink; acidified iodoplatinate solution, positive; Marquis reagent, red; ninhydrin spray, positive.)

Gas Chromatography. System *GA*—RI 3465.

High Pressure Liquid Chromatography. System *HA*— k' 1.0.

Ultraviolet Spectrum. Aqueous acid—255 nm ($A_1^1 = 733$ a), 305 nm; aqueous alkali—257 nm.

Thiopropazate

Tranquilliser

2-[4-[3-(2-Chlorophenothiazin-10-yl)propyl]piperazin-1-yl]-ethyl acetate

$C_{23}H_{28}ClN_3O_2S = 446.0$

CAS—84-06-0

Infra-red Spectrum. Principal peaks at wavenumbers 1222, 1728, 746, 1265, 1250, 1200 (thiopropazate hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 42, 43, 70, 246, 185, 55, 56, 445.

Dose. Initially 15 to 30 mg of thiopropazate hydrochloride daily; maximum of 100 mg daily.

Infra-red Spectrum. Principal peaks at wavenumbers 1156, 1042, 1212, 720, 960, 762 (thiopropazine mesylate, Nujol mull).

Mass Spectrum. Principal peaks at m/z 79, 96, 31, 113, 81, 70, 127, 78.

Dose. Usually 15 to 30 mg of thiopropazine mesylate daily; up to 90 mg daily has been given.

Thiopropazine

Tranquilliser

NN - Dimethyl - 10 - [3 - (4 - methylpiperazin - 1 - yl)propyl]-phenothiazine-2-sulphonamide

$C_{22}H_{30}N_4O_2S_2 = 446.6$

CAS—316-81-4

Crystals. M.p. 140°.

Practically **insoluble** in water.

Thiopropazine Mesylate

Synonyms. Thiopropazine Dimethanesulphonate; Thiopropazine Methanesulphonate.

Proprietary Name. Majeptil

$C_{22}H_{30}N_4O_2S_2 \cdot 2CH_3O_3S = 638.8$

CAS—2347-80-0

A fine, white or pale cream powder, which becomes coloured on exposure to light. M.p. about 227°.

Soluble in water; slightly soluble in ethanol.

Colour Tests. Formaldehyde-Sulphuric Acid—pink; Forrest Reagent—red; FPN Reagent—orange; Mandelin's Test—brown → green → violet; Marquis Test—red.

Thin-layer Chromatography. *System TA*—Rf 46; *system TB*—Rf 07; *system TC*—Rf 34. (*Acidified iodoplatinate solution*, positive.)

Gas Chromatography. *System GA*—not eluted.

High Pressure Liquid Chromatography. *System HA*— k' 4.1.

Ultraviolet Spectrum. Aqueous acid—234 nm, 263 nm ($A_1^1 = 668$ a), 312 nm. No alkaline shift.

Thioridazine

Tranquilliser

Proprietary Names. Mellaril-S; Melleretten; Melleril.

10-[2-(1-Methyl-2-piperidyl)ethyl]-2-methylthiophenothiazine

$C_{21}H_{26}N_2S_2 = 370.6$

CAS—50-52-2

A white or slightly yellow crystalline powder which darkens on exposure to light. M.p. 69° to 74°.

Practically **insoluble** in water; soluble 1 in 6 of ethanol, 1 in 0.8 of chloroform, and 1 in 3 of ether.

Thioridazine Hydrochloride

Proprietary Names. Mellaril; Melleretten (tablets); Melleril (tablets); Novoridazine; Thioril.

$C_{21}H_{26}N_2S_2 \cdot HCl = 407.0$

CAS—130-61-0

A white or slightly yellow crystalline powder. M.p. 157° to 163°.

Soluble 1 in 9 of water, 1 in 10 of ethanol, and 1 in 1.5 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 9.5 (24°).

Colour Tests. Formaldehyde-Sulphuric Acid—blue; Forrest Reagent—blue; FPN Reagent—blue; Mandelin's Test—blue → violet; Marquis Test—violet-red → blue-green.

Thin-layer Chromatography. *System TA*—Rf 48; *system TB*—Rf 43; *system TC*—Rf 30. (*Dragendorff's spray*, positive; *FPN reagent*, blue; *acidified iodoplatinate solution*, positive; *Marquis reagent*, grey-violet.)

Gas Chromatography. System GA—RI 3114.

High Pressure Liquid Chromatography. System HA—thioridazine k' 5.2, mesoridazine k' 5.0.

Ultraviolet Spectrum. Aqueous acid—262 nm ($A_1^1 = 987$ a), 310 nm; aqueous alkali—275 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 754, 1248, 796, 1234, 1281, 1211 (thioridazine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 98, 370, 126, 99, 40, 70, 371, 258; mesoridazine 98, 70, 99, 42, 386, 126, 55, 41.

Quantification. GAS CHROMATOGRAPHY. In plasma: detection limit for thioridazine 100 ng/ml and for mesoridazine and sulforidazine 150 ng/ml, FID—F. A. J. Vanderheeren *et al.*, *J. Chromat.*, 1976, 120, 123–128.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: thioridazine and metabolites, sensitivity 2 ng/ml, fluorescence detection—C. E. Wells *et al.*, *J. pharm. Sci.*, 1983, 72, 622–625.

Disposition in the Body. Readily absorbed after oral administration. It is metabolised mainly by sulfoxidation to give the side-chain sulfoxide (mesoridazine), the side-chain sulphone (sulforidazine), both of which are active, and the ring sulfoxide and sulphone; *N*-demethylation also occurs. Other metabolites are produced by combinations of these metabolic reactions. It is metabolised in the liver, secreted in the bile, and excreted mainly in the faeces. Less than about 10% of a dose is excreted in the

urine, with less than 1% as unchanged drug; mesoridazine and sulforidazine are also excreted in the urine in amounts slightly greater than unchanged drug.

THERAPEUTIC CONCENTRATION. Plasma concentrations of drug and metabolites show considerable intersubject variation. Concentrations appear to be independent of dose and tend to decrease during chronic treatment.

After a single oral dose of 100 mg administered to 5 subjects, the following peak serum concentrations were found: thioridazine 0.05 to 0.50 $\mu\text{g/ml}$ (mean 0.24) in 1 to 4 hours, mesoridazine 0.10 to 0.51 $\mu\text{g/ml}$ (mean 0.32) in 2 to 6 hours, sulforidazine 0.02 to 0.11 $\mu\text{g/ml}$ (mean 0.07) in 5 to 8 hours, ring sulfoxide 0.07 to 0.38 $\mu\text{g/ml}$ (mean 0.18) in 4 to 8 hours (R. Axelsson and E. Martensson, *Curr. ther. Res.*, 1977, 21, 561–586).

Following daily oral doses of 100 to 800 mg (mean 382) to 17 subjects, serum concentrations, determined 12 hours after a dose, were: thioridazine 0.4 to 2.0 $\mu\text{g/ml}$ (mean 0.9), mesoridazine 0.2 to 1.6 $\mu\text{g/ml}$ (mean 0.8), sulforidazine 0 to 0.6 $\mu\text{g/ml}$ (mean 0.2), ring sulfoxide 0.06 to 4.0 $\mu\text{g/ml}$ (mean 1.5) (R. Axelsson *et al.*, *Eur. J. clin. Pharmac.*, 1982, 23, 359–363).

TOXICITY. The estimated minimum lethal dose is 1 g. Blood concentrations greater than about 2 $\mu\text{g/ml}$ may produce toxic effects and can be lethal.

Six cases of non-fatal overdose were found to have blood concentrations in the range 2.4 to 11.8 $\mu\text{g/ml}$ (mean 4.6) (S. L. Tompsett, *Acta pharmac. tox.*, 1968, 26, 298–302).

In 12 cases of death attributed to thioridazine overdose, postmortem concentrations (total thioridazine and metabolites) were: blood 1 to 18 $\mu\text{g/ml}$ (mean 4.7), kidney 18 to 70 $\mu\text{g/g}$ (mean 47, 4 cases), liver 25 to 513 $\mu\text{g/g}$ (mean 100), urine 5 to 236 $\mu\text{g/ml}$ (mean 62, 5 cases). In 4 subjects who were undergoing chronic treatment and who died from causes other than drug overdose, postmortem concentrations were: blood 0.6 to 3.6 $\mu\text{g/ml}$ (mean 1.6), liver 1 to 12 $\mu\text{g/g}$ (mean 5.2) (R. C. Baselt *et al.*, *J. analyt. Toxicol.*, 1978, 2, 41–43).

In 2 fatalities attributed to thioridazine overdose, the following postmortem concentrations were reported, $\mu\text{g/ml}$ or $\mu\text{g/g}$:

	Blood	Liver*
Thioridazine	8.85, 2.43	138, 50
Mesoridazine	26.8, 0.29	—
Sulforidazine	0.87, 0	—

*Total thioridazine plus metabolites determined by a non-specific fluorimetric assay.

The determination of two stereoisomeric ring sulfoxides is also discussed (A. Poklis *et al.*, *J. analyt. Toxicol.*, 1982, 6, 250–252).

HALF-LIFE. Plasma half-life, 10 to 36 hours.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 0.79.

PROTEIN BINDING. In plasma, thioridazine greater than 99.5%; mesoridazine and sulforidazine, about 99%.

Dose. 30 to 300 mg of thioridazine hydrochloride daily; maximum of 800 mg daily.

Thiotepa

Antineoplastic

Synonyms. TESPA; Thiophosphamide; Triethylene Thiophosphoramide; TSPA.

Proprietary Names. Ledertepa; Tifosyl.

Phosphorothioic tri(ethyleneamide)

$\text{C}_6\text{H}_{12}\text{N}_3\text{PS} = 189.2$

CAS—52-24-4

Fine white crystalline flakes. M.p. 52° to 57°.

Soluble 1 in 8 of water, 1 in 2 of ethanol, 1 in 2 of chloroform, and 1 in about 4 of ether.

Caution. Thiotepa is irritant; avoid contact with skin and mucous membranes.

Gas Chromatography. System GA—RI 1504.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 932, 1255, 729, 718, 669, 815 (solution in carbon disulphide).

Dose. Up to 60 mg in single or divided doses by injection or by instillation.

Thiothixene

Tranquilliser

Synonym. Tiotixene

Proprietary Names. Navane (capsules and tablets); Orbinamon.

(Z) - *NN* - Dimethyl - 9 - [3 - (4 - methylpiperazin - 1 - yl)propylidene]thioxanthene-2-sulphonamide

$C_{23}H_{29}N_3O_2S_2 = 443.6$

CAS—5591-45-7; 3313-26-6 (Z)

A white to tan-coloured crystalline powder. M.p. 147° to 152°. Practically **insoluble** in water; soluble 1 in 110 of dehydrated alcohol, 1 in 2 of chloroform, and 1 in 120 of ether.

Thiothixene Hydrochloride

Proprietary Name. Navane (oral concentrate)

$C_{23}H_{29}N_3O_2S_2 \cdot 2HCl \cdot 2H_2O = 552.6$

CAS—58513-59-0 (anhydrous); 49746-04-5 (anhydrous, Z); 22189-31-7 (dihydrate); 49746-09-0 (dihydrate, Z)

A white crystalline powder.

Soluble 1 in 8 of water, 1 in 270 of dehydrated alcohol, and 1 in 280 of chloroform; practically insoluble in ether.

Colour Tests. Formaldehyde-Sulphuric Acid—red; Liebermann's Test—red; Mandelin's Test—red; Marquis Test—red; Sulphuric Acid—orange.

Thin-layer Chromatography. System TA—Rf 49; system TB—Rf 09; system TC—Rf 40. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 3060.

High Pressure Liquid Chromatography. System HA— k' 3.8.

Ultraviolet Spectrum. Aqueous acid—308 nm ($A_1^1 = 191$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1156, 719, 765, 1176, 957, 747 (KBr disk).

Mass Spectrum. Principal peaks at m/z 113, 70, 114, 42, 221, 222, 56, 43.

Quantification. GAS CHROMATOGRAPHY-MASS SPECTROMETRY. In plasma: sensitivity <1 ng/ml—D. C. Hobbs *et al.*, *Clin. Pharmac. Ther.*, 1974, 16, 473-478.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: *cis*- and *trans*-thiothixene, UV detection—S. C. Bogema *et al.*, *J. Chromat.*, 1982, 233; *Biomed. Appl.*, 22, 257-267.

Disposition in the Body. Rapidly absorbed after oral administration. The *N*-desmethyl derivative accounts for about 10% of the plasma concentration; other unidentified metabolites may accumulate on chronic administration.

THERAPEUTIC CONCENTRATION.

Following chronic oral administration of 15 to 60 mg daily in divided doses to 15 subjects, plasma concentrations, determined 2 to 2½ hours after the last daily dose, were in the range 0.010 to 0.023 µg/ml (mean 0.016) (D. C. Hobbs *et al.*, *Clin. Pharmac. Ther.*, 1974, 16, 473-478).

TOXICITY.

In a fatality involving the ingestion of 250 mg of thiothixene and an unknown quantity of doxepin, a postmortem blood concentration of 0.13 µg/ml of thiothixene was reported (R. C. Baselt, *Disposition of Toxic Drugs and Chemicals in Man*, 2nd Edn, Davis, California, Biomedical Publications, 1982, pp. 734-736).

HALF-LIFE. Plasma half-life, about 34 hours.

Dose. Usually 10 to 30 mg daily; up to 60 mg daily may be given.

Thonzylamine*Antihistamine**Synonym.* Histylamine*N-p*-Anisyl-*N,N'*-dimethyl-*N*-(pyrimidin-2-yl)ethylenediamine $C_{16}H_{22}N_4O = 286.4$ *CAS*—91-85-0

An oily liquid.

Practically **insoluble** in water; soluble in chloroform.**Thonzylamine Hydrochloride***Proprietary Names.* Tonamil. It is an ingredient of Biomydrin. $C_{16}H_{22}N_4O \cdot HCl = 322.8$ *CAS*—63-56-9

A white crystalline powder. M.p. 173° to 176°.

Soluble 1 in 1 of water, 1 in 6 of ethanol, and 1 in 4 of chloroform; practically insoluble in ether.**Dissociation Constant.** pK_a 2.1, 8.8 (25°).**Colour Test.** Mandelin's Test—red-violet.**Thin-layer Chromatography.** *System TA*—Rf 55; *system TB*—Rf 38; *system TC*—Rf 28. (*Dragendorff spray*, positive; *acidified iodoplatinate solution*, positive.)**Gas Chromatography.** *System GA*—RI 2203; *system GC*—RI 2576.**High Pressure Liquid Chromatography.** *System HA*— k' 3.2.**Ultraviolet Spectrum.** Aqueous acid—236 nm ($A_1^1 = 857$ a), 274 nm, 316 nm.**Infra-red Spectrum.** Principal peaks at wavenumbers 1515, 1593, 1550, 1250, 1613, 1175 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 58, 121, 72, 71, 216, 215, 122, 78.**Dose.** Usually 50 to 100 mg of thonzylamine hydrochloride daily.**Thymol***Disinfectant**Synonyms.* Acido Timico; Isopropylmetacresol; Timol.

2-Isopropyl-5-methylphenol

 $C_{10}H_{14}O = 150.2$ *CAS*—89-83-8

Colourless crystals or white crystalline powder. M.p. 48° to 51°; when melted it remains liquid at a considerably lower temperature.

Soluble 1 in 1000 of water, 1 in 0.3 of ethanol, 1 in 0.6 of chloroform, and 1 in 0.7 of ether.**Colour Test.** Liebermann's Test—black.**Thin-layer Chromatography.** *System TD*—Rf 73; *system TE*—Rf 81; *system TF*—Rf 68.**Gas Chromatography.** *System GA*—RI 1260.**Ultraviolet Spectrum.** Aqueous acid—272 nm ($A_1^1 = 137$ b); aqueous alkali—292 nm ($A_1^1 = 257$ b).**Infra-red Spectrum.** Principal peaks at wavenumbers 817, 1248, 1290, 1095, 1160, 952.**Mass Spectrum.** Principal peaks at m/z 135, 150, 91, 107, 117, —, —, —.**Thymoxamine***Vasodilator**Synonym.* Moxisylyte

4 - (2 - Dimethylaminoethoxy) - 5 - isopropyl - 2 - methylphenyl acetate

 $C_{16}H_{25}NO_3 = 279.4$ *CAS*—54-32-0Practically **insoluble** in water; soluble in chloroform.**Thymoxamine Hydrochloride***Proprietary Names.* Arlitene; Carlytène Fort; Opilon. $C_{16}H_{25}NO_3 \cdot HCl = 315.8$ *CAS*—964-52-3

A white crystalline powder. M.p. about 212°.

Soluble 1 in 2.5 of water, 1 in 11 of ethanol, and 1 in 3 of chloroform; practically insoluble in ether.**Colour Test.** Marquis Test—yellow-brown.

Thin-layer Chromatography. System TA—Rf 52; system TB—Rf 31; system TC—Rf 44. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 1832.

High Pressure Liquid Chromatography. System HA—thymoxamine k' 2.9, desacetylthymoxamine k' 2.3.

Ultraviolet Spectrum. Aqueous acid—275 nm ($A_1^1 = 80$ a); aqueous alkali—235 nm, 301 nm ($A_1^1 = 146$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1184, 1212, 1761, 1261, 1504, 931 (thymoxamine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 58, 72, 279, 234, 151, 192, 166, 165.

Quantification. SPECTROFLUORIMETRY. In plasma—A. G. Arbab and P. Turner. *J. Pharm. Pharmac.*, 1971, 23, 719–721.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In monkey plasma: metabolites of thymoxamine, detection limits 2 ng for desacetylthymoxamine and 4 ng for desmethylthymoxamine, fluorescence detection—A. E. Geahchan and P. L. Chambon, *Analyt. Chem.*, 1980, 52, 999–1001.

Disposition in the Body. Poorly absorbed after oral administration. Deacetylation to give desacetylthymoxamine and subsequent demethylation to give desmethylthymoxamine may occur.

THERAPEUTIC CONCENTRATION.

After single oral doses of 150 mg to 4 female subjects, plasma concentrations of about 0.06 µg/ml were achieved after 30 to 60 minutes in 2 subjects; the drug was not detected in the other two subjects. After an intravenous injection of 0.2 mg/kg over 2 minutes to 2 male subjects, plasma concentrations at 2, 7 and 15 minutes were 0.14, 0.08 and 0.05 µg/ml in the first subject and 0.1, 0.04 and 0.03 µg/ml in the other (A. G. Arbab and P. Turner, *J. Pharm. Pharmac.*, 1971, 23, 719–721).

Dose. The equivalent of 160 mg of thymoxamine daily.

Thyroxine

Thyroid Agent

Synonyms. Levothyroxine; L-Thyroxine. The abbreviation T_4 is often used for thyroxine in medical and biochemical reports.

4-O-(4-Hydroxy-3,5-di-iodophenyl)-3,5-di-iodo-L-tyrosine

$C_{15}H_{11}I_4NO_4 = 776.9$

CAS—51-48-9

Crystals. M.p. 235° to 236°, with decomposition.

Thyroxine Sodium

Proprietary Names. Cytolen; Eltroxin; Euthyrox; Levoid; Levotheroid; Oroxine; Percutacrine Thyroxinique; Synthroid; Thyroxinal. It is an ingredient of Euthroid and Thyrolar.

$C_{15}H_{10}I_4NNaO_4 \cdot xH_2O = 798.9$ (anhydrous)

CAS—55-03-8 (anhydrous); 25416-65-3 (hydrate)

A white to pale brownish-yellow, hygroscopic, amorphous or crystalline powder. It may assume a slight pink colour on exposure to light.

Soluble 1 in 700 of water and 1 in 300 of ethanol; practically insoluble in chloroform and ether; soluble in solutions of alkali hydroxides. Alkaline solutions are unstable.

Dissociation Constant. pK_a 2.2, 6.7, 10.1.

Ultraviolet Spectrum. Aqueous alkali—325 nm ($A_1^1 = 78$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1628, 1585, 1308, 1185, 1240, 1148 (KBr disk).

Quantification. GAS CHROMATOGRAPHY. In serum: thyroxine and liothyronine, sensitivity 10 ng/ml and 2.7 ng/ml, respectively, ECD—N. N. Nihei *et al.*, *Analyt. Biochem.*, 1971, 43, 433–445.

RADIOIMMUNOASSAY. In serum: thyroxine and liothyronine, detection limit 10 ng/ml and 260 pg/ml, respectively—C. E. Denning *et al.*, *Clinica chim. Acta*, 1979, 98, 5–18.

Disposition in the Body. Incompletely and variably absorbed after oral administration. It is metabolised by de-iodination to liothyronine (tri-iodothyronine) which is the principal active form of thyroxine; further de-iodination to thyroacetic acid (4-*p*-hydroxyphenoxyphenylacetic acid), and conjugation with glucuronic acid and sulphate also occur. About 30 to 55% of a dose is excreted in the urine and 20 to 40% is eliminated in the faeces; of the urinary material about 40% is thyroacetic acid and 20% is liothyronine.

Endogenous serum-thyroxine concentrations range from 0.05 to 0.12 µg/ml in normal subjects.

HALF-LIFE. Plasma half-life, 6 to 7 days which may be increased in pregnancy or myxoedema and decreased in hyperthyroidism.

PROTEIN BINDING. In plasma, more than 99.9%.

Dose. 50 to 300 µg of anhydrous thyroxine sodium daily.

Tiaprofenic Acid

Analgesic

Proprietary Name. Surgam

2-(5-Benzoyl-2-thienyl)propionic acid

$C_{14}H_{12}O_3S = 260.3$

CAS—33005-95-7

A white microcrystalline powder. M.p. about 95°. Slightly **soluble** in water; soluble in ethanol, chloroform, and ether.

Dissociation Constant. pK_a 3.0.

Ultraviolet Spectrum. Ethanolic acid—260 nm ($A_1^1 = 370$ a), 305 nm ($A_1^1 = 575$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1727, 718, 1593, 1198, 1605, 1572 (Nujol mull).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: detection limit 500 ng/ml, UV detection—G. T. Ward *et al.*, *J. liq. Chromat.*, 1982, 5, 165–174.

Disposition in the Body. Rapidly and almost completely absorbed after oral administration. Metabolised by reduction to 2-(5- α -hydroxybenzyl-2-thienyl)propionic acid, oxidation to 2-(5-*p*-hydroxybenzoyl-2-thienyl)propionic acid, and conjugation with glucuronic acid. About 60% of an oral dose is excreted in the urine in 24 hours, about 55% as tiaprofenic acid (excreted mainly as an acylglucuronide conjugate), and about 5% as the two metabolites, excreted partly as acylglucuronides.

THERAPEUTIC CONCENTRATION.

Following daily oral administration of 300 mg twice a day to 6 subjects, maximum steady-state serum concentrations of 18.6 to 73.3 µg/ml (mean 48) were reported 0.5 to 1.5 hour after a dose (T. J. Daymond and R. Herbert, *Br. J. clin. Pharmac.*, 1983, 15, 157P–158P).

HALF-LIFE. Plasma half-life, 1 to 2 hours.

CLEARANCE. Plasma clearance, about 1.4 ml/min/kg.

PROTEIN BINDING. In plasma, about 98%.

NOTE. For a review of tiaprofenic acid see E. M. Sorkin and R. N. Brogden, *Drugs*, 1985, 29, 208–235.

Dose. 600 mg daily.

Tienilic Acid

Diuretic

Synonym. Ticrynafen

Proprietary Name. Diflurex

[2,3-Dichloro-4-(2-thienyl)phenoxy]acetic acid

$C_{13}H_8Cl_2O_4S = 331.2$

CAS—40180-04-9

A white crystalline powder. M.p. 152° to 156°.

Very slightly **soluble** in water; soluble 1 in 14 of ethanol, 1 in about 5 of acetone, 1 in 77 of chloroform, and 1 in about 6 of methanol.

Dissociation Constant. pK_a 2.7 (25°).

Ultraviolet Spectrum. Ethanol—267 nm ($A_1^1 = 343$ a), 296 nm ($A_1^1 = 384$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1185, 1620, 1075, 1762, 1580, 1290 (KBr disk).

Quantification. GAS CHROMATOGRAPHY. In plasma, serum or urine: tienilic acid and metabolites, sensitivity 10 ng/ml, ECD—B. Hwang *et al.*, *J. pharm. Sci.*, 1978, 67, 1095–1098.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: tienilic acid and monohydroxy metabolite, detection limit 200 ng/ml, UV detection—A. L. M. Kerremans *et al.*, *Eur. J. clin. Pharmac.*, 1982, 22, 515–521.

Disposition in the Body. Absorbed after oral administration. It is metabolised by hydroxylation and oxidation. About 40% of a dose is excreted in the urine in 24 hours; about 20% of the dose is excreted in the urine as unchanged drug, up to 10% as [2,3-dichloro-4-(α -hydroxy-2-thienyl)phenoxy]acetic acid, about 15%

as a dihydroxylated metabolite, and 1 to 2% as (2,3-dichloro-4-carboxyphenoxy)acetic acid.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 250 mg to 8 subjects, mean peak plasma concentrations of 11 µg/ml of tienilic acid, 0.7 µg/ml of the monohydroxylated metabolite, and 0.07 µg/ml of the *p*-carboxy metabolite were attained in 3 to 4 hours (B. Hwang *et al.*, *J. pharm. Sci.*, 1978, 67, 1095–1098).

Following a single oral dose of 250 mg to 8 subjects, peak plasma concentrations of 7.7 to 27.4 µg/ml (mean 16) of tienilic acid were attained in 1 to 2 hours (A. L. M. Kerremans *et al.*, *Eur. J. clin. Pharmac.*, 1982, 22, 515–521).

HALF-LIFE. Plasma half-life, 1.5 to 4 hours.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 1.6.

PROTEIN BINDING. In plasma, about 99%.

Dose. Tienilic acid has been given in doses of 0.25 to 1 g daily.

Tigloidine

Anticholinergic

Synonym. Tiglylpseudotropine

(1*R*,3*s*,5*S*)-3-(3-Methylmethacryloyloxy)tropane

$C_{13}H_{21}NO_2 = 223.3$

CAS—495-83-0

Tigloidine was first isolated from *Duboisia myoporoides* (Solana-ceae) but is now synthesised.

A thin syrupy liquid.

Tigloidine Hydrobromide

Proprietary Name. Tiglyssin

$C_{13}H_{21}NO_2 \cdot HBr = 304.2$

CAS—22846-83-9

A white crystalline solid. M.p. 234° to 235°.

Soluble in water and chloroform.

Thin-layer Chromatography. System TA—Rf 42; system TB—Rf 39; system TC—Rf 21. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 1687.

High Pressure Liquid Chromatography. System HA—*k'* 3.6 (tailing peak).

Infra-red Spectrum. Principal peaks at wavenumbers 1700, 1266, 1136, 1036, 1156, 1073 (thin film).

Mass Spectrum. Principal peaks at *m/z* 124, 82, 83, 94, 55, 42, 67, 96.

Dose. 1 to 2 g of tigloidine hydrobromide daily.

Tilidate

Narcotic Analgesic

Synonym. Tilidine

(±)-Ethyl *trans*-2-dimethylamino-1-phenylcyclohex-3-ene-1-carboxylate

$C_{17}H_{23}NO_2 = 273.4$

CAS—20380-58-9

Tilidate Hydrochloride

Proprietary Name. Valoron

$C_{17}H_{23}NO_2 \cdot HCl \cdot \frac{1}{2}H_2O = 318.8$

CAS—27107-79-5 (anhydrous)

A white crystalline powder. M.p. 162°.

Soluble in water.

Gas Chromatography. System GA—tilidate RI 1840, bisnortilidate RI 1825, nortilidate RI 1835.

Ultraviolet Spectrum. Aqueous acid—251 nm ($A_1^1 = 6.2$ b), 257 nm ($A_1^1 = 7.6$ b), 262 nm ($A_1^1 = 6.1$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1714, 1238, 1182, 1263, 1167, 703 (tilidate hydrochloride). (See below)

Mass Spectrum. Principal peaks at *m/z* 103, 77, 82, 29, 97, 42, 51, 104; bisnortilidate 69, 68, 70, 77, 103, 56, 54, 51; nortilidate 83, 68, 82, 72, 84, 77, 103, 115.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: tilidate, nortilidate and bisnortilidate, sensitivity 1 ng/ml, AFID—H. Hengy *et al.*, *J. pharm. Sci.*, 1978, 67, 1765–1768.

Disposition in the Body. Rapidly and almost completely absorbed after oral administration. It is rapidly metabolised by *N*-demethylation to form nortilidate and bisnortilidate; these metabolites may then be conjugated with glucuronic acid. About 80% of an oral dose is excreted in the urine in 24 hours, with less than 0.1% of a dose as unchanged drug, about 1.5% as nortilidate, 2.5% as bisnortilidate, and the rest as unknown metabolites. Up to 10% may be eliminated in the faeces.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 50 mg to 1 subject, peak plasma concentrations of 0.127 µg/ml of (+)-nortilidate and 0.121 µg/ml of (–)-nortilidate were attained in about 2 hours (H. Hengy *et al.*, *Clin. Chem.*, 1978, 24, 692–697).

Dose. The equivalent of up to 400 mg of the anhydrous hydrochloride daily.

Timolol

Beta-adrenoceptor Blocking Agent

(-)-(S)-1-*tert*-Butylamino-3-(4-morpholino-1,2,5-thiadiazol-3-yloxy)propan-2-ol

$C_{13}H_{24}N_4O_3S = 316.4$

CAS—26839-75-8

Timolol Maleate

Proprietary Names. Betim; Blocadren; Temserin; Timacor; Timoptic; Timoptol. It is an ingredient of Moducen and Prestim.

$C_{13}H_{24}N_4O_3S \cdot C_4H_4O_4 = 432.5$

CAS—26921-17-5

A white crystalline powder. M.p. about 200°.

Soluble in water, ethanol, and methanol; sparingly soluble in chloroform; practically insoluble in ether.

Colour Test. Liebermann's Test (100°)—violet.

Thin-layer Chromatography. *System TA*—Rf 52; *system TB*—Rf 06; *system TC*—Rf 11.

Gas Chromatography. *System GA*—RI 2270.

High Pressure Liquid Chromatography. *System HA*— k' 1.2.

Ultraviolet Spectrum. Aqueous acid—295 nm ($A_1^1 = 279$ a). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1497, 1527, 1120, 1230, 1590, 1620 (timolol maleate, KBr disk).

Mass Spectrum. Principal peaks at m/z 30, 86, 57, 129, 74, 56, 41, 114.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: sensitivity 2 ng/ml and 20 ng/ml, respectively, ECD—D. J. Tocco *et al.*, *J. pharm. Sci.*, 1975, 64, 1879–1881.

GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In plasma or urine: sensitivity 5 ng/ml—J. B. Fourtillan *et al.*, *J. pharm. Sci.*, 1981, 70, 573–575.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: detection limit 40 ng/ml, UV detection—M. A. Lefebvre *et al.*, *J. liq. Chromat.*, 1981, 4, 483–500.

Disposition in the Body. Almost completely absorbed after oral administration; bioavailability 50 to 75%. Metabolised mainly by oxidation and hydrolytic cleavage of the morpholine ring. About 70% of a dose is excreted in the urine in 24 hours, with about 20% of the dose as unchanged drug.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 20 mg to 5 subjects, peak plasma concentrations of 0.05 to 0.11 µg/ml (mean 0.08) were attained in 0.5 to 3 hours (J. B. Fourtillan *et al.*, *Eur. J. clin. Pharmac.*, 1981, 19, 193–196).

Following daily oral administration of 15 mg three times a day to 8 subjects, maximum steady-state plasma concentrations of 0.04 to 0.23 µg/ml (mean 0.11) were reported (B. N. Singh *et al.*, *Clin. Pharmac. Ther.*, 1980, 28, 159–166).

HALF-LIFE. Plasma half-life, about 2 to 6 hours.

VOLUME OF DISTRIBUTION. 1 to 3 litres/kg.

CLEARANCE. Plasma clearance, about 5 to 10 ml/min/kg.

Dose. 10 to 60 mg of timolol maleate daily.

Tinidazole

Antiprotozoal

Proprietary Names. Fasigyn; Simplotan.

1-[2-(Ethylsulphonyl)ethyl]-2-methyl-5-nitroimidazole

$C_8H_{13}N_3O_4S = 247.3$

CAS—19387-91-8

Colourless crystals. M.p. about 127°.

Gas Chromatography. System GA—RI 2024.

Ultraviolet Spectrum. Aqueous acid—277 nm ($A_1^1 = 245$ b); methanol—230 nm ($A_1^1 = 148$ b), 311 nm ($A_1^1 = 354$ b).

Quantification. GAS CHROMATOGRAPHY. In plasma or tissues: sensitivity 100 ng/ml and 50 ng/g, respectively, AFID—H. Laufen *et al.*, *J. Chromat.*, 1979, 163; *Biomed. Appl.*, 5, 217–220.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum or urine: sensitivity 300 ng/ml and 600 ng/ml, respectively, UV detection—I. Nilsson-Ehle *et al.*, *Antimicrob. Ag. Chemother.*, 1981, 19, 754–760.

Disposition in the Body. Well absorbed after oral administration; bioavailability greater than 90%. It is excreted in the bile. About 25% of a dose is excreted in the urine unchanged in 72 hours together with small amounts of 2-hydroxymethyltinidazole and its glucuronide.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 2 g to 3 subjects, peak serum concentrations of 35.7, 35.7 and 46.3 µg/ml were attained in 2 to 3 hours; serum concentrations of 0.19, 0.24 and 0.46 µg/ml of the hydroxymethyl metabolite were reported, 6 hours after the dose (R. A. Robson *et al.*, *Clin. Pharmacokin.*, 1984, 9, 88–94).

HALF-LIFE. Plasma half-life, about 12 to 17 hours.

VOLUME OF DISTRIBUTION. About 0.7 litre/kg.

CLEARANCE. Plasma clearance, about 0.6 ml/min/kg.

PROTEIN BINDING. In plasma, about 12%.

NOTE. For a review of tinidazole see A. A. Carmine *et al.*, *Drugs*, 1982, 24, 85–117.

Dose. Usually 2 g initially, by mouth, followed by 1 g daily.

Tobramycin

Antibiotic

Synonym. Nebramycin Factor 6

Proprietary Names. Gernebcin (sulphate); Nebcin(e) (sulphate); Obracin (sulphate); Tobrex; Tobrex.

6-O-(3-Amino-3-deoxy-α-D-glucopyranosyl)-2-deoxy-4-O-(2,6-diamino-2,3,6-trideoxy-α-D-ribo-hexopyranosyl)-D-streptomine

$C_{18}H_{37}N_5O_9 = 467.5$

CAS—32986-56-4; 49842-07-1 (sulphate)

A white hygroscopic powder. A solution in water is dextrorotatory.

Soluble 1 in 1.5 of water and 1 in 2000 of ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 6.7, 8.3, 9.9.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1040, 1590, 845, 770, 660, 1260 (KBr disk).

Quantification. See also under Amikacin.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum or urine: sensitivity 200 ng/ml, fluorescence detection—D. B. Haughey *et al.*, *Antimicrob. Ag. Chemother.*, 1980, 17, 649–653.

Disposition in the Body. Poorly absorbed after oral administration, but rapidly absorbed after intramuscular injection. Up to 90% of a dose is excreted unchanged in the urine in 24 hours, most being excreted within the first 6 hours. It accumulates in the tissues and may be detected in serum and urine for several days after cessation of treatment.

THERAPEUTIC CONCENTRATION. During treatment, the serum concentration should be in the range 4 to 10 µg/ml and should be monitored regularly, especially in patients who have renal insufficiency. During multiple dosing the trough concentration immediately preceding a dose should not exceed 2 µg/ml.

After an intravenous infusion of 100 mg administered over 1 hour to 4 subjects, peak serum concentrations of 4.1 to 5.1 µg/ml (mean 4.6) were achieved at the end of the infusion. After a single intramuscular injection of 100 mg administered to 3 subjects, a mean peak serum concentration of 5.16 µg/ml was achieved after 0.3 to 0.75 hour (C. Regamey *et al.*, *Clin. Pharmac. Ther.*, 1973, 14, 396–403).

TOXICITY. Toxic effects may be produced at serum concentrations of 12 µg/ml or more or, during chronic treatment, if the trough serum concentration exceeds 2 µg/ml.

HALF-LIFE. Plasma half-life, about 2 to 3 hours, increased in renal failure; a long terminal elimination phase of about 6 days has also been reported.

VOLUME OF DISTRIBUTION. About 0.3 litre/kg.

CLEARANCE. Plasma clearance, about 1.5 ml/min/kg.

PROTEIN BINDING. In plasma, up to 10%.

Dose. Usually the equivalent of 3 to 5 mg/kg of tobramycin daily, given parenterally.

Tocainide

Anti-arrhythmic

2-Aminopropiono-2',6'-xylydide

$C_{11}H_{16}N_2O = 193.2$

CAS—41708-72-9

A white waxy solid. M.p. 53° to 55°.

Sparingly **soluble** in water; freely soluble in organic solvents.

Tocainide Hydrochloride

Proprietary Name. Tonocard

$C_{11}H_{16}N_2O \cdot HCl = 228.7$

CAS—35891-93-1

A white crystalline powder. M.p. about 245°, with decomposition.

Freely **soluble** in water and ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 7.8.

High Pressure Liquid Chromatography. *System* HA—k' 1.2.

Ultraviolet Spectrum. Aqueous acid—262 nm ($A_1^1 = 22$ a), 270 nm ($A_1^1 = 18$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1675, 1540, 765, 1128, 772, 1240 (tocainide hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 44, 121, 77, 120, 42, 106, 91, 39.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: detection limit 2 pg, ECD—G. K. Pillai *et al.*, *J. Chromat.*, 1982, 229; *Biomed. Appl.*, 18, 103–109. In plasma or serum: sensitivity 200 ng/ml, FID—S. D. Gettings *et al.*, *J. Chromat.*, 1981, 225; *Biomed. Appl.*, 14, 469–475.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 100 ng/ml, fluorescence detection—A. J. Sedman and J. Gal, *J. Chromat.*, 1982, 232; *Biomed. Appl.*, 21, 315–326.

Disposition in the Body. Almost completely absorbed after oral administration. About 20 to 50% of a dose is excreted in the urine as unchanged drug in 24 hours, and about 20 to 30% as a glucuronide conjugate, which is thought to be tocainide carbamoyl *O*-β-D-glucuronide (TOCG); an additional metabolite, lactoxylidide has also been detected in urine.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 4 to 12 µg/ml.

Following a single oral dose of 400 mg to 3 subjects, peak plasma concentrations of 1.6 to 1.8 µg/ml were attained in 0.5 to 2 hours. After oral administration of 400 mg three times a day to 4 subjects, steady-state plasma concentrations of 4.9 to 7.1 µg/ml (mean 5.9) were reported (C. Graffner *et al.*, *Clin. Pharmac. Ther.*, 1980, 27, 64–71).

HALF-LIFE. Plasma half-life, 8 to 25 hours (mean 14).

VOLUME OF DISTRIBUTION. About 1 to 3 litres/kg.

CLEARANCE. Plasma clearance, about 2 to 3 ml/min/kg.

PROTEIN BINDING. In plasma, variously reported as 10 to 50%.

NOTE. For a review of tocainide see B. Holmes *et al.*, *Drugs*, 1983, 26, 93–123.

Dose. 1.2 to 2.4 g of tocainide hydrochloride daily, by mouth.

Tofenacin

Antidepressant

Synonyms. *N*-Demethylorphenadrine; Desmethylophenadrine.

N-Methyl-2-(2-methylbenzhydryloxy)ethylamine

$C_{17}H_{21}NO = 255.4$

CAS—15301-93-6

A liquid.

Tofenacin Hydrochloride

Proprietary Name. Elamol

$C_{17}H_{21}NO \cdot HCl = 291.8$

CAS—10488-36-5

A white crystalline powder. M.p. 143° to 147°.

Soluble 1 in about 3 of water, 1 in 8 of ethanol, and 1 in 3 of chloroform; practically insoluble in ether.

Colour Tests. Liebermann's Test—red-orange; Mandelin's Test—yellow; Marquis Test—yellow; Sulphuric Acid—orange.

Thin-layer Chromatography. System TA—Rf 45; system TB—Rf 25; system TC—Rf 21. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 1920.

High Pressure Liquid Chromatography. System HA—k' 1.7.

Ultraviolet Spectrum. Ethanol—259 nm, 265 nm, 272 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1102, 704, 757, 1117, 1042, 917 (tofenacin hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 44, 59, 165, 166, 181, 179, 178, 43.

Quantification. See under Orphenadrine.

Disposition in the Body. Tofenacin is a metabolite of orphenadrine.

Dose. Up to 240 mg of tofenacin hydrochloride daily.

Tolazamide

Antidiabetic

Proprietary Names. Diabewas; Norglycin; Tolanas; Tolinas.

1-(Perhydroazepin-1-yl)-3-*p*-tolylsulphonylurea

$C_{14}H_{21}N_3O_3S = 311.4$

CAS—1156-19-0

A white crystalline powder. M.p. 161° to 169°, with decomposition.

Very slightly soluble in water; slightly soluble in ethanol; soluble in acetone; freely soluble in chloroform.

Dissociation Constant. pK_a 3.5, 5.7.

Thin-layer Chromatography. System TD—Rf 52; system TE—Rf 06; system TF—Rf 50. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. System GA—RI 1651.

Ultraviolet Spectrum. Methanol—257 nm, 263 nm ($A_1^{1\%} = 21$ a), 268 nm, 275 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1694, 1176, 884, 819, 675, 1086 (KBr disk). Polymorphism may occur.

Mass Spectrum. Principal peaks at m/z 91, 155, 114, 65, 197, 42, 41, 85.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: sensitivity 1 µg/ml, UV detection—P. G. Welling *et al.*, *J. pharm. Sci.*, 1982, 71, 1259–1263.

Disposition in the Body. Slowly absorbed after oral administration. About 85% of a dose is excreted in the urine in 5 days, mostly in the first 24 hours. Of the urinary material, about 17% is the *p*-carboxy derivative, 25% is 4-hydroxytolazamide, 10% is *p*-hydroxymethyltolazamide, 26% is *p*-toluenesulphonamide, and 7% is unchanged drug.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 500 mg to 20 subjects, a mean peak serum concentration of 27.8 µg/ml was attained in 3 hours (P. G. Welling *et al.*, *J. pharm. Sci.*, 1982, 71, 1259–1263).

HALF-LIFE. Plasma half-life, about 5 hours.

PROTEIN BINDING. In plasma, about 94%.

NOTE. For a review of the pharmacokinetics of sulphonylurea hypoglycaemic drugs see J. E. Jackson and R. Bressler, *Drugs*, 1981, 22, 211–245.

Dose. 0.1 to 1 g daily.

Tolazoline

Vasodilator

Synonym. Benzazoline

2-Benzyl-2-imidazoline

$C_{10}H_{12}N_2 = 160.2$

CAS—59-98-3

Soluble in water and chloroform.

Tolazoline Hydrochloride

Proprietary Names. Priscol; Priscoline; Zoline.

$C_{10}H_{12}N_2 \cdot HCl = 196.7$

CAS—59-97-2

A white or creamy-white crystalline powder. M.p. 172° to 176°.

Soluble 1 in 0.5 of water, 1 in 2 of ethanol, and 1 in 3 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 10.6 (20°).

Colour Tests. Aromaticity (Method 2)—colourless/orange; Liebermann's Test—orange.

Thin-layer Chromatography. System TA—Rf 13; system TB—Rf 02; system TC—Rf 02. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 1598.

High Pressure Liquid Chromatography. System HA—k' 2.1.

Ultraviolet Spectrum. Aqueous acid—257 nm ($A_1^1 = 14.7$ a), 263 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1608, 1296, 721, 1580, 690, 775 (KBr disk).

Mass Spectrum. Principal peaks at m/z 91, 159, 160, 131, 65, 92, 81, 39.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: detection limit 200 ng/ml, UV detection—V. Rovei *et al.*, *J. Chromat.*, 1982, 231; *Biomed Appl.*, 20, 210–215.

Disposition in the Body. Well absorbed after oral or parenteral administration. It is excreted in the urine, about 90% of an oral dose being eliminated unchanged in 12 hours.

THERAPEUTIC CONCENTRATION.

After a bolus intravenous injection of 2 mg/kg followed by continuous intravenous infusion to provide a maintenance dose of 2 mg/kg to 1 neonate, plasma concentrations attained a steady-state of 7 to 8 µg/ml and declined with a half-life of 5 hours at the end of the infusion (V. Rovei *et al.*, *J. Chromat.*, 1982, 231; *Biomed. Appl.*, 20, 210–215).

TOXICITY.

A 54-year-old woman found comatose after ingesting 2.5 g of tolazoline hydrochloride died about 3 hours later. Postmortem concentrations were: femoral blood 130 µg/ml, liver 102 µg/g (L. K. Turner, personal communication, 1964).

Dose. 12.5 to 200 mg of tolazoline hydrochloride daily.

Tolbutamide

Antidiabetic

Synonyms. Butamidum; Tolglybutamide.

Proprietary Names. Artosin; Chembutamide; Dolipol; Glyconon; Guabeta N; Mellitol; Mobenol; Neo-Dibetic; Novobutamide; Oramide; Orinase; Pramidex; Rastinon (tablets); Tolbutone.

1-Butyl-3-*p*-tolylsulphonylurea

$C_{12}H_{18}N_2O_3S = 270.3$

CAS—64-77-7

A white crystalline powder. M.p. 126° to 132°.

Practically **insoluble** in water; soluble 1 in 10 of ethanol and 1 in 3 of acetone; soluble in chloroform; slightly soluble in ether.

Tolbutamide Sodium

Proprietary Names. Orinase Diagnostic; Rastinon (injection).

$C_{12}H_{17}N_2NaO_3S = 292.3$

CAS—473-41-6

A white crystalline powder.

Freely **soluble** in water; soluble in ethanol and chloroform; very slightly soluble in ether.

Dissociation Constant. pK_a 5.3 (20°).

Colour Tests. Koppanyi-Zwicker Test—violet; Mercurous Nitrate—black.

Thin-layer Chromatography. System TA—Rf 76; system TD—Rf 51; system TE—Rf 12; system TF—Rf 55; system TT—Rf 98; system TU—Rf 35; system TV—Rf 04.

Gas Chromatography. System GA—RI 1683.

Ultraviolet Spectrum. Methanol—257 nm, 263 nm ($A_1^1 = 22$ a), 268 nm, 275 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1658, 1157, 1552, 668, 1090, 905 (KBr disk). Polymorphism may occur.

Mass Spectrum. Principal peaks at m/z 91, 30, 155, 108, 65, 197, 39, 107.

Quantification. See also under Chlorpropamide.

GAS CHROMATOGRAPHY. In plasma or urine: tolbutamide and two metabolites, sensitivity 1 µg/ml, ECD—S. B. Matin and M. Rowland, *Analyt. Lett. (Part B)*, 1973, 6, 865–876.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: tolbutamide and carboxytolbutamide, sensitivity 2 µg/ml for tolbutamide and 100 ng/ml for the carboxy metabolite, UV detection—G. Raghow and M. C. Meyer, *J. pharm. Sci.*, 1981, 70, 1166–1168. In plasma: sensitivity 200 ng/ml, UV detection—H. M. Hill and J. Chamberlain, *J. Chromat.*, 1978, 149, 349–358.

Disposition in the Body. Readily absorbed after oral administration. About 85% of an oral dose is excreted in the urine in 48 hours, of which about two-thirds is the 4-carboxy metabolite and about one-third is the 4-hydroxymethyl metabolite; less than 5% is excreted as unchanged drug. About 9% of a dose is eliminated in the faeces in 48 hours.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 500 mg to 1 subject, a peak plasma-tolbutamide concentration of 49 µg/ml was attained in about 4 hours and a peak plasma concentration of the 4-carboxy metabolite of about 2.2 µg/ml was attained in 6 hours (G. Raghoe and M. C. Meyer, *J. pharm. Sci.*, 1981, 70, 1166-1168).

TOXICITY. Several fatalities from hypoglycaemia have been reported.

The following postmortem tissue distribution was reported in one suicide after the ingestion of 50 g: blood 640 µg/ml, kidney 1073 µg/g, liver 930 µg/g, urine 3510 µg/ml (O. Pribilla, *Arch. Tox.*, 1968, 23, 153-159).

HALF-LIFE. Plasma half-life, usually in the range 4 to 12 hours (mean 7) but may vary up to 70 hours during concomitant administration of other drugs such as sulphonamides, phenylbutazone, or dicoumarol.

VOLUME OF DISTRIBUTION. 0.1 to 0.2 litre/kg.

CLEARANCE. Plasma clearance, about 0.3 ml/min/kg.

PROTEIN BINDING. In plasma, about 95% at concentrations up to 100 µg/ml, decreasing to about 90% at plasma concentrations of 200 µg/ml.

NOTE. For a review of sulphonylurea hypoglycaemic drugs see J. E. Jackson and R. Bressler, *Drugs*, 1981, 22, 211-245.

Dose. 0.25 to 3 g daily.

Tolfenamic Acid

Analgesic

Proprietary Name. Clotam

N-(3-Chloro-*o*-tolyl)anthranilic acid

$C_{14}H_{12}ClNO_2 = 261.7$

CAS—13710-19-5

A white crystalline powder. M.p. 210° to 214°.

Practically **insoluble** in water; soluble 1 in 70 of ethanol, 1 in 140 of chloroform, 1 in 15 of dimethylformamide, and 1 in 45 of ether.

Ultraviolet Spectrum. Dehydrated alcohol—294 nm, 330 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1670, 1270, 1590, 755, 1500, 1575 (KBr disk).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: sensitivity 20 ng/ml, UV detection—P. J. Pentikäinen *et al.*, *Eur. J. clin. Pharmac.*, 1981, 19, 359-365.

Disposition in the Body. Readily absorbed after oral administration; bioavailability about 60%. It is metabolised by hydroxylation to *N*-(2-hydroxymethyl-3-chlorophenyl)anthranilic acid and *N*-(2-methyl-3-chloro-4-hydroxyphenyl)anthranilic acid, which are the major metabolites. About 50% of an oral dose is excreted in the urine in 48 hours mainly as glucuronide conjugates of the two hydroxylated metabolites. Less than 10% of a dose is excreted in the urine as unchanged drug or its glucuronide conjugate. Tolfenamic acid and its metabolites are excreted in the bile.

THERAPEUTIC CONCENTRATION.

Following single oral doses of 100 mg and 200 mg to 6 subjects, mean peak plasma concentrations of 2.0 and 3.0 µg/ml were attained in 1.3 and 1.5 hours respectively (P. J. Pentikäinen *et al.*, *ibid.*).

HALF-LIFE. Plasma half-life, about 2.5 hours.

VOLUME OF DISTRIBUTION. About 0.5 litre/kg.

CLEARANCE. Plasma clearance about 2.5 ml/min/kg.

PROTEIN BINDING. In plasma, more than 99.5%.

Dose. Tolfenamic acid has been given in doses of 300 to 600 mg daily.

Tolmetin

(1-Methyl-5-*p*-toluoylpyrrol-2-yl)acetic acid
 $C_{15}H_{15}NO_3 = 257.3$
CAS—26171-23-3

Crystals. M.p. 155° to 157°, with decomposition.

Tolmetin Sodium

Proprietary Names. Tolectin; Tolmex.
 $C_{15}H_{14}NNaO_3 \cdot 2H_2O = 315.3$
CAS—35711-34-3 (anhydrous); 64490-92-2 (dihydrate)

Dissociation Constant. pK_a 3.5.

Colour Tests. Formaldehyde–Sulphuric Acid—brown-red; Liebermann's Test (100°)—red.

Thin-layer Chromatography. *System TD*—Rf 13; *system TE*—Rf 07; *system TF*—Rf 20; *system TG*—Rf 10. (*Ludy Tenger reagent*, black.)

Gas Chromatography. *System GD*—retention times of methyl derivative 1.77 and 1.36, relative to $n-C_{16}H_{34}$.

High Pressure Liquid Chromatography. *System HD*— k' 2.05; *system HV*—retention times 0.60 and 0.99 relative to meclofenamic acid.

Ultraviolet Spectrum. Aqueous acid—262 nm ($A_1^1 = 345$ b), 315 nm ($A_1^1 = 735$ b); aqueous alkali—260 nm ($A_1^1 = 333$ b), 323 nm ($A_1^1 = 762$ b).

Mass Spectrum. Principal peaks at m/z 212, 213, 122, 198, 44, 53, 91, 65.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 100 ng/ml, ECD—K.-T. Ng, *J. Chromat.*, 1978, 166, 527–535.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: sensitivity for tolmetin and the dicarboxylated metabolite, 40 ng/ml in plasma, UV detection—R. K. Desiraju *et al.*, *J. Chromat.*, 1982, 232; *Biomed. Appl.*, 21, 119–128.

Disposition in the Body. Rapidly and almost completely absorbed after oral administration. Metabolised mainly by oxidation to inactive metabolites. More than 90% of a dose is excreted in the urine in 24 hours, mostly in the first 8 hours. The urinary material consists mostly of free and conjugated (glucuronide) 5-(4-carboxybenzoyl)-1-methylpyrrol-2-ylacetic acid and conjugated (glucuronide) tolmetin; up to 15% is excreted in the urine as unchanged drug.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 300 mg to 5 subjects, a mean peak plasma concentration of 29.3 µg/ml of tolmetin was attained in 0.25 to 1 hour; plasma concentrations of the dicarboxylated metabolite reached a peak of about 5 µg/ml in 1.5 to 3 hours (M. L. Selley *et al.*, *Clin. Pharmac. Ther.*, 1975, 17, 599–605).

Following oral administration of 400 mg four times a day to 5 subjects for 7 days, maximum steady-state plasma concentrations of 8.3 to 78.9 µg/ml (mean 45) of tolmetin and 4.1 to 13.6 µg/ml (mean 10) of the dicarboxylated metabolite were reported about 0.75 and 1.75 hour after a dose, respectively (S. H. Dromgoole *et al.*, *Clin. Pharmac. Ther.*, 1982, 32, 371–377).

Analgesic

TOXICITY. Toxic effects are associated with plasma concentrations greater than about 60 µg/ml.

HALF-LIFE. Plasma half-life, about 6 hours.

CLEARANCE. Plasma clearance, about 1 to 2 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 1.8.

PROTEIN BINDING. In plasma, tolmetin more than 99% but displaced by salicylic acid; dicarboxylated metabolite about 70%.

NOTE. For a review of the pharmacokinetics of tolmetin see R. N. Brogden *et al.*, *Drugs*, 1978, 15, 429–450.

Dose. The equivalent of 0.6 to 1.8 g of tolmetin daily.

Tolnaftate**Antifungal**

Proprietary Names. Aftate; Sporiderm; Sporiline; Tinactin; Tinaderm; Tonoftal.

O-2-Naphthyl *m,N*-dimethylthiocarbamate
 $C_{19}H_{17}NOS = 307.4$
CAS—2398-96-1

A white to creamy-white powder. M.p. 109° to 113°. Practically **insoluble** in water; soluble 1 in 4000 of ethanol, 1 in 9 of acetone, 1 in 3 of chloroform, and 1 in 55 of ether.

Colour Tests. Mandelin's Test—brown; Marquis Test—blue-green.

Ultraviolet Spectrum. Methanol—257 nm ($A_1^1 = 708$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1211, 1170, 1156, 754, 1234, 810 (KBr disk).

Use. Topically as a 1% solution, powder, or cream.

Tolpropamine**Antihistamine**

NN-Dimethyl-3-phenyl-3-*p*-tolylpropylamine
 $C_{18}H_{23}N = 253.4$
CAS—5632-44-0

Practically **insoluble** in water; soluble in chloroform.

Tolpropamine Hydrochloride

Proprietary Name. Pragman

$C_{18}H_{23}N \cdot HCl = 289.8$
CAS—3339-11-5

A white crystalline powder. M.p. 182° to 184°.

Soluble in water and ethanol; practically insoluble in chloroform and ether.

Colour Tests. Mandelin's Test—brown; Marquis Test—red.

Thin-layer Chromatography. System *TA*—Rf 51; system *TB*—Rf 52; system *TC*—Rf 32. (Acidified iodoplatinate solution, positive.)

High Pressure Liquid Chromatography. System *HA*— k' 2.9.

Ultraviolet Spectrum. Aqueous acid—260 nm ($A_1^1 = 25$ a), 265 nm ($A_1^1 = 25$ a), 273 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 727, 776, 700, 802, 1515, 970 (tolpropamine hydrochloride, KBr disk).

Use. Topically in a concentration of 1% of the hydrochloride.

Toluene

Solvent

Synonyms. Methylbenzene; Toluol(e).

$C_6H_5 \cdot CH_3 = 92.14$

CAS—108-88-3

A colourless, mobile, highly inflammable liquid which burns with a smoky flame. Wt per ml about 0.87 g. B.p. 109° to 111°. Practically **insoluble** in water; miscible with organic solvents and glacial acetic acid.

Gas Chromatography. System *GA*—RI 756; system *GI*—retention time 24.8 min.

Mass Spectrum. Principal peaks at m/z 91, 92, 65, 39, 63, 93, 51, 89.

Quantification. GAS CHROMATOGRAPHY. In blood or breath: sensitivity 1 µg/ml, FID—J. C. Garriott *et al.*, *Clin. Toxicol.*, 1981, 18, 471–479.

GAS CHROMATOGRAPHY AND GAS CHROMATOGRAPHY–MASS SPECTROMETRY. In blood or tissues: toluene and other volatile compounds, using head-space analysis—J. A. Bellanca *et al.*, *J. analyt. Toxicol.*, 1982, 6, 238–240.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In urine: hippuric acid and *o*-cresol, detection limits hippuric acid 50 µg/ml and *o*-cresol 5 ng/ml, fluorescence and UV detection—S. H. Hansen and M. Døssing, *J. Chromat.*, 1982, 229; *Biomed. Appl.*, 18, 141–148.

Disposition in the Body. Toluene is absorbed from the gastrointestinal tract, through the skin and mucous membranes, and from the lungs. It has an affinity for lipid-rich tissues from which it is slowly released. About 80% of an inhaled dose is oxidised to benzoic acid which is conjugated with glycine to give hippuric acid and excreted in the urine. Conjugation with glucuronic acid also occurs when large amounts of toluene are absorbed. About 20% of the dose is excreted unchanged in expired air with less than 0.1% in the urine.

TOXICITY. Toluene has about the same acute toxicity as benzene but is a less serious industrial hazard. The maximum permissible atmospheric concentration of toluene is 100 ppm. Exposure to air concentrations of 10 000 to 30 000 ppm may cause unconsciousness within a few minutes. A blood concentration of more than 10 µg/ml may be lethal although higher concentrations have been found in habitual abusers.

Exposure to a concentration of 100 ppm of toluene produced a mean venous-blood concentration of about 0.39 µg/ml in 6 healthy subjects at rest and about 1.16 µg/ml in 6 subjects during light exercise, after 20 to 30 minutes. Exposure to 200 ppm for the same time, produced a mean blood concentration of about 0.55 µg/ml in 4 subjects at rest (I. Astrand *et al.*, *Work envir. Hlth*, 1972, 9, 119–130).

Seven children aged from 9 to 13 years, with an acute encephalopathy due to toluene intoxication from glue-sniffing were found to have blood-toluene concentrations of 0.8 to 7.7 µg/g (mean 2.3) (M. D. King *et al.*, *Br. med. J.*, 1981, 283, 663–665).

A boy of 13 years found dead after sniffing glue had the following postmortem concentrations of toluene in body tissues: blood 11 µg/ml, brain 44 µg/g, kidney 39 µg/g, liver 47 µg/g (W. D. Collom and C. L. Winek, *Clin. Toxicol.*, 1970, 3, 125–130).

The following postmortem tissue concentrations of toluene were reported in a 16-year-old boy found dead with a plastic bag over his head: blood 20.6 µg/ml, brain 297 µg/g, liver 89 µg/g; acetone was also detected in blood at a concentration of 3 µg/ml (S. C. Paterson and R. Sarvesvaran, *Medicine, Sci. Law*, 1983, 23, 64–66).

HALF-LIFE. Blood half-life about 7.5 hours.

Tramadol

Narcotic Analgesic

(±) - *trans* - 2 - Dimethylaminomethyl - 1 - (3 - methoxyphenyl) - cyclohexanol

$C_{16}H_{25}NO_2 = 263.4$

CAS—27203-92-5

Tramadol Hydrochloride

Proprietary Name. Tramal

$C_{16}H_{25}NO_2 \cdot HCl = 299.8$

CAS—36282-47-0

A white crystalline powder. M.p. 179° to 180°. Readily **soluble** in water.

Dissociation Constant. pK_a 8.3.

Ultraviolet Spectrum. Aqueous acid—272 nm ($A_1^1 = 70$ a), shoulder at 279 nm. No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1284, 1601, 1042, 1238, 1575, 702 (tramadol hydrochloride, KBr disk).

Disposition in the Body. Rapidly absorbed after oral or parenteral administration; bioavailability about 65%. Peak serum concentrations are achieved in about 2 hours. The main metabolic reactions are *N*- and *O*-demethylation and conjugation with glucuronic acid and sulphate. The major metabolites formed are *O*-monodesmethyltramadol, *N,O*-didesmethyltramadol and their conjugates, and *N*-monodesmethyltramadol. *O*-Monodesmethyltramadol is an active metabolite and has a greater analgesic activity than the parent drug. About 90% of an oral dose is excreted in the urine in 3 days, about 30% of the dose as unchanged drug, and the rest as metabolites. The remainder of the dose is eliminated in the faeces.

HALF-LIFE. Plasma half-life, tramadol about 6 hours, *O*-monodesmethyltramadol, about 9 hours.

VOLUME OF DISTRIBUTION. About 3 litres/kg.

CLEARANCE. Plasma clearance, about 6 ml/min/kg.

PROTEIN BINDING. In plasma, less than 5%.

Dose. Tramadol hydrochloride is given parenterally in doses of 50 to 100 mg.

Tramazoline

Sympathomimetic

2-(5,6,7,8-Tetrahydro-1-naphthylamino)-2-imidazoline

$C_{13}H_{17}N_3 = 215.3$

CAS—1082-57-1

Crystals. M.p. 142° to 143°.

Tramazoline Hydrochloride

Proprietary Names. Biciron; Rhinogutt; Rhinospray; Spray-Tish. It is an ingredient of Dexta-Rhinaspay.

$C_{13}H_{17}N_3 \cdot HCl = 251.8$

CAS—3715-90-0

A white crystalline solid. M.p. 171°.

Soluble 1 in 6 of water.

Partition Coefficient. Log *P* (chloroform/pH 7.4), −0.8.

Colour Tests. Mandelin's Test—brown; Marquis Test—red-violet.

Thin-layer Chromatography. System *TA*—Rf 0.6; system *TB*—Rf 0.4; system *TC*—Rf 0.2. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. System *GA*—RI 2440.

High Pressure Liquid Chromatography. System *HA*—*k'* 1.8.

Ultraviolet Spectrum. Aqueous acid—267 nm, 275 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1667, 1626, 1590, 1302, 797, 1289 (tramazoline hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at *m/z* 215, 214, 44, 185, 200, 216, 157, 186.

Tranlycypromine

Antidepressant (Monoamine Oxidase Inhibitor)

Synonyms. Tranilcipromina; Transamine.

(±)-*trans*-2-Phenylcyclopropylamine

$C_9H_{11}N = 133.2$

CAS—155-09-9

A liquid.

Tranlycypromine Sulphate

Proprietary Names. Parnate; Tylciprine. It is an ingredient of Parstelin.

$(C_9H_{11}N)_2 \cdot H_2SO_4 = 364.5$

CAS—13492-01-8

A white crystalline powder.

Soluble 1 in 20 to 1 in 25 of water and 1 in 2000 of ether; very slightly soluble in ethanol; practically insoluble in chloroform.

Dissociation Constant. pK_a 8.2.

Partition Coefficient. Log *P* (octanol/chloroform), 0.6.

Colour Tests. Liebermann's Test—red-orange; Mandelin's Test—green → violet; Marquis Test—red → brown.

Thin-layer Chromatography. System *TA*—Rf 54; system *TB*—Rf 33; system *TC*—Rf 33. (Dragendorff spray, positive; FPN reagent, yellow; acidified iodoplatinate solution, positive; Marquis reagent, orange-brown; ninhydrin spray, positive.)

Gas Chromatography. System *GA*—RI 1223; system *GB*—RI 1245; system *GC*—RI 1759; system *GF*—RI 1455.

High Pressure Liquid Chromatography. System *HA*—*k'* 1.0; system *HC*—*k'* 0.26.

Ultraviolet Spectrum. Aqueous acid—258 nm, 264 nm ($A_1^{1.0} = 22$), 271 nm; aqueous alkali—260 nm, 266 nm, 273 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1023, 1112, 695, 963, 1153, 743 (tranylcypromine sulphate, Nujol mull).

Mass Spectrum. Principal peaks at m/z 133, 132, 56, 115, 30, 117, 91, 77.

Quantification. GAS CHROMATOGRAPHY. In serum or urine: sensitivity 1 ng/ml, ECD—R. C. Baselt *et al.*, *J. analyt. Toxicol.*, 1977, 1, 215–217. In plasma or urine: sensitivity 2.5 ng/ml, AFID—E. Bailey and E. J. Barron, *J. Chromat.*, 1980, 183; *Biomed. Appl.*, 9, 25–31.

Disposition in the Body. Readily absorbed after oral administration and extensively metabolised. Less than 2% of a dose is excreted as unchanged drug in the urine in 24 hours; this increases to about 8% if the urine is maintained at an acid pH.

THERAPEUTIC CONCENTRATION.

A single oral dose of 30 mg administered to 2 subjects produced a peak serum concentration of about 0.04 μg/ml in 1 hour. During chronic treatment of 42 patients with 10 to 30 mg daily, serum concentrations of 0.005 to 0.01 μg/ml were found when measured 12 hours after the last dose (R. C. Baselt *et al.*, *J. analyt. Toxicol.*, 1977, 1, 215–217).

TOXICITY. Several cases of addiction to tranylcypromine have been reported.

A woman died 24 hours after taking 850 mg of tranylcypromine; the postmortem liver concentration was 0.5 μg/g and the urine concentration 3 μg/ml (G. J. Griffiths, *Medicine, Sci. Law*, 1973, 13, 93–94).

In a fatality attributed to ingestion of 850 mg of tranylcypromine, a postmortem blood concentration of 0.25 μg/ml and a liver concentration of 13 μg/g were reported (M. A. Mackell *et al.*, *Medicine, Sci. Law*, 1979, 19, 66–68).

The following postmortem tissue concentrations were reported in a fatality involving the ingestion of 300 mg of tranylcypromine: blood 3.7 μg/ml, brain 1.0 μg/g, liver 7.3 μg/g, urine 25 μg/ml; several other drugs were detected (R. C. Baselt *et al.*, *J. analyt. Toxicol.*, 1977, 1, 168–170).

HALF-LIFE. Plasma half-life, about 2 hours.

Dose. The equivalent of 10 to 30 mg of tranylcypromine daily.

Trazodone

Antidepressant

2-{3-[4-(3-Chlorophenyl)piperazin-1-yl]propyl}-1,2,4-triazolo-[4,3-*a*]pyridin-3(2*H*)-one

$C_{19}H_{22}ClN_5O = 371.9$

CAS—19794-93-5

Crystals. M.p. 96°.

Soluble 1 in 50 of ethanol and methanol; freely soluble in acetone and benzene; slightly soluble in ether.

Trazodone Hydrochloride

Proprietary Names. Desyrel; Molipaxin; Thombran; Trittico.

$C_{19}H_{22}ClN_5O \cdot HCl = 408.3$

CAS—25332-39-2

White crystals. M.p. about 225°.

Sparingly **soluble** in water, ethanol, and methanol; soluble in chloroform.

Colour Tests. Liebermann's Test—violet (transient); Mandelin's Test—grey → violet.

Thin-layer Chromatography. *System TA*—Rf 63; *system TB*—Rf 09; *system TC*—Rf 58. (Location under ultraviolet light, violet fluorescence; *Dragendorff spray*, positive; *acidified iodoplatinate solution*, positive.)

Gas Chromatography. *System GA*—RI 3250.

High Pressure Liquid Chromatography. *System HA*— k' 0.6.

Ultraviolet Spectrum. Aqueous acid—246 nm ($A_1^1 = 314$ a), 274 nm, 310 nm. No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1705, 1595, 943, 1640, 742, 1272 (trazodone hydrochloride, KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 205, 70, 231, 78, 135, 136, 42, 166.

Quantification. GAS CHROMATOGRAPHY. In plasma or brain: trazodone and 1-(3-chlorophenyl)piperazine, detection limits 50 ng/ml and 10 ng/ml, respectively, AFID—S. Caccia *et al.*, *J. Chromat.*, 1981, 210, 311–318.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 20 ng/ml, UV detection—S. I. Ankier *et al.*, *Br. J. clin. Pharmac.*, 1981, 11, 505–509.

Disposition in the Body. Rapidly and almost completely absorbed after oral administration. It is extensively metabolised by hydroxylation and oxidation. About 75% of a dose is excreted in the urine as metabolites and 15% is eliminated in the faeces, in 72 hours. Less than 1% of a dose is excreted in the urine as unchanged drug. The major urinary metabolites are a propionic acid derivative (3-oxo-1,2,4-triazolo[4,3-*a*]pyridine-2-propionic acid), *p*-hydroxytrazodone, and a dihydrodiol derivative and its glucuronide and sulphate conjugates, which account for about 35%, 20%, and 15% of the urinary material respectively; an *N*-oxide has also been identified. In plasma, the major metabolite is 1-(3-chlorophenyl)piperazine (active), but this accounts for less than 1% of a dose in the urine.

THERAPEUTIC CONCENTRATION.

After an oral dose of 50 mg to 13 subjects, peak plasma concentrations of 0.49 to 2.3 µg/ml (mean 1.1) were attained in 0.5 to 2.5 hours (S. I. Ankier *et al.*, *Br. J. clin. Pharmac.*, 1981, 11, 505–509).

Following a single oral dose of 150 mg to 4 subjects, mean peak plasma concentrations of 2.05 µg/ml of trazodone and 0.01 µg/ml of 1-(3-chlorophenyl)piperazine were reported at about 2 hours and 2 to 4 hours, respectively (S. Caccia *et al.*, *J. Pharm. Pharmac.*, 1982, 34, 605–606).

Following oral administration of 25 mg three times a day to 10 subjects, steady-state serum concentrations averaged 0.7 µg/ml on the twelfth day (B. Catanese *et al.*, *Boll. chim.-farm.*, 1978, 117, 424–427).

TOXICITY.

In a fatality in which a woman was found drowned in a bath following the ingestion of about 2 to 4 g of trazodone, the following postmortem concentrations were reported: blood 15 µg/ml, bile 45 µg/ml, liver 57 µg/g, urine 2.5 µg/ml (D. Demorest, *J. analyt. Toxicol.*, 1983, 7, 63).

HALF-LIFE. Plasma half-life, about 4 to 7 hours.

PROTEIN BINDING. In plasma, about 90%.

NOTE. For a review of the pharmacokinetics of trazodone see R. N. Brogden *et al.*, *Drugs*, 1981, 21, 401–429.

Dose. 100 to 300 mg of trazodone hydrochloride daily; maximum of 600 mg daily.

Triacetyleandomycin

Antibiotic

Synonym. Troleandomycin

Proprietary Names. Cetilmin; Isotriacin; TAO.

The triacetyl ester of oleandomycin.

$C_{41}H_{67}NO_{15}$ = 814.0

CAS—2751-09-9

A white crystalline powder. M.p. 176°, with decomposition.

Slightly **soluble** in water and ether; soluble 1 in 10 of ethanol and 1 in 1 of chloroform.

Colour Tests. Mandelin's Test—violet (slow); Marquis Test—yellow-brown.

Thin-layer Chromatography. System TA—Rf 65. (Acidified iodoplatinate solution, positive.)

Infra-red Spectrum. Principal peaks at wavenumbers 1744, 1239, 1735, 1053, 1004, 1123 (KBr disk).

Dose. The equivalent of 1 to 2 g of oleandomycin daily.

Triamcinolone

Corticosteroid

Synonyms. 9α-Fluoro-16α-hydroxyprednisolone; Fluoxiprednisolone.

Proprietary Names. Aristocort (tablets); Kenacort (tablets); Leder cort (tablets); Triamcort.

9α-Fluoro-11β,16α,17α,21-tetrahydroxypregna-1,4-diene-3,20-dione

$C_{21}H_{27}FO_6$ = 394.4

CAS—124-94-7

A white, slightly hygroscopic, crystalline powder. M.p. about 262°.

Soluble 1 in 500 of water and 1 in 240 of ethanol; slightly soluble in methanol; very slightly soluble in chloroform and ether.

Triamcinolone Acetonide

Proprietary Names. Adcortyl; Aristocort A; Aristogel; Cenocort A; Kenacort-A; Kenalog; Leder cort (cream and ointment); Tédarol (cream); Tramacin; Triaderm; Triam-A; Trimacort. It is an ingredient of Audicort, Aureocort, Nystaderm, and Silderm.

$C_{24}H_{31}FO_6$ = 434.5

CAS—76-25-5

A white or cream-coloured crystalline powder. M.p. about 277°.

Very slightly **soluble** in water; soluble 1 in 150 of ethanol, 1 in 11 of acetone, and 1 in 40 of chloroform; very soluble in dehydrated alcohol and methanol.

Triamcinolone Diacetate

Proprietary Names. Aristocort (injection and syrup); Cenocort Forte; Cino-40; Kenacort (syrup); Ledercort diacetat; Tédarol (injection and syrup); Tracilon.

$C_{25}H_{31}FO_8 = 478.5$

CAS—67-78-7

A fine, white, crystalline powder.

Practically **insoluble** in water; soluble 1 in 13 of ethanol, 1 in 80 of chloroform, and 1 in 40 of methanol; slightly soluble in ether.

Triamcinolone Hexacetonide

Synonym. Triamcinolone Acetonide 21-(3,3-Dimethylbutyrate)

Proprietary Names. Aristospan; Hexatrione; Lederspan.

$C_{30}H_{41}FO_7 = 532.6$

CAS—5611-51-8

A white to cream-coloured powder. M.p. 295° to 296°, with decomposition.

Practically **insoluble** in water; soluble in chloroform; slightly soluble in methanol.

Colour Tests. Naphthol-Sulphuric Acid—green, yellow dichroism/yellow; Sulphuric Acid—orange.

Thin-layer Chromatography. Triamcinolone: *system TP*—Rf 09; *system TQ*—Rf 00; *system TR*—Rf 00; *system TS*—Rf 00. (DPST solution.) Triamcinolone acetonide: *system TP*—Rf 32; *system TQ*—Rf 00; *system TR*—Rf 20; *system TS*—Rf 06. (DPST solution.)

Gas Chromatography. *System GA*—RI 2970 and 3107.

High Pressure Liquid Chromatography. Triamcinolone acetonide: *system HT*— k' 2.5.

Ultraviolet Spectrum. Methanol—238 nm ($A_1^1 = 390$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1663, 1057, 1618, 1609, 902, 1080 (triamcinolone acetonide, KBr disk).

Quantification. RADIOIMMUNOASSAY. In plasma: sensitivity < 12.5 ng/ml—J. C. K. Loo and N. Jordan, *Res. Commun. chem. Path. Pharmac.*, 1979, 23, 493–504.

Dose. 4 to 48 mg daily.

Triamterene

Diuretic

Proprietary Names. Dyrenium; Dytac; Jatropur; Téríam. It is an ingredient of Dyazide, Dytenzide, Dytide, Frusene, and Kalspare.

6-Phenylpteridine-2,4,7-triamine

$C_{12}H_{11}N_7 = 253.3$

CAS—396-01-0

A yellow crystalline powder. Acidified solutions give a blue fluorescence.

Soluble 1 in 1000 of water, 1 in 3000 of ethanol, 1 in 4000 of chloroform, and 1 in 30 of formic acid; very slightly soluble in acetic acid and dilute mineral acids; practically insoluble in ether.

Dissociation Constant. pK_a 6.2.

Colour Tests. Liebermann's Test—red-orange; Marquis Test—yellow.

Thin-layer Chromatography. *System TA*—Rf 51; *system TB*—Rf 01; *system TC*—Rf 08. (Location under ultraviolet light, blue fluorescence.)

Ultraviolet Spectrum. Aqueous acid—250 nm ($A_1^1 = 634$ b), 360 nm ($A_1^1 = 840$ a); aqueous alkali—232 nm, 270 nm ($A_1^1 = 555$ a); methanol—233 nm ($A_1^1 = 1570$ a), 267 nm ($A_1^1 = 580$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1574, 1610, 1584, 1536, 761, 822 (KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 253, 252, 43, 104, 254, 235, 77, 89.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: triamterene and *p*-hydroxytriamterene, detection limit 20 ng/ml, UV detection—G. J. Yakatan and J. E. Cruz, *J. pharm. Sci.*, 1981, 70, 949–951. In plasma, whole blood, or urine: triamterene and *p*-hydroxytriamterene sulphate, sensitivity, for blood, 1 ng/ml and 2 ng/ml, respectively, for urine, 40 ng/ml and 100 ng/ml, respectively, fluorescence detection—F. Sörgel *et al.*, *J. pharm. Sci.*, 1984, 73, 831–833.

Disposition in the Body. Rapidly but incompletely absorbed after oral administration and extensively metabolised; bioavailability

30 to 70%. After oral administration, about 30 to 70% of a dose is excreted in the urine, mainly as the sulphate conjugate of *p*-hydroxytriamterene, with about 5 to 10% of a dose as unchanged drug; variable amounts are excreted in the bile. *p*-Hydroxytriamterene sulphate is an active metabolite.

THERAPEUTIC CONCENTRATION.

After single oral doses of 150 to 300 mg to 7 subjects, peak plasma triamterene concentrations of 0.03 to 0.15 μg/ml (mean about 0.1) were attained in 1 to 2 hours; peak plasma concentrations of *p*-hydroxytriamterene sulphate averaged about 1 μg/ml at 2 to 4 hours; both unchanged drug and the metabolite exhibited a second peak concentration several hours later, possibly due to enterohepatic circulation (U. Gundert-Remy *et al.*, *Eur. J. clin. Pharmac.*, 1979, 16, 39–44).

Following a single oral dose of 100 mg to 6 subjects, peak plasma concentrations of 0.06 to 0.18 μg/ml (mean 0.13) of triamterene and 1.3 to 3.2 μg/ml (mean 1.8) of *p*-hydroxytriamterene sulphate were attained in about 1 to 2 hours (J. Hasegawa *et al.*, *J. Pharmacokinet. Biopharm.*, 1982, 10, 507–523).

HALF-LIFE. Plasma half-life, triamterene about 2 to 4 hours, *p*-hydroxytriamterene sulphate, about 3 hours; half-life derived from urinary excretion data, 6 to 12 hours.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, triamterene 0.97, *p*-hydroxytriamterene sulphate, 1.7.

PROTEIN BINDING. In plasma, triamterene about 45 to 70%, *p*-hydroxytriamterene sulphate about 90%.

Dose. 150 to 300 mg daily.

Triazolam

Synonym. Clorazolam

Proprietary Name. Halcion

8-Chloro-6-(2-chlorophenyl)-1-methyl-4*H*-1,2,4-triazolo[4,3-*a*]-1,4-benzodiazepine

$C_{17}H_{12}Cl_2N_4 = 343.2$

CAS—28911-01-5

Hypnotic

A white or pale yellow crystalline powder. M.p. 233° to 235°. Slightly **soluble** in water; soluble in ethanol.

Thin-layer Chromatography. System *TA*—Rf 60; system *TB*—Rf 01; system *TC*—Rf 40; system *TD*—Rf 05; system *TE*—Rf 45; system *TF*—Rf 02.

Gas Chromatography. System *GA*—RI 2965.

High Pressure Liquid Chromatography. System *HI*—*k'* 4.38; system *HK*—*k'* 1.83.

Infra-red Spectrum. Principal peaks at wavenumbers 761, 842, 1618, 1003, 1310, 827 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 313, 238, 342, 315, 75, 344, 239, 137.

Quantification. GAS CHROMATOGRAPHY. In plasma: limit of detection 250 pg/ml, ECD—D. J. Greenblatt *et al.*, *J. Chromat.*, 1981, 225; *Biomed. Appl.*, 14, 202–207.

GAS CHROMATOGRAPHY (CAPILLARY COLUMN). In plasma or urine: sensitivity 500 pg/ml, ECD—P. Coassolo *et al.*, *J. Chromat.*, 1983, 274; *Biomed. Appl.*, 25, 161–170.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: limit of detection 1 ng, UV detection—W. J. Adams *et al.*, *Analyt. Lett. (Part B)*, 1980, 13, 149–161.

RADIOIMMUNOASSAY. In serum or plasma: sensitivity 1 ng/ml—H. Ko *et al.*, *Analyt. Lett. (Part B)*, 1977, 10, 1019–1040.

Disposition in the Body. Rapidly and almost completely absorbed after oral administration. It is metabolised mainly by hydroxylation. The major metabolite, 1-hydroxymethyltriazolam, has a hypnotic potency approximately equivalent to that of triazolam. Other metabolites include 4-hydroxytriazolam, 1-hydroxymethyl-4-hydroxytriazolam, and three dichlorotriazolylbenzophenone derivatives. About 80% of a dose is excreted in the urine in 48 hours and about 7% is eliminated in the faeces in 72 hours.

THERAPEUTIC CONCENTRATION.

Following oral administration of 0.88 mg of ^{14}C -labelled triazolam to 6 subjects, peak plasma concentrations of 0.006 to 0.017 $\mu\text{g}/\text{ml}$ (mean 0.009) of triazolam were attained in 0.75 to 3 hours; peak plasma concentrations of the glucuronide conjugates of the 1-hydroxymethyl and 4-hydroxy metabolites of 0.003 to 0.010 $\mu\text{g}/\text{ml}$ (mean 0.006) and 0.002 to 0.009 $\mu\text{g}/\text{ml}$ (mean 0.006) were attained in 0.75 to 2.5 hours and 1.5 to 5 hours respectively (F. S. Eberts *et al.*, *Clin. Pharmac. Ther.*, 1981, 29, 81–93).

HALF-LIFE. Plasma half-life, triazolam 1.5 to 3 hours, 1-hydroxymethyltriazolam about 4 hours.

VOLUME OF DISTRIBUTION. About 1 to 2 litres/kg.

CLEARANCE. Plasma clearance, about 10 ml/min/kg.

PROTEIN BINDING. In plasma, about 78%.

NOTE. For a review of the pharmacokinetics of triazolam see G. E. Pakes *et al.*, *Drugs*, 1981, 22, 81–110.

Dose. 125 to 250 μg , as a hypnotic.

Trichlormethiazide*Diuretic*

Proprietary Names. Esmarin; Fluitran; Metahydrin; Naqua. It is an ingredient of Metatensin and Naquival.

6-Chloro-3-dichloromethyl-3,4-dihydro-2H-1,2,4-benzothiadiazine-7-sulphonamide 1,1-dioxide

$\text{C}_8\text{H}_8\text{Cl}_3\text{N}_3\text{O}_4\text{S}_2 = 380.6$

CAS—133-67-5

A white crystalline powder. M.p. about 274°, with decomposition.

Very slightly **soluble** in water, chloroform, and ether; soluble 1 in 48 of ethanol, 1 in about 9 of dioxan, and 1 in about 5 of dimethylformamide; freely soluble in acetone.

Dissociation Constant. pK_a 8.6.

Colour Test. Sulphuric Acid—yellow.

Thin-layer Chromatography. *System TA*—Rf 80; *system TD*—Rf 15; *system TE*—Rf 14; *system TF*—Rf 60. (Acidified potassium permanganate solution, positive.)

High Pressure Liquid Chromatography. *System HN*— k' 3.10.

Infra-red Spectrum. Principal peaks at wavenumbers 1158, 1177, 1597, 772, 1073, 1509 (KBr disk).

Mass Spectrum. Principal peaks at m/z 296, 298, 279, 205, 36, 64, 117, 62.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: sensitivity 10 ng/ml for plasma, UV detection—M. C. Meyer and P. T. R. Hwang, *J. Chromat.*, 1981, 223; *Biomed. Appl.*, 12, 466–472.

Disposition in the Body. Readily absorbed after oral administration. About 70% of a dose is excreted in the urine unchanged in 48 hours, mostly in the first 8 hours.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 4 mg to 7 subjects, peak plasma concentrations of 0.027 to 0.067 $\mu\text{g}/\text{ml}$ (mean 0.04) were attained in 1 to 3.5 hours (mean 2) (I. S. Sketris *et al.*, *Eur. J. clin. Pharmac.*, 1981, 20, 453–457).

HALF-LIFE. Plasma half-life, about 1 to 4 hours (mean 2), increased in renal impairment.

Dose. Usually 2 to 4 mg daily; initial doses of 4 to 8 mg daily may be given.

Trichloroethane*Solvent*

Synonyms. Methylchloroform; α -Trichloroethane.

Proprietary Name. Genklene

1,1,1-Trichloroethane

$\text{CCl}_3 \cdot \text{CH}_3 = 133.4$

CAS—71-55-6

A colourless non-inflammable liquid. F.p. -32.5° to -32.7° . B.p. 71° to 81° .

Practically **insoluble** in water; soluble in organic solvents.

Colour Test. Fujiwara Test—red.

Gas Chromatography. *System GA*—RI 634; *system GI*—retention time 8.2 min.

Mass Spectrum. Principal peaks at m/z 97, 99, 61, 117, 119, 63, 101, 62.

Quantification. GAS CHROMATOGRAPHY. In blood, bile or tissues: using head space analysis and FID—Y. H. Caplan *et al.*, *Clin. Toxicol.*, 1976, 9, 69–74.

Disposition in the Body. Rapidly absorbed from the gastrointestinal tract and the lungs; poorly absorbed through the skin. It is metabolised by oxidation and conjugation; only a small proportion of an absorbed dose is excreted in the urine as trichloroethanol glucuronide (urochloralic acid) and trichloroacetic acid. About 60 to 80% of a dose is excreted unchanged in expired air in one week.

TOXICITY. The estimated minimum lethal dose by ingestion or inhalation is 5 ml and the maximum permissible atmospheric concentration is 350 ppm. Exposure to air concentrations of more than 5000 ppm may cause unconsciousness within a short time. Fatalities have been associated with blood concentrations greater than 15 $\mu\text{g}/\text{ml}$.

During exposure to a concentration of 250 ppm trichloroethane for 30 minutes, mean blood concentrations of 1.4 $\mu\text{g}/\text{g}$ were reported in 12 subjects at rest, and 3.1 $\mu\text{g}/\text{g}$ in 9 subjects who performed light exercise. During exposure to 350 ppm for the same time, a mean blood concentration of 3 $\mu\text{g}/\text{g}$ was produced in 5 subjects at rest (I. Astrand *et al.*, *Scand. J. Work Envir. & Hlth*, 1973, 10, 69–81).

A woman of 40 years was found dead after exposure to trichloroethane vapour; the following postmortem concentrations were reported: blood 20 µg/ml, bile < 10 µg/ml, brain 360 µg/ml, kidney 120 µg/ml, liver 50 µg/ml, and lung 10 µg/ml (Y. H. Caplan *et al.*, *Clin. Toxicol.*, 1976, 9, 69–74). The following postmortem tissue concentrations were reported in a fatality involving the accidental inhalation of trichloroethane: blood 18 µg/ml, brain 80 µg/g, liver 80 µg/g, lungs 31 µg/g, urine 0.9 µg/ml (A. Franc, *Bull. int. Ass. forens. Toxicol.*, 1983, 17(2), 22–25).

HALF-LIFE. Blood half-life, about 10 to 12 hours.

Trichloroethanol

Hypnotic

Synonym. 2,2,2-Trichloroethyl Alcohol

2,2,2-Trichloroethanol

$\text{CCl}_3 \cdot \text{CH}_2\text{OH} = 149.4$

CAS—115-20-8

A hygroscopic liquid or crystals. M.p. 18°. B.p. 151° to 153°.

Soluble 1 in about 12 of water; miscible with ethanol and ether.

Colour Test. Fujiwara Test—yellow.

Gas Chromatography. *System GA*—RI 857; *system GI*—retention time 25.5 min.

Mass Spectrum. Principal peaks at *m/z* 31, 49, 77, 113, 115, 82, 51, 117.

Quantification. See under Chloral Hydrate.

Disposition in the Body. Trichloroethanol is a metabolite of chloral hydrate, trichloroethane, trichloroethylene, and triclofos; it has hypnotic activity. It is further metabolised by conjugation with glucuronic acid to form urochlorallic acid and by oxidation to trichloroacetic acid.

TOXICITY. See under Chloral Hydrate.

HALF-LIFE. Plasma half-life, about 8 hours.

VOLUME OF DISTRIBUTION. About 0.6 litre/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 0.9.

PROTEIN BINDING. In plasma, about 35%.

Trichloroethylene

General Anaesthetic/Solvent

Synonym. Trichlorethylene

Proprietary Names. Triklone (solvent); Trilene.

$\text{CHCl}:\text{CCl}_2 = 131.4$

CAS—79-01-6

A clear, colourless or pale blue, mobile, non-inflammable liquid. It decomposes in light in the presence of air with the formation of hydrochloric acid. Relative density 1.464 to 1.470. B.p. 85° to 88°.

Trichloroethylene (*B.P.*) contains thymol 0.01% w/w as a preservative and may contain not more than 0.001% w/w of a suitable blue colouring matter to distinguish it from chloroform. Practically **insoluble** in water; miscible with dehydrated alcohol, chloroform, and ether.

Colour Test. Fujiwara Test—red.

Gas Chromatography. *System GA*—RI 710; *system GI*—retention time 14.8 min.

Mass Spectrum. Principal peaks at *m/z* 95, 130, 132, 60, 97, 35, 134, 47; trichloroacetic acid 44, 83, 85, 36, 28, —, —, —.

Quantification. **GAS CHROMATOGRAPHY.** In blood: using headspace analysis, FID—F. N. Prior, *Anaesthesia*, 1972, 27, 379–389. In blood or urine: trichloroethanol and trichloroacetic acid, using headspace analysis, detection limit 500 ng/ml for trichlo-

roethanol, ECD—D. D. Breimer *et al.*, *J. Chromat.*, 1974, 88, 55–63.

Disposition in the Body. Rapidly absorbed from the lungs; about 50 to 65% of an inhaled dose is retained. Absorbed from the gastro-intestinal tract and through the skin. It is highly soluble in lipid-rich tissues, from which it is slowly released. Chloral hydrate is a transient metabolite which is further metabolised by reduction to trichloroethanol and oxidation to trichloroacetic acid. Trichloroethanol is mainly excreted as its glucuronide conjugate (urochlorallic acid). Monochloroacetic acid is a minor metabolite. About 45% of an absorbed dose is excreted as urochlorallic acid and about 30% as trichloroacetic acid in the urine in 3 weeks; small amounts are eliminated in the faeces. About 16% is excreted unchanged in expired air.

THERAPEUTIC CONCENTRATION. In blood, for anaesthesia, usually in the range 26 to 82 µg/ml.

During anaesthesia, exposure to an induction level of 1% of trichloroethylene for 30 minutes to 20 patients, produced blood concentrations of 34 to 90 µg/ml (mean 65) (F. N. Prior, *Anaesthesia*, 1972, 27, 379–389).

TOXICITY. The estimated minimum lethal dose by ingestion or inhalation is 5 ml and the maximum permissible atmospheric concentration is 100 ppm.

Exposure of 5 subjects to a concentration of 100 ppm of trichloroethylene for 6 hours produced mean peak blood concentrations of about 1 µg/ml of trichloroethylene 2 hours after the start of exposure, and about 6 µg/ml of trichloroethanol at the end of the exposure period (G. Müller *et al.*, *Arch. Tox.*, 1974, 32, 283–295).

A man of 56 years was found dead after exposure to trichloroethylene fumes. The following postmortem concentrations of trichloroethylene were reported: blood about 90 µg/ml, brain about 270 µg/g, lung about 40 µg/g (A. Alha *et al.*, *Bull. int. Ass. forens. Toxicol.*, 1974, 10(1), 14–15).

In 19 cases of fatal trichloroethylene poisoning, the following postmortem concentrations were reported: blood 1 to 41 µg/ml (mean 14, 15 cases), brain 4 to 74 µg/g (mean 31, 5 cases), kidney 4 to 140 µg/g (mean 30, 8 cases), liver 1 to 250 µg/g (mean 64, 9 cases), lung 1 to 15 µg/g (mean 7, 6 cases), urine a trace to 91 µg/ml (mean 35, 5 cases) (R. Bonnichsen and A. C. Maehly, *J. forens. Sci.*, 1966, 11, 414–427).

HALF-LIFE. About 30 to 38 hours.

Dose. To produce light anaesthesia, 0.5 to 2% of the vapour by inhalation.

Trichlorofluoromethane

Aerosol Propellant/Refrigerant

Synonyms. Fluorotrichloromethane; Propellant 11; Refrigerant 11; Trichloromonofluoromethane.

Proprietary Names. It is an ingredient of PR Spray and Skefron.

$\text{CCl}_3\text{F} = 137.4$

CAS—75-69-4

A clear, colourless, non-inflammable volatile liquid. B.p. about 24°.

In the liquid state it is practically **immiscible** with water but miscible with dehydrated alcohol.

Gas Chromatography. *System GA*—RI 484; *system GI*—retention time 3.0 min.

Mass Spectrum. Principal peaks at *m/z* 101, 103, 105, 66, 47, 35, 31, 82.

Trichlorophenoxyacetic Acid

Herbicide

Synonym. 2,4,5-T

Proprietary Names. Boots Nettle Killer; Marks Brushwood Killer; Phortox; Silvapron T; Trioxone 50. It is an ingredient of Econal, Nettle Ban, Spontox, and Stancide BWK 75.

2,4,5-Trichlorophenoxyacetic acid
 $C_8H_5Cl_3O_3 = 255.5$
 CAS—93-76-5; 35915-18-5

A white crystalline solid. M.p. 154° to 155° .
 Very slightly **soluble** in water; soluble in ethanol, acetone, and ether.

Colour Test. Liebermann's Test—pink (\rightarrow brown).

Gas Chromatography. Trichlorophenoxyacetic acid methyl ester: *system GA*—RI 1740; *system GK*—retention time 0.80 relative to caffeine. Trichlorophenoxyacetic acid iso-octyl ester: *system GK*—retention times 1.24 and 1.31, relative to caffeine.

Mass Spectrum. Principal peaks at m/z 233, 45, 42, 59, 179, 146, 109, 235 (methyl ester); 43, 57, 41, 55, 71, 69, 56, 70 (iso-octyl ester).

Triclocarban

Disinfectant

Synonym. 3,4,4'-Trichlorocarbanilide

Proprietary Names. Cutisan; Nobacter; Septivon-Lavril; Solubacter; TCC.

1-(4-Chlorophenyl)-3-(3,4-dichlorophenyl)urea

$C_{13}H_9Cl_3N_2O = 315.6$

CAS—101-20-2

A fine white powder. M.p. 250° to 256° .

Practically **insoluble** in water; soluble 1 in 25 of acetone and 1 in 100 of propylene glycol.

Thin-layer Chromatography. *System TD*—Rf 60; *system TE*—Rf 75; *system TF*—Rf 59.

Ultraviolet Spectrum. Ethanol—265 nm ($A_1^1 = 1391$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1634, 1587, 1550, 820, 1089, 1232 (KBr disk).

Mass Spectrum. Principal peaks at m/z 127, 161, 163, 153, 129, 187, 90, 189.

Quantification. GAS CHROMATOGRAPHY. In blood: sensitivity 12.5 ng/ml, ECD—D. R. Hoar and M. H. Bowen, *J. pharm. Sci.*, 1977, 66, 725–726.

Use. In concentrations of 1 to 2%.

Triclofos Sodium

Hypnotic

Proprietary Name. Triclos

Sodium hydrogen 2,2,2-trichloroethyl phosphate

$C_2H_3Cl_3NaO_4P = 251.4$

CAS—306-52-5 (triclofos); 7246-20-0 (sodium salt)

A white hygroscopic powder.

Soluble 1 in 2 of water and 1 in 250 of ethanol; practically insoluble in ether.

Colour Test. Phosphorus Test—yellow precipitate.

Infra-red Spectrum. Principal peaks at wavenumbers 1107, 1227, 926, 1124, 709, 876 (triclofos sodium, Nujol mull).

Mass Spectrum. Principal peaks at m/z 31, 49, 77, 29, 113, 51, 48, 115, no peaks above 120 (triclofos); trichloroacetic acid 44, 83, 85, 36, 28, —, —, —; trichloroethanol 31, 49, 77, 113, 115, 82, 51, 117.

Quantification. Determination of trichloroethanol—see under Chloral Hydrate.

Disposition in the Body. Rapidly hydrolysed in the stomach to trichloroethanol which is readily absorbed. Trichloroethanol, the active metabolite, is conjugated with glucuronic acid to give urochloralic acid, and oxidised to trichloroacetic acid. About 12% of a dose is excreted in the urine in 24 hours as metabolites.

THERAPEUTIC CONCENTRATION. In plasma, trichloroethanol, usually in the range 1.5 to 15 µg/ml.

After an oral dose of 22 mg/kg given to 7 subjects, peak plasma concentrations of trichloroethanol and urochloral acid of about 8 µg/ml and 2 µg/ml, respectively, were reported; no unchanged triclosan was detectable in plasma (E. M. Sellers *et al.*, *Clin. Pharmac. Ther.*, 1973, 14, 147).

TOXICITY. Plasma concentrations greater than 40 µg/ml of trichloroethanol are likely to produce toxic effects, and concentrations greater than 100 µg/ml may be fatal.

The following postmortem tissue concentrations of trichloroethanol were reported in a fatality due to triclosan ingestion: blood 335 µg/ml, bile 696 µg/ml, brain 326 µg/g, kidney 928 µg/g, liver 690 µg/g, urine 195 µg/ml; other drugs were also detected (D. J. Doedens and J. A. Benz, *Bull. int. Ass. forens. Toxicol.*, 1976, 12(2), 10-11).

HALF-LIFE. Plasma half-life, trichloroethanol about 8 hours, urochloral acid about 7 hours, trichloroacetic acid about 4 days.

VOLUME OF DISTRIBUTION. Trichloroethanol, about 0.6 litre/kg.

DISTRIBUTION IN BLOOD. Plasma:whole blood ratio, trichloroethanol about 0.9.

PROTEIN BINDING. In plasma, trichloroethanol about 35% and trichloroacetic acid about 94%.

Dose. 1 to 2 g, as a hypnotic.

Triclosan

Disinfectant

Synonym. Cloxifenol

Proprietary Names. Adasept; Gamophen (antiseptic soap); Irgasan DP300; Ster-Zac (bath concentrate); Tersaseptic; Zalclense. It is an ingredient of Manusept.

5-Chloro-2-(2,4-dichlorophenoxy)phenol

$C_{12}H_7Cl_3O_2 = 289.5$

CAS—3380-34-5

A white crystalline powder or soft agglomerates. M.p. 55° to 57°.

Practically **insoluble** in water; very soluble in most organic solvents.

Ultraviolet Spectrum. Ethanol—283 nm ($A_1^1 = 179$ b); alkaline ethanol—295 nm.

Mass Spectrum. Principal peaks at m/z 288, 290, 218, 146, 114, 63, 51, 148.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: sensitivity 2 ng/ml, ECD—A. Sioufi *et al.*, *J. pharm. Sci.*, 1977, 66, 1166-1168.

Use. In concentrations of 0.05 to 2%.

Tricyclamol Chloride

Anticholinergic

1-(3-Cyclohexyl-3-hydroxy-3-phenylpropyl)-1-methylpyrrolidinium chloride

$C_{20}H_{32}ClNO = 337.9$

CAS—3818-88-0

A white crystalline powder. M.p. 165° to 168°.

Soluble 1 in 3 of water, 1 in 3 of ethanol, and 1 in 25 of chloroform; practically insoluble in ether.

Colour Tests. Mandelin's Test—grey-violet; Marquis Test—violet.

Thin-layer Chromatography. System TA—Rf 06. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—251 nm, 257 nm ($A_1^1 = 5.7$ a), 263 nm. No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 705, 920, 1115, 772, 1045, 1061 (KBr disk).

Dose. Tricyclamol chloride has been given in doses of 50 to 100 mg.

Tridihexethyl Chloride

Anticholinergic

Proprietary Names. Pathilon. It is an ingredient of Milpath.

(3 - Cyclohexyl - 3 - hydroxy - 3 - phenylpropyl)triethylammonium chloride

$C_{21}H_{36}ClNO = 354.0$

CAS—60-49-1 (tridihexethyl); 4310-35-4 (chloride)

A white crystalline powder. M.p. 196° to 202°.

Soluble 1 in 3 of water, 1 in 3 of ethanol, and 1 in 2 of chloroform; practically insoluble in ether.

Colour Tests. Mandelin's Test—violet; Marquis Test—brown-violet.

Thin-layer Chromatography. System TA—Rf 07. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—251 nm, 257 nm, 263 nm. No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 717, 1492, 710, 769, 1162, 729 (KBr disk).

Mass Spectrum. Principal peaks at m/z 86, 58, 88, 105, 206, 87, 55, 77.

Dose. 75 to 300 mg daily.

Trifluomeprazine

Tranquilliser (Veterinary)

Synonym. Triflutrimeprazine

2, *N,N* - Trimethyl - 3 - (2 - trifluoromethylphenothiazin - 10 - yl) - propylamine

$C_{19}H_{21}F_3N_2S = 366.4$

CAS—2622-37-9

Trifluomeprazine Maleate

$C_{19}H_{21}F_3N_2S.C_4H_4O_4 = 482.5$

A white crystalline powder. M.p. about 178°.

Very slightly **soluble** in water; soluble 1 in 25 of ethanol and 1 in 25 of chloroform; practically insoluble in ether.

Colour Tests. Mandelin's Test—green → red-violet; Marquis Test—red-violet; Sulphuric Acid—red-violet.

Thin-layer Chromatography. System TA—Rf 65; system TB—Rf 60; system TC—Rf 58. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2250.

Ultraviolet Spectrum. Aqueous acid—255 nm ($A_1^1 = 803$ a), 305 nm, less well-defined.

Mass Spectrum. Principal peaks at m/z 58, 366, 59, 100, 266, 248, 84, 44.

Trifluoperazine

Tranquilliser

10-[3-(4-Methylpiperazin-1-yl)propyl]-2-trifluoromethylphenothiazine

$C_{21}H_{24}F_3N_3S = 407.5$

CAS—117-89-5

**Trifluoperazine Hydrochloride**

Synonym. Triphthazinum

Proprietary Names. Calmazine; Clinazine; Jatroneural; Modalina; Novoflurazine; Pentazine; Solazine; Stelazine; Terfluzin(e); Triflurin; Tripazine. It is an ingredient of Expansyl, Parstelin, and Stelabid.

$C_{21}H_{24}F_3N_3S \cdot 2HCl = 480.4$

CAS—440-17-5

A white to pale yellow, hygroscopic, crystalline powder. M.p. 242° , with decomposition.

Soluble 1 in 2 of water, 1 in 11 of ethanol, and 1 in 100 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 8.1 (24°).

Partition Coefficient. Log P (octanol/pH 7.0), 3.9.

Colour Tests. Formaldehyde-Sulphuric Acid—pink; Forrest Reagent—orange; FPN Reagent—orange; Liebermann's Test—red; Mandelin's Test—red-brown; Marquis Test—red-violet.

Thin-layer Chromatography. *System TA*—Rf 53; *system TB*—Rf 33; *system TC*—Rf 30. (*Dragendorff spray*, positive; *FPN reagent*, pink; *acidified iodoplatinate solution*, positive; *Marquis reagent*, pink.)

Gas Chromatography. *System GA*—RI 2683; *system GF*—RI 3050.

High Pressure Liquid Chromatography. *System HA*— k' 3.0.

Ultraviolet Spectrum. Aqueous acid—256 nm ($A_1' = 743$ a), 305 nm; aqueous alkali—258 nm, 308 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1114, 1316, 1145, 1081, 755, 1255 (trifluoperazine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 113, 70, 407, 43, 141, 42, 127, 71.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 200 pg/ml, AFID—J. I. Javaid *et al.*, *J. pharm. Sci.*, 1982, 71, 63–66.

RADIOIMMUNOASSAY. In plasma: sensitivity 250 pg/ml—K. K. Midha *et al.*, *Br. J. clin. Pharmacol.*, 1981, 12, 189–193.

Wavelength

Disposition in the Body. Absorbed after oral administration. About 1% of a daily dose is excreted in the 24-hour urine as unchanged drug and up to 6% of a dose as the sulphoxide. Metabolism to 7-hydroxytrifluoperazine and desmethyltrifluoperazine has been reported.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 20 mg to 4 subjects, peak plasma concentrations of 0.001 to 0.004 $\mu\text{g/ml}$ (mean 0.002) were attained in 3 to 6 hours (T. J. Gillespie and I. Sipes, *J. Chromat.*, 1981, 223; *Biomed. Appl.*, 12, 95–102).

Following daily oral doses of 80 mg to 1 subject, a peak plasma concentration of 0.028 $\mu\text{g/ml}$ was reported 8 hours after a dose (S. H. Curry *et al.*, *Lancet*, 1981, *i*, 395–396).

TOXICITY.

Postmortem blood and liver concentrations of 0.06 $\mu\text{g/ml}$ and 0.31 $\mu\text{g/g}$ respectively were reported in a woman who died of suspected trifluoperazine overdose whilst receiving daily oral doses of 40 mg (E. Street, per R. C. Baselt, *Disposition of Toxic Drugs and Chemicals in Man*, 2nd Edn, Davis, California, Biomedical Publications, 1982, pp. 759–760).

The following postmortem concentrations were reported in a fatality attributed to trifluoperazine ingestion: blood 0.4 $\mu\text{g/ml}$, kidney 83 $\mu\text{g/g}$, liver 198 $\mu\text{g/g}$; 7-hydroxytrifluoperazine, kidney 61 $\mu\text{g/g}$, liver 161 $\mu\text{g/g}$; desmethyltrifluoperazine, kidney 89 $\mu\text{g/g}$, liver 205 $\mu\text{g/g}$ (I. Quai *et al.*, *J. analyt. Toxicol.*, 1985, 9, 43–44).

HALF-LIFE. Plasma half-life, 7 to 18 hours (mean 12).

Dose. For psychoses, the equivalent of 10 to 20 mg of trifluoperazine daily; more than 40 mg daily has been given.

Trifluoperidol

Tranquilliser

Synonym. Flumoperone

4' - Fluoro - 4 - [4 - hydroxy - 4 - (3 - trifluoromethylphenyl)-piperidino]butyrophenone

$C_{22}H_{23}F_4NO_2 = 409.4$

CAS—749-13-3

A white crystalline powder. M.p. 93° to 95° .

Trifluoperidol Hydrochloride

Proprietary Names. Psicoperidol; Triperidol.

$C_{22}H_{23}F_4NO_2 \cdot HCl = 445.9$

CAS—2062-77-3

A white, amorphous or crystalline, flocculent powder which is stable in air but darkens slowly on exposure to light. M.p. about 205°.

Slightly **soluble** in water and chloroform; soluble in ethanol; practically insoluble in ether; freely soluble in methanol.

Thin-layer Chromatography. *System TA*—Rf 73; *system TD*—Rf 02; *system TE*—Rf 80; *system TF*—Rf 05. (Acidified iodoplatinate solution, positive.)

High Pressure Liquid Chromatography. *System HA*— k' 1.2.

Ultraviolet Spectrum. Aqueous acid—248 nm ($A_1^1 = 308$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1317, 1150, 1665, 1170, 1110, 1595 (trifluoperidol hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 42, 271, 258, 123, 56, 83, 240, 95.

Quantification. GAS CHROMATOGRAPHY. In plasma or tissues: ECD—F. Marcucci *et al.*, *J. Chromat.*, 1971, 59, 174–177.

Dose. Initially the equivalent of 500 µg of trifluoperidol daily, increased to a maximum dose of 8 mg daily.

Trilostane

Adrenocortical Suppressant

Proprietary Name. Modrenal

4 α ,5 α -Epoxy-17 β -hydroxy-3-oxoandrostane-2 α -carbonitrile

$C_{20}H_{27}NO_3 = 329.4$

CAS—13647-35-3

A white powder. M.p. not less than 260°, with some decomposition.

Practically **insoluble** in water, chloroform, and ether; slightly soluble in a mixture of equal parts of chloroform and methanol.

Thin-layer Chromatography. *System TA*—Rf 88; *system TB*—Rf 00; *system TC*—Rf 18; *system TD*—Rf 30; *system TE*—Rf 07; *system TF*—Rf 45. (Marquis reagent, red; mercuric chloride-diphenylcarbazone reagent, violet, fades to pink; acidified potassium permanganate solution, positive.)

Gas Chromatography. *System GA*—RI 3075, decomposition occurs.

Ultraviolet Spectrum. Aqueous alkali—281 nm; ethanol—253 nm ($A_1^1 = 234$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1665, 1060, 1050, 1320, 1205, 1180 (KBr disk).

Mass Spectrum. Principal peaks at m/z 41, 147, 79, 93, 55, 105, 67, 91.

Dose. 120 to 480 mg daily.

Trimeperidine

Narcotic Analgesic

Synonym. Promedolum

1,2,5-Trimethyl-4-phenyl-4-piperidyl propionate

$C_{17}H_{25}NO_2 = 275.4$

CAS—64-39-1

Trimeperidine Hydrochloride

$C_{17}H_{25}NO_2 \cdot HCl = 311.9$

CAS—125-80-4

A white crystalline powder.

Freely soluble in water and chloroform; soluble in ethanol; practically insoluble in ether.

Colour Test. Marquis Test—red-violet.

Thin-layer Chromatography. *System TA*—Rf 58; *system TB*—Rf 41; *system TC*—Rf 41. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, red-violet.)

Gas Chromatography. *System GA*—RI 1652, 1737, 1808, and 1851.

High Pressure Liquid Chromatography. *System HA*— k' 2.1.

Ultraviolet Spectrum. Aqueous acid—251 nm, 257 nm ($A_1^1 = 7.6$ b), 263 nm. No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1738, 1181, 1141, 1162, 1195, 1077 (KBr disk).

Mass Spectrum. Principal peaks at m/z 186, 42, 201, 56, 57, 187, 202, 71.

Dose. Trimeperidine hydrochloride has been given in doses of up to 200 mg daily.

Trimeprazine

Antihistamine/Sedative

Synonym. Alimemazine

NN-Dimethyl-2-methyl-3-(phenothiazin-10-yl)propylamine

$C_{18}H_{22}N_2S = 298.4$

CAS—84-96-8

Crystals. M.p. 68°.

Trimeprazine Tartrate

Proprietary Names. Panectyl; Repeltin; Temaril; Theralene; Vallergran. It is an ingredient of Valledrine and Vallex.

$(C_{18}H_{22}N_2S)_2 \cdot C_4H_6O_6 = 747.0$

CAS—4330-99-8

A white or slightly cream-coloured crystalline powder which darkens in colour on exposure to light. M.p. 159° to 163°.

Soluble 1 in 4 of water, 1 in 30 of ethanol, and 1 in 5 of chloroform; very slightly soluble in ether.

Partition Coefficient. Log *P* (octanol/pH 7.4), 2.9.

Colour Tests. Formaldehyde-Sulphuric Acid—red-violet; Forest Reagent—brown-red; FPN Reagent—brown-red; Mandelin's Test—violet; Marquis Test—violet.

Thin-layer Chromatography. *System TA*—Rf 58; *system TB*—Rf 55; *system TC*—Rf 39. (Dragendorff spray, positive; FPN reagent, pink; acidified iodoplatinate solution, positive; Marquis reagent, pink; ninhydrin spray, positive.)

Gas Chromatography. *System GA*—RI 2309; *system GC*—RI 2646; *system GF*—RI 2715.

High Pressure Liquid Chromatography. *System HA*— k' 3.1.

Ultraviolet Spectrum. Aqueous acid—251 nm ($A_1^1 = 926$ a), 300 nm; aqueous alkali—256 nm, 310 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 748, 1248, 1260, 1305, 1590, 1275 (trimeprazine tartrate, KBr disk).

Mass Spectrum. Principal peaks at m/z 58, 298, 212, 198, 100, 299, 252, 199.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: detection limit 100 pg/ml, electrochemical detection—J. E. Holt *et al.*, *Br. J. clin. Pharmac.*, 1983, 15, 604P–605P.

Disposition in the Body. Readily absorbed after oral administration and widely distributed throughout the body. About 70% of an oral dose is excreted in the urine in 48 hours mostly as sulfoxides and glucuronides.

THERAPEUTIC CONCENTRATION.

Following single oral doses of 5 mg to 2 subjects, peak plasma concentrations of 0.0008 and 0.0018 µg/ml were reported at 4 hours (G. McKay *et al.*, *J. Chromat.*, 1982, 233; *Biomed. Appl.*, 22, 417–422).

Dose. Usually 10 to 40 mg of trimeprazine tartrate daily; up to 100 mg daily has been given.

Trimetaphan Camsylate

Antihypertensive

Synonyms. Méthioplégium; Trimetaphan Camphorsulphonate; Trimetaphan Camsylate.

Proprietary Name. Arfonad

1,3-Dibenzylperhydro-2-oxoimidazo[4,5-*c*]thieno[1,2-*a*]thiolium (+)-camphor-10-sulphonate

$C_{22}H_{25}N_2OS, C_{10}H_{15}O_4S = 596.8$

CAS—7187-66-8 (trimetaphan); 68-91-7 (camsylate)

Colourless crystals or white crystalline powder. M.p. about 232°, with decomposition.

Soluble 1 in less than 5 of water and 1 in 2 of ethanol; freely soluble in chloroform; practically insoluble in ether.

Colour Tests. Aromaticity (Method 2)—colourless/yellow; Liebermann's Test—orange.

Thin-layer Chromatography. System TA—Rf 02. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—252 nm ($A_1^1 = 8.2$ a), 258 nm ($A_1^1 = 8.3$ a), 264 nm. No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1701, 1220, 1184, 1735, 1052, 1672 (KBr disk).

Mass Spectrum. Principal peaks at m/z 91, 65, 187, 92, 277, 259, 90, 273.

Dose. Initially 3 to 4 mg/minute by intravenous infusion.

Trimetazidine*Anti-anginal Vasodilator**Synonym.* Trimetazine

1-(2,3,4-Trimethoxybenzyl)piperazine

 $C_{14}H_{22}N_2O_3 = 266.3$

CAS—5011-34-7

**Trimetazidine Hydrochloride***Proprietary Name.* Vastarel $C_{14}H_{22}N_2O_3 \cdot 2HCl = 339.3$

CAS—13171-25-0

A white crystalline powder. M.p. 222° to 228°.

Soluble in water; very slightly soluble in ethanol.**Colour Tests.** Mandelin's Test—violet; Marquis Test—yellow (fades).**Thin-layer Chromatography.** *System TA*—Rf 22; *system TB*—Rf 05; *system TC*—Rf 04. (Acidified iodoplatinate solution, positive.)**High Pressure Liquid Chromatography.** *System HA*—k' 3.0 (tailing peak).**Ultraviolet Spectrum.** Aqueous acid—231 nm ($A_1^1 = 424$ a), 269 nm.**Infra-red Spectrum.** Principal peaks at wavenumbers 1093, 1494, 1280, 1011, 1042, 1600 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 181, 85, 56, 166, 266, 182, 179, 91.**Dose.** Trimetazidine hydrochloride has been given in doses of 40 to 60 mg daily.**Trimethobenzamide***Antihistamine**N*-[4-(2-Dimethylaminoethoxy)benzyl]-3,4,5-trimethoxybenzamide $C_{21}H_{28}N_2O_5 = 388.5$

CAS—138-56-7

**Trimethobenzamide Hydrochloride***Proprietary Names.* Ibikin; Tigan. $C_{21}H_{28}N_2O_5 \cdot HCl = 424.9$

CAS—554-92-7

A white crystalline powder. M.p. 186° to 190°.

Soluble 1 in 2 of water, 1 in about 60 of ethanol, 1 in 67 of chloroform, and 1 in 720 of ether.**Colour Tests.** Liebermann's Test—black; Mandelin's Test—violet-brown.**Thin-layer Chromatography.** *System TA*—Rf 42. (Acidified iodoplatinate solution, positive.)**Gas Chromatography.** *System GA*—RI 3287.**High Pressure Liquid Chromatography.** *System HA*—k' 4.7.**Ultraviolet Spectrum.** Aqueous acid—258 nm ($A_1^1 = 312$ b). No alkaline shift.**Infra-red Spectrum.** Principal peaks at wavenumbers 1123, 1230, 1575, 1505, 1616, 990 (KBr disk).**Mass Spectrum.** Principal peaks at m/z 58, 195, 59, 72, 388, 89, 315, 42.**Quantification.** GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In saliva: sensitivity <100 ng/ml—T. A. Robert *et al.*, *J. Chromat.*, 1981, 224; *Biomed. Appl.*, 13, 116–121.**HIGH PRESSURE LIQUID CHROMATOGRAPHY.** In serum: UV detection—T. A. Robert *et al.*, *J. clin. Pharmacol.*, 1982, 22, 53–58.

Disposition in the Body.**THERAPEUTIC CONCENTRATION.**

Following a single oral dose of 250 mg to 4 subjects, peak blood concentrations of 1.3 to 2.4 µg/ml (mean 1.7) were attained in 1.5 hours (R. C. Baselt and R. H. Cravey, *J. analyt. Toxicol.*, 1977, 1, 81-103).

TOXICITY.

In a fatality involving the ingestion of trimethobenzamide, postmortem blood and bile concentrations of 184 µg/ml and 1150 µg/ml, respectively, were reported; a postmortem blood-alcohol concentration of 1100 µg/ml was also reported (J. C. Harrill, *Bull. int. Ass. forens. Toxicol.*, 1976, 12(2), 29-30).

Dose. 0.75 to 1 g daily.

Trimethoprim

Antimicrobial

Synonyms. Trimethoxyprim. It is an ingredient of Co-trifamole, Co-trimazine, and Co-trimoxazole.

Proprietary Names. Ipral; Monotrim; Proloprim; Syraprim; Tiempe; Trimogal; Trimopan; Trimpep; Unitrim. It is an ingredient of Bactrim, Borgal (vet.), Chemotrim, Co-Fram, Comox, Cotrimox, Eusaprim, Fectrim, Laratrim, Polytrim, Septra, Septrin, Supristol, Triglobe and Trivetrim (vet.).

5-(3,4,5-Trimethoxybenzyl)pyrimidine-2,4-diylamine

$C_{14}H_{18}N_4O_3 = 290.3$

CAS—738-70-5

White or yellowish-white crystals or crystalline powder. M.p. 199° to 203°.

Soluble 1 in 2500 of water, 1 in 300 of ethanol, 1 in 55 of chloroform, and 1 in 80 of methanol; practically insoluble in ether.

Dissociation Constant. pK_a 7.2.

Colour Tests. Aromaticity (Method 2)—yellow/red; Mandelin's Test—yellow-brown; Marquis Test—orange.

Cold *nitric acid* gives a red colour which fades to yellow on heating.

Thin-layer Chromatography. System TA—Rf 55; system TB—Rf 00; system TC—Rf 22. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2638.

High Pressure Liquid Chromatography. System HA— k' 1.2.

Ultraviolet Spectrum. Aqueous acid—271 nm ($A_1^1 = 218$ a); aqueous alkali—287 nm ($A_1^1 = 250$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1126, 1630, 1596, 1235, 1650, 1565 (KBr disk).

Mass Spectrum. Principal peaks at m/z 290, 259, 275, 291, 243, 123, 200, 43.

Quantification. GAS CHROMATOGRAPHY. In plasma or urine: detection limit 100 ng/ml, AFID—G. Land *et al.*, *J. Chromat.*, 1978, 146; *Biomed. Appl.*, 3, 143-147.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum or urine: detection limit 10 ng/ml, electrochemical detection—L. Nordholm and L. Dalgaard, *J. Chromat.*, 1982, 233; *Biomed. Appl.*, 22, 427-431. In serum or urine: detection limit 100 ng/ml, UV detection—R. Gochin *et al.*, *J. Chromat.*, 1981, 223; *Biomed. Appl.*, 12, 139-145.

Disposition in the Body. Readily absorbed after oral administration. Metabolic reactions include oxidation of the methylene group to a hydroxymethyl group, *N*-oxidation, *O*-demethylation, hydroxylation, and conjugation with glucuronic acid or sulphate. Metabolites are excreted in the urine as conjugates but the greater part of the dose is excreted as unchanged drug. Urinary excretion is pH-dependent and is increased in acid urine. About 40 to 75% of a dose is excreted in 24 hours, up to 60% being in the form of unchanged drug, with about 4% each as the 3'-hydroxymethyl and 4'-hydroxymethyl metabolites, and 2% as the *N*¹-oxide. Less than 4% is eliminated in the faeces.

THERAPEUTIC CONCENTRATION.

Following oral administration of 300 mg once daily to 6 subjects, maximum steady-state plasma concentrations of 3.1 to 9.5 µg/ml (mean 6.0) were attained in 1 to 4 hours (mean 2) (B. Odland *et al.*, *Eur. J. clin. Pharmacol.*, 1984, 26, 393–397).

For further references to trimethoprim when administered with sulphamethoxazole, see under Sulphamethoxazole.

TOXICITY. Toxic effects have been associated with plasma concentrations greater than 20 µg/ml.

A 28-year-old man ingested 8 g of trimethoprim and 14 hours later the plasma concentration was 19.6 µg/ml. It was estimated that the actual amount of trimethoprim absorbed was about 3 g. The patient subsequently recovered (K. Hoppu *et al.*, *Lancet*, 1980, *I*, 778).

HALF-LIFE. Plasma half-life, 8 to 17 hours (mean 11).

VOLUME OF DISTRIBUTION. About 1.4 litres/kg.

CLEARANCE. Plasma clearance, about 2 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 0.78.

SALIVA. Plasma: saliva ratio, about 1.3.

PROTEIN BINDING. In plasma, 40 to 70%.

NOTE. For a review of the clinical pharmacokinetics of sulphamethoxazole and trimethoprim see R. B. Patel and P. G. Welling, *Clin. Pharmacokinet.*, 1980, 5, 405–423.

Dose. Usually 400 mg daily; doses of 1.5 g daily for 3 days have been given for malaria.

**Trimethoxyamphetamine***Hallucinogen*

α -Methyl-3,4,5-trimethoxyphenethylamine

$C_{12}H_{19}NO_3 = 225.3$

CAS—1082-88-8

Trimethoxyamphetamine is the α -methyl homologue of mescaline.

An oil.

Practically **insoluble** in water; soluble in chloroform.

The hydrochloride is soluble in water; m.p. 219° to 220°.

Colour Test. Marquis Test—orange.

Thin-layer Chromatography. System TA—Rf 33; system TB—Rf 08; system TC—Rf 11. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 1748.

High Pressure Liquid Chromatography. System HC— k' 1.48.

Ultraviolet Spectrum. Aqueous acid—269 nm ($A_1^1 = 26$ b). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1130, 1595, 1510, 1240, 1000, 1151 (KBr disk).

Mass Spectrum. Principal peaks at m/z 43, 182, 167, 225, 181, 183, 151, 142.

Trimetozine*Tranquilliser*

Synonyms. Trimethoxazine; Trimolide.

Proprietary Name. Opalene

4-(3,4,5-Trimethoxybenzoyl)morpholine

$C_{14}H_{19}NO_5 = 281.3$

CAS—635-41-6

A white crystalline powder. M.p. about 121°. Slightly **soluble** in water and ethanol; freely soluble in chloroform and methanol.

Colour Tests. Liebermann's Test—black; Marquis Test—red-brown.

Thin-layer Chromatography. System TA—Rf 61; system TB—Rf 11; system TC—Rf 72. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2198.

Ultraviolet Spectrum. Methanol—245 nm ($A_1^1 = 259$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1131, 1642, 1229, 1110, 1592, 1001 (KBr disk).

Mass Spectrum. Principal peaks at m/z 195, 281, 196, 152, 280, 81, 77, 66.

Dose. Usually 0.6 to 1.8 g daily; maximum of 3 g daily.

Trimipramine

Antidepressant

Synonym. Trimeprimine

3-(10,11-Dihydro-5H-dibenz[*b,f*]azepin-5-yl)-2,*N,N*-trimethylpropylamine

$C_{20}H_{26}N_2 = 294.4$

CAS—739-71-9

A pale yellowish-white waxy solid. M.p. about 45°. Practically **insoluble** in water; readily soluble in ethanol.

Trimipramine Maleate

Proprietary Name. Surmontil

$C_{20}H_{26}N_2 \cdot C_4H_4O_4 = 410.5$

CAS—521-78-8

A white crystalline powder. M.p. 140° to 144°.

Slightly **soluble** in water and ethanol; freely soluble in chloroform; practically insoluble in ether.

Colour Tests. Forrest Reagent—blue; FPN Reagent—blue; Mandelin's Test (add water)—blue.

Thin-layer Chromatography. System TA—Rf 59; system TB—Rf 62; system TC—Rf 54. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—trimipramine RI 2201, *N*-monodesmethyltrimipramine RI 2250; system GF—RI 2505.

High Pressure Liquid Chromatography. System HA—trimipramine k' 2.7, *N*-monodesmethyltrimipramine k' 1.8; system HF— k' 6.17.

Ultraviolet Spectrum. Aqueous acid—250 nm ($A_1^1 = 300$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1490, 762, 1240, 1230, 741, 749 (KBr disk).

Mass Spectrum. Principal peaks at m/z 58, 249, 208, 99, 193, 234, 84, 248.

Quantification. GAS CHROMATOGRAPHY. In plasma: trimipramine and *N*-monodesmethyltrimipramine, sensitivity 500 pg/ml, AFID—D. R. Abernethy *et al.*, *Clin. Pharmac. Ther.*, 1984, 35, 348–353. In plasma: sensitivity 5 ng/ml, AFID—G. Caillé

et al., *Biopharm. Drug Disp.*, 1980, 1, 187–194. In postmortem tissues: sensitivity 500 ng/ml, FID—N. B. Wu Chen *et al.*, *J. forens. Sci.*, 1983, 28, 116–121.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: trimipramine and metabolites, sensitivity 3 ng/ml, electrochemical detection—R. F. Suckow and T. B. Cooper, *J. pharm. Sci.*, 1984, 73, 1745–1748.

Disposition in the Body. Readily absorbed after oral administration but undergoes considerable first-pass metabolism to *N*-monodesmethyltrimipramine; bioavailability about 40% with wide intersubject variation. Excreted in the urine mainly as metabolites.

THERAPEUTIC CONCENTRATION.

A single oral dose of 50 mg administered to 9 subjects, resulted in peak plasma concentrations of 0.015 to 0.051 μg/ml (mean 0.028) in 1 to 6 hours (D. R. Abernethy *et al.*, *Clin. Pharmac. Ther.*, 1984, 35, 348–353).

Following daily oral doses of 75 or 150 mg to 29 subjects, the following steady-state plasma concentrations were reported: trimipramine 0.01 to 0.24 μg/ml (mean 0.09), *N*-monodesmethyltrimipramine 0.003 to 0.38 μg/ml (mean 0.07), 2-hydroxytrimipramine 0.003 to 0.04 μg/ml (mean 0.016),

and 2-hydroxy-*N*-monodesmethyltrimipramine 0.003 to 0.05 µg/ml (mean 0.017) (R. F. Suckow and T. B. Cooper, *J. pharm. Sci.*, 1984, 73, 1745–1748).

TOXICITY. Toxic effects have been associated with plasma concentrations greater than 1 µg/ml.

In a fatality involving the ingestion of up to 6 g of trimipramine, the following postmortem tissue concentrations were reported: blood 9.5 µg/ml, brain 27 µg/g, kidney 42 µg/g, liver 224 µg/g, spleen 31 µg/g (J. J. Rousseau and M. Rousseau, *Bull. int. Ass. forens. Toxicol.*, 1970, 7(3), 5–6).

In a fatality involving the ingestion of trimipramine and clomipramine, postmortem concentrations were: blood, trimipramine 11.6 µg/ml, clomipramine 2.1 µg/ml; liver, trimipramine 544 µg/g, clomipramine 56 µg/g (R. S. Hucker, *Bull. int. Ass. forens. Toxicol.*, 1983, 17(2), 20–22).

HALF-LIFE. Plasma half-life, 16 to 40 hours (mean 24).

VOLUME OF DISTRIBUTION. About 20 to 50 litres/kg (mean 30).

CLEARANCE. Plasma clearance, 10 to 25 ml/min/kg (mean 16).

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 1.2.

PROTEIN BINDING. In plasma, about 94%.

Dose. The equivalent of 50 to 300 mg of trimipramine daily.

Trioxsalen

Pigmenting Agent

Synonyms. 4,5',8-Trimethylpsoralen; Trioxysalen.

Proprietary Name. Trisoralen

2,5,9-Trimethyl-7*H*-furo[3,2-*g*]chromen-7-one

$C_{14}H_{12}O_3 = 228.2$

CAS—3902-71-4

A white or greyish crystalline solid. M.p. about 230°. Practically **insoluble** in water; soluble 1 in 1150 of ethanol, 1 in 84 of chloroform, and 1 in 43 of methylene chloride.

Gas Chromatography. *System GA*—RI 2155.

Ultraviolet Spectrum. Methanol—248 nm ($A_1^1 = 981$ b), 296 nm ($A_1^1 = 428$ b), 338 nm ($A_1^1 = 276$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1710, 1600, 1110, 880, 930, 1620 (Nujol mull).

Mass Spectrum. Principal peaks at m/z 228, 200, 199, 128, 229, 185, 115, 201.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In blood, ophthalmic fluid or skin: detection limit 2 ng/ml, UV detection—S. G. Chakrabarti *et al.*, *J. invest. Derm.*, 1982, 79, 374–377.

Dose. 5 to 10 mg daily.

Tripeleennamine

Antihistamine

N-Benzyl-*N'*-dimethyl-*N*-(2-pyridyl)ethylenediamine

$C_{16}H_{21}N_3 = 255.4$

CAS—91-81-6

An oily liquid.

Miscible with water.

Tripeleennamine Citrate

Proprietary Name. PBZ (elixir)

$C_{16}H_{21}N_3 \cdot C_6H_8O_7 = 447.5$

CAS—6138-56-3

A white crystalline powder. M.p. about 107°.

Soluble 1 in 1 of water; freely soluble in ethanol; practically insoluble in chloroform; very slightly soluble in ether.

Tripeleennamine Hydrochloride

Proprietary Names. PBZ (tablets); Pyribenzamine.

$C_{16}H_{21}N_3 \cdot HCl = 291.8$

CAS—154-69-8

A white crystalline powder which slowly darkens on exposure to light. M.p. 188° to 192°.

Soluble 1 in 1 of water, 1 in 6 of ethanol, and 1 in 6 of chloroform; practically insoluble in ether.

Dissociation Constant. pK_a 3.9, 9.0 (25°).

Colour Tests. Cyanogen Bromide—yellow; Liebermann's Test—orange → brown; Mandelin's Test—yellow-brown; Marquis Test—red-brown.

Thin-layer Chromatography. *System TA*—Rf 55; *system TB*—Rf 44; *system TC*—Rf 27. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, brown.)

Gas Chromatography. *System GA*—RI 1980.

High Pressure Liquid Chromatography. *System HA*— k' 3.6.

Ultraviolet Spectrum. Aqueous acid—239 nm ($A_1^1 = 562$ a), 314 nm; aqueous alkali—249 nm, 312 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1496, 1592, 770, 1250, 955, 735 (tripelennamine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 58, 91, 72, 71, 197, 185, 184, 92.

Quantification. GAS CHROMATOGRAPHY. In postmortem tissues: FID—J. R. Monforte *et al.*, *J. forens. Sci.*, 1983, 28, 90–101.

Disposition in the Body. Rapidly absorbed after oral administration. Metabolised by ring hydroxylation and demethylation followed by conjugation with glucuronic acid. It is excreted in the urine, mainly as metabolites, and in the bile, and appears to undergo enterohepatic circulation. The major urinary metabolites are tripeleminamine-*N*-glucuronide, conjugated hydroxytri-peleminamine, and the conjugated hydroxydesmethyl metabolite; the *N*-oxide is a minor metabolite.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 100 mg, a peak plasma concentration of 0.06 µg/ml was reportedly attained in 2 to 3 hours (per M. Bayley *et al.*, *J. forens. Sci.*, 1975, 20, 539–543).

TOXICITY.

In one fatality arising from the ingestion of about 1 g, in which death occurred about 7 hours after ingestion, the following postmortem tissue distribution was reported: blood 10 µg/ml, brain 43 µg/g, kidney 35 µg/g, liver 83 µg/g, urine 287 µg/ml (M. Bayley *et al.*, *ibid.*).

In 17 fatalities involving the intravenous abuse of tripeleminamine and pentazocine, tripeleminamine blood concentrations of 0 to 3.0 µg/ml (mean 0.5) were reported; kidney concentrations of 0.4 to 2.0 µg/g (mean 1.1) were reported in 4 subjects and liver concentrations of 1.0 to 6.5 µg/g (mean 3.1) in 5 subjects; pentazocine blood concentrations ranged from 0 to 11 µg/ml (mean 3) (J. R. Monforte *et al.*, *J. forens. Sci.*, 1983, 28, 90–101).

Dose. 25 to 50 mg of tripeleminamine hydrochloride every 4 to 6 hours; up to 600 mg daily has been given.

Triphenyltetrazolium Chloride

Diagnostic Agent

Synonyms. Red Tetrazolium; RT; TPTZ; TTC.

Proprietary Name. Uroscreen

2,3,5-Triphenyl-2*H*-tetrazolium chloride

$C_{19}H_{15}ClN_4 = 334.8$

CAS—298-96-4

A white crystalline powder. M.p. 243°, with decomposition.

Soluble in water, ethanol, and acetone; practically insoluble in ether.

Colour Tests. Liebermann's Test—red-orange; Mandelin's Test—blue (slow).

Thin-layer Chromatography. System TA—Rf 61. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—246 nm ($A_1^1 = 680$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 691, 769, 1529, 720, 1164, 998 (KBr disk).

Tripolidine

Antihistamine

(*E*)-2-[3-(Pyrrolidin-1-yl)-1-*p*-tolylprop-1-enyl]pyridine

$C_{19}H_{22}N_2 = 278.4$

CAS—486-12-4

Crystals. M.p. 59° to 61°.

Tripolidine Hydrochloride

Proprietary Names. Actidil; Actidilon; Pro-Actidil; Pro-Actidilon. It is an ingredient of Actifed and Linctifed.

$C_{19}H_{22}N_2 \cdot HCl \cdot H_2O = 332.9$

CAS—550-70-9 (anhydrous); 6138-79-0 (monohydrate)

A white crystalline powder. M.p. 118° to 121°.

Soluble 1 in about 2 of water, 1 in about 1.5 of ethanol, 1 in less than 1 of chloroform, and 1 in 2000 of ether.

Dissociation Constant. pK_a 6.5.

Partition Coefficient. Log *P* (octanol), 3.9.

Colour Tests. Cyanogen Bromide—orange-pink (after 1 to 2 min); Liebermann's Test—orange.

Thin-layer Chromatography. System TA—Rf 51; system TB—Rf 39; system TC—Rf 20. (Dragendorff spray, positive; acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2253; system GC—RI 2954; system GF—RI 2600.

High Pressure Liquid Chromatography. System HA— k' 3.2.

Ultraviolet Spectrum. Aqueous acid—290 nm ($A_1^1 = 347$ a). (See below)

Infra-red Spectrum. Principal peaks at wavenumbers 775, 1580, 825, 990, 1509, 1146 (tripolidine hydrochloride, KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 208, 209, 278, 207, 193, 200, 194, 84.

Quantification. THIN-LAYER CHROMATOGRAPHY-DENSITOMETRY. In plasma: sensitivity 800 pg/ml—R. L. DeAngelis *et al.*, *J. pharm. Sci.*, 1977, 66, 841–843.

Disposition in the Body. Irregularly absorbed after oral administration.

THERAPEUTIC CONCENTRATION.

Following oral administration of 15 ml of a syrup containing 3.75 mg of triprolidine hydrochloride to 16 subjects, peak plasma concentrations of 0.004 to 0.017 $\mu\text{g/ml}$ (mean 0.009) were attained in about 2 hours (R. L. DeAngelis *et al.*, *J. pharm. Sci.*, 1977, 66, 841–843).

Following oral administration of 2.5 mg of triprolidine hydrochloride and 60 mg of pseudoephedrine hydrochloride four times a day to 17 subjects for 5 days, peak plasma-triprolidine concentrations of 0.004 to 0.044 $\mu\text{g/ml}$ (mean 0.013) were reported about 1.6 hours after a dose (J. G. Perkins *et al.*, *Curr. ther. Res.*, 1980, 28, 650–668).

HALF-LIFE. Plasma half-life, 1.5 to 20 hours (mean 5).

Dose. Usually 7.5 to 15 mg of triprolidine hydrochloride daily.

Trometamol

Treatment of Acidosis

Synonyms. THAM; Trihydroxymethylaminomethane; TRIS; Tris(hydroxymethyl)aminomethane; Tromethamine.

Proprietary Names. Alcaphor; Thamesol; Trisaminol.

2-Amino-2-hydroxymethylpropane-1,3-diol

$\text{C}_4\text{H}_{11}\text{NO}_3 = 121.1$

CAS—77-86-1

A white crystalline powder. M.p. 168° to 172°.

Soluble 1 in 1.3 of water and 1 in about 45 of ethanol; practically insoluble in chloroform; slightly soluble in ether.

Dissociation Constant. pK_a 8.2 (20°).

Thin-layer Chromatography. System TA—Rf 57. (Ninhydrin spray, positive.)

Gas Chromatography. System GA—RI 1645.

Infra-red Spectrum. Principal peaks at wavenumbers 1031, 1018, 1076, 975, 1582, 1279 (KBr disk).

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 5 ng/ml, FID—A. Hulshoff and H. B. Kostenbauder, *J. Chromat.*, 1978, 145; *Biomed. Appl.*, 2, 155–159.

THIN-LAYER CHROMATOGRAPHY. In serum: detection limit 20 μg —G. Andermann and C. Andermann, *J. High Resolut. Chromat. Chromat. Commun.*, 1980, 3, 36–37.

Disposition in the Body. About 75% of a dose is excreted in the urine as unchanged drug in 8 hours and the remainder is excreted over a period of 3 days. Trometamol may accumulate in the body if large doses are given frequently.

THERAPEUTIC CONCENTRATION.

Following an intravenous injection of 109 mg to an infant, a plasma concentration of 430 $\mu\text{g/ml}$ was reported at 0.5 hour, declining to 86 $\mu\text{g/ml}$ at 4.5 hours (A. Hulshoff and H. B. Kostenbauder, *J. Chromat.*, 1978, 145; *Biomed. Appl.*, 2, 155–159).

Dose. Up to 500 mg/kg by intravenous infusion.

Tropicamide

Anticholinergic

Synonym. Bistropamide

Proprietary Names. Mydriacyl; Mydriaticum; Visumidriatic.

N-Ethyl-N-(4-pyridylmethyl)tropamide

$\text{C}_{17}\text{H}_{20}\text{N}_2\text{O}_2 = 284.4$

CAS—1508-75-4

A white crystalline powder. M.p. 95° to 100°.

Soluble 1 in 160 of water, 1 in 3.5 of ethanol, and 1 in 2 of chloroform.

Dissociation Constant. pK_a 5.2.

Colour Tests. Cyanogen Bromide—violet-pink; Liebermann's Test—yellow.

Thin-layer Chromatography. System TA—Rf 65. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. System GA—RI 2330.

Ultraviolet Spectrum. Aqueous acid—254 nm ($A_1^1 = 180$ a); aqueous alkali—256 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1627, 1601, 709, 1266, 761, 1070 (KBr disk).

Mass Spectrum. Principal peaks at m/z 92, 91, 65, 103, 93, 39, 163, 77.

Use. As a 0.5 to 1% ophthalmic solution.

Troxidone

Anticonvulsant

Synonyms. Trimethadione; Trimethinum.

Proprietary Names. Tridione; Trimedone.

3,5,5-Trimethyloxazolidine-2,4-dione

$C_6H_9NO_3 = 143.1$

CAS—127-48-0

Colourless or white granular crystals. M.p. 45° to 47°.

Soluble 1 in 13 of water and 1 in 2 of ethanol; freely soluble in chloroform and ether.

Gas Chromatography. System GA—RI 1100; system GE—retention time 0.04 relative to phenytoin.

Infra-red Spectrum. Principal peaks at wavenumbers 1730, 1802, 1098, 1200, 770, 1295 (KBr disk).

Mass Spectrum. Principal peaks at m/z 43, 58, 143, 42, 41, 40, 39, 128.

Quantification. GAS CHROMATOGRAPHY. In plasma: troxidone and dimethadione, FID—D. L. Bius *et al.*, *Ther. Drug Monit.*, 1979, 1, 495–505.

Disposition in the Body. Readily absorbed after oral administration and extensively metabolised in the liver to the active metabolite, dimethadione, which is thought to be primarily responsible for the pharmacological activity. It is very slowly excreted in the urine over a period of several days, almost entirely in the form of dimethadione; the excretion of dimethadione is increased in alkaline urine.

THERAPEUTIC CONCENTRATION. Dimethadione attains plasma concentrations about 20 times greater than those of troxidone and accumulates on chronic administration; there is considerable intersubject variation in plasma concentrations.

Steady-state plasma concentrations of 19 to 41 $\mu\text{g/ml}$ (mean 25) of troxidone and 350 to 1033 $\mu\text{g/ml}$ (mean 550) of dimethadione were reported in 5 subjects during chronic treatment with troxidone (D. L. Bius *et al.*, *Ther. Drug Monit.*, 1979, 1, 495–505).

TOXICITY. The estimated minimum lethal dose is 5 g. Toxic effects may be associated with plasma-dimethadione concentrations greater than 1000 $\mu\text{g/ml}$.

HALF-LIFE. Plasma half-life, troxidone about 16 hours; dimethadione, half-life derived from urinary excretion data, 6 to 13 days.

PROTEIN BINDING. In plasma, not significantly bound.

Dose. Initially 900 mg daily, increasing to 1.8 g daily.

Tryptamine

Putrefactive Base

2-(Indol-3-yl)ethylamine

$C_{10}H_{12}N_2 = 160.2$

CAS—61-54-1

A white crystalline powder. M.p. 116°.

Practically **insoluble** in water, chloroform, and ether; soluble in ethanol.

Tryptamine Hydrochloride

$C_{10}H_{12}N_2 \cdot HCl = 196.7$

CAS—343-94-2

A white crystalline powder. M.p. 252°.

Soluble in water.

Colour Tests. *p*-Dimethylaminobenzaldehyde—red/violet; Formaldehyde—Sulphuric Acid—brown; Marquis Test—orange.

Thin-layer Chromatography. *System TA*—Rf 23; *system TB*—Rf 01; *system TC*—Rf 02. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 1742.

High Pressure Liquid Chromatography. *System HA*—*k'* 1.2.

Ultraviolet Spectrum. Aqueous acid—278 nm ($A_1^1 = 353$ a), 287 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 742, 1585, 1233, 1035, 909, 1494 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 130, 131, 30, 160, 77, 103, 132, 102.

Tryptophan

Amino Acid

Synonyms. L-Trp; L-Tryptophan.

Proprietary Names. Pacitron; Trofan; Tryptacin. It is an ingredient of Optimax.

L-2-Amino-3-(indol-3-yl)propionic acid

$C_{11}H_{12}N_2O_2 = 204.2$

CAS—73-22-3

White to slightly yellowish-white crystals or crystalline powder.

Soluble 1 in about 100 of water; very slightly soluble in ethanol; practically insoluble in chloroform and ether; soluble in solutions of dilute acids and alkali hydroxides.

Ultraviolet Spectrum. Aqueous acid—278 nm ($A_1^1 = 290$ b), 286 nm ($A_1^1 = 234$ b); aqueous alkali—280 nm, 288 nm.

Dose. 3 to 6 g daily.

Tuaminoheptane

Sympathomimetic

1-Methylhexylamine

$C_7H_{17}N = 115.2$

CAS—123-82-0

A colourless or pale yellow volatile liquid.

It absorbs carbon dioxide on exposure to air, forming a white precipitate of tuaminoheptane carbonate. Sp. gr. 0.760 to 0.763.

Soluble 1 in 100 of water, 1 in 25 of ethanol, and 1 in 20 of chloroform; freely soluble in ether.

Tuaminoheptane Sulphate

Proprietary Name. Tuamine Sulfate

$(C_7H_{17}N)_2 \cdot H_2SO_4 = 328.5$

CAS—6411-75-2

A white powder.

Freely **soluble** in water; soluble in ethanol; sparingly soluble in ether.

Dissociation Constant. pK_a 10.5.

Thin-layer Chromatography. *System TA*—Rf 33; *system TB*—Rf 01; *system TC*—Rf 07. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 888; *system GB*—RI 849; *system GC*—RI 1287.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Mass Spectrum. Principal peaks at *m/z* 44, 30, 42, 41, 29, 27, 100, 55.

Use. As a 1% solution of the sulphate for nasal drops or spray.

Tubocurarine Chloride*Muscle Relaxant**Synonym.* *d*-Tubocurarine Chloride*Proprietary Names.* Curarin; Intocostrin-T; Jexin; Tubarine.*(+)-7',12'-Dihydroxy-6,6'-dimethoxy-2,2',2'-trimethyltubocuraranium dichloride pentahydrate* $C_{37}H_{42}Cl_2N_2O_6 \cdot 5H_2O = 771.7$ *Note.* The empirical formula of tubocurarine chloride was formerly considered to be $C_{38}H_{44}Cl_2N_2O_6 \cdot 5H_2O$.*CAS*—57-95-4 (tubocurarine); 57-94-3 (chloride, anhydrous); 6989-98-6 (chloride, pentahydrate)

The chloride of an alkaloid, (+)-tubocurarine. It may be obtained from extracts of the stems of *Chondodendron tomentosum* (Menispermaceae).

A white or slightly yellowish-white or greyish-white crystalline powder. M.p. about 270°, with decomposition.

Soluble 1 in 20 of water and 1 in about 30 of ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 8.0, 9.2 (22°).

Colour Tests. Aromaticity (Method 2)—yellow/brown; Folin-Ciocalteu Reagent—blue; Liebermann's Test—black; Mandelin's Test—brown; Millon's Reagent (hot)—red.

Cold *nitric acid* gives a black colour.

Thin-layer Chromatography. *System TA*—Rf 00; *system TN*—Rf 85; *system TO*—Rf 40. (*Acidified iodoplatinate solution*, positive.)

Gas Chromatography. *System GA*—RI 2495.

Ultraviolet Spectrum. Water—280 nm ($A_1^1 = 119$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1516, 1228, 1120, 1280, 1265, 1165 (KBr disk).

Mass Spectrum. Principal peaks at m/z 298, 594, 58, 593, 299, 609, 595, 564.

Quantification. ULTRAVIOLET SPECTROPHOTOMETRY. In postmortem tissues—H. M. Stevens and R. H. Fox, *J. forens. Sci. Soc.*, 1971, 11, 177–182.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 25 ng/ml, UV detection—A. Meulemans *et al.*, *J. Chromat.*, 1981, 226; *Biomed. Appl.*, 15, 255–258.

RADIOIMMUNOASSAY. In serum or urine: sensitivity 5 ng/ml—P. E. Horowitz and S. Spector, *J. Pharmac. exp. Ther.*, 1973, 185, 94–100.

Disposition in the Body. After intravenous administration it is widely distributed throughout the tissues and is concentrated at the neuromuscular junctions; slowly and irregularly absorbed

following intramuscular injection. About 45% of a dose is excreted in the urine unchanged in 24 hours.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 0.7 to 1 μg/ml.

After an intravenous bolus of 540 μg/kg followed by constant intravenous infusion of 2.9 μg/kg/min to 9 subjects, a mean steady-state plasma concentration of 1.1 μg/ml was attained in about 1 hour (M. I. Ramzan *et al.*, *Br. J. Anaesth.*, 1980, 52, 893–899).

TOXICITY.

In a fatality due to tubocurarine, a postmortem liver concentration of about 0.8 μg/g was reported (H. M. Stevens and R. H. Fox, *J. forens. Sci. Soc.*, 1971, 11, 177–182).

HALF-LIFE. Plasma half-life, about 2 to 4 hours.

VOLUME OF DISTRIBUTION. About 0.3 to 0.6 litre/kg.

CLEARANCE. Plasma clearance, about 2 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, 1.9.

PROTEIN BINDING. In plasma, 33 to 50%.

NOTE. For a review of the pharmacokinetics of neuromuscular blocking agents see M. I. Ramzan *et al.*, *Clin. Pharmacokinet.*, 1981, 6, 25–60.

Dose. Initially 10 to 15 mg intravenously, with additional doses of 5 mg.

Tybamate*Tranquilliser**Proprietary Name.* Tybatran

2-Methyl-2-propyltrimethylene butylcarbamate carbamate

 $C_{13}H_{26}N_2O_4 = 274.4$ *CAS*—4268-36-4

A white crystalline powder or clear viscous liquid which may congeal to a solid form on standing. M.p. of the powder 49° to 54°.

Very slightly **soluble** in water; very soluble in ethanol and acetone; freely soluble in ether.

Thin-layer Chromatography. *System TA*—Rf 77; *system TD*—Rf 35; *system TE*—Rf 68; *system TF*—Rf 65. (*Furfuraldehyde reagent*, positive.)

Gas Chromatography. *System GA*—RI 1725; *system GF*—RI 2130.

Ultraviolet Spectrum. No significant absorption, 230 to 360 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1695, 1250, 1065, 1538, 1600, 1140 (KBr disk).

Mass Spectrum. Principal peaks at m/z 55, 72, 97, 41, 56, 158, 118, 57.

Disposition in the Body. Readily absorbed after oral administration. Metabolised in the liver and excreted in the urine, mainly as hydroxylated compounds. Meprobamate can appear as a minor metabolite.

HALF-LIFE. Plasma half-life, about 3 hours.

Dose. Usually 0.75 to 2 g daily; maximum of 3 g daily.

Tylosin

Antibiotic (Veterinary)

Proprietary Names of Tylosin and its Salts. Tylamix; Tylan. Tylosin tartrate is an ingredient of Tylasul Soluble.

CAS—1401-69-0

An antimicrobial substance with a macrolide structure, produced by a strain of *Streptomyces fradiae*.

An almost white to buff-coloured powder. M.p. 128° to 132°.

Soluble 1 in 400 of water, 1 in 15 of ethanol, 1 in 30 of chloroform, and 1 in 6 of methanol.

Tylosin Tartrate

CAS—1405-54-5

A white to buff-coloured powder. M.p. 140° to 146°.

Soluble 1 in 10 of water; slightly soluble in ethanol; very slightly soluble in chloroform; practically insoluble in ether.

Colour Tests. Mandelin's Test—yellow → yellow-brown; Marquis Test—yellow-brown; Sulphuric Acid—yellow-brown (slow).

Thin-layer Chromatography. *System TA*—Rf 72. (*Acidified iodoplatinate solution*, positive.)

Ultraviolet Spectrum. Aqueous acid—290 nm ($A_1^1 = 225$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1075, 1052, 1162, 1111, 1010, 1587.

Tyramine

Diagnostic Agent/Sympathomimetic

Synonyms. *p*-Tyramine; Tyrosamine.

4-(2-Aminoethyl)phenol

$C_8H_{11}NO = 137.2$

CAS—51-67-2

Colourless crystals. M.p. 164° to 165°.

Soluble 1 in 95 of water and 1 in 10 of boiling ethanol.

Tyramine Hydrochloride

Proprietary Name. Mydrial

$C_8H_{11}NO \cdot HCl = 173.6$

CAS—60-19-5

Crystals. M.p. about 270°, with decomposition.

Soluble in water.

Dissociation Constant. pK_a 9.5 (phenol), 10.8 ($-NH_2$).

Colour Tests. *p*-Dimethylaminobenzaldehyde—orange/violet; Marquis Test—brown → green.

Thin-layer Chromatography. *System TA*—Rf 31. (*Acidified potassium permanganate solution*, positive.)

Gas Chromatography. *System GA*—RI 1436.

High Pressure Liquid Chromatography. *System HA*— k' 1.2; *system HB*— k' 0.81; *system HC*— k' 1.47.

Ultraviolet Spectrum. Aqueous acid—274 nm ($A_1^1 = 110$ a); aqueous alkali—294 nm ($A_1^1 = 182$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1266, 1518, 1595, 822, 1495, 1612 (KBr disk).

Mass Spectrum. Principal peaks at m/z 30, 108, 107, 77, 39, 51, 137, 27.

Quantification. GAS CHROMATOGRAPHY. In urine: sensitivity 25 ng, ECD—R. T. Coutts *et al.*, *Res. Commun. chem. Path. Pharmac.*, 1980, 28, 177–184.

Dose. Tyramine hydrochloride has been given by mouth in doses of up to 250 mg daily, in the investigation of migraine.

Urea

Diuretic

Synonyms. Carbamide; Ureum.

Proprietary Names. Aquacare; Aquadrate; Calmurid; Carmol; Gormel; Nutraplus; Ultra-Mide; Ureaphil. It is an ingredient of Psoradrate.

$NH_2 \cdot CO \cdot NH_2 = 60.06$

CAS—57-13-6

Colourless, slightly hygroscopic, prismatic crystals or pellets, or white crystalline powder. M.p. 132° to 135°.

Soluble 1 in about 1.5 of water and 1 in about 11 of ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 0.2 (25°).

Colour Test. Nessler's Reagent—brown-orange.

Gas Chromatography. *System GA*—not eluted.

Mass Spectrum. Principal peaks at m/z 60, 44, 28, —, —, —, —.

Disposition in the Body. Rapidly absorbed after oral administration. Excreted in the urine as unchanged drug and also metabolised to ammonium salts in the colon. Endogenous urinary excretion is in the range 10 to 35 g in 24 hours; urea is not usually found in the faeces.

THERAPEUTIC CONCENTRATION. Endogenous concentrations in blood are about 300 µg/ml in adults and lower in infants.

After intravenous infusion of 0.6 to 1.2 g/kg of a solution containing 30% urea and 10% invert sugar to 7 subjects over a period of 0.5 to 2 hours, plasma concentrations at the end of the infusion were reported to range from 1160 to 3400 µg/ml (mean 2430) (P. R. Yarnell *et al.*, *Clin. Pharmacol. Ther.*, 1972, 13, 558–562).

HALF-LIFE. Biological half-life, about 1 hour.

Dose. 40 to 80 g by intravenous infusion, not exceeding 1.5 g/kg daily.

Urethane

Antineoplastic

Synonyms. Ethylurethane; Urethan.

Ethyl carbamate

$NH_2 \cdot CO \cdot O \cdot C_2H_5 = 89.09$

CAS—51-79-6

Colourless crystals or white granular powder. M.p. 48° to 50°.

Soluble 1 in 1.5 of water, 1 in 1 of ethanol, 1 in 1 of chloroform, and 1 in 2 of ether.

Gas Chromatography. *System GA*—RI 838.

Infra-red Spectrum. Principal peaks at wavenumbers 1713, 1075, 1610, 805, 1010 (KBr disk).

Dose. Formerly given in doses of 3 g daily; maximum of 6 g daily.

Valethamate Bromide

Anticholinergic

Proprietary Name. Epidosin

Diethylmethyl[2-(3-methyl-2-phenylvaleryloxy)ethyl]ammonium bromide

$C_{19}H_{32}BrNO_2 = 386.4$

CAS—16376-74-2 (valethamate); 90-22-2 (bromide)

A white crystalline powder. M.p. 100° to 101°.

Freely **soluble** in water; very soluble in ethanol; practically insoluble in ether.

Thin-layer Chromatography. *System TA*—Rf 02. (Acidified iodoplatinate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—253 nm, 259 nm ($A_1^1 = 5.4$ b), 265 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1730, 1230, 695, 726, 1163, 1265 (KBr disk).

Dose. 30 to 80 mg daily.

Valproic Acid

Anticonvulsant

Proprietary Names. Convulex (capsules); Depakene (capsules).

2-Propylvaleric acid

$C_8H_{16}O_2 = 144.2$

CAS—99-66-1

A colourless liquid.

Very slightly **soluble** in water.

Sodium Valproate

Proprietary Names. Convulex (solution and tablets); Depakene (syrup); Depakin(e); Epilim; Ergenyl; Orfiril.

$C_8H_7NaO_2 = 166.2$

CAS—1069-66-5

A white, crystalline, deliquescent powder.

Soluble 1 in 5 of water and of ethanol.

Dissociation Constant. pK_a 5.0.

Colour Test. Ferric Chloride—orange.

Thin-layer Chromatography. *System TD*—Rf 00; *system TE*—Rf 00; *system TF*—Rf 00.

Gas Chromatography. *System GE*—retention time 0.09 relative to phenytoin.

Infra-red Spectrum. Principal peaks at wavenumbers 1708, 1213, 1250, 1278, 946, 1107 (thin film).

Mass Spectrum. Principal peaks at m/z 73, 102, 41, 57, 43, 27, 55, 29.

Quantification. GAS CHROMATOGRAPHY. In plasma: detection limit 1 to 2 µg/ml, FID—R. Riva *et al.*, *J. pharm. Sci.*, 1982, 71, 110–111.

GAS CHROMATOGRAPHY—MASS SPECTROMETRY. In serum, urine, or breast-milk: valproic acid and several metabolites, detection limits between 2.8 and 18 ng/ml in serum—H. Nau *et al.*, *J. Chromat.*, 1981, 226; *Biomed. Appl.*, 15, 69–78.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: detection limit 9 µg/ml, UV detection—J. P. Moody and S. M. Allan, *Clinica chim. Acta*, 1983, 127, 263–269.

Disposition in the Body. Well absorbed after oral administration; bioavailability almost 100%. Metabolised mainly by oxidation to a number of metabolites, including 3-oxovalproic acid, 2-propylglutaric acid, 3-hydroxyvalproic acid, 4-hydroxyvalproic acid, 5-hydroxyvalproic acid, and valpro-1,4-lactone. About 20% of a dose is excreted in the urine as the glucuronide of valproic acid in 72 hours; most of the remainder is excreted as glucuronides of metabolites, less than 5% of a dose being excreted as unchanged drug.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 40 to 100 µg/ml, but there is no clear correlation with therapeutic effect.

Following a single oral dose of 500 mg to 6 subjects, peak plasma concentrations of 36 to 73 µg/ml (mean 58) were attained in 1 to 5 hours (mean 3) (C. A. May and W. R. Garnett, *Clin. Pharm.*, 1983, 2, 143–147). Daily oral doses in the range 1 to 3.75 g were administered to 20 patients; at the end of 10 weeks, minimum serum concentrations were 30 to 135 µg/ml (mean 82) and maximum concentrations were 70 to 190 µg/ml (mean 109). About 75% of the patients had serum concentrations within 55 to 100 µg/ml (J. Bruni *et al.*, *Clin. Pharmacol. Ther.*, 1978, 24, 324–332).

TOXICITY. Plasma concentrations greater than 200 µg/ml are associated with toxic effects but valproic acid is relatively non-toxic after overdose, and recovery after the ingestion of up to 75 g has been reported. Hepatotoxicity has been reported during therapeutic administration.

A patient whose death was attributed to an overdose of valproic acid had ingested 2.25 g each day for 5 days; the postmortem blood concentration was 52 µg/ml and therapeutic concentrations of phenobarbitone and phenytoin were also present; death was thought to be due to the high initial dose of valproic acid (J. P. Tift, *New Engl. J. Med.*, 1980, 303, 394).

HALF-LIFE. Plasma half-life, about 6 to 20 hours, reduced when administered in combination with other anticonvulsants.

VOLUME OF DISTRIBUTION. About 0.1 to 0.2 litre/kg.

CLEARANCE. Plasma clearance, about 0.1 to 0.3 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 1.8.

PROTEIN BINDING. In plasma, about 90% (concentration-dependent; decreased at plasma concentrations > 100 µg/ml).

NOTE. For a review of the clinical pharmacokinetics of valproic acid see R. Gugler and G. E. von Unruh, *Clin. Pharmacokinet.*, 1980, 5, 67–83.

Dose. Initially 600 mg of sodium valproate daily, increasing to 2.6 g daily.

Vancomycin

Antibiotic

CAS—1404-90-6

An amphoteric glycopeptide antimicrobial substance produced by the growth of certain strains of *Streptomyces orientalis*.

Vancomycin Hydrochloride

Proprietary Name. Vancocin

CAS—1404-93-9

A light brown powder.

Soluble 1 in 10 of water and 1 in 700 of ethanol; practically insoluble in chloroform; slightly soluble in ether.

Colour Test. Marquis Test—yellow.

Thin-layer Chromatography. System TA—Rf 22. (Acidified potassium permanganate solution, positive.)

Ultraviolet Spectrum. Vancomycin hydrochloride: aqueous acid—281 nm ($A_1^1 = 34$ b).

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum: sensitivity 2 µg/ml, UV detection—R. J. Hoagland *et al.*, *J. analyt. Toxicol.*, 1984, 8, 75–77.

RADIOIMMUNOASSAY. In serum or urine: sensitivity 40 pg/ml—K.-L. L. Fong *et al.*, *Antimicrob. Ag. Chemother.*, 1981, 19, 139–143.

Disposition in the Body. Not absorbed from the gastro-intestinal tract. About 90% of an intravenous dose is excreted in the urine with about 50% of the dose being excreted in 4 hours.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 10 to 40 µg/ml.

HALF-LIFE. Plasma half-life, about 4 to 10 hours.

VOLUME OF DISTRIBUTION. About 0.4 to 1 litre/kg.

CLEARANCE. Plasma clearance, about 1 ml/min/kg.

PROTEIN BINDING. In plasma, about 55%.

NOTE. For a review of vancomycin see B. A. Cunha and A. M. Ristuccia, *Clin. Pharm.*, 1983, 2, 417–424.

Dose. The equivalent of up to 2 g of vancomycin daily, by mouth or by intravenous infusion.

Vanillin

Flavouring Agent

Synonyms. Vainillina; Vanillic Aldehyde.

4-Hydroxy-3-methoxybenzaldehyde

$C_8H_8O_3 = 152.1$

CAS—121-33-5

White or slightly yellow crystalline needles or powder. M.p. 81° to 83°.

Soluble 1 in 100 of water; soluble in ethanol, chloroform, and ether.

Dissociation Constant. pK_a 7.4 (20°).

Ultraviolet Spectrum. Aqueous acid—230 nm, 278 nm ($A_1^1 = 685$ b), 309 nm; aqueous alkali—248 nm, 348 nm ($A_1^1 = 1640$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1660, 1153, 1267, 735, 1590, 1300 (KCl disk).

Mass Spectrum. Principal peaks at m/z 152, 151, 81, 109, 51, –, –, –.

Verapamil

Anti-arrhythmic

Synonym. Iproveratril

5-[N-(3,4-Dimethoxyphenethyl)-N-methylamino]-2-(3,4-dimethoxyphenyl)-2-isopropylvaleronitrile

$C_{27}H_{38}N_2O_4 = 454.6$

CAS—52-53-9

A pale yellow viscous oil.

Practically **insoluble** in water; soluble in ethanol, chloroform, and ether.

Verapamil Hydrochloride

Proprietary Names. Berkaten; Calan; Cordilox; Isoptin(e); Securon.

$C_{27}H_{38}N_2O_4 \cdot HCl = 491.1$

CAS—152-11-4

A white crystalline powder. M.p. 141° to 144°.

Soluble 1 in 20 of water, 1 in 25 of ethanol, and 1 in 1.5 of chloroform; practically insoluble in ether.

Colour Tests. Liebermann's Test—black; Marquis Test—yellow-green → grey.

Thin-layer Chromatography. System TA—Rf 59; system TB—Rf 23; system TC—Rf 70. (Acidified iodoplatinate solution, positive.)

High Pressure Liquid Chromatography. System HA—verapamil k' 2.6, norverapamil k' 1.7.

Ultraviolet Spectrum. Aqueous acid—278 nm ($A_1^1 = 127$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1510, 1253, 1026, 1232, 1149, 1587 (thin film).

Mass Spectrum. Principal peaks at m/z 303, 58, 43, 304, 151, 44, 42, 57.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 25 ng/ml, FID—R. G. McAllister *et al.*, *J. pharm. Sci.*, 1979, 68, 574–577. In postmortem tissues—B. M. Thomson and L. K. Pannell, *J. analyt. Toxicol.*, 1981, 5, 105–109.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum, saliva or urine: sensitivity 10 ng/ml, fluorescence detection—V. K. Piotrovskii *et al.*, *J. Chromat.*, 1983, 275; *Biomed. Appl.*, 26, 195–200. In plasma: verapamil and metabolites, sensitivity 2.5 ng/ml, fluorescence detection—M. Kuwada *et al.*, *J. Chromat.*, 1981, 222; *Biomed. Appl.*, 11, 507–511. In postmortem tissues: see B. M. Thomson and L. K. Pannell, *J. analyt. Toxicol.*, 1981, 5, 105–109.

Disposition in the Body. Almost completely absorbed after oral administration but undergoes extensive first-pass metabolism; bioavailability about 20%. The main metabolic reactions are *N*-dealkylation (*N*-demethylation gives norverapamil which is thought to be active), and *O*-demethylation of the resulting compounds. About 70% of a dose is excreted in the urine in 5 days with about 50% in the first 24 hours; less than 5% is excreted as unchanged drug. The urinary metabolites consist mainly of *N*-dealkylated compounds together with about 10% of the dose as norverapamil or its *O*-demethylated derivative; conjugated *O*-demethylated products account for about 17% of the urinary material. About 16% of a dose is eliminated in the faeces.

THERAPEUTIC CONCENTRATION.

Following single oral doses of 80 mg to 20 subjects, mean peak plasma concentrations of 0.038 µg/ml of verapamil and 0.026 µg/ml of norverapamil were attained in about 3 hours; after oral doses of 120 mg to the same subjects, mean peak plasma concentrations of 0.068 µg/ml of verapamil and 0.059 µg/ml of norverapamil were reported at 2 hours (R. G. McAllister and E. B. Kirsten, *Clin. Pharmac. Ther.*, 1982, 31, 418–426).

Following chronic oral doses of 80 mg 6-hourly to 16 subjects, steady-state trough plasma concentrations of 0.031 to 0.168 µg/ml (mean 0.105) of verapamil, and 0.078 to 0.279 µg/ml (mean 0.171) of norverapamil were reported; maximum steady-state plasma concentrations were 0.135 to 0.447 µg/ml (mean 0.255) and 0.134 to 0.361 µg/ml (mean 0.226) for verapamil and norverapamil respectively, attained 1 hour after a dose (S. B. Freedman *et al.*, *Clin. Pharmac. Ther.*, 1981, 30, 644–652).

TOXICITY.

In a fatality due to verapamil ingestion, the following postmortem tissue concentrations were reported: blood 8.8 µg/ml, kidney 28 µg/g, liver

165 µg/g (B. M. Thomson and L. K. Pannell, *J. analyt. Toxicol.*, 1981, 5, 105–109).

Serum concentrations of 3 µg/ml of verapamil and 2.5 µg/ml of norverapamil were reported in a 17-year-old girl 12 hours after ingestion of an unknown overdose of verapamil; death occurred after 19 hours (G. M. Orr *et al.*, *Lancet*, 1982, 2, 1218–1219).

HALF-LIFE. Plasma half-life, verapamil about 2 to 7 hours, increased during long term oral dosing and in subjects with liver disease; norverapamil about 5 to 13 hours.

VOLUME OF DISTRIBUTION. About 2 to 6 litres/kg.

CLEARANCE. Plasma clearance, about 10 to 20 ml/min/kg.

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 1.2.

PROTEIN BINDING. In plasma, about 90%.

NOTE. For a review of the pharmacokinetics of verapamil see S. R. Hamann *et al.*, *Clin. Pharmacokin.*, 1984, 9, 26–41.

Dose. 120 to 480 mg of verapamil hydrochloride daily.

Veratrine

A mixture of alkaloids from *sabadilla*, the dried ripe seeds of *Schoenocaulon officinale* (Liliaceae).

Note. Veratrine should be distinguished from protoveratrine obtained from *veratrum*.

CAS—8051-02-3 (mixture)

A white or greyish-white powder. M.p. 145° to 155°.

Practically **insoluble** in water; soluble 1 in 3 of ethanol, 1 in 3 of chloroform, and 1 in 6 of ether.

Caution. Veratrine has a violent irritant action on mucous membranes, even in minute doses, and must be handled with great care.

Colour Tests. Liebermann's Test—brown; Mandelin's Test—yellow → orange → violet-brown; Marquis Test—orange; Sulphuric Acid—yellow → violet.

Thin-layer Chromatography. *System TA*—Rf 59; *system TB*—Rf 04; *system TC*—Rf 35.

Ultraviolet Spectrum. Aqueous acid—262 nm ($A_1^1 = 67$ b), 292 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1270, 1085, 1111, 1136, 1234, 1035 (KBr disk).

Viloxazine

Antidepressant

2-(2-Ethoxyphenoxy)methyl)morpholine

$C_{13}H_{19}NO_3 = 237.3$

CAS—46817-91-8

Viloxazine Hydrochloride

Proprietary Names. Vicilan; Vivalan.

$C_{13}H_{19}NO_3 \cdot HCl = 273.8$

CAS—35604-67-2

M.p. 185° to 186°.

Dissociation Constant. pK_a 8.1.

Colour Tests. Liebermann's Test—black; Mandelin's Test—blue-green; Marquis Test—violet.

Thin-layer Chromatography. System TA—Rf 42; system TB—Rf 07; system TC—Rf 23.

Gas Chromatography. System GA—RI 2005.

High Pressure Liquid Chromatography. System HF—k' 2.7.

Ultraviolet Spectrum. Aqueous acid—273 nm ($A_1^1 = 92$ b). No alkaline shift.

Infra-red Spectrum. Principal peaks at wavenumbers 1217, 1121, 1252, 739, 1511, 1031 (viloxazine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at m/z 56, 100, 138, 110, 57, 237, 70, 41.

Quantification. GAS CHROMATOGRAPHY. In plasma: detection limit 200 ng/ml, FID—T. R. Norman *et al.*, *Br. J. clin. Pharmac.*, 1979, 8, 169–171.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: sensitivity 25 ng/ml and 1 µg/ml, respectively, fluorescence detection—R. Gillilan and W. D. Mason, *J. pharm. Sci.*, 1981, 70, 220–221.

Disposition in the Body. Rapidly and completely absorbed after oral administration and crosses the blood-brain barrier. It is extensively metabolised by hydroxylation. About 90% of an oral dose is excreted in the urine in 24 hours, of which 12 to 15% is unchanged drug, 3% is the free 4- and 5-hydroxy metabolites, and more than 40% is the glucuronide conjugate of 5-hydroxyviloxazine; about 16% is excreted as the glucuronide of a hydroxylated 5-oxo metabolite.

THERAPEUTIC CONCENTRATION.

Following single oral doses of 100 mg to 10 subjects, peak plasma concentrations of 1.11 to 2.93 µg/ml (mean 1.7) were attained in about 1.5 hours (B. Vandel *et al.*, *Eur. J. drug Met. Pharmacokinet.*, 1982, 7, 65–68). Following oral doses of 400 mg daily in divided doses to 13 subjects, a mean steady-state blood concentration of about 1.3 µg/ml was reported (P. F. C. Bayliss and D. E. Case, *Br. J. clin. Pharmac.*, 1975, 2, 209–214).

TOXICITY. A number of attempted suicides have been reported but recovery has occurred after the ingestion of up to 6.5 g of viloxazine together with other drugs.

The following postmortem tissue concentrations were reported in a fatality attributed to viloxazine: blood 45 µg/ml, liver 185 µg/g, urine 640 µg/ml; death occurred about 8 to 12 hours after ingestion (M. Bailey, *Bull. int. Ass. forens. Toxicol.*, 1976, 12(3), 22).

HALF-LIFE. Plasma half-life, 2 to 5 hours.

VOLUME OF DISTRIBUTION. About 0.5 to 1.5 litres/kg.

PROTEIN BINDING. In plasma, about 85 to 90%.

NOTE. For a review of viloxazine see R. M. Pinder *et al.*, *Drugs*, 1977, 13, 401–421.

Dose. The equivalent of 100 to 400 mg of viloxazine daily.

Vinbarbitone

Barbiturate

Synonyms. Butenemal; Vinbarbital.

5-Ethyl-5-(1-methylbut-1-enyl)barbituric acid

$C_{11}H_{16}N_2O_3 = 224.3$

CAS—125-42-8

A white powder. M.p. 160° to 163°.

Very slightly soluble in water; soluble in ethanol; sparingly soluble in ether.

Dissociation Constant. pK_a 7.5 (20°).

Colour Tests. Koppanyi-Zwicker Test—violet; Mercurous Nitrate—black; Vanillin Reagent—violet-brown/colourless.

Thin-layer Chromatography. System TD—Rf 50; system TE—Rf 32; system TF—Rf 64; system TH—Rf 56. (Mercurous nitrate spray, black; acidified potassium permanganate solution, yellow-brown; Zwicker's reagent, pink.)

Gas Chromatography. System GA—RI 1740; system GF—RI 2495.

High Pressure Liquid Chromatography. System HG—k' 4.83; system HH—k' 2.32.

Ultraviolet Spectrum. Borax buffer 0.05 M (pH 9.2)—238 nm ($A_1^1 = 452$ a); M sodium hydroxide (pH 13)—254 nm ($A_1^1 = 374$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1675, 1760, 1725, 1234, 1282, 1298 (KBr disk).

Mass Spectrum. Principal peaks at m/z 195, 41, 141, 69, 39, 152, 135, 196.

Quantification. See under Amylobarbitone.

Dose. 100 to 200 mg daily.

Vinblastine

Antineoplastic

Synonyms. Vincaleucoblastine; Vincaleukoblastine.

$C_{46}H_{58}N_4O_9 = 811.0$

CAS—865-21-4

An alkaloid extracted from *Vinca rosea* (*Catharanthus roseus*) (Apocynaceae).

Crystals. M.p. 211° to 216°.

Practically **insoluble** in water; soluble in ethanol and chloroform.

Vinblastine Sulphate

Proprietary Names. Velban; Velbe.

$C_{46}H_{58}N_4O_9 \cdot H_2SO_4 = 909.1$

CAS—143-67-9

A white to slightly yellow, very hygroscopic, amorphous or crystalline powder. M.p. about 284°, with decomposition.

Soluble 1 in 10 of water, 1 in 1200 of ethanol, and 1 in 50 of chloroform; practically insoluble in ether; soluble in methanol.

Dissociation Constant. pK_a 5.4, 7.4.

Colour Test. Marquis Test—red.

Thin-layer Chromatography. *System TA*—Rf 60; *system TB*—Rf 01; *system TC*—Rf 60.

Ultraviolet Spectrum. Aqueous acid—268 nm ($A_1^1 = 176$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1227, 1136, 1111, 1724, 1176, 1613 (vinblastine sulphate, KBr disk).

Quantification. RADIOIMMUNOASSAY. In plasma: vinblastine and vincristine, sensitivity 2.1 ng/ml and 3.8 ng/ml, respectively—J. D. Teale *et al.*, *Br. J. clin. Pharmac.*, 1977, 4, 169–172.

Disposition in the Body. Poorly absorbed after oral administration. After intravenous administration, it is metabolised to desacetylvinblastine which is active. About 14% of a radioactively-labelled dose is excreted in the urine in 72 hours and 10% is eliminated in the faeces in the same period.

HALF-LIFE. Plasma half-life (total radioactivity), about 20 hours.

PROTEIN BINDING. In plasma, about 99%.

Dose. Initially 100 µg/kg of vinblastine sulphate weekly, by intravenous injection.

Vincristine

Antineoplastic

Synonym. Leurocristine

22-Oxovincalcoloblastine

$C_{46}H_{56}N_4O_{10} = 825.0$

CAS—57-22-7

An alkaloid obtained from *Vinca rosea* (*Catharanthus roseus*) (Apocynaceae).

Crystals. M.p. 218° to 220°.

Vincristine Sulphate

Proprietary Name. Oncovin

$C_{46}H_{56}N_4O_{10} \cdot H_2SO_4 = 923.0$

CAS—2068-78-2

A white to slightly yellow, very hygroscopic, amorphous or crystalline powder. M.p. about 277°.

Soluble 1 in 2 of water, 1 in 600 of ethanol, and 1 in 30 of chloroform; practically insoluble in ether; soluble in methanol.

Dissociation Constant. pK_a 5.0, 7.4.

Ultraviolet Spectrum. Aqueous acid—256 nm ($A_1^1 = 181$ b), 297 nm ($A_1^1 = 179$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1230, 1745, 1170, 1685, 1030, 1130 (vincristine sulphate, KBr disk).

Quantification. See under Vinblastine.

Disposition in the Body. Poorly absorbed after oral administration. After intravenous injection it disappears rapidly from the blood and is excreted mainly in the bile. About 12% of a dose is excreted in the urine in 72 hours, and 70% is eliminated in the faeces in the same period.

HALF-LIFE. Plasma half-life, about 3 hours; a terminal elimination half-life of about 23 hours has also been reported.

Dose. Initially 25 to 75 µg/kg of vincristine sulphate weekly, by intravenous injection.

Vindesine

Antineoplastic

Synonym. Desacetyl Vinblastine Amide

3 - Carbamoyl - *O*⁴-deacetyl - 3 - de(methoxycarbonyl)vincalcoloblastine

$C_{43}H_{55}N_5O_7 = 753.9$

CAS—53643-48-4

Crystals. M.p. 230° to 232°.

Vindesine Sulphate

Proprietary Name. Eldisine

$C_{43}H_{55}N_5O_7 \cdot H_2SO_4 = 852.0$

CAS—59917-39-4

An amorphous solid.

Freely **soluble** in water.

Dissociation Constant. pK_a 5.4, 7.4.

Ultraviolet Spectrum. Methanol—270 nm ($A_1^1 = 235$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1120, 1230, 1680, 1175, 1610, 1038 (vindesine sulphate, KBr disk).

Quantification. RADIOIMMUNOASSAY. In plasma: sensitivity 50 pg/ml—R. Rahmani *et al.*, *Clinica chim. Acta*, 1983, 129, 57–69.

Disposition in the Body. Poorly absorbed after oral administration. After intravenous injection, about 13% of a dose is excreted in the urine in 24 hours.

HALF-LIFE. Plasma half-life, about 24 hours.

Dose. Initially 3 mg/m² of vindesine sulphate weekly, by intravenous injection.

Vinylbitone

Barbiturate

Synonyms. Butylvinal; Butyvinal; Vinylbital; Vinyalum.

Proprietary Names. Bykonox; Optanox; Speda; Suppoptanox.

5-(1-Methylbutyl)-5-vinylbarbituric acid

$C_{11}H_{16}N_2O_3 = 224.3$

CAS—2430-49-1

Crystals. M.p. 90° to 92°.

Gas Chromatography. *System GA*—RI 1720.

Ultraviolet Spectrum. Aqueous alkali—247 nm ($A_1^1 = 298$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1692, 1730, 1750, 1318, 1220, 1630.

Quantification. See also under Amylobarbitone.

GAS CHROMATOGRAPHY. In plasma: sensitivity < 125 ng/ml, AFID—D. D. Breimer and A. G. de Boer, *Arzneimittel-Forsch.*, 1976, 26, 448–454.

Disposition in the Body. Readily absorbed after oral administration. Metabolites which have been identified in urine are 3'-hydroxyvinylbitone and the corresponding desvinyl derivative, 5-(3-hydroxy-1-methylbutyl)barbituric acid. Less than 5% of a dose is excreted in the urine unchanged in 72 hours.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 150 mg to 6 subjects, peak plasma concentrations of 2.2 to 3.9 µg/ml were attained in 1 to 2 hours (D. D. Breimer and A. G. de Boer, *ibid.*).

HALF-LIFE. Plasma half-life, 18 to 34 hours (mean 24).

VOLUME OF DISTRIBUTION. About 0.7 litre/kg.

REFERENCE. D. D. Breimer and A. G. de Boer, *ibid.*

Dose. 100 to 200 mg, as a hypnotic.

Vipryinium Embonate

Anthelmintic

Synonyms. Pyrvinium Pamoate; Vipryinium Pamoate.

Proprietary Names. Molevac; Pamovin; Povan; Povanyl; Pyr-Pam; Vanquin.

Bis[6-dimethylamino-2-[2-(2,5-dimethyl-1-phenylpyrrol-3-yl)vinyl]-1-methylquinolinium} 4,4'-methylenebis(3-hydroxy-2-naphthoate)

$C_{52}H_{56}N_6 \cdot C_{23}H_{14}O_6 = 1152$

CAS—3546-41-6

A bright orange or orange-red to almost black, crystalline powder. M.p. about 206°, with decomposition.

Practically **insoluble** in water and ether; very slightly soluble in ethanol; soluble 1 in 1000 of chloroform; freely soluble in glacial acetic acid.

Colour Tests. Mandelin's Test—yellow; Marquis Test—yellow.

Thin-layer Chromatography. *System TA*—Rf 67. (Acidified potassium permanganate solution, weak reaction.)

Ultraviolet Spectrum. 2-Methoxyethanol—239 nm, 358 nm ($A_1^1 = 380$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1592, 1618, 1294, 1188, 1500, 1513 (KBr disk).

Dose. The equivalent of 5 mg/kg of vipryinium as a single dose.

Warfarin

Anticoagulant/Rodenticide

Proprietary Names. Biotrol; Dethmor; Sorex (all rodenticides).

4-Hydroxy-3-(3-oxo-1-phenylbutyl)coumarin

$C_{19}H_{16}O_4 = 308.3$

CAS—81-81-2

Colourless crystals. M.p. of the purified compound 159° to 160°; of the technical grade 157°.

Practically **insoluble** in water; moderately soluble in alcohols; readily soluble in acetone.

Warfarin Potassium

Proprietary Name. Athrombin-K

$C_{19}H_{15}KO_4 = 346.4$

CAS—2610-86-8

A white crystalline powder which discolours on exposure to light.

Soluble 1 in 1.5 of water and 1 in 1.9 of ethanol; very slightly soluble in chloroform and ether.

Warfarin Sodium

Proprietary Names. Coumadin(e); Marevan; Panwarfin; Warfilone; Warnerin.

$C_{19}H_{15}NaO_4 = 330.3$

CAS—129-06-6

A white amorphous or crystalline powder which discolours on exposure to light.

Soluble 1 in less than 1 of water and ethanol; slightly soluble in chloroform and ether.

Dissociation Constant. pK_a 5.0 (20°).

Partition Coefficient. Log *P* (octanol/pH 8.0), 0.0.

Colour Test. Liebermann's Test—red-orange.

Thin-layer Chromatography. *System TD*—Rf 64; *system TE*—Rf 18; *system TF*—Rf 62. (Acidified potassium permanganate solution, positive.)

Gas Chromatography. *System GA*—RI 1432.

Ultraviolet Spectrum. Aqueous acid—270 nm, 280 nm, 303 nm; aqueous alkali—293 nm, 308 nm ($A_1^1 = 462$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1517, 1599, 1640, 750, 1700, 692 (warfarin sodium, KBr disk).

Mass Spectrum. Principal peaks at m/z 265, 308, 121, 43, 266, 187, 213, 251.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 300 ng/ml, FID—S. Hanna *et al.*, *J. pharm. Sci.*, 1978, 67, 84–86.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma or urine: (R)- and (S)-warfarin and metabolites, fluorescence detection—C. Banfield and M. Rowland, *J. pharm. Sci.*, 1984, 73, 1392–1396. In plasma or serum: sensitivity 50 ng/ml, UV detection—R. A. R. Tasker and K. Nakatsu, *J. Chromat.*, 1982, 228; *Biomed. Appl.*, 17, 346–349. In plasma or urine: warfarin and metabolites, fluorescence detection—S. H. Lee *et al.*, *Analyt. Chem.*, 1981, 53, 467–471.

Disposition in the Body. Readily absorbed after oral administration. The (R)-enantiomer of warfarin is metabolised mainly by reduction to (RS)-3'-hydroxywarfarin although 6-hydroxylation also occurs. The (S)-enantiomer is metabolised mainly by 6- and 7-hydroxylation with smaller amounts of the (SS)-3'-hydroxy metabolite; the reduced metabolites are less active than warfarin; the 6- and 7-hydroxy metabolites are inactive. Less than 1% of a dose is excreted in the urine as unchanged drug. About 16 to 43% of a single dose is excreted in the urine as free or conjugated metabolites in 6 days.

THERAPEUTIC CONCENTRATION. In plasma, usually in the range 1 to 3 µg/ml but there are considerable intersubject variations in sensitivity to warfarin and measurement of the plasma concentration is generally of little value since the pharmacological effect can be easily measured.

Following a single oral dose of 50 mg to 8 subjects, peak plasma concentrations of 5.2 to 10.9 µg/ml (mean 7.2) were attained in 0.3 to 3 hours (mean 1.5) (A. Welle-Watne *et al.*, *Meddr norsk farm. Selsk.*, 1980, 42, 103–113).

In 6 subjects receiving daily oral doses of 5 to 11 mg, steady-state plasma concentrations of 1.2 to 2.6 µg/ml were attained (M. L'E. Orme *et al.*, *Br. med. J.*, 1977, 1, 1564–1565).

TOXICITY. Toxic effects are associated with plasma concentrations greater than 10 µg/ml. The maximum permissible atmospheric concentration is 0.1 mg/m³.

HALF-LIFE. Plasma half-life, 15 to 85 hours (mean 42), decreased in subjects with renal disease. The half-life of the R-enantiomer (mean about 45 hours) appears to be longer than that of the S-enantiomer (mean, about 30 hours).

VOLUME OF DISTRIBUTION. 0.05 to 0.25 litre/kg (mean 0.15).

CLEARANCE. Plasma clearance, 0.02 to 0.08 ml/min/kg (mean 0.04).

DISTRIBUTION IN BLOOD. Plasma: whole blood ratio, about 1.8.

PROTEIN BINDING. In plasma, 97 to 99%, reduced in renal impairment.

Dose. Maintenance, 3 to 12 mg of warfarin sodium daily.

Xanthinol Nicotinate

Vasodilator

Synonym. Xanthinol Niacinate

Proprietary Names. Complamin(e); Emodinamin; Vasoprin.

7-{2-Hydroxy-3-[(2-hydroxyethyl)methylamino]propyl}theophylline nicotinate

C₁₃H₂₁N₅O₄·C₆H₅NO₂ = 434.5

CAS—2530-97-4 (xanthinol); 437-74-1 (nicotinate)

Colourless crystals. M.p. 180°.

Soluble in water.

Colour Tests. Amalic Acid Test—orange/violet; Cyanogen Bromide—orange.

Thin-layer Chromatography. System TA—Rf 41. (Acidified potassium permanganate solution, positive.)

Ultraviolet Spectrum. Aqueous acid—267 nm ($A_1^1 = 300$ a). Xanthinol: aqueous acid—273 nm ($A_1^1 = 270$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1658, 1695, 1548, 763, 750, 1029 (xanthinol, KBr disk).

Dose. 450 to 900 mg daily.

Xipamide

Diuretic

Proprietary Name. Diurexan

4-Chloro-5-sulphamoylsalicylo-2',6'-xylidide

C₁₅H₁₅ClN₂O₄S = 354.8

CAS—14293-44-8

A white crystalline substance. M.p. about 260°, with decomposition.

Practically **insoluble** in water; soluble in ethanol; very soluble in acetone; slightly soluble in chloroform and ether.

Dissociation Constant. pK_a 4.8 (phenol), 10.0 (sulphonamide).

Colour Tests. Koppanyi-Zwicker Test—violet; Liebermann's Test—orange; Mandelin's Test—blue; Mercurous Nitrate—black.

Thin-layer Chromatography. System TD—Rf 38; system TE—Rf 11; system TF—Rf 64.

Ultraviolet Spectrum. Aqueous acid—296 nm ($A_1^1 = 92$ b); aqueous alkali—330 nm ($A_1^1 = 160$ b).

Infra-red Spectrum. Principal peaks at wavenumbers 1163, 1635, 1578, 1560, 975, 1525 (KBr disk). (See below)

Mass Spectrum. Principal peaks at m/z 121, 120, 354, 122, 43, 234, 106, 64.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In urine: UV detection—W. Diembeck *et al.*, *Arzneimittel-Forsch.*, 1982, 32, 1482–1485.

THIN-LAYER CHROMATOGRAPHY-SPECTROFLUORIMETRY. In plasma or urine: detection limit <10 ng/ml in plasma—M. Sobel and E. Mutschler, *J. Chromat.*, 1980, 183; *Biomed. Appl.*, 9, 124–130.

Disposition in the Body. Completely and fairly rapidly absorbed after oral administration. About 88% of a dose is excreted in the urine in 48 hours with about 50% as unchanged drug and 30% as xipamide-*O*-glucuronide; free amine metabolites have also been detected. In normal subjects, only traces are excreted in the bile, but biliary excretion may be extensive in renal failure.

HALF-LIFE. Plasma half-life, about 5 to 8 hours.

PROTEIN BINDING. In plasma, about 99%.

Dose. Usually 20 to 40 mg daily; doses of 80 mg daily have been given.

Xylazine

Sedative/Analgesic (Veterinary)

Proprietary Name. Rompun

N-(5,6-Dihydro-4*H*-1,3-thiazin-2-yl)-2,6-xylidine

$C_{12}H_{16}N_2S$ = 220.3

CAS—7361-61-7

Colourless crystals. M.p. about 138°.

Practically **insoluble** in water; soluble in acetone and chloroform.

Xylazine Hydrochloride

$C_{12}H_{16}N_2S \cdot HCl$ = 256.8

CAS—23076-35-9

A white powder. M.p. 164° to 167°.

Readily **soluble** in water, ethanol, and methanol; very slightly soluble in chloroform and ether.

Colour Tests. Liebermann's Test—red; Mandelin's Test—blue.

Thin-layer Chromatography. *System TA*—Rf 60. (*Acidified iodoplatinate solution*, positive.)

Infra-red Spectrum. Principal peaks at wavenumbers 1613, 1585, 1164, 1314, 1085, 1099 (KBr disk).

Mass Spectrum. Principal peaks at *m/z* 205, 77, 41, 39, 220, 130, 145, 131.

Disposition in the Body.

TOXICITY.

Coma and severe respiratory depression occurred in a 34-year-old man after the intramuscular injection of about 10 mg of xylazine hydrochloride; the subject recovered (S. G. Carruthers *et al.*, *Clin. Toxicol.*, 1979, 15, 281–285).

Xylazine was detected in the urine but not in plasma (<100 ng/ml) in a non-fatal poisoning case following the ingestion of 400 mg (A. G. Gallanosa *et al.*, *Clin. Toxicol.*, 1981, 18, 663–678).

Xylene

Solvent

Synonym. Xylol(e)

Proprietary Name. Cerulyse

A mixture of *o*-, *m*- and *p*-dimethylbenzene in which the *m*-isomer predominates.

C_8H_{10} = 106.2

CAS—1330-20-7; 108-38-3 (*m*-xylene); 95-47-6 (*o*-xylene); 106-42-3 (*p*-xylene)

A colourless, inflammable liquid. Wt per ml 0.85 to 0.86 g. B.p. 136° to 142°.

Practically **insoluble** in water; miscible with ethanol, ether, and other organic solvents.

Gas Chromatography. *System GA*—*o*-xylene RI 884, *m*-xylene RI 863, *p*-xylene RI 860; *system GI*—*o*-xylene retention time 34.5 min, *m*-xylene retention time 33.2 min, *p*-xylene retention time 34.2 min.

Mass Spectrum. Principal peaks at *m/z* 91, 106, 105, 77, 51, 39, 29, 92 (*m*-xylene).

Quantification. GAS CHROMATOGRAPHY. In urine: *m* and *p*-methylhippuric acids, sensitivity 1.0 µg/ml, AFID—M. Morin *et al.*, *J. Chromat.*, 1981, 210, 346–349.

GAS CHROMATOGRAPHY AND GAS CHROMATOGRAPHY-MASS SPECTROMETRY. In blood or tissues: xylenes and other volatile compounds, using headspace analysis—J. A. Bellanca *et al.*, *J. analyt. Toxicol.*, 1982, 6, 238–240.

Disposition in the Body. The three isomers of xylene are absorbed from the gastro-intestinal tract, through the skin, and from the lungs. The main metabolic reactions are oxidation of a methyl group to give the corresponding *o*-, *m*-, or *p*-toluic acid and conjugation with glycine to *o*-, *m*-, or *p*-methylhippuric acid; about 70% of the absorbed material is excreted as these conjugates in the urine in 18 hours. Hydroxylation of the xylenes to the corresponding xyleneols also occurs and these may be excreted in the urine as conjugates. About 5% of a dose is excreted unchanged in expired air and less than 0.01% in the urine.

TOXICITY. Xylene has about the same acute toxicity as benzene or toluene. The maximum permissible atmospheric concentration is 100 ppm. Exposure to air concentrations of 10 000 ppm has been reported to cause unconsciousness or death.

Exposure to a concentration of 100 ppm of *m*-xylene, for 6 hours, produced a mean peak blood-xylene concentration of about 1.0 µg/ml in 4 subjects at rest; when the concentration was increased to 200 ppm for 3 hours, the mean peak blood concentration was about 2.1 µg/ml (K. Savolainen *et al.*, *Int. Archs occup. Envir. Hlth*, 1979, 44, 201–211).

Two men, aged 51 and 55 years, died in two separate incidents after ingestion of petrol which contained xylenes. The following postmortem concentrations of xylene in body tissues were reported: blood 20 and 3.0 µg/ml, and liver 1.0 µg/g for both subjects. A woman of 55, found dead, had the following postmortem concentrations of xylene in body tissues: blood 40 µg/ml, liver 1.0 µg/g (R. Bonnicksen *et al.*, *J. forens. Sci.*, 1966, 11, 186–204).

HALF-LIFE. Blood half-life, about 20 to 30 hours.

Xylometazoline

Sympathomimetic

2-(4-*tert*-Butyl-2,6-dimethylbenzyl)-2-imidazoline

$C_{16}H_{24}N_2 = 244.4$

CAS—526-36-3

M.p. 131° to 133°.

Xylometazoline Hydrochloride

Proprietary Names. Long Acting Neo-Syneprine; Otrivin(e); Otrix; Sinex Long-Acting; 4-Way.

Note. The name Otrivin has also been applied to a preparation containing naphazoline hydrochloride.

$C_{16}H_{24}N_2 \cdot HCl = 280.8$

CAS—1218-35-5

A white crystalline powder. M.p. above 300°, with decomposition.

Soluble 1 in 12 of water, 1 in 4 of ethanol, and 1 in 25 of chloroform; practically insoluble in ether.

Partition Coefficient. Log *P* (chloroform/pH 7.4), 0.6.

Colour Tests. Mandelin's Test—red; Marquis Test—orange.

Thin-layer Chromatography. *System TA*—Rf 13; *system TB*—Rf 08; *system TC*—Rf 05. (Acidified iodoplatinate solution, positive.)

Gas Chromatography. *System GA*—RI 1940.

High Pressure Liquid Chromatography. *System HA*—k' 1.6.

Ultraviolet Spectrum. Aqueous acid—265 nm ($A_1^1 = 11.5$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1602, 1253, 1298, 871, 1237, 800 (xylometazoline hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at *m/z* 244, 229, 44, 173, 40, 230, 243, 245.

Disposition in the Body.

TOXICITY.

The following postmortem concentrations were reported in a 23-year-old man who died after the intravenous self-administration of xylometazoline: blood 0.14 µg/ml, liver blood 0.37 µg/ml (P. Vanezis and P. A. Toseland, *Medicine, Sci. Law*, 1980, 20, 35–36).

Use. In concentrations of 0.05 to 0.1% of the hydrochloride, as nasal drops or spray.

Yohimbine

Alkaloid

Synonyms. Aphrodine; Corynine; Québrachine.

Methyl 17 α -hydroxy-yohimban-16 α -carboxylate

$C_{21}H_{26}N_2O_3 = 354.4$

CAS—146-48-5

The principal alkaloid of the bark of the yohimbe tree, *Pausinystalia yohimbe* (= *Corynanthe yohimbi*) (Rubiaceae). Crystals. M.p. about 234°.

Very slightly **soluble** in water; soluble in ethanol and chloroform; sparingly soluble in ether.

Yohimbine Hydrochloride

Proprietary Name. It is an ingredient of Vikonon.

$C_{21}H_{26}N_2O_3 \cdot HCl = 390.9$

CAS—65-19-0

A white crystalline powder. M.p. about 302°, with decomposition.

Soluble 1 in 100 of water; more soluble in hot water and ethanol.

Colour Tests. Liebermann's Test—blue; Mandelin's Test—blue → green.

Thin-layer Chromatography. *System TA*—Rf 63; *system TB*—Rf 05; *system TC*—Rf 38. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, grey.)

Gas Chromatography. *System GA*—RI 3269.

Ultraviolet Spectrum. Aqueous acid—271 nm ($A_1^1 = 211$ a), 277 nm ($A_1^1 = 207$ a), 287 nm; aqueous alkali—280 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 1705, 741, 1197, 1160, 1290, 1135 (yohimbine hydrochloride, KBr disk).

Mass Spectrum. Principal peaks at *m/z* 353, 354, 169, 170, 355, 156, 184, 144.

Quantification. HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: sensitivity 10 ng/ml, electrochemical detection—M. R. Goldberg *et al.*, *J. liq. Chromat.*, 1984, 7, 1003–1012.

Dose. Yohimbine hydrochloride has been given in doses of up to 30 mg daily.

Zimeldine

Antidepressant

Note. Zimeldine was previously known as zimelidine.

(*Z*)-4-Bromo-*NN*-dimethyl- γ -(3-pyridyl)cinnamylamine

$C_{16}H_{17}BrN_2 = 317.2$

CAS—56775-88-3

A white crystalline solid.

Zimeldine Hydrochloride

Proprietary Name. Zelmid

$C_{16}H_{17}BrN_2 \cdot 2HCl \cdot H_2O = 408.2$

CAS—60525-15-7 (anhydrous); 61129-30-4 (monohydrate)

A white to yellowish-white crystalline substance. M.p. 195° to 200°, with decomposition.

Soluble 1 in less than 1 of water and 1 in 1000 of ethanol; practically insoluble in chloroform and ether.

Dissociation Constant. pK_a 3.8, 8.6.

Colour Tests. Cyanogen Bromide (30 s)—red; Liebermann's Test—brown.

Thin-layer Chromatography. *System TA*—Rf 47; *system TB*—Rf 27; *system TC*—Rf 25. (Location under ultraviolet light, violet fluorescence; *Dragendorff spray*, positive.)

Gas Chromatography. *System GA*—RI 2213.

High Pressure Liquid Chromatography. *System HA*—zimeldine k' 3.2 (tailing peak), norzimeldine k' 2.9 (tailing peak); *system HF*— k' 0.67.

Ultraviolet Spectrum. Aqueous acid—250 nm ($A_1^1 = 630$ a); aqueous alkali—258 nm.

Infra-red Spectrum. Principal peaks at wavenumbers 815, 1492, 699, 953, 1075, 840 (KBr disk).

Mass Spectrum. Principal peaks at m/z 58, 70, 318, 316, 317, 193, 319, 161.

Quantification. GAS CHROMATOGRAPHY. In plasma: zimeldine and norzimeldine, sensitivity 5 ng/ml, ECD—G. Caillé *et al.*, *Clin. Pharmacokinet.*, 1983, 8, 530–540.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In plasma: zimeldine and norzimeldine, detection limits 1.5 ng/ml and 700 pg/ml, respectively, UV detection—D. Westerlund and E. Erixson, *J. Chromat.*, 1979, 185, 593–603.

Disposition in the Body. Readily absorbed after oral administration and rapidly demethylated by first-pass metabolism to norzimeldine which is active; bioavailability 20 to 50%. Other metabolites include zimeldine *N*-oxide and 3-(4-bromophenyl)-3-(3-pyridyl)acrylic acid; very little unchanged drug is excreted in the urine.

THERAPEUTIC CONCENTRATION.

Following a single oral dose of 100 mg to 10 subjects, peak plasma-zimeldine concentrations of 0.048 to 0.164 $\mu\text{g/ml}$ (mean 0.10) were attained in 2 to 3 hours and peak plasma-norzimeldine concentrations of 0.012 to 0.092 $\mu\text{g/ml}$ (mean 0.04) were attained in 1.5 to 8 hours (G. Caillé *et al.*, *Clin. Pharmacokinet.*, 1983, 8, 530–540).

Following oral doses averaging 225 mg daily, given twice a day to 8 subjects, steady-state plasma concentrations of 0.029 to 0.102 $\mu\text{g/ml}$ (mean 0.07) of zimeldine and 0.145 to 0.554 $\mu\text{g/ml}$ (mean 0.25) of norzimeldine were reported. The corresponding steady-state concentrations in cerebrospinal fluid were 0.003 to 0.007 (mean 0.006) and 0.027 to 0.072 (mean 0.043) for zimeldine and norzimeldine respectively (H. M. Calil *et al.*, *Clin. Pharmac. Ther.*, 1982, 31, 522–527).

TOXICITY. Zimeldine has been withdrawn from use because of potentially severe neurological side-effects. Recovery within 48 hours of ingestion of 3 g of zimeldine together with half a bottle of vodka has been reported.

The following postmortem tissue distribution was reported in a female subject who had been receiving 300 mg of zimeldine daily and had been found drowned: blood, zimeldine 0.3 $\mu\text{g/ml}$, norzimeldine 0.9 $\mu\text{g/ml}$; bile, zimeldine 5.0 $\mu\text{g/ml}$, norzimeldine 15 $\mu\text{g/ml}$; liver, zimeldine 4.0 $\mu\text{g/g}$, norzimeldine 16 $\mu\text{g/g}$ (R. Geyer, *Bull. int. Ass. forens. Toxicol.*, 1981, 16(2), 30–31).

HALF-LIFE. Plasma half-life, zimeldine about 4 to 9 hours, norzimeldine about 15 to 25 hours.

VOLUME OF DISTRIBUTION. Zimeldine, about 4 litres/kg, norzimeldine, about 9 litres/kg.

CLEARANCE. Plasma clearance, zimeldine about 7 to 11 ml/min/kg, norzimeldine about 8 ml/min/kg.

PROTEIN BINDING. In plasma, zimeldine about 90%, norzimeldine about 80%.

NOTE. For a review of the pharmacokinetics of zimeldine see R. C. Heel *et al.*, *Drugs*, 1982, 24, 169–206.

Dose. Zimeldine hydrochloride has been given in doses of 100 to 300 mg daily.

Zomepirac

Analgesic

5-(4-Chlorobenzoyl)-1,4-dimethylpyrrol-2-ylacetic acid

$C_{15}H_{14}ClNO_3 = 291.7$

CAS—33369-31-2

White crystals. M.p. 178° to 179°, with decomposition.

Zomepirac Sodium

Proprietary Name. Zomax

$C_{15}H_{13}ClNNaO_3 \cdot 2H_2O = 349.7$

CAS—64092-48-4 (anhydrous); 64092-49-5 (dihydrate)

A pale yellow crystalline powder. M.p. 303° to 305°.

Colour Tests. Formaldehyde—Sulphuric Acid—red; Liebermann's Test (100°)—orange; Marquis Test—yellow (\rightarrow orange at 100°); Sulphuric Acid—yellow.

Thin-layer Chromatography. *System TD*—Rf 12; *system TE*—Rf 04; *system TF*—Rf 12. (Marquis reagent, yellow \rightarrow green, slow; mercuric chloride-diphenylcarbazone reagent, blue, pink after heating; acidified potassium permanganate solution, positive; Van Urk reagent, positive, red after heating.)

Gas Chromatography. *System GA*—zomepirac RI 2048, zomepirac decomposition product RI 1870.

High Pressure Liquid Chromatography. *System HD*— k' 3.7.

Ultraviolet Spectrum. Aqueous acid—262 nm ($A_1^1 = 418$ b), 324 nm ($A_1^1 = 492$ b); aqueous alkali—261 nm, 330 nm ($A_1^1 = 525$ a).

Infra-red Spectrum. Principal peaks at wavenumbers 1587, 1560, 760, 1275, 958, 1493 (zomepirac sodium, KBr disk).

Mass Spectrum. Principal peaks at m/z 246, 291, 248, 290, 247, 139, 111, 292.

Quantification. GAS CHROMATOGRAPHY. In plasma: sensitivity 5 ng/ml, ECD—K.-T. Ng and J. J. Kalbron, *J. Chromat.*, 1983, 276; *Biomed. Appl.*, 27, 311–318.

HIGH PRESSURE LIQUID CHROMATOGRAPHY. In serum or plasma: sensitivity 50 ng/ml, UV detection—C. L. Welch *et al.*, *Clin. Chem.*, 1982, 28, 481–484. In urine: zomepirac and zomepirac glucuronide, detection limit about 100 ng/ml, UV detection—P. Pietta and A. Calatroni, *J. Chromat.*, 1983, 275; *Biomed. Appl.*, 26, 217–222.

Disposition in the Body. Rapidly and completely absorbed after oral administration. About 90% of a dose is excreted in the urine in 48 hours with about 5 to 20% as unchanged drug and about 60 to 80% as a glucuronide conjugate; about 5% of the dose is excreted as a hydroxylated metabolite; 4-chlorobenzoic acid has been reported to be a minor metabolite. Less than 2% of a dose is eliminated in the faeces.

THERAPEUTIC CONCENTRATION.

After a single oral dose of 100 mg to 21 subjects, peak plasma concentrations averaged 4.7 µg/ml at about 1 hour; following oral administration of 100 mg four times a day to 10 subjects, steady-state plasma concentrations of about 3 to 4 µg/ml were reported (R. K. Nayak *et al.*, *Clin. Pharmac. Ther.*, 1980, 27, 395–401).

Following a single oral dose of 200 mg to 5 subjects, peak plasma concentrations of 4.5 to 11.3 µg/ml (mean 9) were attained in about 1 hour; mean peak plasma concentrations of zomepirac glucuronide and hydroxyzomepirac of 3.9 µg/ml and 0.2 µg/ml, respectively, were attained in 0.5 to 3 hours (P. J. O'Neill *et al.*, *J. clin. Pharmac.*, 1982, 22, 470–476).

TOXICITY. Zomepirac has been withdrawn from use because of reports of allergic anaphylactoid reactions.

In a fatality due to the ingestion of 9 g of zomepirac sodium, a postmortem blood concentration of 152 µg/ml and an antemortem blood concentration, obtained 9 hours prior to death, of 286 µg/ml were reported (R. C. Backer *et al.*, *J. analyt. Toxicol.*, 1983, 7, 223–224).

HALF-LIFE. Plasma half-life, about 4 to 10 hours.

DISTRIBUTION IN BLOOD. Plasma : whole blood ratio, 1.9.

PROTEIN BINDING. In plasma, 98 to 99%.

NOTE. For a review of zomepirac see P. A. Morley *et al.*, *Drugs*, 1982, 23, 250–275.

Dose. Zomepirac sodium has been given in doses equivalent to 400 to 600 mg of zomepirac daily.

Ultraviolet Absorption Maxima

In the following tables no values below 230 nm have been included although some have been recorded in the monographs in Part 2. Details of A(1%, 1 cm) values are given in the monographs in Part 2.

Table A gives the wavelengths of maximum absorption, together with the wavelengths of any subsidiary peaks in the range 230 to 360 nm, for the compounds in **acid** solution. Table B gives the wavelengths of maximum absorption in **alkaline** solution when values in acid solution are not recorded in the monographs in Part 2 or when the

values in alkaline solution differ significantly from the values in acid solution. Table C gives the values in **neutral** solution for compounds for which values in acid or alkaline solution are not recorded in the monographs in Part 2 or when the values in neutral solution differ significantly from those in acid or alkaline solution.

For an unknown compound, the wavelength of maximum absorption should be compared with the tables using a tolerance of ± 2 nm to give a list of possible compounds; reference may then be made to the monographs in Part 2.

A. In Acid Solution—Wavelengths of Maximum Absorption

B. In Alkaline Solution—Wavelengths of Maximum Absorption

In this table wavelengths of maximum absorption in alkaline solution are given only for those compounds for which maxima in acid solution are

not recorded in the monographs in Part 2, or for which the maxima in alkaline solution differ significantly from the maxima in acid solution.

C. In Neutral Solution—Wavelengths of Maximum Absorption

The compounds listed below are those whose wavelengths of maximum absorption in acid or alkaline solution are not given in the monographs

in Part 2 or for which the maxima in neutral solution differ significantly from those in acid or alkaline solution.

λ max nm	Compound	Subsidiary peaks nm	λ max nm	Compound	Subsidiary peaks nm
230	Benzyl Benzoate			Triamcinolone	
	Bezafibrate		239	Beclomethasone Dipropionate	
	Hexoestrol	280		Clobetasol Propionate	
	Lorazepam	316		Propylidone	281
	Meclozine	266, 273		Santonin	
	Oxazepam	315	240	Benorylate	
	Prilocaine			Benizodaron	275, 357
	Temazepam	314		Betamethasone	
231	Camazepam	315		Cortisone Acetate	
	Oestradiol Benzoate			Deoxycortone Acetate	
232	Eugenol	282		Dequalinium Chloride	326, 335
233	4-Aminophenol	303		Dexamethasone	
	Bromazepam	320		Dimethisterone	
	Clioquinide			Ethisterone	
	Doxorubicin	253, 290		Fludrocortisone Acetate	
	Triamterene	267		Fluocinolone Acetonide	
234	Bephenium Hydroxynaphthoate	263, 270, 283, 295, 352		Fluocinonide	
	Cephaloridine			Fluoxymesterone	
	Quinethazone	278, 345		Gestronol Hexanoate	
235	Acebutolol	328		Hydralazine	260, 304, 315
	Aniline	286		Hydrocortisone	
	Flurandrenolone			Hydroxyprogesterone Hexanoate	
236	Clobetasone Butyrate			Methylprednisolone	
	Demoxepam	310		Metomidate	
	Dicophane	267		Nandrolone Decanoate	
	Fluclorolone Acetonide			Nandrolone Phenylpropionate	
	Metformin			Norethandrolone	
237	Cephalothin Sodium	265		Norethisterone	
	Cycloguanil	278, 289, 301		Prednisolone	
238	Flugestone Acetate			Prednisone	
	Flumethasone			Progesterone	
	Methyl Salicylate	306	241	Testosterone	
	Phenazopyridine	277		Aldosterone	
	Sodium Cromoglycate	326		Betamethasone Sodium Phosphate	

λ_{max} nm	Compound	Subsidiary peaks nm	λ_{max} nm	Compound	Subsidiary peaks nm
	Fluorometholone			Diloxanide Furoate	
	Medroxyprogesterone Acetate			Diphenoxylate	252, 264
	Methyltestosterone			Glutethimide	252, 264
	Nomifensine	292		Nitrobenzene	
	Paramethasone			Phenacemide	265
	Stilboestrol			Phenytoin	264
242	Etomidate			Prenylamine	253, 268
	Fluocortolone			Primidone	252, 264
	Indapamide	288		Syrosingopine	298
	Ketazolam		259	Ethotoin	265
	Meclofenamic Acid	282, 331		Isopropamide Iodide	265
	Salol	310		Pheneturide	265
243	Buclosamide	301		Phenprobamate	254, 261, 265, 269
	Colchicine	350		Proguanil	
	Desonide		260	Aminacrine	311, 325
244	Ketoconazole	296		Buclizine	255
	Noxythiolin			Cephalexin	
245	Benzaldehyde	279, 289		Chlorproguanil	
	Clonazepam	309		Clotrimazole	254
	Methandienone			Melphalan	301
	Trimetozine		261	Proflavine Hemisulphate	
246	Ethebenecid		262	Benzalkonium Chloride	256, 268
	Sulthiame			Benzyl Nicotinate	
247	Azaperone	300		Simazine	
	Chlorotrianisene	307	263	Atrazine	
	Methsuximide	252, 258, 264		Bacampicillin	258, 269
	Phensuximide	252, 258, 264		Cetalkonium Chloride	253, 258, 270
248	Diazinon			Nicotinic Acid	
	Halquinol	263, 334		Tolazamide	257, 268, 275
	Practolol			Tolbutamide	257, 268, 275
	Trioxsalen	296, 338	264	Glibornuride	257, 275
249	Broxyquinoline	325		Methallenoestril	253, 273, 317, 332
	Phytomenadione	244, 263, 270, 331		Methyl Nicotinate	
250	Diuron	287		Pindolol	287
251	Bamipine	298	265	Cholecalciferol	
	Chlorquinaldol	315		Ergocalciferol	
	Dihydrotachysterol	242		Pipothiazine	315
252	Clorexolone			Suprofen	291
	Danthron	283		Tofenacin	259, 272
	Flunitrazepam	308		Triclocarban	
	Fluspirilene	273, 293	266	Deptropine	272
253	Trilostane			Phenaglycodol	259, 275
254	Phenothiazine	317	267	Propamidine	
255	Benzene			Reserpine	295
	Clioquinol	325	268	Domiphen Bromide	277
	Dixyrazine	305		Phenoxymethylpenicillin	275
	Lofepramine			Polythiazide	317
256	Busulphan			Proxymetacaine	231, 310
	Dithranol	288, 360	269	Clopidol	
257	Benzylpenicillin Sodium	264, 325		Isopropylaminophenazone	243
	Lorcainide	263		Octaphonium Chloride	263, 274, 282
	Methoin	264		Propicillin	276
	Methyl Hydroxybenzoate		270	Fenclofenac	276
	Tolnaftate			Thiambutosine	
258	Alfentanil	264, 268		Vindesine	
	Aprindine	296	271	Benzoic Acid	280
	Beclamide	252, 264, 268		Chloramphenicol Palmitate	
	Benethamine			Paradichlorobenzene	265, 282
	Benzyl Alcohol	252, 264		Sulphasomidine	
	Chlorambucil	303	272	Miconazole	264, 280
	Clidinium Bromide	252, 264	273	Fenoprofen	280
	Cyclandelate	252, 264		Methoserpidine	
	Di-iodohydroxyquinoline		274	Betanaphthol	285, 322, 330

λ max nm	Compound	Subsidiary peaks nm	λ max nm	Compound	Subsidiary peaks nm
	Dibutyl Phthalate			Cannabinol	
	Etamiphylline			Carbamazepine	237
	Methisazone	241		Chlormadinone Acetate	
	Parathion		286	Anisindione	340
275	Chlorthalidone	284		Dydrogesterone	
	Cresol	279	287	Megestrol Acetate	
	Dimethyl Phthalate			Mexenone	243, 325
	Dodecyl Gallate			Nicergoline	
	Ecgonine		288	Flufenamic Acid	339
	Ethyl Biscoumacetate	303		Phthalylsulphathiazole	260
	Ethyl Gallate		289	Camphor	
	Methocarbamol			Clonixin	335
	Nabilone	282		Indoramin	273, 289
	Naphthalene	266, 286	290	Alphadolone Acetate	
276	Cephaeline	235		Alphaxalone	
	Mefruside	284		Methoxamine	
	Methoxychlor			Propranolol	306, 319
277	Bamifylline		291	Griseofulvin	236
	Clopamide	232, 286		Prothionamide	
	Meptazinol		293	Benzocaine	
	Phenolphthalein		294	Butyl Aminobenzoate	
278	Butylated Hydroxytoluene			Tolfenamic Acid	330
	Cannabidiol		295	Hydroquinone	
	Chloramphenicol			Procaine Penicillin	
	Diloxanide		296	Fenbendazole	
	Mestranol	287		Procaine	
	Nadolol	270		Tienilic Acid	267
	Δ^9 -Tetrahydrocannabinol		298	Choline Salicylate	
279	Butoxyethyl Nicotinate		299	Hexachlorophane	
	Carbaryl		300	Glibenclamide	275
280	Aminohippuric Acid		303	Clefamide	
	Chlorphenesin Carbamate	288		Oxyclozanide	
	Clofibrate	288		Pentachlorophenol	295
	Methicillin		308	Benzonatate	
	Methylchlorophenoxyacetic Acid		310	Phenprocoumon	285
	Oestriol		311	Bitoscanate	296
	Oestrone			Gliquidone	
	Propanidid			Tinidazole	230
	Tubocurarine Chloride		313	Ranitidine	
281	Chlorphenesin	289	315	Rifamycin SV	
	Ethinylloestradiol		322	Morantel	
	Monosulfiram		324	Pyridoxine	254
282	Alclofenac	290	328	Thiacetazone	
	Hexylresorcinol		330	Loprazolam	
	Indoprofen		333	Niclosamide	
283	Nicoumalone	306	351	Hydroxocobalamin	274
	Δ^9 -Tetrahydrocannabinolic Acid	278	344	Harmaline	260
	Triclosan		356	Carbazochrome	
284	Alpha Tocopheryl Acetate		358	Viprynum Embonate	239
	Dichlorophenoxyacetic Acid	292	361	Cyanocobalamin	278
	Parachlorophenol		367	Furazolidone	259
285	Acetomenaphthone	322		Nitrofurantoin	266
	Azinphos-methyl	302, 315	386	Aminonitrothiazole	

Infra-red Peaks

The table below lists the six major absorption bands which have been selected from recorded spectra over the range 2000 to 650 cm^{-1} (5 to 15 μm). The selected peaks are the six most intense peaks, except that peaks in the region where Nujol absorbs (1490 to 1320 cm^{-1} , 6.7 to 7.6 μm) have been omitted. The peaks are arranged in descending order of amplitude. Shoulders have been chosen only if they are clearly resolved and the point of maximum absorption can be easily determined. Where there is more than one peak of the same intensity at the sixth intensity level, the choice has been arbitrary. It should be noted that, because of variations in instruments and conditions, other determinations of the spectrum may not give peaks

with the same relative intensities. In particular, the order of the two most intense peaks may be reversed and this should be taken into consideration when using the index.

To identify an unknown compound, the wavenumbers of the two most intense peaks should be compared with the table, initially allowing a tolerance of $\pm 4 \text{ cm}^{-1}$, to produce a list of possible compounds. Comparison of the six most intense peaks with this list may allow a tentative identification; reference should then be made to the spectra given in the monographs in Part 2.

If a tentative identification cannot be made it may be necessary to use a wider coverage, or to search on the 3rd most intense peak.

Principal Peaks in Descending Order of Amplitude

Mass Spectral Data of Drugs

In the following table the m/z values of the eight most intense ions are listed in descending order of intensity for drugs and other compounds of forensic interest. To identify an unknown compound, the m/z values of the two most intense ions should be compared with the table in order to produce a list of possible compounds. The eight most intense ions

of the unknown can then be compared with this list. Comparison with standard spectra should then be made. Complete mass spectra for about 1000 drugs, metabolites, and other compounds of forensic and pharmaceutical interest are reproduced in *Pharmaceutical Mass Spectra* (London, Pharmaceutical Press, 1985).

Principal peaks at m/z								Compound
29	30	28	31	32	—	—	—	Formaldehyde
29	41	39	42	69	116	167	168	Ascorbic Acid

Mass Spectral Data of Pesticides and Gas Chromatographic Decomposition Products (GCDP)

In the following table the m/z values of the eight most intense ions are listed in descending order of intensity; the table should be used as described under Mass Spectral Data of Drugs.

The values for m/z in this table were obtained using a quadrupole spectrometer, after gas chromatography unless otherwise stated, except for those substances marked † the data for which were obtained on a magnetic sector instrument.

<i>Principal peaks at m/z (percentage relative abundance)</i>								<i>Compound</i>

Part 4: Appendix of Reagents and Proprietary Test Materials

Reagents

The names of all the reagents listed and defined below are printed in *italic type* wherever they occur in descriptions of tests in Part 1 or Part 2.

Acetate Buffer (pH 5): dissolve 13.6 g of sodium acetate and 6 ml of *acetic acid* in sufficient water to produce 1000 ml.

Acetic Acid: Glacial Acetic Acid: contains not less than 99% w/w of $\text{CH}_3\text{CO}_2\text{H}$.

Acetic Acid, Dilute: contains approximately 6% w/w of $\text{CH}_3\text{CO}_2\text{H}$.

Ammonia Buffer (pH 9.5): dissolve 10.7 g of ammonium chloride in 40 ml of 5M ammonia and dilute with water to 1000 ml.

Ammonia Solution, Dilute: dilute 37.5 ml of *strong ammonia solution* to 100 ml with water. It contains about 10% w/w of NH_3 .

Ammonia Solution, Strong: contains 27 to 30% w/w of NH_3 .

Ammonium Polysulphide Solution: dissolve a sufficient quantity of precipitated sulphur in *ammonium sulphide solution* to produce a deep orange solution.

Ammonium Sulphide Solution: saturate 120 ml of 5M ammonia with washed hydrogen sulphide and add 80 ml of 5M ammonia. It should be recently prepared.

***p*-Anisaldehyde Reagent:** dissolve 0.5 ml of *p*-anisaldehyde in 50 ml of *acetic acid* and 1 ml of *hydrochloric acid*.

Ascorbic Acid Reagent: a 2% solution of ascorbic acid.

Barium Chloride Solution: a 10% solution of barium chloride.

Benzalkonium Chloride Solution: a solution containing 50% of a mixture of alkylbenzyltrimethylammonium chlorides.

Borax Buffer 0.05M: dissolve 19.07 g of borax in sufficient water to produce 1000ml.

Bromine Solution: Bromine Water: a freshly-prepared, saturated solution of bromine.

Chlorine Solution: a freshly-prepared, saturated solution of chlorine.

Chromic Acid Solution: dissolve 3 g of potassium dichromate in 10 ml of water, then carefully dilute to 100 ml with *sulphuric acid* with continuous stirring. The solution is stable for one month.

Cobalt Thiocyanate Solution: dissolve 6 g of cobalt nitrate and 18 g of potassium thiocyanate in 100 ml of water.

Copper Sulphate Solution: a 5% solution of copper sulphate.

Dimethyl Yellow Solution: a 0.2% solution of dimethyl yellow in ethanol (90%).

Copper Sulphate Solution: a 5% solution of copper sulphate.

Dimethyl Yellow Solution: a 0.2% solution of dimethyl yellow in ethanol (90%).

Dithiobisnitrobenzoic Acid Solution: dissolve 10 mg of 5,5'-dithiobis-2-nitrobenzoic acid in 100 ml of *phosphate buffer (pH 7.4)*.

DPST Solution: dissolve 0.5 g of 2,5-diphenyl-3-(4-styrylphenyl)-tetrazolium chloride in 100ml of ethanol; dilute 5 ml of this solution to 50 ml with 2M sodium hydroxide immediately before use.

Dragendorff Spray: (a) mix together 2 g of bismuth subnitrate, 25 ml of *acetic acid*, and 100 ml of water; (b) dissolve 40 g of potassium iodide in 100 ml of water. Mix together 10 ml of (a), 10 ml of (b), 20 ml of *acetic acid*, and 100 ml of water. Prepare every 2 days.

Duquenois Reagent: dissolve 2 g of vanillin and 0.3 ml of acetaldehyde in 100 ml of ethanol. The reagent should be stored in the dark.

Fast Blue B Solution: a 1% solution of fast blue B salt (diazotised *o*-dianisidine). It should be freshly prepared.

Ferric Ammonium Sulphate Solution: a 10% solution of ferric ammonium sulphate.

Ferric Chloride Solution: a 5% solution of ferric chloride.

Fluorescein Solution: mix 10ml of a saturated solution of fluorescein in *acetic acid* with 15 ml of *acetic acid* and 25 ml of *strong hydrogen peroxide solution*. This solution must be freshly prepared.

Formaldehyde Solution: Formalin: contains 34 to 38% w/w of formaldehyde.

Forrest Reagent: mix together equal volumes of a 0.2% solution of potassium dichromate, a 30% v/v solution of *sulphuric acid*, a 20% w/w solution of *perchloric acid*, and a 50% v/v solution of *nitric acid*.

FPN Reagent: mix together 5 ml of *ferric chloride solution*, 45 ml of a 20% w/w solution of *perchloric acid*, and 50 ml of a 50% v/v solution of *nitric acid*.

Furfuraldehyde Reagent: (a) dilute 2 ml of redistilled furfuraldehyde to 100 ml with acetone; (b) dilute 4 ml of *sulphuric acid* to 100ml with acetone; prepare immediately before use. Spray with (a) first, followed by (b).

Furfuraldehyde Solution: a 10% solution of furfuraldehyde in ethanol.

Hydriodic Acid: contains about 55% w/w of HI.

Hydrochloric Acid: Concentrated: contains 35 to 39% w/w of HCl.

Hydrochloric Acid, Dilute: mix 274 g of *hydrochloric acid* with 726 g of water. It contains about 10% w/w of HCl.

Hydrogen Peroxide Solution, Strong: 100 volume: contains 29 to 31% w/v of H_2O_2 .

Hydroxylamine Hydrochloride Solution: dissolve 3.5 g of hydroxylamine hydrochloride in 95 ml of ethanol (60%), add 0.5 ml of a 0.1% solution of bromophenol blue followed by 0.5M potassium hydroxide in ethanol until a green tint develops in the solution, then add sufficient ethanol (60%) to produce 100 ml.

Iodine Solution: dissolve 2 g of iodine and 3 g of potassium iodide in sufficient water to produce 100 ml.

Iodobismuthous Acid Solution: mix 40 mg of bismuth subcarbonate with 0.5 ml of 0.5M sulphuric acid and add 5 ml of a 10% solution of potassium iodide, 1 ml of 0.5M sulphuric acid, and 25 ml of water.

Iodoplatinate Solution: dissolve 0.25 g of platonic chloride and 5 g of potassium iodide in sufficient water to produce 100 ml.

Iodoplatinate Solution, Acidified: add 5 ml of *hydrochloric acid* to 100 ml of *iodoplatinate solution*.

Lead Acetate Paper: immerse white filter paper in a mixture of 10 volumes of *lead acetate solution* and 1 volume of 2M acetic acid. After drying, cut the paper into strips. Store in a well-closed container.

Lead Acetate Solution: a 10% solution of lead acetate in carbon dioxide-free water.

Ludy Tenger Reagent: dissolve 5 g of bismuth subcarbonate in 15 ml of *hydrochloric acid*, add 30 g of potassium iodide and then add 85 ml of water very slowly and with constant stirring. For use as a TLC spray, dilute 1 volume with 4 volumes of water.

Mandolines Reagent: dissolve 0.5 g of ammonium vanadate in 1.5 ml of water and dilute to 100 ml with *sulphuric acid*. Filter the solution through glass wool.

Marquis Reagent: mix 1 ml of *formaldehyde solution* with 9 ml of *sulphuric acid*. Prepare daily.

Mercuric Chloride-Diphenylcarbazone Reagent: (a) dissolve 0.1 g of diphenylcarbazone in 50 ml of ethanol; (b) dissolve 1 g of mercuric chloride in 50 ml of ethanol; prepare the solutions daily. Mix (a) and (b) just before spraying.

Mercuric Nitrate Solution: dissolve 40 g of mercuric oxide (red or yellow) in a mixture of 32 ml of *nitric acid* and 15 ml of water. Store in glass containers protected from light.

Mercurous Nitrate Spray: a saturated solution of mercurous nitrate.

Molybdate-Antimony Reagent: dissolve 10g of ammonium molybdate in 40ml of 2M sulphuric acid; dissolve 0.1 g of sodium antimony tartrate in 50 ml of 2M sulphuric acid. Mix the two solutions and dilute to 500 ml with 2M sulphuric acid.

Naphthoquinone Sulphonate Solution: dissolve 0.3 g of sodium 1,2-naphthoquinone-4-sulphonate in 100ml of ethanol: water (1:1).

N-(1-Naphthyl)ethylenediamine Solution: a 0.5% solution of *N*-(1-naphthyl)ethylenediamine hydrochloride.

Ninhydrin Spray: add 0.5 g of ninhydrin to 10 ml of *hydrochloric acid* and dilute to 100 ml with acetone. Prepare daily.

Nitric Acid: Concentrated: contains 69 to 71% w/w of HNO_3 .

Nitric Acid, Dilute: mix 106 ml of *nitric acid* with sufficient water to produce 1000ml. It contains about 10% w/w of HNO_3 .

Nitric Acid, Fuming: contains not less than 95% w/w of HNO_3 .

Nitrogen Dioxide Vapour: produced by the action of *nitric acid* on copper turnings. For location in thin-layer chromatography the TLC plate is exposed to the nitrous fumes which are evolved.

Nitroso-naphthol Solution: a 0.2% solution of 2-nitroso-1-naphthol in ethanol.

Perchloric Acid: contains about 72% w/w of HClO_4 .

Perchloric Acid Solution: add 15 ml of *perchloric acid* to sufficient water to produce 100 ml.

Phosphate Buffer (pH 5.6): dissolve 62.4 g of sodium dihydrogen phosphate in sufficient water to produce 100 ml.

Phosphate Buffer (pH 6.88): dissolve 3.40 g (0.025M) of potassium dihydrogen phosphate and 3.53 g (0.025M) of anhydrous disodium hydrogen phosphate, both previously dried at 110° to 130° for 2 hours, in sufficient water to produce 1000 ml.

Phosphate Buffer (pH 7.4): (a) dissolve 9.465 g of anhydrous disodium hydrogen phosphate in water and dilute to 1000 ml; (b) dissolve 9.073 g of potassium dihydrogen phosphate in water and dilute to 1000 ml. Mix 80 ml of (a) with 20 ml of (b) to obtain a solution of pH 7.4.

Phosphoric Acid: contains 84 to 90% w/w of H_3PO_4 .

Potassium Cupri-tartrate Solution: Fehling's Solution: (a) dissolve 34.64 g of copper sulphate in a mixture of 0.5 ml of *sulphuric acid* and sufficient water to produce 500 ml; (b) dissolve 176 g of sodium potassium tartrate and 77 g of sodium hydroxide in sufficient water to produce 500 ml. Mix equal volumes of solutions (a) and (b) immediately before use.

Potassium Cyanide Solution: a 10% solution of potassium cyanide.

Potassium Permanganate Solution, Acidified: a 1% solution of potassium permanganate in 0.25M sulphuric acid.

Silver Nitrate Solution: a freshly-prepared 5% solution of silver nitrate.

Sodium Chloride-Potassium Chloride Solution: mix 140 ml of M sodium chloride with 50 ml of 0.1 M potassium chloride, and dilute with water to 1000 ml.

Sodium Hydroxide Solution: a 20% solution of sodium hydroxide.

Sodium Hydroxide Solution, Dilute: a 5% solution of sodium hydroxide.

Sodium Hypobromite Solution: dissolve 5 ml of bromine in 50 ml of a 40% solution of sodium hydroxide, with agitation and cooling.

Starch-iodide Paper: impregnate unglazed white paper with *starch mucilage* diluted with an equal volume of a 0.4% solution of potassium iodide.

Starch Mucilage: triturate 0.5 g of starch with 5 ml of water and add this, with constant stirring, to sufficient water to produce about 100 ml. Boil for a few minutes, cool, and filter. It should be freshly prepared.

Sulphuric Acid: Concentrated: contains not less than 95% w/w of H_2SO_4 .

Sulphuric Acid, Dilute: mix carefully 104 g of *sulphuric acid* with 896 g of water and cool. It contains about 10% w/w H_2SO_4 .

Sulphuric Acid, Fuming: Oleum: prepared by the addition of sulphur trioxide to *sulphuric acid* and is available containing about 30% of free SO_3 .

Sulphuric Acid-Ethanol Reagent: add gradually 10 ml of *sulphuric acid* to 90 ml of ethanol.

Tetrabutylammonium Phosphate, 0.005M, pH 7.5: PIC Reagent A. Marketed by Waters Associates Inc., Milford, MA 01757, USA; Waters Associates (Instruments) Ltd, Northwich, Cheshire, UK.

p-Toluenesulphonic Acid Solution: dissolve 4 g of *p*-toluenesul-phonic acid in 20 ml of ethanol.

Trinder's Reagent: dissolve 40 mg of mercuric chloride in 850 ml of water, add 120 ml of M hydrochloric acid and 40 g of hydrated ferric nitrate, and dilute to 1000 ml with water.

Van Urk Reagent: dissolve 1 g of *p*-dimethylaminobenzaldehyde in 100 ml of ethanol and add 10 ml of *hydrochloric acid*.

Zwicker's Reagent: mix 40 ml of a 10% solution of copper sulphate with 10 ml of pyridine and add sufficient water to produce 100 ml.

Proprietary Test Materials

Amberlite XAD-2: polymeric adsorbent beads for adsorbing water-soluble organic substances.

Marketed by Rohm and Haas Company, Philadelphia, PA 19105, USA; Rohm and Haas (UK) Ltd, Croydon, Surrey, UK.

Anabolic Steroid Radioimmunoassay Kits: for nandrolone and for 17 α -methyl substituted anabolic steroids. Obtainable from Prof. R. V. Brooks, Dept of Chemical Pathology, St. Thomas' Hospital Medical School, London, UK.

Carbon Monoxide in Blood: Spectrophotometric Reference Standards.

Marketed by American Hospital Supply Corporation, Evanston, IL 60201, USA; American Hospital Supply (UK) Ltd, Ashford, Middlesex, UK.

Cholinesterase Activity Assay Kit: colorimetric method for plasma or serum.

Marketed by Sigma Chemical Co., St. Louis, MO 63178, USA;

Sigma London Chemical Co. Ltd, Poole, Dorset, UK.

Co-oximeter, IL 282: for the determination of carbon monoxide in blood.

Marketed by Instrumentation Laboratory Inc., Lexington, MA 02173, USA; Instrumentation Lab. UK Ltd, Warrington, Cheshire, UK.

Dextrostix: reagent strips for the approximate estimation of glucose in blood.

Marketed by Ames, Division of Miles Laboratories Inc., Elkhart, IN 46515, USA; Ames Division of Miles Laboratories Ltd, Stoke Poges, Buckinghamshire, UK.

Ethanol Assay Kit: enzymatic method for the determination of ethanol in whole blood, plasma, or serum. Marketed by Sigma Chemical Co., St. Louis, MO 63178, USA; Sigma London Chemical Co. Ltd, Poole, Dorset, UK.

Extrelut: a column containing granules of diatomaceous earth with a large pore volume.

Marketed by E. Merck, D-6100 Darmstadt, W. Germany; BDH Chemicals Ltd, Poole, Dorset, UK.

High Performance Silica Gel TLC Plates: with fluorescent indicator and concentration zone.

Marketed by E. Merck, D-6100 Darmstadt, W. Germany; BDH Chemicals Ltd, Poole, Dorset, UK.

Labstix: reagent strips for urine testing to indicate pH, and the presence of protein, glucose, ketones, and blood. Marketed by Ames, Division of Miles Laboratories Inc., Elkhart, IN 46515, USA; Ames Division of Miles Laboratories Ltd, Stoke Poges, Buckinghamshire, UK.

Paracetamol Assay Kit: enzymatic method for the determination of paracetamol in plasma.

Marketed by Cambridge Life Sciences, Cambridge, UK.

Sephadex LH-20: a bead-formed dextran gel with hydrophilic and lipophilic properties.

Marketed by Pharmacia (Great Britain) Ltd, Milton Keynes, Buckinghamshire, UK; Pharmacia Fine Chemicals, Division of Pharmacia Inc., Piscataway, NJ 08854, USA.

Sep-Pak C-18 Cartridge: a silica cartridge for column chromatography.

Marketed by Waters Associates Inc., Milford, MA 01757, USA; Waters Associates (Instruments) Ltd, Northwich, Cheshire, UK.

Serum-Iron Assay Kit

Marketed by Travenol Laboratories Inc., Deerfield, IL 60015, USA; Lome Laboratories Ltd, Reading, Berkshire, UK.

SubtilisinA

Marketed by Novo Enzyme Products Ltd, Windsor, Berkshire, UK.

Tox Elut: a column containing granules of diatomaceous earth with a large pore volume.

Marketed by Analytichem International Inc., Lawndale, CA 90260, USA.

Urastrat: a complete quantitative system for the determination of urea nitrogen in serum.

Marketed by General Diagnostics, Warner-Lambert (UK) Ltd, Eastleigh, Hampshire, UK.
